By the end of 1943, our production of aluminum will be at a rate almost seven times greater than was attained in 1939 after 50 years of intensive development. And we will be recovering from brine, sea water, and other sources approximately 100 times the amount of magnesium that was produced in 1939, when the magnesium industry in America was 24 years old.

Our aviation industry is establishing facilities for the manufacture in one year of almost double the number of planes it produced throughout the 37 years of its history beginning with the Wright brothers at Kitty Hawk and culminating in the defense program. Meanwhile, largely as a result of chemical advances in fuels, plastics, and light metals, aircraft engineers are designing transoceanic planes capable of flying to Europe and back nonstop, carrying payloads of 20 tons. The projected planes are quadruple the size of the famous Clipper planes that pioneered in inaugurating trans-Atlantic commercial air service.

The Nation will emerge from this war with capacities for making plastics, synthetic fibers, nitrates, hydrocarbons, high octane gasolines, and literally scores of chemical and other raw materials on a scale that only two years ago was beyond our comprehension. The changes that have taken place in our thinking and planning approach the unbelievable when one detaches himself from the present long enough to regain the viewpoint of only the recent past. The first proposal that we build 50,000 war planes left us incredulous. We asked how could we maintain such a vast fleet even should it be built, or train the men to fly it. Now, the demand for 125,000 war planes in a single year is met with the answer, "Give us the materials and we'll give you the planes, as ordered."

In terms of dollars, the hundreds of millions of that by-gone economy stemming from World War I have suddenly become tens of billions! A million dollars is hardly pin money in our planning!

Few of us, even among scientists, grasp the technical implications of these enormous projects which are becoming facts with emergency speed. The aluminum-producing capacity being created will furnish in one year metal enough to build thrice the number of passenger cars now operating on all American railroads. To produce this aluminum will require more electricity annually than was consumed in 1940 in 27 of our 48 states. Despite wartime tax schedules and wages, aluminum ingots now cost 25 per cent less than in 1940, and further economies are forecast through savings in fabricating costs. Aluminum has become a major metal.

Magnesium is about 60 per cent the weight of aluminum and about one fifth the weight of steel. It sold, in 1915, for $5.00 per pound and until a few years ago was a structural curiosity. Today, measured by cubic feet, magnesium at 22.5 cents a pound is cheaper than aluminum selling at 15 cents a pound, and almost a half ton of it, on the average, is going into every American fighting plane that is built. After the war, the Nation's capacity for producing this lightest of all structural metals will be more than double its aluminum output of 1939.

Equally significant is the source of most of the magnesium now employed industrially. For the first time in the history of the world a structural metal is being obtained from the sea by a chemical process. Huge pumps force 300,000,000 gallons of sea water daily through intricate apparatus. At present, magnesium and bromine are the only products precipitated, but potentially the water contains traces of every element found on land. Are we opening a new field of chemistry, far more bizarre than any of the imaginings of fictionists? Nobody knows as yet.

In turn, steel is challenging the light metals. Low alloy steels and new modifications of the higher alloy steels, fresh

from the laboratory, are bidding for expanding uses in aviation and wherever lightness and strength are requisites. In steel industry today, technicians speak confidently of monster aircraft that will be largely steel. These new alloys are three times the weight of aluminum and almost five times the weight of magnesium, but their tensile strength approximates 190,000 pounds to the square inch. This advantage permits weight to be shed by reducing bulk and eliminating needless supports.

The larger planes grow in the future, say the chemists of steel, the more pronounced will be the trend to the new steel alloys. Less subject to corrosion than plain steel, they are more easily corroded than aluminum, but this problem in protection is said to be on the way to early solution. So watch steel in the mounting competition of light metals.

By all means, too, watch petroleum. Some years ago it was believed that the ultimate in motor fuel would be reached by the creation of a gasoline equivalent in power and antiknock qualities to pure iso-octane. So superior was iso-octane in these respects that it arbitrarily was given an octane number of 100, which became the standard in evaluating all gasolines. But that was before the Battle of Britain.

The epic fight of the Royal Air Force to save England, raging month upon month against odds, was also a chemists' fight to produce better fuels—fuels that would get planes into the air in a fraction of the former time, that would give greater and yet greater speeds, longer and yet longer ranges. The American chemist was in that fight because he knew more about motor fuels than any other chemist on earth. The Battle of Britain became a testing and development laboratory in which a nation's life was the stake.

The work done in that laboratory, and in our laboratories here at home as an outgrowth of that experience, has precipitated changes in motor fuel technology of which the effects will be reverberating long after the peace. Fuels now can be made that go beyond the octane scale. Their estimated octane numbers are of the order of 110 or 115 and even higher. They deliver one half again as much power as 100 octane fuel. Looking upon the situation that is indicated after the war, the petroleum chemist now sees all existing motors as out of date, with knowledge of fuels advancing so rapidly that September's motor might be out of date in October.

Let us glance at another phase of petroleum chemistry. A barrel of crude oil contains literally thousands of chemical compounds. The chemist has long been fascinated by the possibility that almost anything under the sun might be created with these chemical building blocks of hydrogen and carbon; that simply by the addition of oxygen and other elements in the proper combination he might obtain new alcohols, esters, acids, solvents, perfumes, pharmaceuticals, and organic synthetics of every type. Catalytic cracking processes and adaptations of them, brought very recently to high stages of performance, are now leading toward this goal and taking petroleum chemistry into a realm once exclusive to coal-tar chemistry.

The largest catalytic cracking capacity in the world is being operated by American oil companies. Soon this capacity will approximate some hundreds of thousands of barrels daily. The significance of this development, well underway in 1939 but expanded to gigantic size by the needs of war, is beyond all present vision. Synthetic rubber, which as every chemist knows is not rubber at all but a new material of broader and yet more promising utility, is being produced from butadiene and styrene synthesized from petroleum. Toluene, best known as the basis of one of the most important of modern high explosives but also essential in dye chemistry and many other industries, is now a petroleum product.

With almost equal facility the petroleum chemist can give us ethylene, on the one hand, or benzene on the other, and supply them in quantities measured in hundreds of tons daily. This feat might be likened to drawing wine or water at will from the same cask, or getting beef or pork from the same animal, inasmuch as ethylene and benzene are members of quite different chemical families. Practically, they are employed in such diverse uses as the manufacture of styrene plastics, both the Buna and Thiokol types of synthetic rubbers, drugs, dyes, and nylon. Moreover, acetylene can be produced from refinery gases to furnish the principal intermediate in the manufacture of neoprene.

Germany's early mastery and world monopoly of the production of benzene, toluene, and other coal-tar crudes and intermediates—her then "secret weapon"—brought her armies almost to victory in World War I. It was only by prodigious effort and at huge cost that private industry in the United States was able, during and after that war, to win independence in these chemicals, which are part and parcel of the Nation's economic life blood both in peace and war.

Today, we are doubly independent. Our coal-tar chemical industry is securely established. In addition, the possible output of benzene and toluene from petroleum is many times their peak output from coal tar. Furthermore, in super motor fuels, which may well be this war's deciding weapons, we are excelling the enemy's best in quantity and quality alike. Where Germany stood in 1914 with coal tar, the United States stands today with petroleum.

A sign of the swiftness of the pace with which the hurly-burly of change is sweeping the petroleum industry, is given by a printed card that now hangs behind the desk of the research director of one of America's greatest oil companies. The card reads: "YOU DON'T HAVE TO BE CRAZY TO WORK HERE, BUT IT SURELY HELPS!"

May I add that a similar card could be hung with profit in every American office and shop and laboratory and farm barn. We are going to need to be "crazy", as judged by 1940's thinking, to make this upset world right again. We are going to need to be visionary to the point of audacity, in the light of today's evident facts, to discharge just a fair share of the postwar opportunities and responsibilities.

Plastics were of sensational promise before Pearl Harbor. The newest and most versatile of plastics will be available after this war on a scale beyond all previous conceptions. The high-pressure synthesis of ammonia, one of the major chemical exploits of the century, will have taken on an industrial status that, in terms of new producing capacity, may be comparable to the discovery of a sixth continent. The amount of fertilizer chemicals that this new capacity will be able to supply farmers will be so large that the basic trends of agriculture might be changed. And these are but one group of a hundred or more products stemming from this high-pressure synthesis, which utilizes air, water, and coal as its building blocks.

We will have glass that is unbreakable and glass that will float, wood that will not burn, and laminations of plastics and wood that will compete with the structural metals. Hosiery derived from air, water, and coal, a wonder of prewar days, is but the forerunner of many innovations from the same source, ranging from shoes that contain no leather and window screens that contain no wire, to machinery bearings that contain no metal.

At the moment we are handicapped by shortages. Scarcity, as such, is not the reason for them, however. Never has there been so great a plenty as measured by our ability to produce, and that ability grows by the hour. The shortages are the consequences of the diversion of goods to war, and from ourselves to others. Today, we produce to destroy.

But tomorrow we will produce to build, and we will continue to invent and thus to multiply our possessions. Released by an American victory the stream of production, compared with its volume in the past, will be as a great river is to one of its tributary creeks. We will have at our command 10, 50, 100 times what we had before, chiefly of new materials.

That prospect is as certain as tomorrow's dawn. We need only to make the victory definite. Then, the choice will be ours, either boldly to harness the stream of plenty, or, if we are timid and of myopic or restricted vision, to be embarrassed by the very abundance of means we have created.

If I know the American chemist, his will be the bold course—the course to-

ward a better destiny. And all science will set its course by the same compass!

Possessing the tools, the experience, and the knowledge that we now have, we should be unfaithful servants indeed if, upon the coming of peace, we merely buried the talents charged to our keeping. Means will be at hand to perform feats that men have long dreamed of doing.

Fuels and metals and plastics are now ready to complete the revolution in transportation begun early in the century. The automobile manufacturer's slate has been wiped clean for a fresh start, which should result in new cars that will be of incredible efficiency as judged by present standards. Since motor car production stopped, the shiny new models that are now gathering dust in dealers' storerooms have aged, technically, at least two decades. We are now in the 1960's of motor cars, as measured by the old pace of development.

Sealed cooling systems, proved on large scale by aviation, may end in the postwar car the nuisance of adding water to radiators. Weights may be half what they are, saving from 1,500 to 2,000 pounds of useless load. The power output per cubic inch of piston displacement may double, treble, and even quadruple. Fuels may yield 50 miles to the gallon, or better.

In the oil industry they are speculating on fuels with octane ratings of 150, or almost twice that of the best automobile gasoline of two years ago. They say gasoline itself may be displaced by a superior petroleum product. They are talking of the practicability of midget automobiles for children.

Instead of rubber alone, there will be a hundred and one rubbers for tires and other uses. In tires, the indicated range is from all natural rubber casings, through varying combinations of natural rubber and synthetics, to the all-synthetics. When one remembers that at present the synthetics are being adapted to tire specifications written for rubber, and that the truly synthetic-type tire is yet to be engineered, the prospect is one of progressive changes.

The upsurge of automobile technology will be paralleled in aviation. Designers are thinking in terms of hemisphere-spanning freighters and of passenger air carriers in fleets numbering hundreds of planes. Transcontinental nonstop air trains of gliders, which would drop off or pick up "coaches" over the principal cities en route, are no longer figments of an imaginative air man's dreams. They are probabilities. Leaders of the industry say that technical considerations no longer limit the size of airplanes that can be built.

Now present are most of the elements essential to the wide popular ownership of planes. Small, highly efficient, almost foolproof craft can be produced at low cost. An enormous plant capacity will be awaiting utilization, tens of thousands will have been trained in flying, and the postwar land will be dotted with air fields. Only within very large cities will we be deficient in field facilities, and there, too, the signs of impending change are clear.

As never before we are conscious of the need for cheaper and better housing. Crowded city slums stand as an ugly reproach to our lack of initiative and vision in home building. The slums should be emptied after the war by the combination of forces that is being arrayed against them; and once empty, airports might well take over those bleak blocks.

Lower cost motor cars, which will draw still more thousands of city dwellers to suburbs and country, represent one of the forces that are going to help empty the slum. Public opinion, shaped by a more enlightened conception of the basic needs of healthful living, is another. The third will be the better housing that so long has been awaited. It is coming.

It is coming because in no better way will we be able to put into worthwhile service the abundance of materials suitable for building all kinds of things. The very prospect of this plenty, on the one hand, and the all too glaring lack of inexpensive modern housing on the other, have started men thinking who have given but little attention to this problem in the past. The engineer, the chemist, the production expert, and the development departments of some of our largest companies are alert to an opportunity, and will become productively interested the moment the war releases their services.

Thus far, only general objectives have taken form. They are for homes costing in the order of $500 to $800 per room. Prefabricated sections, which can be easily handled by two men, will permit flexibility in architectural designs. New insulating materials, making possible light walls that will be several times as efficient as heavy masonry ones, will allow the use of revolutionary structural principles.

Plywood, plastics, rustless steels, nonferrous alloys, various types of composition board, fire-resistant woods, ceramics, and synthetic finishes of lasting durability will be employed in profusion. For example, stainless steel is indicated as a common roofing material of the future. It will last as long as the house and require no maintenance. Lighting will be automatic, governed by electric "eyes" sensitive to outside variations in the daylight. Air-conditioning units will filter out the pollens of hay fever and asthma.

The movement for better homes marches side by side with that to educate the public in better diet. I venture to say that more popular training in the chemistry of food and its digestion has been crammed into the past two years than was given in the preceding two centuries. The knowledge of food's real values to the body that is flowing from sound scientific studies of broad scope is accumulating means of incalculable power to prolong life.

Science, too, follows the flag. This war, spreading over all zones and into all climates, presents a challenge to American medicine that is without precedent. That challenge is being met by a mobilization of all the sciences that likewise is without precedent in man's fight against disease.

The weapons being employed are unique to our time. They include the ultracentrifuge, in which there is a peripheral speed of the rotating disk comparable to the velocity of a rifle bullet. Still another is the electron microscope, the largest of which, now being built at Stanford University, is expected to magnify 150,000 times. Mention should also be made of the giant cyclotrons, sometimes referred to as atom smashers, with which it is possible to transform certain ordinary elements into wholly different elements possessing radioactivity. In addition, synthetic organic chemistry is making an ever-increasing and significant contribution to remedial medicine.

The single objective of this mobilization of science against disease is to prevent suffering and save human lives, irrespective of color or creed. The results which are certain to accrue may ultimately outweigh by many times even the staggering losses of the world-wide conflagration.

Taking an over-all look at the current press of events, one notes that, perhaps, the most important of all the signs pointing to better days is the fact that the emergency of war has dissipated innumerable inertias, each an interruptant of progress. Normally, the new is received with suspicion. People cling to the old and tried, are loath to experiment, slow to change. With peace, however, the usual slow developmental process will have been reversed. War shortages of conventional materials will have resulted n eager trials of every new material science and industry could offer. And countless of the "substitutes" will have proved their superiority. Thus, an experience with and an acceptance of the new will have been gained that ordinarily might have taken many years to achieve.

No doubt, some will become alarmed over the possible displacement of old materials and old industries. Changes of a drastic nature are inevitable but they seldom result in the hardships that the timid predict. More wrought iron is being used in the world today than when wrought iron occupied the province now held by steel. The horse and buggy vanished, but the buggy manufacturers who were alert rose to new affluence with the motor car. The coal-tar colors ended the centuries-long reign of natural dyestuffs, but the dyestuffs industry has grown to many times its former size, and spawned a dozen new industries in addition.

Progress means going forward. It must build more than is destroyed or it does not merit its name. Not only should it be of a tangible, material character, but it should contain the elements of greater spiritual growth for the individual and community alike. It should lift the chin and put a new spring into humanity's step.

The President of the United States has said that we are fighting for four freedoms —freedom from want and freedom from fear, freedom of speech and freedom of religion. A former President of the United States, Herbert Hoover, has added that a fifth freedom is also mandatory in the victory—freedom of economic enterprise.

The scientist accepts these freedoms unreservedly. To their attainment he is glad to give life itself, if that is the price. But the scientist is fighting just as wholesouledly for 500, yes, for 5,000 other freedoms.

The freedom to work, to expand the intellect, to worry through with a theory until it is validated or disproved; the freedom to banish the wasteful and enthrone the efficient; the freedom to improve, if he can, everything that exists under the sun, and beyond that to create things upon which the sun has never before shone—these, too, are freedoms for which the true scientist fights.

As a man, he fights for the freedom to better his lot and for the rewards that ability merits. As an incurable altruist—and the true scientist is one—he fights even harder for the freedom to better the lot of mankind, that each generation may rise to heights loftier than any won by its predecessor.

A soldier of peace, he fights for the freedom to mold a better destiny, both for the individual and for the race.

These freedoms have always been America's. We fight to keep them America's. Let our swords be mighty, and mighty indeed will be our plowshares.

Increased Chemical Sales in 1941

THE U. S. Tariff Commission's preliminary report on 1941 sales of synthetic organic chemicals shows that volume increased 50 per cent over the record set in 1940 and was valued at $724,000,000. Sales of finished coal-tar products and intermediates were valued at 60 per cent over the previous year, while noncoal-tar synthetics were 42 per cent higher.

Thin Polarized Plastic Film

A MEANS of producing thinner films of polarizing plastic than have hitherto been made, but without sacrifice of efficiency, is covered by U. S. Patent 2,289,-713 issued to Edwin H. Land of Boston, Mass., and assigned to the Polaroid Corp.

Data Published on Selective Service

BECAUSE of the wide interest in this subject and the need for obtaining trained men for our Production Army, we give below references to information we have published on occupational deferments, including those of men in training, and the need for technically trained persons. Future developments will be brought to the attention of our readers.

Junior Metallurgists Needed

INCREASING numbers of scientifically and technically trained men and women will be required for the war effort this year and next. Junior metallurgists are urgently needed to conduct investigative, developmental, or production work in various branches of metallurgy; to assist in the design, construction, installation, and operation of metallurgical equipment; or to perform metallurgical work in the recovery or fabrication of metals.

The U. S. Civil Service Commission is recruiting junior metallurgists under a new announcement (No. 254) for which the qualifications are: (1) completion of a four-year college course in metallurgy or metallurgical engineering, or (2) completion of a four year course in chemistry, geology, physics, or engineering, supplemented by (a) one year of paid experience in metallurgy (college teaching in metallurgy is acceptable), or (b) 15 semester hours in metallurgy or metallurgical engineering, or (c) completion of two war training courses in metallurgy.

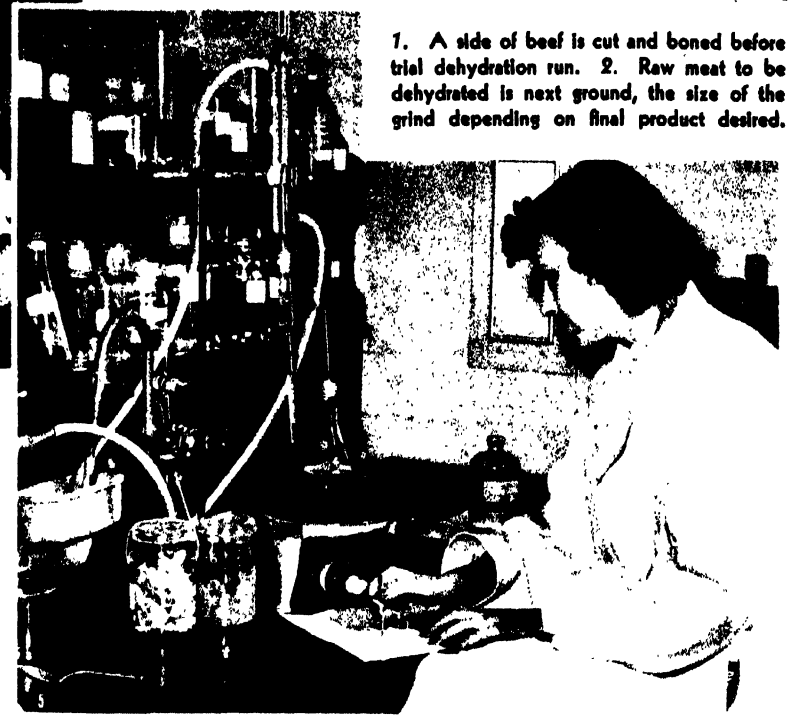
Applications will be accepted from college senior or graduate students who expect to complete the required courses within 6 months after filing applications.

In addition to the positions which pay $2,000 a year, there are a large number of vacancies in subprofessional positions at $1,800 and $1,620 a year. There is no maximum age limit. No written test is required.

Announcements and application forms may be obtained at any first- or second-class post office or from the Civil Service Commission, Washington, D. C.

Sullivan Goes to Institute of Gas Technology

FREDERICK W. SULLIVAN, JR., has been appointed technical director of the Institute of Gas Technology, Chicago, effective September 1. Dr. Sullivan goes to the Gas Institute from the Barrett Division of Allied Chemical and Dye Corp. where he has been manager of chemical research since 1940. Previous to his service there, he was director of research for Standard Oil Co. of Indiana from 1931 to 1938, and assistant director from 1923 to 1931.



Appointment of the new technical director marks the beginning of the second year of operation for the Gas Institute, which was founded a year ago. Like the Armour Research Foundation, it is located at and affiliated with Illinois Institute of Technology. Mr. Vagtborg is director of both the Gas Institute and the Research Foundation. The Gas Institute is the only institution of its kind in the Nation, and is the only place in the country where students may work for graduate degrees in gas technology. It was founded with four principal objectives: the training of personnel for the gas industry; the prosecution of fundamental research in gas technology; the collection and dissemination of scientific information; the conduct of applied research investigations on specific industrial problems.

Dr. Sullivan will have direct supervision of all research work at the institute, both on specific projects for specific firms and on general projects which the institute carries on for the entire gas industry. With the addition of a full-time technical director, Mr. Vagtborg announced that the Gas Institute is planning an expansion of its program in both research and educational work. L. E. Thiesmeyer, student counselor, directs the latter phase of work.

1. A side of beef is cut and boned before trial dehydration run. 2. Raw meat to be dehydrated is next ground, the size of the grind depending on final product desired.

U. S. D. A. PHOTOGRAPHS BY FORSYTHE

The U. S. Department of Agriculture experiments on meat now being dehydrated for Lend-Lease and other wartime shipments abroad.

3. Dehydrated meat removed here from experimental dryer is shown before it is tested for quality. 4. *Left.* The weight and volume of meat are reduced by dehydration. *Right.* Compression still further reduces the volume for packaging. 5. Moisture content of samples is checked frequently and rapidly. 6. Ground beef already dehydrated is compared here with a small sample of raw meat (held in lower hand) that has not been dried. 7. Cans of dehydrated meat are stored at 110° F. to predetermine results of severe climatic conditions.

District of Columbia Taxation of Educational Institutions

Hearing on Senate Bill 2673

A PROPOSAL to tax the real properties owned and used by educational institutions such as the AMERICAN CHEMICAL SOCIETY has been introduced in the United States Senate. Under the terms of this bill, only those educational institutions that give classroom instruction would in the future be entitled to exemption from real estate taxation on the properties they own and use in the District of Columbia for their educational purposes.

The principle proposed by this measure is so far reaching in its ultimate effect on educational work that hearings were promptly ordered on it.

On Tuesday, August 4, 1942, the District of Columbia Committee of the Senate, Senator McCarran of Nevada, chairman, accorded a hearing to representatives of the AMERICAN CHEMICAL SOCIETY, the National Academy of Sciences, and the Carnegie Institution of Washington, all functioning under national charter and all contending that tax exemption of real estate owned by them and used for educational and scientific purposes be continued and no bill be passed that would deny them the privileges heretofore accorded.

Secretary Charles L. Parsons and Counsel Elisha Hanson appeared for the AMERICAN CHEMICAL SOCIETY and presented and filed the following statement and brief, the latter being a joint brief with the National Geographic Society for whom Mr. Hanson also acts as counsel.

Statement of Charles L. Parsons

Mr. Chairman and Members of the Committee:

My name is Charles L. Parsons. I am Secretary of the AMERICAN CHEMICAL SOCIETY, which has headquarters at 1155 Sixteenth St., N. W., Washington, D. C.

I desire to address myself to S. 2673, introduced on July 22 last by Senator Clark of Idaho for Senator McCarran. The purpose of this measure is to define the real property exempt from taxation in the District of Columbia.

The AMERICAN CHEMICAL SOCIETY is particularly interested in this measure because it seeks to repeal the present exemption from taxation of property owned and used by scientific and educational institutions in the District of Columbia and to substitute for the present statutory exemption one much narrower in scope and limited to school, college, and university buildings operated by institutions not organized or operated for private gain and embracing the relationship of teacher and student.

Perhaps I can best illustrate the difference between existing law and the proposal before you by quoting each.

The present law reads:

> Property used for educational purposes that is not used for private gain shall be exempt from taxation, and all other property used for educational purposes shall be assessed and taxed as other property is taxed and assessed. D. C. Code 1929, Title 20, par. 755.

Section (a), (5), of the measure here under discussion would exempt from taxation only

> School, college, and university buildings (including buildings and structures reasonably necessary and usual to the operation of such school, college, or university) belonging to and operated by institutions not organized or operated for private gain, and embracing the generally recognized relationship of teacher and student.

Section (b) of the pending bill proposes to exempt the grounds actually used or necessary for the enjoyment of the buildings exempted by Section (a), (5). This section has one merit in my opinion and that is its proposal for proportionate exemption of property partially used for educational purposes and partially used to secure income by an institution exempted in Section (a), (5.)

The AMERICAN CHEMICAL SOCIETY is a scientific and educational institution, originally organized in 1876.

On August 25, 1937, it was incorporated by Act of Congress, Public No. 358, 75th Congress, 1st Session. Its objects are stated in the act incorporating it as follows:

> Section 2. That the objects of the incorporation shall be to encourage in the broadest and most liberal manner the advancement of chemistry in all its branches; the promotion of research in chemical science and industry; the improvement of the qualifications and usefulness of chemists through high standards of professional ethics, education, and attainments; the increase and diffusion of chemical knowledge; and by its meetings, professional contacts, reports, papers, discussions, and publications, to promote scientific interests and inquiry, thereby fostering public welfare and education, aiding the development of our country's industries, and adding to the material prosperity and happiness of our people.

When the measure proposing to incorporate the SOCIETY was reported to the House, Committee Report No. 1508, 75th Congress, 1st Session, accompanying it said: (see page 1092 where report is printed in full).

As stated in the committee report, five members of the Cabinet, the heads of those departments which employ chemists or engage in chemical research, indorsed the measure. These indorsements were sent to the House Committee on Judiciary in response to an inquiry made of the heads of the departments by the chairman of that committee.

Prior to federal incorporation, the headquarters of the SOCIETY were in New York. After federal incorporation the SOCIETY established its headquarters in Washington and about 15 months ago moved into its present home at 1155 Sixteenth St., N. W., which it had purchased and remodeled for its uses.

There is no question that the AMERICAN CHEMICAL SOCIETY is an educational institution not operated for private gain. In its whole history, both before and since federal incorporation, it has never had any capital stock structure; it has never paid any dividends; unless its charter be amended, and it does not even contemplate such a thing, it can never operate for the private gain of any shareholder or individual. All of its income is devoted to carrying out its objects, as heretofore stated and as set forth in the act incorporating it.

The Bureau of Internal Revenue, the Bureau of Customs, and the Post Office Department under applicable laws have ruled the SOCIETY to be an educational and scientific institution not operated for private gain. The District Commissioners have ruled it exempt from personal property taxes under the exemption granted educational institutions. However, because part of its new home is rented to others, the Commissioners have refused to exempt under existing law that portion occupied and used by the SOCIETY, which is all the SOCIETY has sought.

It is quite apparent that if the pending measure should be enacted in the form here under consideration, this institution would be subjected to real estate taxes on its property used for its educational pur-

poses in the District of Columbia. Until the recent action of the District Commissioners in taxing its home, it has never been compelled to pay any taxes by any state, municipal, or federal agency incident to the carrying on of its educational and scientific work.

At the present time the SOCIETY has a membership of 31,000 chemists and chemical engineers. It has a membership in the District of Columbia of 813.

It has but two paid officers, the Secretary and Business Manager and the Treasurer. All other officers and Directors serve without compensation.

To further its dissemination of information it publishes five journals as follows:

The *Journal of the American Chemical Society* with a circulation in 1941 of 12,505; *Chemical Abstracts* with a circulation of 14,243; *Industrial and Engineering Chemistry* with a circulation of 24,030; the *Analytical Edition* with a circulation of 24,030; and CHEMICAL AND ENGINEERING NEWS, which goes to every member, with a circulation of 34,156.

Its total revenue in 1941 was $798,512.11. Its total expenditures were $874,302.28.

The AMERICAN CHEMICAL SOCIETY believes that the present exemption statute is adequate for the description of institutions to be exempted, unless it be the desire of Congress to penalize those institutions which are carrying on far-flung educational activities of the greatest importance. Education does not cease when one is graduated from grammar school, from high school or preparatory school, from college, nay, even from professional schools after an academic degree has been obtained. It is a continuing process, ever broadening throughout life. One of the greatest functions of a society such as the AMERICAN CHEMICAL SOCIETY is to bring to its members the very latest information in the entire field of chemistry, so that all, whether still student in college, teacher, or professional chemist or engineer in industry, officer in our Army, Navy, or Marine Corps, researcher in government, or wherever employed in the field of chemistry, shall constantly increase his or her knowledge of this subject.

CHARLES L. PARSONS,
Secretary and Business Manager
AMERICAN CHEMICAL SOCIETY

Following the above statement the Secretary was questioned at length by Senator McCarran as to the SOCIETY'S educational activities and functions, financial receipts, and expenditures. Full detail is available to any one when the hearings of the District of Columbia Committee are ultimately issued as a public document.

The Act of Incorporation, H. R. 7709, referred to in the Secretary's statement was printed in the NEWS EDITION for January 20, 1938, page 47.

Report No. 1508 to the House of Representatives 75th Congress, 1st Session, presented again at this hearing has heretofore been available only in the records of Congress. It is such a remarkable document, carrying as it does unstinted endorsement by five government departments and the Judiciary Committee of the House of Representatives of the AMERICAN CHEMICAL SOCIETY and its undertakings, that it is printed here in full as an official record for future easy reference.

75TH CONGRESS *1st Session* } HOUSE OF REPRESENTATIVES { REPORT No. 1508

Incorporating the American Chemical Society

AUGUST 11, 1937.—Committed to the Committee of the Whole House on the state of the Union and ordered to be printed

Mr. TOWEY, from the Committee on the Judiciary, submitted the following

Report

[To accompany H. R. 7709]

THE Committee on the Judiciary, to whom was referred the bill H. R. 7709, after consideration, report the same favorably to the House with amendments with the recommendation that the bill as amended do pass.

The committee amendments are as follows:

On page 3, line 10, after the words "United States" strike out the period and insert the following:

: *Provided*, That the title to any and all inventions and discoveries made in the course of such investigations, examinations, and experiments that, in the opinion of the Secretary of the Navy or the Secretary of War involve the national defense, shall vest in the Government of the United States, and the Government of the United States shall have unlimited license under all other such inventions and discoveries.

On page 5, after line 9, insert a new section, as follows:

SECTION 8. That the corporation shall, on or before the 1st day of December in each year, transmit to Congress a report of its proceedings and activities for the preceding calendar year, including the full and complete statement of its receipts and expenditures. Such reports shall not be printed as public documents.

On page 5, lines 10 and 12, change sections 8 and 9 to sections 9 and 10, respectively.

The committee has heretofore stated its position—that it will limit its recommendation of federal incorporations to organizations national in character, and which assist in the execution of some expressed and implied powers in the Constitution, or form governmental functions thereunder.

It is the judgment of the committee that this proposed incorporation comes within the rule stated.

The purpose of the bill is to provide a charter under the laws of the United States of America for the AMERICAN CHEMICAL SOCIETY, originally organized in 1876. It is a nonprofit, nonstock, membership corporation. The SOCIETY is the largest organization in the world devoted to science. It has a membership of 20,500, and includes in its membership nearly all prominent chemists in America, including such men as Nobel prize winners, the president of Harvard University, the president of the Massachusetts Institute of Technology, and also includes the heads of every prominent chemical industry who, being chemists, are eligible to membership; the leading research and industrial chemists of the country, National, State, and municipal; chemists in private employ; and the professors and instructors in the chemical departments of schools, colleges, and universities.

The objects of the SOCIETY, since its inception, have been to encourage the advancement of chemistry and chemical industry in all its branches; the promotion of research in chemical science and industry; and the improvement of the status of chemists through high standards of professional ethics, education, and attainments. This is accomplished specifically through the increase, diffusion, and recording of chemical knowledge.

The proposed incorporation of the SOCIETY has been approved by the War Department, Navy Department, Department of Commerce, Department of the Interior, and the Agricultural Department, as appears from the following letters received from the said Departments:

WAR DEPARTMENT
Washington, D. C., August 10. 1937

HON. HATTON W. SUMNERS
Chairman, Committee on the Judiciary
House of Representatives

Dear Mr. Sumners:

Careful consideration has been given to the bill (H. R. 7709) to incorporate the AMERICAN CHEMICAL SOCIETY, which you transmitted to the War Department under

date of July 6, 1937, with a request for the views of the department thereon.

There are no provisions of existing law relating to this subject.

With reference to the services being rendered to the War Department, as requested in your letter, the AMERICAN CHEMICAL SOCIETY has for many years cooperated with the War Department as a working organization of Nation-wide scope representing all phases of the American chemical industry. Its officers respond promptly and fully to requests for advice on chemical aspects of problems of national defense. The SOCIETY maintains a committee on cooperation with the Chemical Warfare Service, composed of authorities in the several fields of chemical research, development, and production, who consult periodically with the technical organization of the Chemical Warfare Service.

As to the views of the War Department on H. R. 7709, since the services of the AMERICAN CHEMICAL SOCIETY and its members will unquestionably be available to the War Department in the future as in the past, whenever called upon, it appears that section 4, page 3, lines 1 to 10, in H. R. 7709, is unnecessary and perhaps objectionable. It is accordingly suggested that this entire section be omitted. If thus amended the War Department will offer no objection to the legislation.

The proposed bill in itself carries no increased cost to the Government.

This report was submitted to the Bureau of the Budget which advised, under date of August 7, 1937, that there would be no objection by that office to the submission of the proposed report to the committee.

Sincerely yours,

HARRY H. WOODRING
Secretary of War

NAVY DEPARTMENT
Washington, August 10, 1937

THE CHAIRMAN
Committee on the Judiciary
House of Representatives
Washington, D. C.

My dear Mr. Chairman:

The bill (H. R. 7709) to incorporate the AMERICAN CHEMICAL SOCIETY, was referred to the Navy Department by your committee with request for views relative to this bill.

The purpose of this bill is to incorporate certain persons as the AMERICAN CHEMICAL SOCIETY. The stated objects of the incorporation are to engage in the broadest and most liberal manner the advancement of chemistry in all its branches including research, professional ethics, education, and attainments of chemists, increase and diffusion of chemical knowledge, etc., thereby fostering public welfare and education, aiding the development of the country's industries, and adding to the material prosperity and happiness of the people. The AMERICAN CHEMICAL SOCIETY would, whenever called upon by the War or Navy Departments, investigate, examine, experiment, and report upon any subject in pure or applied chemistry connected with the national defense, without compensation other than that for actual expenses. The bill further sets out the powers of the SOCIETY and other matters concerning its administration.

It is appreciated that the AMERICAN CHEMICAL SOCIETY through its membership is in a position to nominate experienced chemists for induction into reserve forces of the Navy in time of emergency. The assistance of the AMERICAN CHEMICAL SOCIETY in this manner resulted in the supply of a number of excellent officers in the recent war. Federal incorporation of the SOCIETY would accordingly appear advantageous.

It is especially noted that under section 4 of the bill the SOCIETY would, whenever called upon by the War or Navy Departments, investigate, examine, experiment, and report upon any subject in pure or applied chemistry connected with the national defense. The SOCIETY would receive its actual expenses for such assistance but would receive no other compensation for any services to the Government. While the Navy Department considers that, as a general rule of law, an unlimited license would flow to the United States for the use of any invention or discovery resulting from this assistance, it is believed that the SOCIETY will probably conduct investigations of a confidential nature which would result in inventions and discoveries which should be kept secret. This may be accomplished only if the title to the inventions and discoveries is in the United States. (See U. S. Code, title 34, section 37, providing for delay in the issuing of patents in certain cases.) The Navy Department, therefore, recommends that the following proviso be added to section 4 of the bill, H. R. 7709:

"*Provided*, That the title to any and all inventions and discoveries made in the course of such investigations, examinations, and experiments that, in the opinion of the Secretary of the Navy or the Secretary of War involve the national defense, shall vest in the Government of the United States, and the Government of the United States shall have unlimited license under all other such inventions and discoveries."

If amended as above recommended, the Navy Department recommends the enactment of the bill H. R. 7709.

Sincerely yours,

WILLIAM D. LEAHY, *Acting*

DEPARTMENT OF COMMERCE
Washington, August 9, 1937

HON. HATTON W. SUMNERS
Chairman, Committee on the Judiciary
House of Representatives
Washington, D. C.

My dear Mr. Chairman:

In your letter dated July 6, 1937, you requested the department to furnish your committee with a report concerning H. R. 7709, a bill to incorporate the AMERICAN CHEMICAL SOCIETY.

The National Bureau of Standards and the United States Patent Office of this department are vitally interested in the activities of the AMERICAN CHEMICAL SOCIETY, due to the valuable services rendered by it to these bureaus.

The Bureau of Standards has worked closely with the SOCIETY in the establishment of standards of purity for chemical reagents in other fields of standardization, and has found the SOCIETY very cooperative and helpful. One valuable service is its abstracting of papers on chemical subjects in all languages, and in publishing the same for the use of the members of the SOCIETY, and others. These abstracts are of exceptional value to chemists in keeping abreast with recent developments in the field of chemistry.

Furthermore, the SOCIETY now has in course of preparation a combined index of abstracts for the past 10 years, which will greatly aid chemists in following the development in any particular field of chemistry. Many chemists employed by the Bureau of Standards are members of the SOCIETY, and the bureau would find it difficult to carry on its chemical work without the benefit of these abstracts.

These chemical abstracts are classified, and appear in a large number of volumes. They abstract United States and foreign patents and publications relating to organic and inorganic chemistry and allied arts. This service supplies very valuable information to the examining divisions of the United States Patent Office. Ten of the 65 examining divisions are concerned with chemistry and metallurgy, and in these divisions in particular the SOCIETY'S publications are exceedingly useful.

The department favors the objects sought to be attained by H. R. 7709, and recommends its enactment, if in accord with the program of the President.

The Bureau of the Budget has advised that there would be no objection by that office to the submission of this report to your committee.

Cordially yours,

ERNEST G. DRAPER
Assistant Secretary of Commerce

DEPARTMENT OF THE INTERIOR
Washington, August 9, 1937

HON. HATTON W. SUMNERS
Chairman, Committee on the Judiciary
House of Representatives

My dear Mr. Sumners:

This will acknowledge the receipt of your letter of July 6, with which was enclosed copy of a bill (H. R. 7709) to incorporate the AMERICAN CHEMICAL SOCIETY and requesting the views of the Department of the Interior concerning this proposed legislation.

The bill was referred to the directors of the Bureau of Mines and the United States Geological Survey. These agencies employ numerous chemists and conduct chemical research in connection with studies of the Nation's mineral resources, and the preparation and utilization of mineral products.

After careful examination of the bill both directors recommend a favorable report, and I concur in this recommendation.

The AMERICAN CHEMICAL SOCIETY is a scientific society of chemists whose principal services consist in publishing chemical journals and affording regular meetings for he presentation of papers and discussion by members. Its journal, *Chemical Abstracts*, is of outstanding value to every branch of chemistry. Its other journals afford a medium of publication for reports of investigations in every field of chemical activity.

The work of the chemical laboratories of the Department of the Interior would cost much more and be much less effective if it had to be carried on without the help of the publications of the AMERICAN CHEMICAL SOCIETY and the contacts made at meetings of the SOCIETY and its local sections throughout the country. In fact, it would be impossible to carry on chemical research without access to these journals.

The Secretary's office of the SOCIETY has been in Washington for many years, so that national incorporation of the AMERICAN CHEMICAL SOCIETY would recognize the national outlook and national interest of the SOCIETY. It seems probable that such incorporation would be of value in the management of the SOCIETY and the conduct of its work and, also, it would be advantageous to the Federal departments in Washington.

During the World War the AMERICAN CHEMICAL SOCIETY rendered a very great service to the National Government in mobilizing American chemists for war work. Section 4 of the bill provides for effective future service of the SOCIETY.

I believe that in the public interest national incorporation should be granted to the AMERICAN CHEMICAL SOCIETY.

Sincerely yours,
CHARLES WEST
Acting Secretary of the Interior

DEPARTMENT OF AGRICULTURE
Washington, August 7, 1937

HON. HATTON W. SUMNERS
House of Representatives

Dear Mr. Sumners:

I have your letter of July 6, transmitting H. R. 7709, a bill to incorporate the AMERICAN CHEMICAL SOCIETY, and requesting the opinion of this department upon the proposed legislation.

I am of the opinion that the federal incorporation of this national society will serve a useful purpose and further the public welfare.

The AMERICAN CHEMICAL SOCIETY renders signal service to this department as follows:

(*a*) By the prompt publication and very wide dissemination of the results of the research of department chemists.

(*b*) By making available to the chemists of the department the results of research carried on elsewhere, both by primary publication in the two regular monthly journals of the SOCIETY and by means of brief summations in *Chemical Abstracts* of articles appearing in other journals both here and abroad.

(*c*) Through the two semiannual meetings of the AMERICAN CHEMICAL SOCIETY and the organization of local sections, it is possible for the chemists in the Department of Agriculture, both in Washington and elsewhere, to meet groups of scientists interested in the same or allied lines of research, for the purpose of technical discussion and professional contact.

Pursuant to the requirements of Budget Circular 336, the above was referred to the Bureau of the Budget for clearance and under date of August 6, 1937, the Acting Director thereof advised the Department of Agriculture that "there would be no objection by this office to the submission of your proposed report to the committee."

Sincerely,
M. L. WILSON, *Acting Secretary*

The SOCIETY has always given freely of its time and services and its loyalty and active cooperation with the Government of the United States both in war- and peacetimes, and performs a service in its particular field which no other private or governmental agency has ever performed or is equipped to perform. Without this service government bureaus and agencies engaged in many kinds and descriptions of chemical research and control, including the application of chemical knowledge to the improvement of life and health in America, would be functioning without their most important tool.

The SOCIETY abstracts and indexes all papers on chemistry published throughout the world in any language. Its index is a key that makes this great fund of knowledge, taken from more than 2,900 publications, promptly available to all American chemists. No agency of the Government is either equipped to do this work or supplied with funds for the purpose, and these abstracts are always available and are used in every Government, State, municipal, and industrial laboratory and are furnished to all at approximately one half of the cost of production by means of contributions made by American chemists.

There is not a farm in America today which is not affected in its operations by the work done by members of the AMERICAN CHEMICAL SOCIETY.

The AMERICAN CHEMICAL SOCIETY believes that it can more effectively carry on its work with a national charter, and has plans to erect imposing headquarters in Washington similar to those of the National Academy, the Carnegie Institution, and the American Pharmaceutical Association. All income of the SOCIETY is devoted exclusively to the advancement of chemistry.

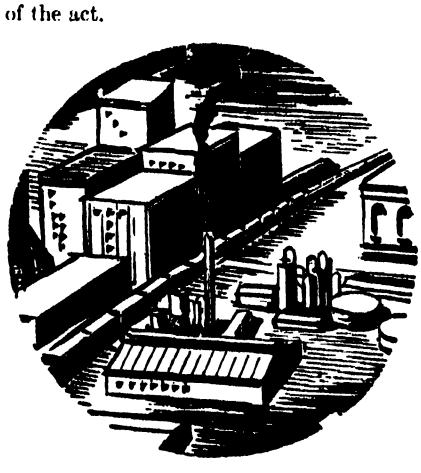
Section 1 of the bill provides for the incorporation of the SOCIETY.

Section 2 states the objects of the corporation.

Section 3 states the powers of the corporation.

Section 4 states the willingness of the SOCIETY at all times to cooperate with the War and Navy Departments, and contains the amendment suggested by the Navy Department.

Section 5 provides for the necessary corporate powers to receive devises, bequests, and donations for the uses and purposes of the SOCIETY.



Section 6 provides for the organization meeting of the SOCIETY under the national charter.

Section 7 protects the rights of the creditors of the present corporation under the New York laws.

Section 8 requires the corporation to transmit to Congress an annual report of its proceedings, and provides that such report shall not be printed as a public document.

Section 9 preserves the right of Congress to alter, amend, or repeal the act at any time.

Section 10 provides for the effective date of the act.

Brief by Elisha Hanson, Counsel

Before the Committee on the District of Columbia, United States Senate

In re S. 2673, A Bill to Define the Real Property Exempt from Taxation in the District of Columbia

THE following brief is submitted to the Committee on the District of Columbia of the United States Senate in behalf of the National Geographic Society and the AMERICAN CHEMICAL SOCIETY, each of which is a nonprofit, educational institution organized for the purpose of increasing and diffusing knowledge.

Each of these institutions maintains its headquarters in Washington, D. C. Each owns real estate, some of which is used for its educational purposes and some of which is put to other use. Neither one at any time has ever sought any exemption from taxation of any of its property that is not being used for its own educational purposes. Therefore, in the following discussion of Senate 2673 it must be borne in mind that neither of these societies is seeking exemption or advocating exemption of properties owned by educational institutions that are not used for educational purposes.

The National Geographic Society

The National Geographic Society was originally organized and incorporated in the District of Columbia in 1888 as a nonprofit, educational institution to increase and diffuse geographic knowledge. In its original charter the society was authorized to publish the transactions of the society, to publish a periodical magazine and other works relating to the science of geography, to dispose of such publications by sale or otherwise, and to acquire a library. In 1920 the society was reincorporated under the laws of the District of Columbia with the following powers in addition to those above enumerated:

* * * to conduct and assist investigation and research in any branch of the science of geography * * *, to conduct lectures, hold meetings, and (in addition to acquiring a library) maintain a library; to purchase such property, real or personal, and construct such building or buildings as may be necessary to carry on the work of the society; and in general to do and perform all things necessary to promote the objects of the society.

The entire income of the National Geographic Society is devoted to the objects set forth in its charter. No dividends are, ever have been, or can be paid out, for there is no capital structure and all revenues must be devoted to the objects of the society.

All of the activities of the society are wholly educational in nature and do not

inure to the private benefit or gain of any individual.

The American Chemical Society

The AMERICAN CHEMICAL SOCIETY is a nonprofit scientific and educational institution originally organized in 1876 under the laws of the State of New York.

On August 25, 1937, it was incorporated by Act of Congress, Public No. 358, 75th Congress, 1st Session. Its objects are stated in the act incorporating it as follows:

Section 2. That the objects of the incorporation shall be to encourage in the broadest and most liberal manner the advancement of chemistry in all its branches; the promotion of research in chemical science and industry; the improvement of the qualifications and usefulness of chemists through high standards of professional ethics, education, and attainments; the increase and diffusion of chemical knowledge; and by its meetings, professional contacts, reports, papers, discussions, and publications, to promote scientific interests and inquiry, thereby fostering public welfare and education, aiding the development of our country's industries, and adding to the material prosperity and happiness of our people.

The entire income of the AMERICAN CHEMICAL SOCIETY is devoted to the objects set forth in its charter. No dividends are, ever have been, or can be paid out for there is no capital stock structure and all revenues must be devoted to the objects of the SOCIETY.

All of the acitivities of the SOCIETY are wholly educational in nature and do not inure to the private benefit or gain of any individual.

Reasons for Filing Brief

Since 1902 the D. C. Code has provided for the exemption of property used for educational purposes in the following provision:

Property used for educational purposes that is not used for private gain shall be exempt from taxation, and all other property used for educational purposes shall be assessed and taxed as other property is taxed and assessed. D. C. Code 1929, Title 20, Section 713.

Section (a) (5) of the measure here under discussion would exempt from taxation only

School, college, and university buildings (including buildings and structures reasonably necessary and usual to the operation of such school, college, or university) belonging to and operated by institutions not organized or operated for private gain, and embracing the generally recognized relationship of teacher and student.

Section (b) of the pending bill proposes to exempt the grounds actually used or necessary for the enjoyment of the buildings exempted by Section (a) (5). This section has the merit that it provides for proportionate exemption of property partially used to secure income by an institution exempted in Section (a) (5).

Turning the Clock Back

But a brief reference to the legislative history of the exemption of real estate owned by educational institutions in the District of Columbia will show that if Section (a) (5) of the pending measure be enacted into law, Congress will be turning the hands of the clock back to 1870 when, under the act which became effective on June 17, 1870, the exemption of real property used for educational purposes was limited to school houses and the property appurtenant thereto and used in connection therewith.

The legislative history of the exemption of real estate owned by educational institutions in the District of Columbia shows that until the present time it has been the intention of Congress to broaden rather than to narrow the scope of exemption, so as to give the benefits of exemption to all educational institutions that are not operated for private gain rather than to limit the exemption to those institutions which maintain the relationship of teacher and student.

Legislative History

In the Act of June 17, 1870, it was provided:

All churches and school houses, and all buildings, grounds, and property appurtenant thereto, and used in connection therewith * * * shall be exempt from any and all taxes and assessments, national, municipal, or county.

Following the enactment of this act with its narrow application to school properties, the taxing authorities exempted only the property of secondary schools and taxed that of colleges. Congress therefore enacted legislation in 1876, amended June 11, 1878, which reads, in part, as follows:

The term "school houses" in the Act of June 17, 1870, Chapter 30, was intended to embrace all collegiate establishments actually used for educational purposes, and not for private gain * * *. But if any portion of any such building, house, or grounds in terms excepted is used to secure a rent or income, or for any business purpose, such portion of the same, or a sum equal in value to such portion, shall be taxed.

The scope of the exemption of this act was evidently still considered too narrow, for on July 1, 1902, the present exemption provision, first above quoted, was enacted. This was, as above recited, restated without change and carried into the D. C. Code (1929), Title 20, Section 713. The Code was published in 1930 under an Act of Congress of May 29, 1928, and Public Resolution of March 2, 1929. Congress directed that there be prepared and published under the supervision of the Committee on Revision of the Laws of the House of Representatives, a consolidation and codification of the laws, general and permanent in their nature, relating to or in force in the District of Columbia. It is to be presumed that at this time Congress knew the construction which had for many years been placed on the exemption provision and the exemptions which were granted thereunder by the highest officers charged with enforcement of the tax laws. In carrying this provision into the Code, Congress indicated its approval of such construction.

A revision or codification of statutes is something more than a restatement of the substance thereof in different language. It implies a re-examination of them, and is applied to a restatement of the law in a corrected and improved form, which restatement may be with or without material change. 59 Corpus Juris, Section 480, p. 887.

It is clear from the language of the succession of statues that it was the intention of Congress to broaden rather than narrow the scope of exemption of educational institutions. A conclusion that Congress intended to limit the exemption of property to that of educational institutions such as schools, colleges, and universities where classroom instruction is given could be supported only by ignoring the exemption in Title 20, Section 713 of the D. C. Code and relying upon the Acts of April 17, 1870, and June 11, 1878.

Last year in a series of cases initiated by the Commissioners of the District of Columbia a special committee set up by the Commissioners to review the status of tax-exempt properties in effect held that the only properties of educational institutions that were entitled to exemption were those properties used for classroom instruction where the generally recognized relationship of teacher and student existed. It is respectfully submitted that such a narrow conclusion cannot be supported under the existing law, for by its several enactments Congress first exempted property of schools, then of colleges and universities, and then "property used for educational purposes that is not used for private gain".

The Issue before This Committee

The issue before this committee therefore is whether or not the Congress at this time shall narrow the scope of exemption or maintain the present exemption statute and enact proper procedural provisions for the guidance of the administrative officials charged with the enforcement of the statute so that both they and those who are entitled to the benefit of the statute shall know exactly what are the respective rights arising thereunder.

To the end of assisting this committee, the following information relating to certain of the terms in exemption statutes is given:

Meaning of "Educational"

The meaning of the word "educational" and the words "educational purposes" as

used in exemption statutes is interpreted as not restricted to schools, colleges, and institutions of that character.

In Zollman's "American Law of Charities" it is said:

In statutes exempting educational institutions, the word "educational" is used in its broader signification as the art of developing, cultivating, and maturing the physical, intellectual, and moral faculties, and thus improve the body, the mind, and the heart. * * * the New York Court has held that the Metropolitan Museum of Art is an educational corporation though it has no regular corps of teachers with regular classes of students. The Court states that appliances and restrictions essential to the stimulation to study of youthful and immature persons are not necessary, where the aim is to supply education in the higher branches to more mature students.

The author cites the case of In re Moses, 123 N. Y. Supp. 443. The question involved was whether a devise to a certain institution was exempt from a New York tax. The statute in question reads in part as follows:

But any property devised or bequeathed to any person who is a bishop, or to any religious, educational, charitable, missionary, benevolent, hospital or infirmary corporation * * * shall be exempt from and not subject to the provisions of this act.

With regard to the word "educational" the Court said:

I think that the Young Men's Christian Association falls within the definition of "educational", as the term is used in this statute. As the terms are all general, we cannot expect to find the definition as exact as if it aimed directly at any particular corporation. "Educational" is not used in its meaning of instruction by school, college, or university which is a narrower or more limited meaning of the word (Century Dictionary), but in its broader signification as the act of developing and cultivating the various physical, intellectual, and moral faculties towards the improvement of the body, the mind, and the heart. I am justified in this statement by the definition of the Century Dictionary, of Webster, and of Worcester.

In Mount Hermon Boys' School *vs.* Hill, 145 Mass. 139, the Court said:

Education is a broad and comprehensive term. * * * Education may be particularly directed to either the mental, moral, or physical powers, but in its broadest and best sense is related to them all.

In the case of In re Arnot's Estate, 130 N. Y. Supp. 197, there was a devise of real and personal property to a corporation to be formed to establish an art class to which the public was to have free access and a reference library free to all. The Court held that it was an educational corporation and exempt from the transfer tax.

In the case of In re Mergentime's Estate, 113 N. Y. S. 948, which is referred to in above quotation from "American Law of Charities", the interpretation of the word "educational" as used in an exemption statute was involved. There was a legacy to the Metropolitan Museum of Art, and the question was whether the legacy was exempt from tax under the New York statute hereinbefore quoted. The Court said in part:

I do not suppose it is essential to constitute an educational corporation that there should be furnished a regular corps of teachers, with regular classes of students. A corporation which is organized for the purpose of supplying instruction to those who are willing to accept the facilities or opportunities supplied, it seems to me, is organized for an educational purpose. Certainly education is not confined to the youthful and immature * * * when the aim of the institution is to supply education in the higher branches to more mature students.

The Court said further in this case that a corporation organized for the education of people generally in the observance of proper and sanitary rules to escape infection from disease, especially when such education was free to the public and to all who would avail themselves of the opportunities afforded, would be an educational institution, although no classes were established and no regularly paid professors employed to teach such classes.

Federal Cases

The definition of "educational" in the federal income tax law is contained in Regulations 103, Section 19.101 (6)-1. That section provides, in part:

An educational organization within the meaning of the Internal Revenue Code is one designed primarily for the improvement or development of the capabilities of the individual, but, under exceptional circumstances, may include an association whose sole purpose is the instruction of the public, or an association whose primary purpose is to give lectures on subjects useful to the individual and beneficial to the community, even though an association of either class has incidental amusement features.

The Social Security Act exempts from the definition of employment "Service performed in the employ of a corporation * * * organized and operated exclusively for * * * educational purposes". The exemption of employees in that act is substantially similar to the exemption of property used for educational purposes in the District of Columbia.

In a case that arose in the United States District Court for the Western District of Oklahoma, the Better Business Bureau sued to recover taxes paid under protest under the Social Security Act. The plaintiff, an Oklahoma corporation, was organized as a nonprofit educational corporation without capital stock. Its expenses are defrayed by annual subscriptions of persons who approve of its activities. It furnishes information to members and nonmembers of the corporation; it attempts to educate and inform merchants, manufacturers, and consumers as to honest, fair, and legitimate advertising and business methods; and attempts to discourage unfair competition and unfair dealings with the public.

The Court, in holding that the Better Business Bureau was exempt from the tax, said:

Educational training is not confined to colleges, universities, or even the public schools, but consists, in the broadest sense, of acquiring information or inspirational suggestions which cause the individual to think and act along proper lines. Certainly, the teaching of honesty, integrity, and truthfulness is the very highest objective of an education. Better Business Bureau *vs.* Jones, 34 F. Supp. 573 (D. C. W. D. Okla. 1940). (Emphasis supplied.)

In another case a taxpayer, who had contributed to the League for Industrial Democracy, claimed a deduction for income tax purposes on the ground that he had made the gifts for educational purposes. The league engages in research, gives lectures, holds debates and discussions, writes and distributes pamphlets and books giving information concerning economic and social problems. The United States Circuit Court of Appeals for the Second Circuit held that the gift was deductible and in its opinion said:

In the absence of specific definition, the words are to be given their usual and accepted meaning. * * * "Education" has been defined by the encyclopedia and dictionaries as "imparting or acquisition of knowledge; mental and moral training; cultivation of the mind, feelings, and manners." The definition given by the Funk & Wagnalls' New Standard Dictionary, Vol. 1, may be referred to:

> "Education as understood today, connotes all those processes cultivated by a given society as means for the realization in the individual of the ideals of the community as a whole. It has for its aim the development of the powers of man (1) by exercising each along its particular line, (2) by properly coordinating and subordinating them, (3) by taking advantage of the law of habit, and (4) by appealing to human interest and enthusiasm. It includes not only the narrow conception of instruction, to which it was formerly limited, but embraces all forms of human experience, owing to the recognition of the fact that every stimulus with its corresponding reaction has a definite effect on the character. It may be either mainly esthetic, ethical, intellectual, physical or technical, but to be most satisfactory it must involve and develop all these sides of human capacity."

The literature which the League distributes covers different authors, and is of interest and information to students of political subjects and political economy. All is the subject of education. Weyl *vs.* Commissioner of Internal Revenue, 48 F. (2d) 811 (C. C. A. 2d, 1931).

Rule as to Construction of Exemption Statutes

It is conceded that there is a general rule to the effect that tax exemption statutes are to be strictly construed. There is ample authority, however, supporting a liberal construction of such statutes in the exemption of the property of religious, charitable, and educational institutions.

In Cooley, "Taxation", 4th edition, that authoritative author says:

While in some states exemptions of religious, charitable, and educational property or institutions are strictly construed, the better rule seems to be that laid down in some states requiring a liberal rather than a strict construction in such cases or at least that the same strictness of construction will not be indulged where the exemption is of such institutions.

* * * statutes exempting property used for educational and charitable purposes or for public worship, under the great weight of authority, should receive a broad and more liberal construction than those exempting property used with a view to gain or profit only. Salt Lake Lodge *vs.* Groesbeck, 120 Pac. 192.

Perhaps a better wording would be to say that the courts have never been overanxious to apply the rule so as to impose burdens upon religious, scientific, literary, and educational institutions. Strict construction has largely been applied to corporations performing a public service. State ex rel. Waller *vs.* Trustees of William Jewell College, 234 Mo. 299.

In another Missouri decision the court said that such exemptions should be attributed not so much to a recognition of the value of such institutions to the state but should be considered as the product of a sense of propriety and fitness in regard to places set apart and devoted to the relief of suffering or the diffusion of light and knowledge among men. Wyman *vs.* St. Louis, 17 Mo. 335.

The general rule of strict construction does not require a limitation of the language used by the legislature to its narrowest meaning nor that the narrowest possible meaning be given to the words descriptive of the exemptions.

It is very important not to misapply the rule and thus by too great a strictness strangle the purpose of the law-making power. Courts certainly are not at liberty to defeat the legislative intent by a strict construction merely because they consider that the law is improper * * *. The rule of strict construction does not require a limitation of legislative terms to their narrowest meaning nor to any particular meaning. * * * The rule, therefore, comes into play only when the legislative language, after analysis and subjection to the ordinary rules of interpretation, presents ambiguity. The possibility of a doubt is not sufficient to bring it into operation. "American Law of Charities", by Zollman.

A fair and reasonable construction of the statute or contract must always be adopted, giving the language used its ordinary meaning, and taking into consideration the purpose and spirit of the exemption as well as the public policy entertained at the time and the history of the times when the statute was passed. Strict construction does not require that the narrowest possible meaning be given to words descriptive of the exemption. Cooley, "Taxation", 4th ed.

The language of an exemption statute must be given its ordinary meaning. * * * While tax exemption statutes should be strictly construed, that principle does not justify the interpolation of such qualifications into a statute, clear in its meaning, for the purpose of defeating the privilege granted. District of Columbia *vs.* Mount Vernon Seminary, 69 Appls. D. C. 251.

Decisions of the D. C. Court of Appeals

Many years ago the Court of Appeals for the District of Columbia, now the United States Court of Appeals for the District of Columbia, held that an incorporated institution covered by the exemption statute and having no object of private gain is exempt from all real estate taxes. District of Columbia *vs.* Sisters of Visitation, 15 Appls. D. C. 300 (1899).

In 1938 the United States Court of Appeals for the District of Columbia held that the principle that tax exemption statutes should be strictly construed does not justify interpolation of qualifications into a statute, clear in its meaning, for the purpose of defeating the privilege granted. District of Columbia *vs.* Mount Vernon Seminary, 69 Appls. D. C., 251, 254.

Meaning of "Private Gain"

It is quite possible for an educational institution that is not operated for private gain actually to make a profit on its operations in some years or from year to year. The question therefore for the courts to determine in the controversies which go before them is whether or not those earnings are devoted to the purposes for which the institution was chartered or are diverted to the private gain of some individual through the payment of dividends.

In so far as the existing law in the District of Columbia is concerned, this question of "private gain" was settled in the Mount Vernon Seminary case. The Mount Vernon Seminary is a corporation formed and existing under the laws of the District of Columbia for the purpose of operating a girls school not for private gain. The Court found that because none of the income of that school could inure to the benefit of any private shareholder or individual, the Mount Vernon Seminary had been granted exemption from federal income tax.

The Court said that

The term "private gain", as used in the statute, has reference only to gain realized by any individual or stockholder who has a pecuniary interest in the corporation and not, as appellant contends, to profits realized by the institution but turned back into the treasury or expended for permanent improvements.

The Court further held

It is the evident intention of the statute to exempt all institutions, educational in nature, which are not commercial in their purpose. (Emphasis supplied.)

The Court pointed out that Congress had long recognised the fundamental difference between income earned by an educational institution which is diverted into private use and similar income which is dedicated to the continued improvement of the institution. The Court said:

The latter is a highly desirable use from the public point of view and equally worthy of tax exemption as the property out of which the income was produced.

The Court then referred to the case of Trinidad *vs.* Sagrada Orden, 263 U. S. 578, and pointed out that

The provisions in the Federal Income Tax Act of 1913, * * * exempting any corporation "organized and operated exclusively for religious, charitable, scientific, or educational purposes, no part of the net income of which inures to the benefit of any private stockholder or individual", was intended to aid institutions *not conducted for private gain.* It would seem to follow, from the language used by the Supreme Court, that an educational institution is not conducted for private gain if no part of the net income is applied to the benefit of any individual.

The Court added:

The language of an exemption statute must be given its ordinary meaning. Moreover, when the legislative intent is plain and the language used is free from ambiguity, there is no reason for judicial construction of a statute.

The Mount Vernon Seminary had many students in attendance who were nonresidents of the District of Columbia. In its appeal from an adverse decision by the lower court, the District of Columbia urged in the Mount Vernon Seminary case, just as the officials of the District of Columbia have urged before this committee, that the benefits of the statute be withheld from institutions whose educational activities reach beyond the boundaries of the District. On this point the Court said:

There is no qualification, expressed or implied, in the statute favoring institutions which cater to all classes of persons or solely to residents of the District of Columbia. * * *

The intermingling of students from all parts of the country is one of our surest guarantees of a national culture, which, while preserving the quaint and interesting idiosyncracies of each locality, gives us a common basis of understanding, a common medium of expression, and a vital capacity for that national outlook which is so essential to the preservation and development of a democratic order. It is highly appropriate that the laws of the District of Columbia should recognize, as they do, the fundamental importance of such a policy. *It is the nation's capital, seat of the national government, temporary abode of thousands of government employees, mecca of loyal citizens throughout the United States. * * * it would be indeed a new principle in the law of taxation if exemption should be limited in favor of institutions which excluded all except resident.* (Emphasis supplied.)

The Problems of the Committee

The problem with which the Senate Committee is now dealing really has two phases. First, the committee must de-

termine whether or not it will narrow the present exemption statute so as to exempt as is provided in Section (a) (5) of the present bill only

School, college, and university buildings * * * belonging to and operated by institutions not organized or operated for private gain, and embracing the generally recognized relationship of teacher and student,

or maintain the present broad exemption statute which provides that

Property used for educational purposes that is not used for private gain shall be exempt from taxation, and all other property used for educational purposes shall be assessed and taxed as other property is taxed and assessed.

Second, whatever the committee does in respect of the matter of exemption of property itself, it is confronted with the necessity of providing in statutory form a simple and proper administrative procedure for the determination of questions that arise under the statute and for an orderly system of reporting to the Government of the District of Columbia by institutions whose property is exempted of the uses to which the exempted property is put so that the District Commissioners may have before them at all times completely adequate information on which to determine the status of any institution claiming exemption for its properties under the statute and the use to which those properties is being put.

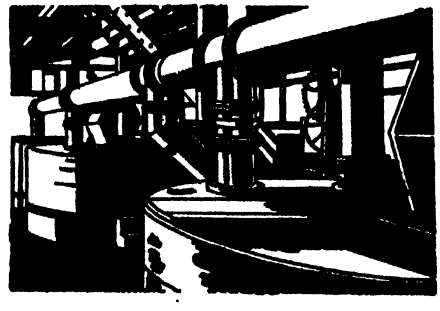
In view of the many decisions by our courts, both state and federal, as to the meaning of the terms in the present exemption statutes which have hereinbefore been discussed, it is thought that criteria for the interpretation of the existing exemption statute are now sufficient in detail and in scope to permit the authorities of the District of Columbia properly to apply that statute to the institutions entitled to exemption thereunder. As has been pointed out hereinbefore, the terms "educational" and "private gain" have been clearly defined not only by the courts generally but specifically by our own Court of Appeals.

However, it is quite clear that some form of procedure for the administration of the law should be enacted by Congress. The District Commissioners have never set up any system under which exempted institutions periodically report on the scope and nature of their activities and the use of their properties. The National Geographic Society, for instance, in 1905, in 1915, and again in 1938, after notice and opportunity to be heard on questions arising concerning the use of its properties, was determined by the Board of Commissioners of the District of Columbia to be a nonprofit, educational institution entitled to exemption from taxation on those of its properties which it was using for its educational purposes.

On August 25, 1938, the Board of Commissioners of the District of Columbia concurred in the opinion of its corporation counsel,

that the business and objects of the society are educational and scientific, and that the real and personal property of the corporation should be exempted from taxation, and, therefore, the property of the society should be exempted from real and personal taxes.

The board further determined that



Any property not used exclusively for educational and scientific purposes should not be exempted. Whether any property of the society is not used for educational or scientific purposes is a question of fact for the assessor to determine.

The Assessor of the District of Columbia, following the entry of this order, made a survey of the properties of the society and the uses to which they were put. As a result of this survey the Board of Commissioners of the District of Columbia on September 30, 1938, entered a further order as follows:

That Lots 836, 838, 840, and 842 in Square 183, and Lot 32 in Square 3574, assessed to the National Geographic Society, be noted on the records of the Assessor's Office as exempt from the payment of general taxes, beginning July 1, 1936, and to continue as long as the property is used for educational purposes, and that no penalties be charged on Lots 839, 813, 814, and 815, and 41 and 42.

The history of what has happened to the National Geographic Society since the order of September 30, 1938, was adopted by the Board of Commissioners of the District of Columbia demonstrates the necessity of setting up certain procedural requirements governing the methods employed by the District Commissioners in their consideration of such properties.

In 1941 the Board of Commissioners of the District of Columbia ordered an investigation of all tax-exempt properties in the District of Columbia for the purpose of determining whether or not any properties theretofore exempted should continue on the exempt list. Without notice or opportunity to be heard, the National Geographic Society was notified on March 15, 1941, that the properties which the Board of Commissioners in 1938 had specifically exempted from taxation and which they had ordered to continue to be exempt "as long as the property is used for educational purposes" had been restored to the tax rolls. There was absolutely no evidence before the District Commissioners in 1941 that there had been any change in the charter, by-laws, organization, or methods of operation of the society or in the use of the properties in controversy. In fact, there had been no change either in the organization or in the use. As has been stated, the action was taken without notice or opportunity given to the SOCIETY to be heard and in the absence of any evidence that would justify the restoration of any of the property specifically exempted by the order of September 30, 1938, and ordered to continue exempt as long as the property is used for educational purposes.

For many years educational institutions such as the AMERICAN CHEMICAL SOCIETY and the National Geographic Society have been exempted from the payment of income taxes by those provisions in the respective income tax laws exempting nonprofit, educational, and scientific organizations.

Over a period of years the Bureau of Internal Revenue from time to time checked up on the operations of the various organizations and the societies claiming exemption. Recently the bureau adopted a rule requiring each of those societies or organizations claiming exemption to file a return with it each year. No one who is entitled to exemption should object to filing such a return. Any governmental agency should be entitled at all times to information concerning the activities of an organization claiming exemption and to the uses to which the exempted property is being put. Therefore, it does seem desirable that procedural provisions similar to those set forth in Sections 3, 4, and 5 of the pending bill should be enacted into law. Such provisions would not only place an obligation upon the District Commissioners to observe due process in controversies arising before them, but would also place an obligation upon those claiming exemption to furnish the necessary information to the District Commissioners for the determination of their claims.

Because many educational institutions own property which they are holding for future use or from which they receive revenues even though they may use a portion of the latter for their educational purposes, it seems desirable that the Congress should enact legislation such as is provided in Section (b) of the pending bill for proportionate exemption and taxation of property which is partially used for educational purposes and partially used to secure a rent or income or for any business purpose other than that of the exempt institution.

The foregoing suggestions are offered solely in the hope that they may be of value to the committee in its consideration of the pending problem.

Respectfully submitted,
THE AMERICAN CHEMICAL SOCIETY
NATIONAL GEOGRAPHIC SOCIETY

ELISHA HANSON
THEIR COUNSEL

Saving Technical Men for Winning the War

FRANK C. WHITMORE

State College, Penna.

THE actual and critical need in the production army for more technical men than exist or can be trained in time is now an accepted fact. Although many types of technical men, such as physicists and engineers, are finding places of usefulness in all branches of the war effort, it is now definitely clear that the armed forces do not need additional chemists or chemical engineers.

In spite of the dangerously increasing shortage of chemists and chemical engineers, there is still induction of such men into the armed forces. This leakage is a help to the Axis. It is due to a lack of understanding of the nature of this war by some local boards, some employers, and some chemists and chemical engineers. Part of the difficulty is due not to a lack of understanding but to a lack of courage of convictions and a failure to use proper aggressiveness in the winning of the war by holding technically trained men where they can best serve the cause of victory.

Proper steps for conserving a chemist or chemical engineer for the war effort are:

1. Immediately on receipt of the Selective Service Questionnaire, a sworn statement of the facts, including a request for deferment, should be filed with the local board. In the case of an employed man, this should be from his employer. In the case of a man in training, it preferably should be from a professor who understands the field thoroughly rather than from a general administrative officer. This first statement and request for deferment should be made on Form 42A, on Form 42, or on the standard form for statement by a college or university. If, for any reason, there is trouble in obtaining forms, the statement and request should be made in writing on suitable letterhead paper. At the bottom of the letter should appear the ordinary form of oath.

I, Richard Roe, do solemnly swear that the above facts are true.

.....
(Signature of Claimant)

.....
(Address of Claimant)

Subscribed and sworn to before me this ——day of——, 1942.

.....
(Signature of official administering oath)

.....
(Official designation of official administering oath)

The local board should be provided with an accurate statement of all pertinent facts. Among others, these should include place and time of training, experience, type of work, its necessity in relation to the war effort, and facts as to whether or not the man can be replaced.

A few words of caution may prove helpful. Some chemists and chemical engineers have been lost to the production army because of difficulty in obtaining proper blanks; others because the statement and request were signed but not in affidavit form. It is a safe rule to swear to everything that goes to a local or an appeal board. Many local boards and a few employers think that a man cannot be a "necessary man" unless he has had long experience with the company which fills out the statement and request. This might be true if there were plenty of chemists and chemical engineers. The important point is the replaceability of the man. At the present time, even in the rare cases where a man can be replaced, the fact of replaceability is not significant because a new man has to be taken from another position in which he is needed. The total number of chemists and chemical engineers is not nearly as large as our needs, both now and later in 1943 and 1944 when the great new plants for munitions, synthetic rubber, and the like will be ready to operate.

2. If any questions, either written or oral, come from the local board, they should be answered in writing as soon as possible.

3. If the man is placed in I-A, the following steps should be taken.

(*a*) He should immediately (necessarily within 10 days of the date of the notice) file a simple personal appeal to be placed in Class II, including a statement of his time of training and time of experience, and that he is making the request because of the need for technically trained men in the production army without which the combat army cannot hope to function. Under his signature should appear his typed name and order number. The appeal should be dated. A copy should go to the man's employer or professor and a copy should be retained. There should be no delay beyond the 10 days legally allowed.

(*b*) The man should immediately inform his employer or professor of his classification and his appeal with a copy of the appeal.

(*c*) The sponsor (employer or professor) should immediately sign and return the "Notice of Appeal" if he receives that from the local board. If not received, he should promptly ask for it.

(*d*) The sponsor should consult his copy of the original request for deferment and should make out a fuller and more detailed statement in support of the appeal of the man involved. This additional material should include any new facts which have developed. They would include a statement of the relation of the work to the war effort and the special need of the man in his position. Emphasis is often advisable that the winning of the war depends not only on actual munitions and ordnance but on almost everything else required in civilized life. A war merely requires more of almost all of these things.

The statement should be in affidavit form.

(*e*) Both the man and his sponsor should acquaint themselves with the Appeal Officer of the local board. It is becoming increasingly helpful to have this Appeal Officer make out a formal appeal on behalf of the man to supplement his brief personal appeal. It is very important to determine whether the Appeal Officer and the local board are familiar with Occupational Bulletin No. 10 (see page 837 of CHEMICAL AND ENGINEERING NEWS for July 10). A planographed copy of this bulletin will be furnished upon request to the Secretary of the AMERICAN CHEMICAL SOCIETY. As it is an official document it is more effective with local boards than a printed copy. A great deal of trouble would have been saved if every employer and every chemist or chemical engineer had kept in handy form a copy of the publication containing this material. The local boards receive so much material that the particular significance of this special Occupational Bulletin and its application to all chemists and chemical engineers and their special need in the production army have often escaped their notice. Do this diplomatically and carefully. Avoid even the appearance of giving them definite instructions. Most local boards will accord a hearing to both the man and his sponsor.

4. If the appeal to the local board is lost and the need remains, it is the duty of the man and his sponsor to appeal at once to the State Director. This is usually most effectively done through the Local Appeal Agent, although it can be done directly. For the sake of the record, it is best that the individual chemist or chemical engineer file a brief statement of his appeal. His employer should prepare an even fuller and more detailed statement of the facts than before. This should usually be prefaced by a brief paragraph summarizing the material presented earlier with dates of the documents involved. Then should follow the additional material. Of course, all this should be sworn to. At all points, care, patience, and consideration for the board's problems must be exercised in familiarising everyone involved, first of all, as regards the general situation of chemists and chemical engineers in connection with the war effort, and secondly, on the particulars of the individual case.

5. In connection with the state appeal, the man should send word that he has

lost the local appeal and is appealing to the state board to the National Roster of Scientific and Specialized Personnel, 10th & U Streets, N. W., Washington, D. C., and to the Secretary of the AMERICAN CHEMICAL SOCIETY, 1155 Sixteenth St., N. W., Washington, D. C. In each case full details should be given including the name and address of the local board, the name and address of the Government Appeal Agent if he has been called on the case, and the name, address, and order number of the man making the appeal.

Every chemist and chemical engineer of selective service age should be familiar with the material printed in CHEMICAL AND ENGINEERING NEWS, July 10, 1942, long before any question arises as to his diversion from the war effort.

6. In the very few cases where the state appeal is lost, it is important that the man and his sponsor recognize that an unusual responsibility toward the winning of the war has fallen on their shoulders. They must renew their courage and review the facts. Now is the time for the final appeal to the President. Part 628.1 of the regulations of the Selective Service System reads: "When either the State Director of Selective Service or the Director of Selective Service deems it to be in the national interest, he may appeal to the President from any determination of a Board of Appeal. He may take such an appeal at any time." Of course the State Director or the National Director can make such an appeal only if in possession of the facts. It is the patriotic duty of the man and his sponsor to put such facts effectively in the hands of the State Director with an urgent request that he either appeal the case himself to the President or request General Hershey to do so. In view of General Lewis B. Hershey's Occupational Bulletin No. 10 of June 18, 1942, reprinted on page 837 of CHEMICAL AND ENGINEERING NEWS of July 10, 1942, there can be no doubt that the induction of a competent chemist or chemical engineer into the armed forces is contrary to the national interest. Consequently, an appeal to the President not only is in order but is a matter of duty for all concerned.

7. The matter of dependency is a distinct field and has no relation to essential occupation. A man in III-A or III-B cannot be inducted without first being placed in I-A. At that point he has 10 days in which to appeal. See paragraphs 3 to 6 above.

AUSTRALIA is reported to have in operation an explosives factory extending over several square miles of what was farm land. Although 1,000 buildings are in use, more are being put up, the plants using new processes, some discovered by Australian chemists to make propellents, high explosives, and incendiaries.

Occupational Classification

IN ALL cases of reclassification, National Selective Service Headquarters has emphasized in amendments and a memorandum that consideration shall be given to deferment in Class II-A or Class II-B of the registrant who is not continued in Class III-A or Class III-B but who may be a necessary man in a critical occupation essential to the war effort or war production as defined by Selective Service Regulations.

The list of civilian activities necessary to war production and essential to the war effort, which may be used to guide local boards in considering occupational classification of registrants, specifies that such activities must meet one or more of the following tests:

(a) that the business is fulfilling a contract of the Army, Navy, Maritime Commission, or other governmental agencies engaged directly in war production;
(b) that the business is performing a governmental service directly concerned with promoting or facilitating war production;
(c) that the business is performing a service, governmental or private, directly concerned with providing food, clothing, shelter, health, safety, or other requisites of the civilian daily life in support of the war effort;
(d) that the business is supplying material under subcontracts for contracts included in a, b, or c above;
(e) that the business is producing raw materials, manufacturing materials, supplies, or equipment, or performing services necessary for the fulfillment of contracts included in a, b, c, or d above.

After it has been found that the business in which a registrant is engaged comes under some group in the attached list, the tests have been applied, and it has been determined that the business is an essential activity, consideration will be given to the occupation of the registrant, within that activity. If he is found to be a necessary man as defined by Selective Service Regulations, occupational classification may be made by the local board.

The list of essential activities, compiled by the War Manpower Commission and distributed to agencies of the Selective Service System, follows. The list was prepared to guide local boards when considering individual registrants for occupational classification but in no way alters the statutory ban on group deferments.

List of Essential Activities

Production of aircraft and parts. Production, maintenance, and repair of aircraft gliders, parachutes, dirigibles, balloons, aircraft engines, parts, pontoons, propellers, and similar products.

Production of ships, boats, and parts. Production, maintenance, and repair of ships, boats, parts, and equipment.

Production of ordnance and accessories. Production, repair, and maintenance of firearms, guns, howitzers, mortars, gun turrets, mounts, tanks, sighting and fire-control equipment, torpedo tubes, and similar products.

Production of ammunition. Bombs, mines, torpedoes, grenades, chemical-warfare projectiles, explosives, fuses, pyrotechnics as well as products such as glycerol which go into the manufacture of ammunition.

Agriculture. Dairy, livestock, poultry, truck, sugar beet, sugar cane, hay, peanut, soybean, cotton, fruit and nut, potato, dried pea and bean, crop specialty (e. g., flax, hemp), seed and general farms; agricultural and horticultural and animal husbandry services such as tree planting, cattle feed-lot operation, threshing, grist milling, grain cleaning, plowing, corn shelling. Includes also such essential assembly and marketing services as milk and cream assembly stations and cooperative marketing associations.

Food processing. Fishing, meat packing and slaughtering, production of butter, cheese, condensed and evaporated milk, canned and cured fish, canned and dried fruits and vegetables, canned soups, fruit and vegetable juices, flour and other grain mill products, prepared feeds for animals and fowls, starch, cereals, baking powder, rice, bread and other bakery products, sugar, leavening compounds, corn sirup, and edible fats and oils.

Forestry, logging, and lumbering. Timber tracts, logging camps, sawmills, and veneer, lath, shingle, cooperage-stock, planing and plywood mills, raising of tung-oil trees; fire prvention, pest control, forest nurseries and reforestation services; gathering of gums and barks for the manufacture of naval stores and medicinal purposes.

Construction. Highway and street construction, marine construction; and construction of approved industrial plants, houses, hospitals, and military projects and repair of such facilities; as well as all basically metallic materials, parts, equipment; and services necessary to complete such construction.

Coal mining. Mining of anthracite, bituminous coal, semianthracite, lignite and peat, and the operation of breakers or preparation plants. Includes also removing overburden and other such activities preparatory to coal-mining operations.

Metal mining. Mining of iron, copper, lead, zinc, aluminum, mercury, manganese, chromium, molybdenum, tungsten, vanadium, and similar ores, and the dressing of such ores. Includes also removing overburden, sinking shafts, and other such activities preparatory to metal-mining operations.

Nonmetallic mining and processing and quarrying. Mining and processing of rock salt, phosphate rock, sulfur, potash, asbestos, graphite pyrites, graphite, borates and other salines, fluorspar, mica, talc, abrasive sands, and similar products. Excludes all mined or quarried nonmetallic materials used exclusively in construction.

Smelting, refining, and rolling of metals. Primary and secondary smelting and refining, alloying, rolling, and drawing of iron, steel, copper, lead, zinc, magnesium, aluminum, brass, bronze, nickel, tin, cadmium, and any other metals used in the production of war materials.

Production of metal shapes and forgings. The manufacture of castings, die castings, forgings, wire, nails, chains, anchors, axles, pipe, springs, screws, tubing, stampings, pressings, and structural shapes.

Finishing of metal products. Enamel-

ing, japanning, lacquering, painting, and galvanising essential metal products.

Production of industrial and agricultural equipment. Power boilers; wiring devices and supplies; agricultural implements; electric lamps; storage and primary batteries; pumps, compressors, and pumping equipment; recording, controlling, and measuring instruments and meters; conveyors; industrial cars and trucks; blowers, exhaust and ventilating fans; mechanical power-transmission equipment such as clutches, drives, and shafts; mechanical stokers; tools, files, and saws; plumbers' supplies; professional and scientific instruments, photographic apparatus, and optical goods; and all equipment necessary to operate plants producing essential commodities.

Production of machinery. Engines and turbines; machine tools, equipment, and accessories; electrical generating, distribution, and industrial apparatus for electric public utility, manufacturing, mining, transportation, and construction use, for incorporation in manufactured products, or for use in service industries; construction, mining, agricultural, oil fields, food products, smelting and refining, as well as all machinery necessary to produce, equip, and maintain aircraft, ships, ordnance, and other military material.

Production of chemicals and allied products. Glycerol; turpentine, rosin, and other naval stores; wood tars, oils, acids, and alcohols; lubricating oils and greases; animal and vegetable oils; fertilizers; tanning materials; salt; synthetic rubber; primary coal-tar products; plastics; compressed and liquefied gases; refined sulfur; sulfuric and other acids; caustic and other sodas; industrial alcohols; electrochemical and electrometallurgical products such as carbide, sodium and potassium metals, and high-percentage ferroalloys; drugs and medicines; insecticides and related chemical compounds; nylon and other synthetic textile fibers used in military equipment exclusively; grease and tallow; candles. (Explosives, flares, and other fireworks, generally classified as chemical products, are included with ammunition.)

Production of rubber products. All rubber products.

Production of leather products. Sole and belting leather; industrial belting for transmission of power; boots, shoes, and gloves for military and industrial use; saddlery, harness, and accessories.

Production of textiles. Spinning and weaving of silk and nylon for parachutes and powder bags; of canvas for tents, sails, tarpaulins, and other related heavy canvas products; cotton, woolen, linen, and knit goods for military use.

Production of apparel. Apparel for the armed forces and work clothing.

Production of stone, clay, and glass products. Technical, scientific, and industrial pressed and blown ware; sand-lime and fire-brick and other heat-resisting clay products; lime; abrasive wheels, stones, paper, cloth, and related products; asbestos products including steam and other packing, pipe and boiler covering; crucibles and retorts; porcelain electrical supplies; as well as parts of military apparatus.

Production of petroleum, natural gas, and petroleum and coal products. Drilling, rig building, and maintenance service operations, and petroleum refining. Includes also production of tar and pitch, coal gas, coke.

Production of finished lumber products. Cork products such as life preservers, storage battery boxes, and insulating material; oars, matches, and wood preservation activities, as well as wooden parts of aircraft, ships, and other military equipment.

Production of transporation equipment. Motor vehicles such as trucks, ambulances, fire engines, busses, and military motorized units; essential parts and accessories of such motor vehicles; motorcycles, bicycles, and parts; locomotives and parts; railroad and street cars and equipment.

Transportation services. Line-haul railroads and railroad service; switching and terminal services; railway express service; local and street railways and bus lines; trucking; warehousing of perishable commodities, stock piles, and essential materials; pipe lines; air and water transportation including shore services such as stevedoring. Includes also services allied to transportation such as freight forwarding and packing, operation of terminals, roads, and tunnels.

Production of materials for packing and shipping products. Textile bags, vegetable and fruit baskets, cooperage, wooden boxes, excelsior, pulp and paper, paper bags, paperboard containers and boxes, glass and fiber containers, cordage and twine, metal barrels, kegs, drums, and cans.

Production of communication equipment. Including radios and radio equipment, television, telephone, and telegraph equipment, and signaling apparatus.

Communication services. Telephone, telegraph, newspaper, radio broadcasting, and television services, and the repair of facilities.

Heating, power, and illuminating services. Electric light and power and gas utilities; steam-heating companies.

Repair and hand trade services. Blacksmithing; armature rewinding; electrical and bicycle repair; automobile repair and service; harness and leather repair; clock repair; tool repair and sharpening.

Health and welfare services, facilities, and equipment. Water supply and sewerage systems; irrigation systems; dental and medical laboratories; hospitals; nursing services; fire and police protection; public health services; weather services; coast and geodetic services; engineering and other testing laboratories; offices of dentists, physicians, surgeons, osteopaths, chiropodists, and veterinarians; professional engineering services. Includes also the manufacture of x-ray and therapeutic apparatus, and of surgical, medical, and dental instruments, equipment, and supplies.

Educational services. Public and private vocational training; elementary, secondary, and preparatory schools; junior colleges, colleges, universities, and professional schools; educational and scientific research agencies.

Governmental services. Including services necessary for the maintenance of health, safety, and morale, and the prosecution of the war.

American Documentation Institute's Wartime Activities

THE American Documentation Institute, 1719 N St., N. W., Washington, D. C., is devoting its major energy to auxiliary publication, particularly as applied to the interchange of scientific and scholarly information under war conditions, to providing sets of scientific journals through microfilm, and to facilitating receipt of current scientific and scholarly journals.

Help Wanted—Instruments

REQUESTS have been received by the Committee on the Location of New and Rare Instruments for these instruments from research workers who urgently need them. If you have any available to lend, lease, or sell please write the undersigned.

Instruments Sought

Microammeters and electrical meters generally
Ultraviolet microscope
Zeiss optimeter (for measuring fine wires to 0.00001 inch)
Two-circle reflecting goniometer (Goldschmidt)
Electro encephalograph (3-channel)
Warburg apparatus

The following listed instruments are offered for use by others and inquiries for them are invited:

Instruments Offered

Zeiss-Pulfrich refractometer
Hunter reflectometer (infrared reflectance)
Coleman spectrophotometer (complete)
Capacigraph [*J. Lab. Clin. Med.*, 22, 1279 (1937); 25, 175 (1939)]
Mechanical ink writing recorder [*Am. J. Obstet. Gynecol.*, 40, 330 (1940)].
Grating spectrograph
  Focal length 2 meters
  Dispersion 8 Å./mm. first order
Grating spectrograph
  Focal length 8 meters

The Committee on Location of New and Rare Instruments of the Division of Chemistry and Chemical Technology, National Research Council, will be glad to put inquirers in appropriate contact with those who can supply their needs. In so doing the committee assumes no responsibility, and owners of instruments must make their own arrangements with prospective users. Correspondence should be addressed to

D. H. KILLEFFER, *Chairman*

60 East 42nd St.
New York, N. Y.

Borden Award Continued

THE five Borden awards, each consisting of a gold medal and $1,000, to foster research in milk and related fields will be made in 1943, the company has announced. Begun in 1936, the awards are administered by scientific organizations. The Borden Co. takes no part in determining the winning scientists.

One award will be given through the AMERICAN CHEMICAL SOCIETY for outstanding research in milk chemistry, another by the American Home Economics Association with problems of human nutrition as the basis, and a third by the American Poultry Science Association for distinctive contribution to poultry science advancement. The American Dairy Science Association will administer two awards, one in the field of production and the other in manufacturing.

Civilian Defense Activities of the Western Connecticut Section

WILLIAM CABLER MOORE, 41 Magee Ave., Stamford, Conn.

On April 10, nearly 11 months after the Western Connecticut Section of the American Chemical Society authorized its secretary to offer the section's services as consultants on the chemical aspects of home defense to civil authorities, the Stamford Civilian Defense Council appointed its Chemical Advisory Committee. The fundamental idea of this suggestion for cooperation with public officials was to use the knowledge of the many internationally known chemists on the section's membership list and the experience of those who, as civilians or members of the armed forces, worked with chemical defense during World War I.

William Cabler Moore, secretary of the section, was appointed chairman of the Chemical Advisory Committee. Other members are Jordan W. Lambert, chief air-raid warden; J. H. Harvey, commissioner of service for the City of Stamford; L. Bromfield, Stamford town engineer; Paul D. Brown, chief medical officer of Stamford; Paul Kingsley, business manager for the committee; and Harry L. Fisher, R. Bowling Barnes, and Theodore F. Bradley.

The committee went to work even before formal ratification of the appointments. Its first task was to select a technical staff with Mr. Moore as director. This staff was organized as two subcommittees: Education, under the general charge of Dr. Fisher, and Decontamination, directed by Mr. Bradley. In addition to these three chemists the staff consists of Pierrepont Adams, L. M. Burghart, Jack T. Cassaday, Russell Dean, Henry Dutot, J. C. Eck, Dan McLachlan, Thomas Goode Moore, William H. Patrick, Joseph Paden, D. J. Salley, Donald S. Shepherd, Roland Menard, and Herbert J. West. Most of these men are members of the section, and all are chemists except Thomas Goode Moore who is a mechanical engineer.

The Educational Committee has already given a comprehensive course on Chemical Warfare Agents to about 200 selected air-raid wardens; a four-hour course to the men's Civilian Motor Corps; a condensed, two-hour version of the four-hour course to a group of industrial air-raid wardens and to a select group of physicians, air-raid wardens, nurses, and Red Cross workers in Danbury. The committee is now conducting the two-hour course for small groups of air-raid wardens, and eventually each of the many wardens in Stamford will have an opportunity to receive instruction. The committee is training every member on its personnel in gas identification methods and, while at first this training will consist largely in developing the odor sense, some work is planned using the gas identification apparatus developed by Mr. Bradley[1]. Another job which the Educational Committee has before it is the training of the personnel of the Decontamination Squad. These men will be recruited largely from the collectors of refuse and garbage in Stamford. Committee members have spoken on their work before the industrial air-raid wardens in Danbury, a local FBI School in Stamford, a group of interns in a New York hospital, and the office and executive force of the American Cyanamid Co. in New York.

The Decontamination Committee, working through the industrial air-raid wardens, is making an inventory of all equipment and supplies in Stamford which might be pooled for decontamination purposes should a chemical attack occur. Working in close cooperation with public health authorities, hospitals, and the Red Cross, the committee has developed a mobile first-aid unit for treatment and decontamination of gas casualties. This outfit will consist of a converted steel truck which will carry about 240 gallons of hot water to the scene of a gas incident. Gas casualties will receive first-aid treatment from first-aid workers and physicians who will man the truck, after the patients have disrobed and had a hot shower from tanks on top of the unit. The labor for construction of this novel outfit will be contributed by a group of expert pipe fitters. The committee has arranged with the laundries for mass decontamination of clothing if long and heavy gas raids occur. It will direct and supervise all decontamination squads which will clean up public property after any incident requiring such work.

Neighboring towns have followed the lead of Stamford in this important work. B. L. Souther in New Canaan and S. K. Clever in Darien have charge of chemical defense activities in their localities. R. M. Carter is on Mr. Clever's staff, as is Roland Menard. These men are all members of the Western Connecticut Section, and with the examples of these three communities before them it is hoped that similar chemical groups may be organized elsewhere. In some cases, as in Norwalk, capable members of the section have already offered their services for this purpose but as of this writing the civil authorities there have not availed themselves of the opportunity to organize chemical defense on a sound basis.

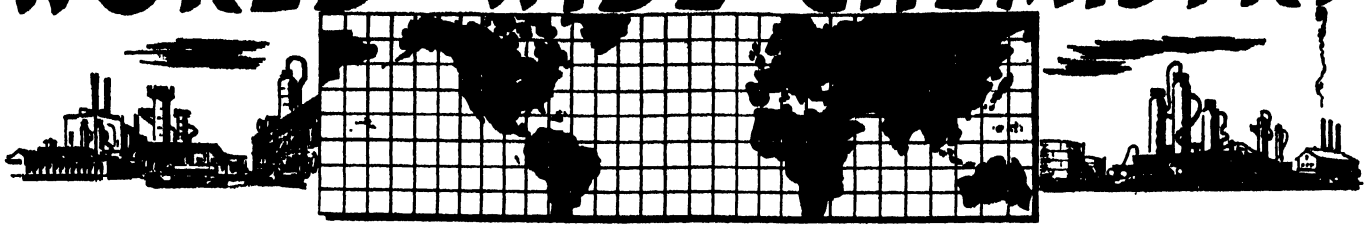
Military Chemistry

The University of Pittsburgh will offer a course in Military Chemistry and Chemical Agents each trimester beginning September 28. It will be based on War Department Technical Manual 3-215 and will cover all of the fundamentals and principles which are required by the manual. Two fully illustrated lectures will be given weekly by A. L. Robinson of the chemistry staff. The purpose of the course is to train prospective registrants for military service.



Two department managers of the Whiting Corp., Harvey, Ill., who have been promoted to vice presidencies are **H. W. Anderson** of the Aviation Division and **M. J. Rice** of the Quickwork-Whiting Division.

John P. Cunningham has been transferred by Shell Development Co., from San Francisco to its newly opened New York office in the capacity of technical assistant.

A. C. S. Student Affiliate Chapter at Northeastern University, Boston, Mass.

WORLD-WIDE CHEMISTRY

BRAZIL

The government recently signed several decrees for improvement in the mining of iron ore. In the first two decrees the Brazilian Government approved the agreement between Great Britain and Brazil in which the former country cedes to Brazil without compensation the properties belonging to the Itabira Iron Ore Co., located at Itabira, State of Minas Geraes, and ratified the agreement between Great Britain, the United States, and Brazil concerning improvements to the Estrada de Ferro Vitória a Minas as well as sales of iron ores to Great Britain and the United States.

The government also approved the organization of a new company in which the Vitória a Minas Railway was merged with the Itabira Mining Co. to form the Companhia Vale do Rio Doce S. A. with a capital of 200,000 contos de reis (about $10,000,000). The new company will develop, trade in, transport, and export the iron ores of the Itabira mines and operate the Vitória a Minas Railway. The company, divided in two departments, one controlling the railway and the other the mining operations, will be managed by a board having one Brazilian-born president, two Brazilian-born directors, and two directors from the United States. The Railway Department will be administered by Brazilian-born directors, and the Mining Department jointly by Brazilian and United States directors. Fifty-five per cent of the new company, capital will be contributed by the Brazilian Government, and the balance will be offered to public subscription.

Construction Started on Plant for Production of Cellophane

Press notices published recently in São Paulo say that the Industrias Reunidas F. Matarazzo has started building a new factory for the production of cellophane and other transparent papers. The plant's capacity will be enough to meet requirements of all South American countries. Brazilian-made machinery will be installed. The Matarazzo concern owns 286 factories, mills, and other industrial establishments producing a large variety of commodities which are both consumed locally and exported to other American countries.

Production and Exportation of Cotton Products Reported

Cotton production during 1941 amounted to 521,600 metric tons against 468,695 metric tons in 1940. Production of cottonseed showed considerable improvement over the previous years, totaling 1,217,067 metric tons in 1941 against 1,093,618 in 1940. The State of São Paulo alone contributed 74.8 per cent of the total production. Exports of cotton products, however, suffered the consequences of the war and changed radically. Cottonseed exports dropped from 55,403 metric tons in 1939 to only 2,457 in 1941, while cottonseed oil had an increase from 23,223 metric tons in 1939 to 33,458 in 1941. Exportation of cottonseed bran was reduced from 19,353 metric tons in 1939 to only 8,857 in 1941, and of cottonseed meal from 208,444 in 1939 to 31,960 metric tons in 1941. No stocks of cottonseed meal exist at present in the factories, since cottonseed meal is being largely used by Brazilian industries as fuel. The shortage of fuel oil has forced local industries to look for new sources of heating.

Brazil Reports Favorable Trade Balance Despite War Conditions

Despite abnormal conditions in foreign trade, a favorable balance of 850,217 contos de reis was recorded during the first four months of 1942 against only 368,931 contos de reis during the same period of 1941. A great number of products was responsible for the increase in export value, principally hides and leather, rubber, carnauba and ouricurí waxes, babassú nuts, castor seeds, tobacco, pine wood, cottonseed oil, rock crystals, cotton and rayon yarns, sugar, cocoa, maté, preserved and frozen meats, coffee, cotton and woolen textiles, and cotton waste.

Only a few imported goods showed increases in volume during the first four months of 1942 compared with the same period of 1941, the principal ones being asphalt, sulfur, gasoline, fuel oil, lubricating oils, kerosene, jute, wheat, tin plate, fertilizers, caustic soda, cement, and copper. However, all imported goods showed an increase in value, especially during April 1942 when import value increased in about 31 per cent over the preceding month. Many of the imported materials decreased in both tonnage and value—celluloid, scientific apparatus, sewing machines, radios and electrical appliances, motor cars, tires and inner tubes, cellulose acetate, turpentine oil, flaxseeds, coke, mineral pigments, iron bars and sheets, petroleum crude oil, silk, perfumery essences, paints, edible fruits, cork, newsprint, barbed wire, iron rails, and iron pipe lines.

Number of New Industries Opened in Brazilian States

Press notices in technical magazines indicate that several factories have been opened for production of cellulose pulp in the States of Rio Grande do Sul and Santa Catarina, for extraction of caffeine from maté in the States of Santa Catarina and São Paulo, for production of tar and other by-products from wood distillation in the State of Paraná, for the production of linseed oil in the State of Rio Grande do Sul, and for output of citric fruit essences in the State of São Paulo.

Editor's Note. Those interested in further details should address the correspondent whose name and address appear for each country, and enclose sufficient international coupons to prepay the reply. United States stamps should not be sent.

South African Fertilizer Industry Meets Demands

Careful planning by the South African fertilizer industry has so far managed to meet the country's need despite heavy demands, particularly for superphosphate. Before the war South Africa imported 100,000 tons of superphosphate annually from the Netherlands, and with this supply cut off, the industry has faced a serious shortage. Important local factories were entirely dependent in the past on imported phosphate rock for production of superphosphate, but reports on the South African industry indicate that it is overcoming such obstacles.

Operation of the various raw material controls and the policy of chemical manufacturers tend to reduce price changes to a minimum, but if present quotations are compared with those ruling at previous dates, numerous advances are noted. Potash alum, white arsenic 99–100 per cent, barium carbonate 94 per cent, barium chloride crystals, and sodium percarbonate are chemical products which have risen greatly during the first half of 1942, according to the *Chemical Trade Journal*. Price advances of chemicals by about 10 per cent were fairly numerous. In the field of coal-tar products prices increased for benzene and creosote oil. Butyl alcohol also advanced, whereas quotations of xylene and methyl ethyl ketone were slightly reduced. Prices for carbon disulfide, sodium nitrite, and dibasic sodium phosphate are also lower. Heavy price advances occurred in the field of vegetable oils. Supplies of paint oils are still well maintained, but deliveries are subject to severe restrictions so that consumption is almost entirely reserved for essential needs. Soapmakers have received smaller allocations recently, and technical consumers generally must do with the minimum of necesary supplies.

New Ministry Formed to Control Fuel and Power

Increasing industrial demands for fuel and power in the face of coal supplies limited by the calls for manpower from the army have caused the government to form a Ministry of Fuel and Power. This ministry has full control over the operation of all coal mines and, if supplies do not improve greatly or voluntary restrictions do not result in a substantial reduction of domestic consumption, may introduce a rationing system for coal, gas, and electricity. The Minister of Fuel and Power is assisted by a Controller-General, while activities of the ministry are divided into four sections, headed by directors of production, labor, services, and finance. National and regional coal boards have been formed to advise the ministry in technical and administrative matters. Part of the new ministry's task will be to encourage the use of manufactured fuels, where this is advantageous, with a view to an increase in the output of by-products for use in the chemical industries.

Government Forms Non-Ferrous Minerals Development, Limited

The Non-Ferrous Minerals Development, Ltd., has been formed with a capital of £1,000 to assist the Non-Ferrous Minerals Development Controller. The Controller plays a prominent part in utilisation of non-ferrous mineral deposits in the British Isles and has paid particular attention to the Cornish tin and tungsten mining industry. Although operations are hindered by the shortage of labor and claims of other war industries, some success has been noted.

Derbyshire Stone Goes into Fluorspar Production

The Derbyshire Stone, Ltd., has entered the production of fluorspar and will probably remain in this field after the war. Deposits of high-grade glass sands, which were discovered in Argyllshire on the banks of Loch Aline shortly before the war, are being used and have proved superior to other sands after purification.

Licensing System on Chemicals and Related Products Extended

The license system is being extended in various directions. Acquisition of refractory dolomite, including bricks, cements, and compositions, has been subject to license since June 19, but this does not apply to refractory dolomite which has been mixed with a bonding material but not further processed or manufactured. Acquisition of chromium metal is also subject to license. So are, since July 8, the acquisition, disposal, treatment, use, and consumption of dammar, gum dammar, manila, and gum manila. Licenses are required as from August 1 for imports of mica slabs, splittings, ground, and waste from the British Empire, Free French Colonies, and the Belgian Congo. No more table jellies must be made in British factories, and no more ice cream will be made in Great Britain after August 31. Export licenses are required for preparations containing isinglass, for gum copal and gum kauri, for abrasive segments consisting of grains of natural or manufactured abrasive bonded together with other material, and for articles of various descriptions made wholly or mainly of plastic material derived from cellulose, casein, or synthetic resin.

Shipping Problems Restrict Phosphatic Fertilizer Supply

The supply of phosphatic fertilizers is also limited by shipping considerations, and though more use than ever before is made of animal products like bone meal, strict allocation is necessary to ensure fair distribution of available supplies. The authorities have investigated the possibility of working certain low-grade phosphate deposits in the country, but the chief obstacle seems to be the amount of labor and transportation that would be required for their utilization.

Four Manufacturers Agree in Production of Pharmaceutical

Pethidine hydrochloride, the hydrochloride of 1-methyl-4-phenylpiperidine-4-carboxylic acid ethyl ester, which is recommended as an analgesic and antispasmodic, has been introduced in the British market under an arrangement by four leading manufacturing firms.

Potash Limited to Certain Crops

The bulk of the potash requirements of British farmers is being met by imported muriate of potash containing 60 per cent or more of K_2O. Preference is given to this highly concentrated potash salt because of the need to conserve shipping. Under a new order potash fertilizers of foreign origin must be used only for potatoes, flax, sugar beet, root and vegetable crops grown for seed, market-garden crops, black currants, and tomatoes. The amount to be used on these crops is limited to certain quantities per acre. For other crops potash fertilizers may be supplied under permits from the County War Agricultural Committees, if they are grown on land seriously deficient in potash but these permits will be issued in comparatively rare cases only.

Strategic Importance of West Africa Is Stressed

The strategic importance which is attached to West Africa as a producer of important vegetable and mineral raw materials has been stressed by the appointment of a resident minister in that area. Lord Swinton, who has held high offices in the government including that of Secretary for Air, will devote much of his time to the development of the economic resources of the countries under his charge. About the same time the West African Cocoa Control Board has been reconstituted as the West African Produce Control Board. In its new form it is responsible for the control of various vegetable products including oilseeds and vegetable oils, of which the British colonies in West Africa are important producers. The Free French National Committee has appointed observers to maintain contact with the West African Produce Control Board and has agreed to cooperate with the board in organization of the vegetable oil trade from the French colonies in West Africa. The board will use the services of existing trade organizations for the purchase and collection of oilseeds.

Mineral exports from West Africa have increased in importance as a result of recent changes in other countries. Output of tin concentrates has increased and is to be increased further in Nigeria where colum-

bite mining has also made progress as a result of larger demands from the United States. Iron ore from Sierra Leone is another mineral of considerable importance, as also is bauxite from the Gold Coast for which the Department of Scientific and Industrial Research has developed a concentration process to reduce moisture content before shipping.

Attention has also been paid lately to the possibility of tapping wild rubber in West Africa. While the quantities expected from this source may be comparatively small, they are not without value. Efforts have been made for an increase in food growing for the local market and neighboring countries. As a supplier of raw materials West Africa has the great advantage that it is favorably situated for shipments to both England and North America.

Shipments of Manganese and Iron Ore at Rio Port Regulated

FORMATION of a syndicate of miners, producers, and exporters of manganese and iron ore through the port of Rio de Janeiro is reported from Brazil by official sources. The syndicate is to be named Sindicato National dos Productores e Exportadores de Minerio de Ferro e Manganese.

Functions of this organization will be to sample and analyze manganese and iron ore shipped through the port, keep records of ore movements from mine to boat, and make recommendations to the Central Railroad on the allotment of cars based on available ore, boats expected, and other factors in the industry.

Zinc Refinery May Be Built in Quebec

ACCORDING to an unofficial report to the U. S. Department of Commerce, interest in the possibilities of a zinc refinery in Quebec is being revived. There is belief that sufficient deposits in the province warrant building of a refinery with the Quebec Government reported to be considering allocation of $1,000,000 as a subsidy for zinc mined and refined in the province. Most of the zinc concentrates from that area at present are sent to the United States for treatment.

Damaged Nitrogen Plant at Moscice Reported Operating

GERMAN reports indicate that damage to the nitrogen plant at Moscice has been repaired and the plant is again in full operation. These works were making ammonia, calcium nitrate, nitrophosphates, calcium carbide, ammonium nitrate, nitric acid, and calcium chloride, which as the most easterly of German chemical plants of any size, readily accessible to Germany's eastern front, have strategic importance.

India Undertakes Program for Mineral Production

STEPS are being taken by the British Indian Government for exploring that country's mineral resources, word to the U. S. Department of Commerce indicates. The program aims to indicate the practicability of establishing mineral production and use of ores not previously fully utilized. The plan will involve proving of deposits and construction and operation of experimental and pilot plants. It will continue until large-scale operations can be launched.

Hungarian Paint, Acid Companies Are Merged

MERGER of the Hungaria, Phoenix, Metallochemical, and Zorke companies of Hungary, makers of acid, paints, and other products, is reported. These companies are now located in Hungary since the Rumanian and Yugoslavian border zones changed. The Hungaria company is a subsidiary of the former Verein für Chemische and Metallurgische Produktion of Prague, now under German control. Combined output of the companies exceeds Hungarian home market demand, and markets are said to be a problem. The capital of the companies was increased in the move.

Canadian Government to Purchase Scheelite Ore

GOVERNMENT purchases of scheelite ore in lots of 100 to 1,000 pounds, as an encouragement to tungsten production and an aid to the small shipper, is reported from Canada.

The authorities, as a war conservation measure, are reported planning to restrict construction of trails and roads by mining properties engaged in production of nonessential metals.

Australian Cultivation of Tung Trees Increased

TUNG trees are believed to grow well in new South Wales, Australia, and under proper cultivation give good yields, the U. S. Department of Commerce reports. The grove reported on gave 18 per cent oil from whole fruit. The quantity of fruit has been increased annually since the first crop in 1937, it was said, with a quality of oil equal to the China product.

ENLARGEMENT of Japan's aluminum industry to develop ore deposits in Korea, Formosa, and Manchukuo is projected, according to German reports.

War Stimulates South Africa's Chemical Output

MINING, agriculture, and some secondary industries absorb the output of South Africa's chemical industry, both local production and imports being devoted almost entirely to these industries' requirements, an official survey states.

Johannesburg gold mines require approximately 200 tons of explosives per day, cyanide valued at £1,500,000 annually, 80,000,000 detonators annually, besides large quantities of other chemical products used in refractory and refining branches.

Agricultural demands, second to those in the mining industry, comprise 300,000 tons of superphosphates annually, besides organic nitrogen and potash fertilizers. Others utilizing the Union's chemical output include the tanning, paper, canning, soap, paint, and pharmaceutical industries.

Local production has been stimulated by the fact that war has interfered with the supply of raw materials largely imported, particularly superphosphates. Some production has been possible using rock from North Africa, but this supply has been cut off by war. Using just the phosphate rock available in South Africa, plants have been able to supply local requirements, and the postwar prospect is for expansion provided there is an increased domestic output of sulfuric acid. This acid already has assumed importance because of its place in explosives manufacture.

Prior to war approximately half of South Africa's cyanide requirements were filled by imports, some from Germany. Local production has increased as these imports were cut off, but the local product is said to be inferior. War conditions likewise have increased production in the Union of chrome salts, sodium silicate, and sodium sulfide, and since necessary raw materials are available, there is a prospect of this industry continuing in postwar years.

Production of Polishes Cut in United Kingdom

REDUCED production, under government limitation effective since June 1, of wax polishes, creams, and dressings for floors, furniture, and shoes has been reported from the United Kingdom. These articles come under the Limitation of Supplies Order. Producers must restrict the supply to 60 per cent by value based on the six months ended November 30, 1939.

THE Government of Eire is reported to be promoting a limited company to prospect for and develop minerals, under an act passed in June 1941. The company is now reported to be in operation under this stimulus.

India Endeavors to Become Self-Sufficient in Chemicals

THE increasing effort of the Indian Government to make the country as self-sufficient as possible in chemicals and other raw materials is reflected in the report of the Board of Scientific and Industrial Research for the year 1941, relayed through official sources to this country. The activities of the board are pictured as a major contribution to the further industrialization of India, particularly under stimulus of war conditions.

The Alipore Laboratory has followed through a number of research programs sponsored by industrial firms rather than by the government. Included among them are research on the utilization of naphthalene and its products; manufacture of phthalic anhydride in pure state, with a pilot plant under construction for large-scale experimental production; research in development of resins from bagasse, jute waste, and other waste products, with large-scale development begun (the resins are notably cheap, and impart an elastic finish to cloth, besides being used in bonding wood and cellulose matter); refinement of certain imported sulfur products; investigations on indigenous paint thinners, synthetic wool, cork substitutes, commercial use of animal wastes, and unbreakable wood substitutes.

New Zealand Looks to Increased Agar Output

ENOUGH agar to supply essential requirements of both New Zealand and Great Britain is sought in developments progressing in New Zealand, looking to an annual harvest of 10 tons of dried weed. This will produce 3 tons of agar, sufficient for the purpose. New Zealand's canning industry consumes about 18 tons annually, compared with only 400 pounds used for bacteriological purposes. Recent reports of agar production from New Zealand indicate that 15 pounds were produced in semi-official extractions under direction of the Dominion's laboratory in recent months. Official tests in Great Britain are said to have indicated that the New Zealand product compared favorably physically, chemically, and bacteriologically with the Japanese product, but has a less attractive color.

Belgian Congo to Increase Production of Copal Gum

INCREASED production of copal gum during the current year is anticipated from the Belgian Congo, which exported 15,114 metric tons in 1938 and progressively declining amounts in succeeding years, until for January to June 1941 only 3,659 tons were exported. The 1942 output, it is estimated, will reach 16,200 tons. Prior to the war virtually all this product from the area was shipped to Belgium first.

Mexico Engages in Large-Scale Production of Acid

LARGE-SCALE production of sulfuric acid from smelter gases is reported from Mexico through semiofficial sources. Sulfuric acid also is being made from sulfur by the contact process.

A plant has recently been completed for refining sulfur, and a new plant is making carbon disulfide with sulfur from the only deposits in Mexico—those in San Luis Potosi. This latter plant will supply domestic requirements, which are about 150 tons annually.

Two Mexican plants are making hydrochloric acid, while the sodium sulfate by-product is used to prepare sodium sulfide, of which the country produces all requirements of the domestic leather industry. The glass industry is aided in that several lakes in the northern part of the country furnish sodium sulfate, which is not entirely free of chlorides but which is useful in glass manufacture. Another plant that will produce chloride-free sulfate is being installed at one of the lakes, the output to be utilized at a new sulfate pulp plant.

Imported sodium nitrate supplies a dynamite plant that produces its nitric acid requirements. An output of three tons daily is reported for an electrolytic alkali plant, while other Mexican products reported include potassium chlorate, copper sulfate, and calcium arsenate, the latter from domestic arsenic. A new plant is scheduled to produce calcium carbonate.

Great Britain Seeks Lime Supply Maintenance

MAINTENANCE of a lime supply for English farmers for the 1942–43 season is an urgent consideration of the British Government, faced with possibilities of a serious shortage for the winter liming season.

This is due to labor problems in the lime industry, and also to increasing demands of other industries for lime, limestone, and chalk. A suggested remedy is that farmers take substantially larger amounts of their lime requirements during the summer, thus enabling lime producers to operate their works throughout the year at an even maximum level.

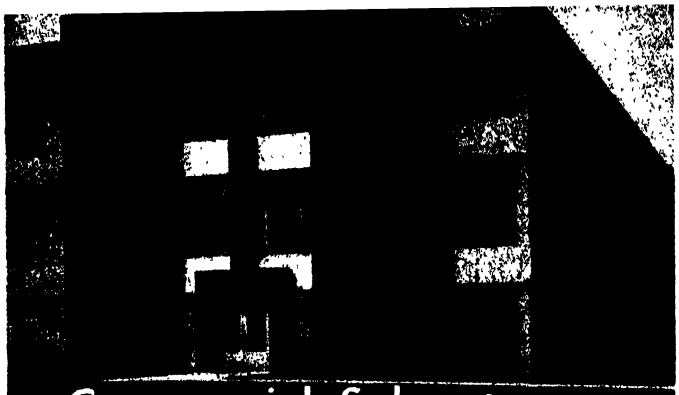
To encourage such advance buying, the government contemplates a summer delivery payment to farmers, amounting to an increase of from 50 to 75 per cent in the treasury contribution under the land fertility scheme Although an emergency measure, the payment will be made in respect to deliveries to those on the land between mid-May and the end of August. It is intended as compensation for additional costs to the farmer, and inconvenience that may be occasioned through double handling and storage of lime supplies.

Trade Agreement Signed by Uruguay, United States

UNDER a new trade agreement between the United States and Uruguay the present moderate Uruguayan duty on sulfur is bound against increase. Exports of sulfur from the United States to Uruguay have not been large in the past, but $69,000 worth was shipped in 1940, the U. S. Department of State said.

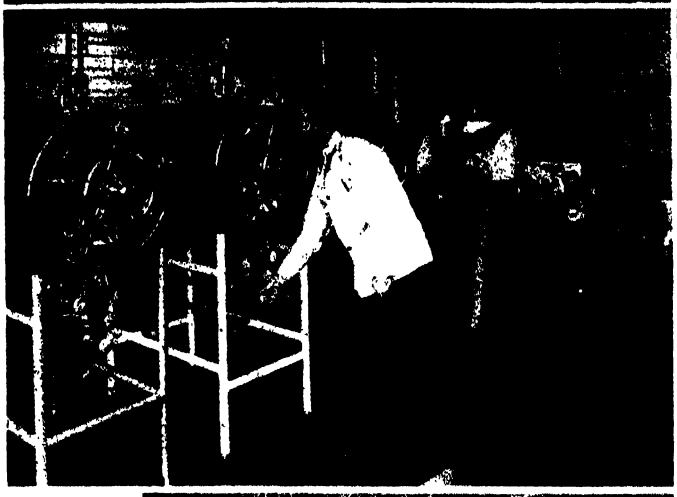
Duty on nitrocellulose and pyroxylin lacquers, typical and important United States paint products, is reduced by 30 per cent. These products are specifically included, under the agreement, in a Uruguayan tariff classification which covers varnish, clear or with the addition of any coloring matter, whether concentrated or not. A 30 per cent reduction is also obtained for medicinal petroleum jelly, for liquid insecticides with a base of pyrethrum or of ethers and hydrocarbides, and for composition-coated roofing paper. The existing rate on certain liquid roofing compounds is bound against increase.

The United States is generally the chief supplier of Uruguayan imports of nitrocellulose or pyroxylin lacquers, medicinal petroleum jelly, liquid insecticides, and roofing compounds and paper.



British India Utilizes Phosphate Rock Deposits

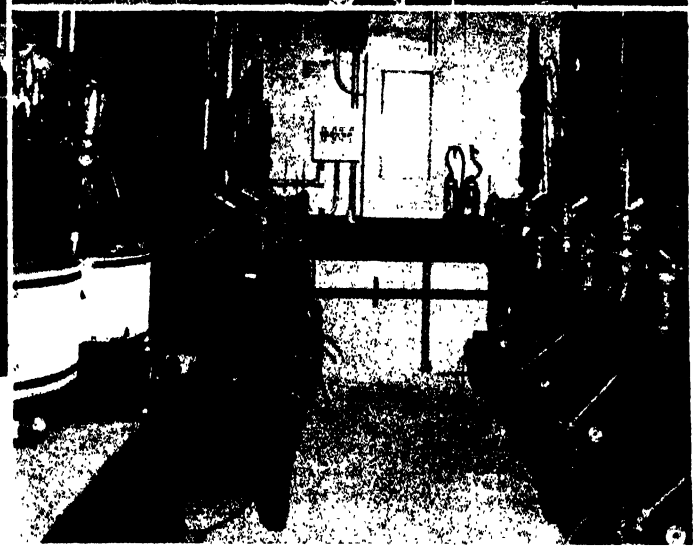
INVESTIGATIONS are reported under way in British India on production of phosphoric acid and phosphorus from phosphate rock, while fertilizers having a high citric-soluble phosphate have been made in some places from phosphatic nodules. Urea from ammonia and carbon dioxide using high pressures has been made in good quantity, together with moderate quantities of formaldehyde.



COPPER-BEARING insecticides (Bordeaux mixture, and others, except straight copper sulfate) have been placed under permit by the Ministry of Commerce of Bohemia-Moravia, consular advices reveal. The apparent object is to reduce copper consumption and conserve national stocks of this metal.

ABRASIVE production, natural and synthetic abrasives, and their products, have been placed under government control in Bohemia-Moravia, according to consular advices. Establishment of plants, recommissioning of old factories, increased output are subject to government permit.

THE government of Eire has been searching for substitute local phosphate deposits. Engaged in the search is the Mineral Exploration and Development Company, recently established under government auspices to locate and develop the country's mineral resources.



Commercial Solvents New Research Building

RESEARCH has always played an important part in the history of Commercial Solvents and, as the company expanded in both size and the number of products manufactured, the scope of activities of the Research Department was constantly increased. For many years their quarters were in a wing of the parent plant at Terre Haute, Ind., but by 1940 the elastic limit of this building had finally been reached. It was then decided to erect a new building to house the present staff and provide, at the same time, for future expansion.

Terre Haute was selected as the most advantageous location for the new research building, the deciding factor being the convenient supervision over new processes and products through laboratory and pilot-plant to full-scale production which location at this plant makes possible. The Terre Haute plant is not the largest but it is the most diverse in equipment and operations of all the Commercial Solvents plants.

The new three-story research building, completed late last year, houses the biological and chemical staffs together with the patent division and technical library. Provision has been made for addition of a fourth floor or expansion at the rear of the building. The building is divided transversely by a fire wall sealed by automatic fire doors. The front portion of each of the three floors is given over to offices, conference rooms, and the like, while all the laboratories are located back of the fire wall. The building is fireproof, and its contents are protected by a sprinkler system covering all laboratories, offices, and corridors. A carbon dioxide system protects the vaults. Provisions have been made for installation of air-conditioning equipment when it again becomes readily available, and in the meantime the building is cooled in warm weather by flooding the roof with water.

The shortage of structural steel early in 1941 when the building was started suggested the use of reinforced concrete for the frame. This type of construction required only 20 per cent of the steel needed by a conventional steel frame. Use of a patented method of floor reinforcing, known as "smooth ceiling construction", eliminated the column caps and ceiling beams characteristic of reinforced concrete frame slab construction. The erection of forms and subsequent installation of wiring, piping, and sprinkler systems were thus greatly simplified.

Exterior walls of the building are all glass block and concrete. Two types of block are used in the east and south walls to give maximum light with minimum glare. To a height of 7.5 feet from the floor a block which refracts light downward is used. Above that height a block which refracts light upward is used. Blocks in the north wall are of nondirectional diffusing type.

Fluorescent lighting ensures a minimum illumination of 25 foot candles in every office and laboratory. The interior walls in the laboratory are finished with tan glazed tile which are easy on the eyes, simple to clean, and unaffected by laboratory fumes. The interior office partitions are constructed of Haydite, a porous concrete block, painted a light green. Floors throughout are concrete covered with asphalt tile.

ESMWT Succeeds ESMDT

Austin M. Patterson

U. S. Office of Education, Washington, D. C.

DURING the past year readers have seen references in newspapers and elsewhere to short college-grade training courses being given for workers in war activities by various schools under the sponsorship of the U. S. Office of Education. In some cases it has been mentioned in addition that the program was called Engineering, Science, and Management Defense Training, or ESMDT.

The ESMDT program officially terminated June 30, 1942, although courses already begun under it may continue as late as September 30. Its successor is called Engineering, Science, and Management War Training, or ESMWT. The new program will be of the same nature in all important respects as the previous one; the four fields of training, for engineers, chemists, physicists, and production supervisors, remain the same.

Figures for ESMDT are not complete, but as of June 30 they show a net total authorization of 8,014 courses offered by 196 institutions to a net authorized enrollment of 456,439 persons (the actual enrollment as finally reported will be somewhat under this figure). That the courses are accomplishing their purpose of upgrading technical workers in industry is evidenced by much accumulated testimony. For example, from a thousand inquiries to industry as to the value of the training, only three replies were unfavorable, while many were enthusiastic. Over 90 per cent of the courses are of the in-service type, with very direct benefit to industry and little loss. While the effectiveness of the pre-employment courses is more difficult to gage and some scattering of effort has been inevitable, results also have been gratifying on the whole.

Of the total authorized enrollment of 456,439, only 9,110 were in courses classed as chemistry. However, 1,123 additional were enrolled in "chemistry for engineers" and 12,175 in chemical engineering. This makes a total of 22,408 enrolled in chemical courses. Other branches of engineering had an enrollment of 347,736, production supervision (management) 80,025, and physics 6,270. The institutions approved to give ESMDT courses numbered 213. Of these, 194 were approved for chemistry, 154 for engineering, 140 for production supervision, and 135 for physics.

The most common type of training in chemistry has been analytical, next to which has come general chemistry for workers in chemical plants. Organic chemistry ranks third, and physical fourth. In chemical engineering, training in fundamentals comes first, followed in order by explosives, plastics, inspection and testing, petroleum, and other special subjects. Training in the health field and in chemical warfare has been left for the most part to other agencies.

While the shortage of technical persons in all four of the above fields is serious, the relative need for training chemists has apparently been less than that for the other three classes; at any rate, the demand for training in the chemical field ran about as expected, while that in the other three exceeded expectations. This seems to agree with reports from other quarters that the shortage of physicists and engineers, including chemical engineers, is greatest, with that of chemists relatively less acute. According to one authority, the need for chemists of B.S. grade or beyond is relatively greater than for those who have had only one to three years of training.

An interesting recent development has been the entry of women's colleges into the program and an increase in the number of women enrollees. The number of Negroes trained is also increasing as the demand for them in industry grows. An expansion of about 50 per cent is anticipated in the ESMWT program during the year begun July 1, as compared with the ESMDT program which preceded it.

Training for War Industries

THE Chemistry Department in the University of Pittsburgh plans to offer free evening courses for the training of individuals in chemistry for war industries. The purpose of these courses is to prepare new men and women to replace those who have entered the armed forces and to train individuals already employed in industry for more advanced chemical service. The courses planned include: Introductory and Advanced Metallurgical Analysis; Microscopical Testing of Industrial Materials; Electrical and Optical Instruments for Analytical Control; Practical Food Testing and Control; Food and Water Inspection; Practical Vitamin Assaying; Industrial Quantitative Organic Analysis.

An elementary course on Chemical Fundamentals for War Workers is also planned to prepare individuals for the more advanced practical courses which are listed above.

A descriptive bulletin of courses may be obtained by writing to Herbert Spencer, Regional Coordinator of Engineering, Science, and Management War Training Courses, Pennsylvania College for Women, Pittsburgh, Penna. Fall courses are scheduled to begin October 12, and registration will take place during the preceding week.

H. V. Fairbanks has been appointed assistant professor of chemical engineering at Rose Polytechnic Institute, Terre Haute, Ind. He began his work there September 1.

A Tool for Re-forming Two-Piece Compression Copper Tubing Couplings

J. C. WHITWELL AND W. T. McKEE, Princeton University, Princeton, N. J.

Users of the two-piece compression tubing coupling will be aware that, although it is the simplest and least expensive type of coupling, there are difficulties attendant upon its re-use. The top, or compression nut, is pressed into the tubing in such a manner as to deform the nut. As a result, direct re-use is impossible. A tool for re-forming the fittings for re-use is described. Advantages are simplicity and cheapness. By its use, purchase of new brass couplings, unobtainable except with very high priorities, is obviated.

Copper Tubing Couplings

THERE are several characteristic forms of copper tubing couplings. These may be classified in three groups: two-piece compression couplings; three-piece compression couplings; and flared tube couplings. The three types are illustrated in Figures 1, 2, and 3, respectively. The first is the cheapest and easiest to install. The square-cut tubing is slipped into the coupling and the top nut tightened in place, the seals forming at the end of the tubing and at the brass contact of the two nuts. Both other types require more handling, the second in placement of the sleeve upon the tubing requiring opening of the coupling prior to installation and the third in placing the union nut on the tubing, flaring the tubing, and fastening the two parts together. A separate tool is used for the flaring operation.

The main disadvantage to the two-piece compression coupling is the inability to re-use the top, or compression, nut. In original use the end of the compression nut is pressed into the tubing, gripping it permanently. After this initial operation, the fitting may be uncoupled and re-coupled, but the compression nut may not be removed and replaced on another piece of tubing. Re-use on another piece of tubing requires reshaping the compression nut to remove the crimp in the tapered end. A tool to perform this operation is described.

The above difficulty is not characteristic of the other two types of coupling. However, in the case of the sleeve type, the sleeve is permanently crimped onto the tubing. This single part of the fitting is not suitable for re-use. In normal times these sleeves may be purchased inexpensively. At present they are largely unobtainable. The flared tubing coupling may be re-used by cutting off the flared end and slipping the union nut from the tubing.

A second reputed objection to the double compression fitting is its unreliability under high pressure. The authors have used these fittings under 1,000 pounds per square inch without any difficulty of this nature.

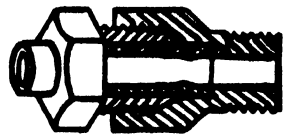

Figure 1.

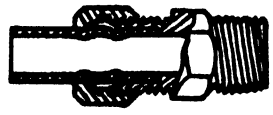

Figure 2.

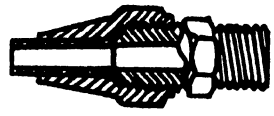

Figure 3.

Necessity for Re-forming Tool

Stringent government requirements have made it apparent that brass will be unobtainable for the remainder of the present emergency except under priority ratings which are not available to many laboratories. Until substitute plastic tubing and fittings are manufactured on large scale, recurrent demand for fittings may work a considerable hardship. With the demands of the author's laboratory in mind, the tool presented here was designed and thoroughly tested. It was found to be satisfactory, not only for one, but for successive operations on the same fitting. Since correspondence has indicated that no such tool is sold, the design is presented here for others who may find themselves in the same predicament regarding tubing and fittings as experienced by the writers. It is believed that use of the tool will be found to be so satisfactory technically and economically, that its continuation as a standard laboratory item is probable even after new fittings again become available.

Tool Design

The tool, illustrated in Figure 4, con-

sists of a block of steel, A, and tapered steel rods, B, for each size coupling handled. The steel block is drilled with several holes, again one for each size of coupling handled. Proper sizes are indicated in the appended table.

The block and rods may be of ordinary low carbon steel. For best service, the rods should be turned from tool steel and subsequently hardened. However, a low carbon steel rod will have a considerable life. The taper of 12° specified for the expanding end of the rod has been arbitrarily chosen and is not closely defined. Any moderate taper is satisfactory.

Use of the tool is as follows. The compression nut is removed from the tubing by cutting off the protruding end of copper tubing (not over 1/8 inch in length). The cut is made as near as possible to the fitting, but without burring the nut with the hacksaw teeth. The tubing is then filed flush with the nut, when the latter can be drawn from the tubing with comparative ease. If the nut fails to draw off easily, a few turns with a wrench will loosen it. Another method of loosening is clamping the nut in a vise and twisting the tubing by hand.

Fundamental to satisfactory re-forming of the nut is a heat treatment. The crimp in the nut has cold-worked the brass sufficiently to make it quite brittle. Removal of this embrittlement is essential and simply accomplished by heating the nut to a temperature somewhat below the melting point of the brass. While this operation may be performed in a furnace, a hand torch of the gas-air type is quite satisfactory for any but very large-scale reclaiming operations.

The heat-treated nut is placed in the proper hole in the block, A, where it is supported by its hexagon head. The block is most satisfactorily held in an ordinary machinist's vise. Rod B of an outside diameter corresponding to the inside diameter of the hole in the compression nut is selected. The rod is placed in the hole in the compression nut and gently tapped through with a hammer. The reduction in diameter of the upper part of the rod allows it to fall freely through the nut after the reforming operation is complete. This is an essential point in efficient operation.

The nut is now ready for reuse. The number of repetitions of this process should be unlimited.

A. A. T. C. C. Organizes New Committee

The American Association of Textile Chemists and Colorists, in its program of cooperation with the Government in defense and war programs, has recently organized a committee to study the aging of sulfur-dyed textiles. This project will include development of a reproducible accelerated aging test, to be used for predicting aging characteristics of sulfur-dyed materials.

The committee, which is in close contact with the Quartermaster Depot at Philadelphia, is composed of T. R. Smith, chairman, A. H. Gaede, R. H. Souther, J. L. Crist, O. G. Edwards, M. H. Klein, D. P. Knowland, C. A. Seibert, J. R. Bonnar, Wm. R. Moorhouse, H. G. Macdonald, and Major F. M. Steadman.

Ibert Mellan has recently joined the staff of the Armour Research Foundation, Chicago, Ill., as a research chemist.

Laboratory Testing of Magnesium Incendiary Bomb Extinguishers[1]

MICHAEL FLEISCHER AND JOSEPH J. FAHEY

Geological Survey, U. S. Department of Interior, Washington, D. C.

The problem of combating incendiary bombs has engaged the attention of a number of laboratories in this country in recent months. Many different substances, few of which are satisfactory, have been suggested as smothering agents for magnesium incendiary bombs. The ultimate test of any of these substances is their behavior when applied to actual burning bombs, but much time and material can be saved by small-scale laboratory testing. Such laboratory tests have been confined, so far as we know, to fires set in small quantities of magnesium shavings or turnings. Our experience has been that the results obtained in this way are not comparable to those obtained in tests using actual bombs. Fires set in shavings are much more easily extinguished and in addition, the reproducibility of the tests is poor.

The following simple method devised by us overcomes these difficulties. Approximately 1 ounce of magnesium, either as a solid piece or as shavings but preferably the former, is weighed and placed in an iron crucible with a closely fitting cover. The crucible is heated by means of a blast-lamp until the magnesium is melted. The cover is removed, and the molten metal is cautiously but rapidly poured out on a wooden board, preferably of the tongue-and-groove type. After a specified time interval (we wait five seconds) to give the fire a fair start, the extinguisher being tested is poured over the fire from a weighed container until it is judged that sufficient has been used. By simple proportion, this gives a rough approximation to the quantity needed for a bomb.

Our experience has been that the results obtained in such tests are closely comparable to those obtained in tests using standard test bombs. Materials which are unsatisfactory smothering agents in such tests may safely be discarded from consideration, and larger-scale testing with test bombs may then be restricted to materials which in the laboratory tests show promise of being useful.

Pure Mercury

EDWARD WICHERS, National Bureau of Standards, Washington, D. C.

Chemical literature contains many contributions dealing with purification of mercury but very few on criteria of its purity. It has long been known that certain impurities alter the appearance and mobility of mercury. The terms "sickening" or "deadening" were early applied to these effects. It does not appear, however, that more than a very few workers have recognized how extremely sensitive a criterion of purity the surface behavior of mercury is. Consequently, I am convinced, a great deal of time and effort are being spent in these days that are too busy for any wasted effort on the "purification" of mercury which is already pure to a degree seldom found in any other substance.

Virgin mercury, that is, mercury as produced at the mines, usually has a bright, mirrorlike surface and is clean except for traces of scum or perhaps particles of rust or other foreign matter from dirty containers. If such mercury is filtered through a pinhole in a paper cone, a glass filtering crucible, or several thicknesses of finely woven cloth into a clean, dry glass vessel and thereupon retains a bright and clean appearance, one can be sure that it does not contain so much as one part per million of any base metal. Metals more noble than mercury, that is, silver, gold, and platinum group elements, are not disclosed, but virgin mercury is not likely to contain them in amounts as great as a few parts in a million. Reclaimed mercury is generally as clean as the virgin metal, but may contain more of the noble metals because it is not always subjected to distillation in the reclaiming process.

The statement that mercury which looks clean and does not show the behavior known as tailing is at least 99.9999 per cent pure with respect to base metals may be challenged by many readers. It is indeed hard to believe that any commercial substance possesses such an exceptional degree of purity. But it can be demonstrated quite readily. To do so, drop about 0.5 mg. of tin foil into 100 grams of clean mercury in a small beaker or Erlenmeyer flask. Swirl the mercury around for a minute or so and observe the skin or crust that forms almost immediately. I think the observer will agree that the visible effect can be safely extrapolated to less than one part of tin in a million of mercury. Similar trials can be made with other base metals. The visible effects will not be exactly alike or appear equally rapidly, but they will be equally unmistakable.

The statements made here about the sensitivity and significance of this simple criterion of purity are based on observations made by the late A. Isaacs at the National Bureau of Standards (*2*) in connection with a discussion of mercury for use in dental amalgams Mr. Isaacs prepared a series of amalgams, each containing 0.001 per cent of one of the following metals: gold, silver, copper, zinc, cadmium, antimony, tin, lead, and bismuth. Weighed amounts of each metal were dissolved in the proper amounts of mercury, previously purified by approved methods, to yield amalgams of the desired concentration. The amalgams were prepared in glass ampoules, about half full, and then sealed with ordinary air over the metal. Upon agitation, the presence of each of the metals, except silver and gold, was promptly revealed by a film or skin on the surface of the mercury, by a deposit on the glass, or by a wetting of the glass. Metals such as iron, nickel, cobalt, and tungsten were not included in the tests because they are very unlikely impurities in mercury. Their amalgams, which are not easily prepared, would undoubtedly behave in the same way as those of the metals previously mentioned. Silver and gold in concentrations up to 0.1 per cent were not detectable by the appearance of their amalgams.

F. W. Schwab, also of our staff, later prepared much more dilute amalgams of zinc, antimony, copper, lead, and tin, and found that either the formation of a film or "tailing" of the mercury could readily be detected when the concentration of base metal was no greater than 1 or 2 parts in 10,000,000. This test, simple as it is, can therefore be regarded as far more sensitive than any ordinary chemical or spectrochemical test for base metal impurities.

Silver, gold, and elements of the platinum group can be readily determined by evaporating a sample of the mercury of sufficient weight to yield any desired degree of sensitivity. This should be done in a well-ventilated hood, or better in an apparatus designed to condense and recover the evaporated mercury. The residue, usually predominantly silver, can be analyzed by methods customarily used for the noble metals. A low temperature of distillation, perhaps 200° C., is desirable to minimize the slight volatilization of silver (and even slighter of gold) which is known to occur when amalgams of these metals are distilled. If the evaporation is conducted in the presence of air from a clean porcelain or glass vessel without boiling or other agitation, traces of base metals, if present, will produce a film on the surface which retards evaporation and may virtually prevent it. If the surface remains clean and mirrorlike and the nonvolatile residue is within acceptable limits, any further attempts to determine the purity of the mercury by chemical or spectrochemical analysis are meaningless. The only test that may be more sensitive, as far as the writer knows, is that described by Hulett and Minchin (*1*). It is based on the electrolytic potential of amalgams against pure mercury. By its means they were able to detect as little as 1 part of zinc in 10,000,000,000 of mercury.

It should be noted that the presence of a film on mercury, or the appearance of a dark ring on glass in which the metal is stored, is not necessarily an indication of the presence of base metals. This may occur in varying degree with the most rigorously purified mercury but usually only after storage for some time. How soon this occurs and its extent depend upon a number of conditions. An important factor appears to be the type of glass in contact with the mercury. Others may be the cleaning treatment used for the glass and the amount of moisture in the air. (In this connection it should not be overlooked that sulfur-bearing gases are an important cause of fouling of mercury.) The distinction between the behavior of pure and impure mercury is that the impure metal shows a new film or a deposit on the glass almost immediately after it is filtered into a clean vessel.

Since the surface behavior of mercury is of primary importance in most uses of the metal, other than in the preparation of mercury compounds, the condition of the surface is a very practical criterion of quality as well as a sensitive measure of chemical purity.

It is possible that some reader will know of some other criterion or test which could be used as a check on what seem to be the inescapable conclusions to be drawn from the observations of Isaacs and Schwab. If so, he will render a service by bringing it to the attention of the editor or of the writer. Meanwhile the writer hopes that some users of mercury will be stimulated to compare the service given in instruments by commercial mercury which meets the appearance test and that of mercury which has undergone the usual "purification". Before the untreated mercury is used, a desirable precaution is to heat it to about 150° C. in a porcelain dish covered with a watch glass and placed in a well-ventilated hood, so as to make sure that the metal is free from water. Practical trials of this kind may lead to considerable savings of time spent in putting the metal through a process of "purification" or of money spent for the so-called purified grades of mercury.

Numerous methods have been proposed for purification of mercury that has become contaminated with base metals. The most commonly used treatment is washing the metal with a solution containing nitric acid and mercurous nitrate. Doing this in a Meyer column, in which the metal falls in fine droplets through a long column of the acid solution, is less convenient and probably less satisfactory than the simple scheme of agitating a relatively large volume of the mercury in contact

with the acid solution by means of a stream of air. A heavy-walled filter flask is a convenient utensil for this purpose. The appearance of a sample of the mercury, after washing it thoroughly with water, drying, and filtering, can be used as a guide to determine the length of time it should be treated. Amalgams of different metals will require different lengths of treatment. If mercury has been fouled with sulfide, the cleaning is aided by adding a little hydrogen peroxide to the nitric acid wash solution.

The fact that base metal amalgams react rapidly with air is an indication that air alone can be used to purify mercury contaminated with these amalgams. This has been proposed by various workers. W. S. Clabaugh, of this bureau, uses a simple and ingenious procedure for the purpose. He puts the "dirty" mercury into a heavy-walled separatory funnel, adds a little water, and, with the stopcock slightly opened, applies suction to the upper (stopper) end of the funnel, thus drawing a lively stream of air through the mercury. After some hours not only is the metal freed of base-metal impurities, but nearly all the scum that is formed, together with the layer of water, is carried off in the air stream. A trap is placed in the suction line to catch the scum and to permit the recovery of mercury from it. When the suction is stopped, the cleaned mercury runs slowly through the slight aperture in the stopcock and is thus "filtered" from any residual scum. During the "scrubbing" the funnel is supported in a padded tripod to prevent breakage caused by the lively agitation of the mercury.

Hulett and Minchin (*1*) showed that, if mercury is to be purified by distillation, air at a low pressure should be present to eliminate base metals, especially zinc, from the distilled metal. They also studied the completeness of the removal of silver, gold, and platinum during distillation.

Rubberlike Soybean Material→

In the search for rubber substitutes with less exacting requirements than tires and for extenders that can be mixed with natural rubber to make it go further, U. S. Department of Agriculture chemists have produced a rubberlike substance from vegetable oils that looks promising. It has passed laboratory tests successfully and is being tested in the pilot plant. If these tests are satisfactory, it will be subjected to commercial trials. *Top.* Chemists of the Northern Regional Research Laboratory, Peoria, Ill., test the stretch of a rubber substitute made from soybean oil. It has a 200 per cent stretch, compared with a 600 per cent stretch of real rubber. *Center.* A chemist and associate are milling the soybean material. *Bottom.* The substitute is tested for elasticity.

Plastic for Waterproofing Fabrics

A NEW substitute for rubber in waterproof fabrics which meets specifications for natural rubber and can be handled with the same machinery and processes as rubber has been announced by the Hodgman Rubber Co., Framingham, Mass. It is Monsanto Chemical Co.'s Saflex, a vinyl acetal resin already familiar to the automotive and glass industries as the interlayer in safety glass.

The process for plasticizing and compounding Saflex for application to fabric by conventional rubberizing methods was developed by Joseph L. Haas, Hodgman technical director and fabric superintendent, in conjunction with research chemists of Monsanto's Plastics Division at Springfield, Mass. Both process and materials are available to other manufacturers, enabling the development to serve the war effort as widely as possible.

By the process, Saflex is transformed from a thermoplastic to a thermosetting material with markedly increased resistance to solvents and greatly decreased water absorption. The Saflex-coated fabrics readily meet most of the tests applied to rubber, oil, and pyroxylin coatings and in some cases are said to outstrip the materials around which the tests were written. In government tests of the raincoat material, it did not crack at −60° C. or adhere to itself at 120° C.

The modified plastic is said to lend itself to the coating of fabric by either of the two conventional rubberizing methods —spreading or calendering—more readily than any other synthetic rubber or resin. The entire processing and curing of Saflex is so analogous to that of rubber that no changes from the usual procedure are necessary, no new equipment or mechanical adjustments are needed, and no additional training is required for labor. The properly plasticized Saflex is received in cakes which can be cut into convenient slabs for milling and compounding quickly and easily, since the material does not require a "breakdown" like rubber. If the plastic is to be made into cement for spreading, it is taken from the mill and placed into churns with a solvent. If it is to be calendered, it is taken off in convenient sheets and stacked until used.

Before calendering, these sheets are warmed up in the usual manner on a mill and fed into the calender where they are joined to cloth in the same manner as rubber. The coated fabric is either draped in a heater to be cured or sent to the cutting room where it is fabricated into finished articles which are cured after fabrication. Curing is accomplished at the same temperatures at which rubberized articles are vulcanized.

Saflex-coated fabric, which the Hodgman company has christened Horco-X, has already been made into Army raincoats, hospital sheeting, gas protective fabric, life-preserver jackets, and water bags, while many other military items are awaiting final action or are in the experimental manufacturing stage. In the Army raincoat use of Saflex saves more than 1¾ pounds of crude rubber per coat, with proportionately greater savings in heavier fabrics such as the hospital sheeting and gas protective cloth. With a 10,000,000 man Army, the saving in raincoats alone would amount to as much as 17,500,000 pounds of rubber. Since it is possible to use a lighter base fabric with Saflex, the new Army raincoat weighs 2 pounds less than the present rubberized coats.

Manufacture of Saflex-coated raincoats and other products is pictured on pages 1116 and 1117.

War Gas Identification Kit

A WAR gas identification kit has been developed by Fritzsche Brothers, Inc., 76 Ninth Ave., New York, N. Y., approved by the Office of Civilian Defense, and made available without charge to state-appointed instructors in war gas identification. The kit contains five harmless compositions which have the odors characteristic of the five poison gases regarded by the Chemical Warfare Service as most likely to be used by the enemy in bombing our cities. These are phosgene, lewisite, mustard, chloropicrin, and chloroacetophenone. A blower provided with each set enables the instructor to disseminate the odors as a fine vapor which duplicates the condition under which the gas would be encountered in a real attack.

POTOMAC POSTSCRIPTS

WPB Activities

Alcohol. A decrease in the amount of ethyl alcohol that may be used in the manufacture of shoe polish and an increase in the amount for vinegar are made in a revision of the alcohol order, M-30. The increase for vinegar was made because of its demand as a food. No other changes are permitted in the amounts for the manufacture of various products, which are 70 per cent for toilet articles and similar items and unlimited for chemical and military uses.

References to isopropyl and butyl alcohol and their derivatives are removed from M-30 as these are covered by other orders. Restrictions on the use of alcohol in antifreeze also are removed for the same reason.

Borax and Boric Acid. Inventory restrictions on borax and boric acid have been removed to permit industrial stock piling of these materials. The action was taken by adding them to the materials list of Order M-161.

Chlorinated Paraffin, the entire supply of which is used by the Army, Navy, and Maritime Commission, is placed under complete allocation control in M-189. Consumers must file by the 10th of the month preceding the month in which they seek delivery requests for allocation on Form PD-619. Producers must schedule their deliveries monthly on Form PD-618 by the 15th of each month.

Chlorinated Rubber. Three changes in the chlorinated rubber order, M-46, have been made. The first removes permission to use chlorinated rubber in the manufacture of electrical insulation. Substitutes are available. The second permits use of chlorinated rubber in the manufacture of core binder cement for use in casting equipment made for the armed services. The third continues the order in effect until revoked. It had been due to expire on July 31.

Chlorine. Restrictions on the "brightness ceilings" of 100 per cent rag content paper are removed by Amendment 2 to General Limitation Order L-11, which is designed to conserve chlorine. Previously, the "brightness ceiling" of 100 per cent rag content grade paper under the chlorine conservation order had been fixed at 82 per cent. After investigation, WPB's Pulp and Paper Branch found that very slight quantities of chlorine are required for processing 100 per cent rag papers. Reducing the brightness of these papers, it was determined, contributes nothing to the conservation of chlorine.

Cobalt. Cobalt used for ground coat frit is limited, in any one quarter, to 35 per cent of the amount used in the first six months of 1941, by Amendment 2 to Conservation Order M-39-b, issued by the Director General for Operations.

Cotton Fabrics. Adequate supplies of cotton fabrics for the manufacture of industrial cloth or tape, surgical dressings, and laminated phenolic products are expected to be made available as a result of action taken recently. Order M-134 has been amended, and three schedules issued which assign a preference rating of A-2 to orders placed for fabrics suitable for manu-

NEW TOOLS FOR THE

The Shape of Things to Come"...NOW!

ALIPHATIC CARBOXYL DERIVATIVES

Processes developed and put into large-scale operation in the Armour Chemical Division will produce the *Primary, Secondary* or *Tertiary Amine* . . . the *Nitrile* . . . the *Symmetrical Aliphatic Ketone* . . . the *Amide* . . . in carload quantities from any available fatty acid.

Normally, 11 different derivatives of each of the above series of chemicals would be available, ranging in alkyl chain length from 6 to 18 carbon atoms. Current productions are centered around those materials of domestic origin, and we are limited to 5 members of each series, with the exception of high-ranking, priority-rated orders.

High Molecular Weight Carboxyl Derivatives . . . Basic Ingredients for Chemical Synthesis . . . Now Available in Carload Quantities from the ARMOUR CHEMICAL DIVISION

These new, important chemicals comprise an extensive and useful group of Carboxyl Derivatives, now ready for shipment as "CD" AMINES . . . NITRILES . . . AMIDES . . . KETONES.

Their major applications to America's war effort and to important industrial processes await your demonstration in your own operations.

The field of industrial application for these newly available chemicals is developing rapidly. A few of the diverse jobs in which their usefulness has already been proved are: Flotation re-agent for oxidized, "acidic" minerals . . . germicides . . . fungicides . . . insecticides . . . plasticizers and lubricants for synthetic rubber . . . dispersion and coagulation agents . . . improving adhesion of aggregate and asphalt . . . stabilizing hydrocarbons . . . water-proofing . . . rust-proofing . . . grease-proofing . . . plasticizing and lubricating acetate molding resins.

The Realm of New Discoveries via chemical synthesis offers limitless opportunities for using these new compounds. All of the many "CD" derivatives have challenging possibilities as basic ingredients in the production of other chemicals.

Thus they will play a vital role in hewing "The Shape of Things to Come." Let us work with you in making them produce tomorrow's developments . . . today.

The Armour Chemical Division invites research and creative chemists to investigate the versatile characteristics and development potentials of these new chemicals . . . in relation to your own present-day problems of substitution and synthesis . . . . We will gladly submit samples, complete data on physical properties, detailed information on present uses and prices.

Alkyl cyanides so high in molecular weight that they can be eaten by the pound without ill effects . . . unusual solvent characteristics . . . very heat stable . . . unreactive except under drastic treatment . . . ranging in boiling point from 165°C to 357°C at atmospheric pressure . . . melting point from —79°C to 41°C . . . ranging in molecular weight from 97 to 265.

Organic ammonia that can be flaked, and shipped in bags . . . ranging in molecular weight from 101 to 773 . . . with only one amino grouping . . . boiling points range from 133°C to more than 550°C at atmospheric pressure . . . melting points from 19°C to 65°C . . . exactly the reverse of a fatty acid . . . in reality, fatty alkalies.

Chemically very inert . . . excellent lubricity . . . absorbs onto metallic surfaces . . . exceptionally heat stable . . . ranging in molecular weight from 170 to 507 . . . melting point from 14 to 86.7 . . . boiling points ranging from 226°C to more than 550°C at atmospheric pressure.

Soft . . . plastic . . . regardless of melting point . . . unusual lubricity . . . emulsifiable in aqueous solutions . . . unreactive except under drastic conditions . . . molecular weights ranging from 115 to 704 . . . boiling points, 255°C to more than 550°C at atmospheric pressure . . . melting range 101°C to 160°C.

CHEMICAL NEWS PARADE

Story on Page 1113

(1) A 129-pound drum of Saflex as it reaches the Hodgman Rubber Co., contrasted with a 200-pound bale of crude rubber in right foreground. Crude rubber must be laboriously uncrated. Saflex is quickly removed from its fiber drum with help of a block and tackle. *(2)* Saflex cake is sliced into sections for the mixing mill. In the foreground is a slab of crude rubber also sliced ready for the mill. *(3)* The slices of Saflex are ground between heated rolls of this mixing mill. Other ingredients are added and worked in and the plastic is removed in thin rubbery sheets. In the added ingredients lies the secret of the Hodgman process. Otherwise this step, like all that follow, is almost exactly analogous to those in conventional rubberizing. *(4)* Fabric for the Army raincoats is first given a thin binder coat of Saflex on a spreader. *(5)* In big calenders a thicker Saflex coat is applied and the fabric is ready for cutting and fabricating. Here the calender foreman checks the thickness of the coating. *(6)* Girls cement the raincoat seams with a special cement also made from the plastic. *(7)* Finished coats, 80 at a time, are hung inside out on racks and cured in an oven for two hours. *(8)* This water bag for the Marine Corps is made of Saflex-coated fabric. The seams are being sealed with the special cement. *(9)* The raincoat fabric, coated with Saflex, is tested for permeability. *(10)* This is the new Army raincoat. *(11)* The kapok-filled fabric inserts in this Navy life-jacket are coated with Saflex to make them waterproof.

American Chemical Society[1]

105TH MEETING. Indianapolis, Ind., April 12 to 16, 1943.

106TH MEETING. Minneapolis, Minn., fall of 1943.

NATIONAL CHEMICAL EXPOSITION and NATIONAL INDUSTRIAL CHEMICAL CONFERENCE. Sherman Hotel, Chicago, Ill., November 24 to 29, 1942.

Other Scientific Societies

AMERICAN CERAMIC SOCIETY, White Wares and Materials and Equipment Divisions. Pennsylvania State College, State College, Penna., September 18 and 19. Autumn meeting.

AMERICAN INSTITUTE OF CHEMICAL ENGINEERS. Netherland Plaza Hotel, Cincinnati, Ohio, November 16 to 18.

AMERICAN OIL CHEMISTS' SOCIETY. Drake Hotel, Chicago, Ill., October 7 to 9.

AMERICAN PETROLEUM INSTITUTE. Palmer House, Chicago, Ill., November 9 to 13. Annual meeting.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA. William Penn Hotel, Pittsburgh, Penna., November 9 and 10. Third annual water conference.

NATIONAL LUBRICATING GREASE INSTITUTE. New Orleans, La., October 26 to 28.

NATIONAL PETROLEUM ASSOCIATION. William Penn Hotel, Pittsburgh, Penna., September 17 and 18. Annual meeting.

TECHNICAL ASSOCIATION OF THE PULP AND PAPER INDUSTRY. Hotel Statler, Boston, Mass., September 29 to October 1.

[1] The list of the SOCIETY'S National Officers and Directors, Editors, members of Council, Divisional and Local Section Officers, Committees, and Chapters of Student Affiliates appears in CHEMICAL AND ENGINEERING NEWS three times a year—usually February 10, May 10, and October 10. The latest list is printed on page 601 of the May 10 issue.

National Power Show

A WIDE variety of timely displays will feature the 1942 National Power Show which is being planned as a direct aid to war production. Scheduled for Grand Central Palace, New York, N. Y., November 30 to December 5, the 15th National Exposition of Power and Mechanical Engineering will be celebrating its 20th year of service to industry. The management announces that 170 spaces have already been definitely engaged by 137 concerns, and there will probably be at least 175 displays when the exposition opens.

Included among the products to be exhibited are valves, piping, instruments, stokers, pumps, refractories, dust collectors, steam traps and specialties, lubricants and lubricating equipment, insulation, combustion controls, boiler tubes, metals, fans and blowers, coal and ash handling equipment, engineering supplies, blueprinting machinery, metal hose, scales, packing, gaskets, electrical equipment, welding apparatus, power transmission and material handling products, tools for production and maintenance, etc.

Microchemical Society Elects Officers

THE Metropolitan Microchemical Society of New York at its last meeting of the year 1941–42 elected D. L. Sabine chairman, F. A. Meier vice chairman, L. K. Yanowski secretary-treasurer, and Mrs. O. R. Fry and J. Kuck members of the Executive Committee.

The secretary is endeavoring to obtain a list of specialists in the society who will volunteer consulting service gratis to local government agencies about to set up micro laboratories in the interest of the national effort. The following members have volunteered their services: J. Alicino, N. Barsel, A. A. Benedetti-Pichler, H. Ehrhardt, A. A. Elek, G. F. Hand, R. Harte, H. W. Hermance, W. A. Hynes, F. Pickel, Rev. F. W. Power, A. Steyermark, G. Weingarten, L. K. Yanowski, and D. W. Young.

Research Work under the War Production Board

THE contract between the National Academy of Sciences and the War Production Board, covering the establishment of technological committees, has been enlarged to include actual laboratory work. Up to the end of July 143 reports had been requested, 82 relating to processes and production, and 124 reports made.

The War Production Board has made extensive use of the services of the Bureau of Mines, the Geological Survey, and the National Bureau of Standards, as well as many industrial laboratories, including Bell Telephone, General Motors, Westinghouse, General Electric, Chrysler, Battelle Institute, Mellon Institute, California Institute of Technology, and many others.

The Inventors Council transmits to the War Production Board reports of inventions that should have further attention.

Gary Synthetic Rubber Project Deferred

THE Gary synthetic rubber project, according to Jesse Jones, has been deferred because it has been found that the amount of butadiene contemplated by the Gary plant can be obtained from existing equipment or by modification of plants already under construction in other parts of the country.

The deferment of this plant will result in a very substantial saving of critical materials and will not reduce the over-all synthetic rubber program of 877,000 tons annually, heretofore approved by WPB.

Sets of Abstracts

SETS of abstracts of the Buffalo meeting papers in planographed book form are now available from the A. C. S. News Service, 1155 16th St., N. W., Washington, D. C. Sets are not guaranteed to be complete, but contain abstracts from all divisions as submitted by authors.

This enterprise is undertaken in a spirit of service and not for profit. Sets are offered on the following terms:

To members of divisions who forward receipt for divisional dues with remittance and order, 50 cents.

To those without receipt for divisional dues, who remit with order, $1.00.

To those who fail to enclose remittance with order, necessitating correspondence, $1.25.

To those who require bills to be rendered, $1.50.

Potomac Postscripts

facture into industrial tape, surgical dressings, and laminated phenolic products.

Dyes. Conservation Order M-103, as amended, limits the quantities of anthraquinone (nonfading) dyes that may be used in the third quarter as well as amounts that may be sold and delivered. The order imposes a double restriction. Certain listed anthraquinone vat dyes may not either be sold or used except for the purposes specified. The amount of other anthraquinone vat dyes which a user may receive in the third quarter is limited to 17.5 per cent of the amount of all anthraquinone vat dyes received by him in 1941. Likewise, and as a further restriction, the amount which he may use in that quarter is limited to 17.5 per cent of the amount used by him in 1941, regardless of what amounts were delivered to him in 1941. The quotas are for uses other than those specified in the order as being exempted from the restrictions. Similar provision is made with respect to all other anthraquinone dyes.

The quotas established by the order are set on a quarterly basis and if not consumed within the quarter may not be carried over to the next quarter. The Dyestuffs Section warned the industry that waste or excessive use of color might result in the reduction of dyestuffs quotas and extension of control over dyes now freely available.

Exemption Order. Companies operating under the Production Requirements Plan are given permission to purchase a number of commodities in greater quantities than authorized on their PRP certificates by Exemption 2 to Priorities Regulation 11. Materials chiefly affected are chemicals, which were omitted from the materials list of the fourth quarter PD-25A form. Among other materials exempted from PRP restrictions because they are listed in General Inventory Order M-161 are certain materials used in the manufacture of refractory brick, waste paper, bulk salt, borax, caustic soda, and soda ash. The exemption will also apply to such other materials as may be added to M-161 from time to time.

Nitrocellulose. Control over the distribution of soluble nitrocellulose has been ordered in M-196. Soluble nitrocellulose falls into four types, depending upon end use—lacquer, coated textile, film, and plastics—and the Director General now has power to direct the amounts of each type that may be produced.

Deliveries of more than 1,000 pounds a month of soluble nitrocellulose may be made only by special authorization. Deliveries of more than 232 pounds and less than 1,000 may be made without allocation, but with a certificate to the supplier that the soluble nitrocellulose is to be used to fill war orders, plus an amount not in excess of 50 per cent of the average monthly consumption of the consumer in 1941. Deliveries under 232 pounds to one person in a month are not restricted.

Form PD-609 is provided for requests for allocation of soluble nitrocellulose, and PD-610 for monthly reports by producers and distributors. Deliveries of smokeless powder scrap by the Army or Navy do not require either authorization or a purchaser's certificate. No deliveries of undissolved film scrap may be made without express authorization of the Director General.

Printing Ink. Amendment 1 to Conservation Order M-53 also permits the unrestricted uses of orange mineral (lead oxide) as a pigment in printing ink and of varnishes containing glycerol phthalate resins and phenolic resins in making gloss ink, nonscratch ink, or gloss overprint varnish, if such varnishes were manufactured prior to March 30, 1942, for use in printing ink. The original order, as amended, limited use of orange mineral to 70 per cent of 1941 consumption and forbade the use of the resins.

Easing of the lead supply situation plus the very small amount used as a pigment in printing inks now indicate that further restriction on the use of this small amount of lead in printing inks is unnecessary. Glycerol phthalate resins and phenolic resins are both scarce, all available supply being needed for essential war work, but the varnishes freed by this amendment have already been processed and cannot be used for any purpose other than ink manufacture.

Research Laboratories which put into process $5,000 worth of metals per quarter or more are required to file under the Production Requirements Plan, it has been pointed out by Amory Houghton, Director General for Operations.

Special instructions for the use of research, analytical, and testing laboratories in filling out Form PD-25A have been issued by the Safety and Technical Equipment Branch. These instructions take cognizance of the problems of laboratories in estimating requirements of most materials and fabricated parts.

Laboratories are required to show figures on anticipated requirements because such information is necessary to direct the flow of critical materials, the demand for which is far in excess of supply.

Class I producers, those who put into process in any one quarter $5,000 worth of metals in the form listed on the Metals List, must file under the Production Requirements Plan. The plan is voluntary for other producers.

Scrap Material. The Conservation Division has published an appeal by S. J. Dunaway, chief, Retail and Wholesale Trade Section of WPB's Service Branch, asking wholesalers and retailers to make a clean sweep-up of critically needed scrap material accumulated in their storerooms and shops.

"There are nearly 2,000,000 retail distributors and over 100,000 wholesale distributors of all types throughout the United States", said Mr. Dunaway, "and I am certain that every one of them has a lot of old damaged merchandise gathering dust in odd corners and an accumulation of discarded, used, and broken metal equipment which should be added to our Nation's scrap stock pile. Burlap bags, old rope, rags, and rubber hose, tires, and other salvagable articles can be found on every distributor's premises".

Salvaged material is not given to the Government. It is returned to the mills and the reclaiming plants through the usual channels of the scrap business. Merchants may sell their scrap to the junkman or give it to charitable organizations which have undertaken to collect it. In either event, it will go into war production.

Solvents. A program for reclamation of millions of gallons of war-essential chemical solvents and oils has been announced by the Conservation Division of WPB.

It is estimated that over one billion pounds of solvents are now recovered annually. Practically double this amount could be recovered if cooperation of all producers could be obtained.

Solvents which can be reclaimed include a wide variety of chemicals such as alcohols, chlorinated compounds, esters, ethers, hydrocarbons, and ketones. Under these general classifications are innumerable specific products including benzene needed to make synthetic rubber, toluene which goes into TNT, naphtha, gasoline, and other compounds used in everyday operations of many different types of industrial plants.

While the most important consideration in reclaiming solvents is that of making available essential chemicals for the war production program, there is also a substantial saving in raw material costs involved. A solvent that cost 20 cents a gallon, for example, may be reclaimed and used again at a fraction of the original cost.

Equipment for reclaiming solvents requires large amounts of steel, copper, aluminum, and other metals needed for production of war equipment. In order to obviate the need for producing new equipment to assure the success of the program, the Industrial Salvage Section

Technical Committee for Individual Awards Appointed

THE appointment of a Technical Committee for Individual Awards has been announced by War Production Drive Headquarters. The committee, composed of distinguished engineers and technicians, will select the first list of workers in war plants to be honored by the Government for contributing valuable suggestions for increasing production.

The members of the committee are: J. L. Bray, head of the School of Chemical and Metallurgical Engineering, Purdue University, Lafayette, Ind.; Whiting Williams, author, lecturer, and consultant in industrial relations; Paul H. Stanley, chief engineer, Pitcairn Auto Gyro Co., Willow Grove, Penna.; Charles B. Francis, chemical engineer and consultant, Carnegie-Illinois Steel Corp., Pittsburgh, Penna.; Henry C. Atkins, Jr., superintendent, E. C. Atkins Co., Indianapolis, Ind.; Joseph Rockoff, chief chemist, Dayton Rubber Manufacturing Co., Dayton, Ohio; William Plumer Hill, assistant superintendent, Bethlehem Steel Corp., Sparrows Point, Md.

The committee met in Washington August 20 and 21 to review approximately 100 of the best of more than 5,000 suggestions which workers have submitted to the labor-management committees in their plants.

Manpower Commission Studies Need for Chemists

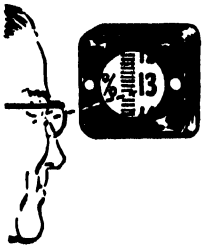
BUSINESS establishments engaged in war production are going to be told soon where and how they can obtain chemists, engineers, metallurgists, and other professional and scientifically trained men, Paul V. McNutt, Chairman of the War Manpower Commission, has announced. He said that representatives of the U. S. Employment Service have been instructed to find out how many employees of this type war production plants will require before the end of the year and during 1943.

With this information in hand the Employment Service, Mr. McNutt explained, can draw upon the country's largest registration of technically trained persons, the National Roster of Scientific and Professional Personnel. This roster, to which are now being added the names of the scientifically and professionally trained persons who have registered for military service, has been placed under the direction of the War Manpower Commission.

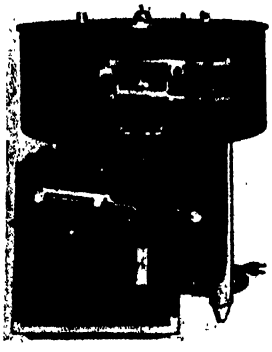
Mr. McNutt explained that the Employment Service would not "raid" the staffs of universities in carrying out this program. The U. S. Employment Service, he said, will attempt to place only those persons who are now unemployed or not engaged in work essential to the prosecution of the war. "Scientifically trained men and women who are now engaged as educators in colleges and universities are already performing services that may be regarded as vital," Mr. McNutt said.

Third Surface Active Agent List

INDUSTRIAL AND ENGINEERING CHEMISTRY has announced several changes for the third biennial listing of Surface Active Agents to be published in the January 1943 issue.



Mostly the changes will be those suggested by the desire to make the new compilation more representative of synthetic surface active agents. Plans now call for the elimination from the listing of alkaline earth cleaners, phosphate salts, sulfated castor oil, and the like.



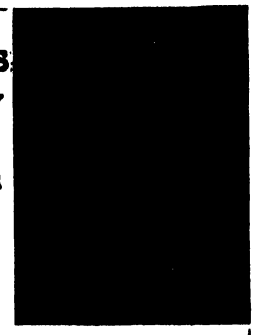
Where possible, manufacturers of surface active agents are being asked to identify the alkyl group or at least to roughly indicate its size as being longer or shorter than the keryl group. It is also hoped that the aryl portion of the agents will be defined more thoroughly.

Manufacturers represented on the former lists which appeared in January 1939 and 1941 are being canvassed by mail. Companies having new surface active agents are asked to correspond with F. J. Van Antwerpen, 60 East 42nd St., New York, N. Y.

YOU READ ONLY *Percentage* OF MOISTURE

ON THE DIAL OF A *Brabender* MOISTURE TESTER

The MOISTURE TESTER does away with the old, laborious method of determining moisture content. One instrument takes the place of the oven, the balance and the desiccator. Moisture content can be determined while samples are in the oven.



Wherever moisture content is a factor—in the laboratory or in the plant—there the MOISTURE TESTER will make its place.

- TEN TESTS AT ONCE
- SENSITIVE TO .002g
- READINGS TO .05%

NEW BASE MATERIAL

FOR PAINT AND VARNISH

A recently developed new resin, Poly-Pale, has some interesting characteristics pointing to important applications in paint and varnish products.

It is pale in color (from WG to X on the rosin scale), free of metals, and has a lower acid number and an appreciably higher melting point than any of the natural rosins.

It is soluble in most of the organic solvents; and solutions of Poly-Pale are considerably higher in viscosity than equal concentrations of ordinary rosin. It is compatible with waxes, most synthetic resins, and all of the vegetable oils used in protective coatings.

Extensive tests indicate that this new resin should be a valuable raw material in gloss oils, hardened rosin varnishes, ester gum, rosin-modified phenolic resins, spirit varnishes, and wherever rosin is used in protective coatings.

New and valuable data are contained in the revised second edition of the booklet "Poly-Pale Resin," which has just been issued. Mail the coupon for your free copy today.

NECROLOGY

Ralph E. Case

RALPH E. CASE, retired development engineer for the International Nickel Co., died July 24 at the age of 59. He became affiliated with International Nickel in 1916, and was a consultant on metal problems until his retirement because of ill health a year ago.

Henry C. Fuller

HENRY C. FULLER, consulting chemist, died August 26, after being in ill health for some time.

Mr. Fuller was born in Worcester, Mass., November 13, 1879, and received the B.S. degree from Worcester Polytechnic Institute in 1901. From 1901 to 1907 he worked as chemist for industrial firms, from 1907 to 1911 was with the U. S. Bureau of Chemistry, and from 1911 to 1921 was drug and food investigator for the Institute of Industrial Research.

He also collaborated with Dr. Harvey W. Wiley on certain problems arising out of the Food and Drug Act of 1906 and in analytical work for *Good Housekeeping* magazine. Since 1921 he had been a consulting and research chemist in Washington, D. C. His interests included pharmaceutical chemistry, food technology and analysis, drug plant introduction and propagation, and alkaloids. In Europe between 1922 and 1924 he studied problems relating to the wine industries of Italy and France.

Mr. Fuller joined the AMERICAN CHEMICAL SOCIETY in 1909. He was also active in the Association of Official Agricultural Chemists, being referee from 1909 to 1911 and from 1914 to 1921, and was a member of the American Pharmaceutical Association (secretary in 1917 and 1918), American Institute of Chemists, Ornithological Union, Biological Society of Washington (president in 1936), the Washington Academy of Sciences (vice president in 1936), and the Society of Chemical Industry, London.

Thomas S. Grasselli

THOMAS S. GRASSELLI, former head of the Grasselli Chemical Co., died on August 22 after an illness of several months. He was 67 years old.

After the Grasselli company was absorbed by E. I. du Pont de Nemours & Co., Inc., Mr. Grasselli became vice president and director of du Pont. He retired in 1939.

Edwin L. Hulett

EDWIN L. HULETT, dean of the College of Arts and Sciences, St. Lawrence University, from 1915 to his retirement a year ago, died August 30 at the age of 72.

Dr. Hulett was born in Heuvelton, N. Y., April 30, 1870, and received his B.A. degree from St. Lawrence University in 1903. He became instructor in chemistry the following autumn, assistant professor a year later, and in 1905 was appointed professor and head of the department, holding the post until 1929. In 1925 he received from the university the honorary degree of LL.D., and on his retirement was elected a life member of the board of trustees.

He had been a member of the AMERICAN CHEMICAL SOCIETY since 1914.

Theodore F. Pappe

THEODORE F. PAPPE, 57, chief of the Buffalo office of the Federal Food and Drug Administration since 1935, died August 4. Mr. Pappe had been in charge of enforcing federal food and drug regulations in western New York and western Pennsylvania. He was formerly chief chemist at the Baltimore station and chief of the Galveston, Tex., laboratory.

Willard A. Roberts

WILLARD A. ROBERTS, engaged in research chemistry for the General Electric Co. for 23 years, died July 24 at the age of 52.

Dr. Roberts was born in Newberg, Oreg., and was educated at Earlham College and the University of Chicago, where he received his Ph.D. degree. He served in the Sanitation Division of the U. S. Army and engaged in research chemistry at Yale and the Rockefeller Institute before joining the Army Signal Corps. He had been successful in formulating and making available for use the fluorescent lamp powders that have been widely employed in recent years, and also developed the lighting of instrument dials by the chemical process described as black light.

He had been a member of the AMERICAN CHEMICAL SOCIETY since 1917.

Arthur H. Thomas

ARTHUR H. THOMAS, president of the Arthur H. Thomas Co., died August 31 at the age of 69. He had been in ill health for a considerable time.

Mr. Thomas was born in Beaver County, Penna., and attended the Westtown Boarding School. In 1892 he entered the employ of the Philadelphia firm of James W. Queen, manufacturers of optical and scientific instruments, and in 1900 founded his own company, dealing in laboratory apparatus and chemicals. He had made important contributions by way of encouraging a number of developments new to the apparatus business, through support and introduction to the trade of new sources of supply.

He had been a member of the AMERICAN CHEMICAL SOCIETY since 1909.

EXPECTATION that a South African plant soon will be producing ferromanganese, ferrochrome, and ferrosilicon, is voiced by reports from that country, where a development is projected at Vereeniging.

Specify Florite Desiccant

For Efficient Dehydration of GASES and LIQUIDS

FLORITE, the new granular drying agent, is now being used successfully for dehydrating natural gas, propane, gasoline, air, nitrogen, carbon dioxide and other gases and liquids where high drying efficiency is required.
It selectively adsorbs 4 to 20% of its weight in water, depending upon the particular application, and is regenerated by heating to 300–350°F. FLORITE is hard, stable, non-corrosive, non-poisonous, and is available in a variety of particle size classifications.

WHAT HAPPENS ?

THE DIAGRAM shows the structure of Furfural, a heterocyclic aldehyde useful in a variety of ways due to its unique characteristics.

For example, one of the major uses of Furfural involves reactions with a number of materials to form resins with highly desirable properties. These reactions take place with phenol, acetone, aniline, urea and a number of other materials. Furfural resins are economical to make and have excellent moisture resistance, electrical properties, and mechanical strength.

When used as a solvent for resins, dyes, and preservatives, Furfural acts as an aid to penetration and wetting. In the resinoid bonded grinding wheel industry it has no peer and practically all wheel manufacturers use Furfural in their production.

Furfural is an aldehyde and exhibits the general properties of this class of compounds. It can be reduced to alcohols, and oxidized to acids. When treated with strong caustic, it undergoes the Cannizzero reaction, forming Furfuryl Alcohol and Sodium Furoate. The latter can be used to make Furoic Acid.

Other applications involve its use as a selective solvent in the refining of lubricating oil, diesel fuel, and crude wood rosin.

Typical properties of the commercial product are:

Specific gravity (20/20)	1.161
Boiling point	157–167°C. (99%)
Flash point (open cup)	56°C.
Surface tension (dynes/cm)	49
Viscosity at 38°C. (centipoises)	1.35

Investigate the possibilities of using Furfural today. It will pay dividends.

NEWS-MAKERS

Lucius W. Elder has been appointed director of the Physical Chemistry Section, Central Research Laboratories, General Foods Corp., New York, N. Y. Dr. Elder has been engaged in research work with the company since 1932, when he joined the staff at Battle Creek, Mich.

Charles L. Gabriel has left the Commercial Solvents Corp., with which he had been associated for 22 years, and taken an executive position with the Publicker Commerical Alcohol Co., Philadelphia, Penna., where he will work on development of new products.

Paul S. Greer, formerly employed by Carbide & Carbon Chemicals Corp., South Charleston, W. Va., is now with the Chemicals Section, Office of Civilian Supply, WPB, in Washington, D. C., as senior industrial specialist.

Robert A. Harte, formerly of the Rockefeller Institute for Medical Research, has joined the staff of The Arlington Chemical Co., Yonkers, N. Y., as research biochemist.

W. H. Long, member of the Sales Promotion and Advertising Department of the York Ice Machinery Corp., York, Penna., has been commissioned an ensign in the United States Naval Reserve. He reported on August 1 to Cornell University for a training period prior to being assigned to active duty.

L. S. McCollum has been made manager of the new district office of The Dicalite Co., recently opened in Atlanta, Ga.

Robert D. Macdonald has been made research engineer on the technical staff of the Battelle Memorial Institute, Columbus, Ohio, and has been assigned to the materials beneficiation division.

Ralph B. Meisenhelder, assistant to the president of the York Ice Machinery Corp., York, Penna., has been appointed director of War Contract Progress. Duties will consist of coordination and liaison responsibilities within the Sales, Engineering, Manufacturing, Administrative and War Material Divisions.

William W. Mills, for several years head, Analytical Department, Mellon Institute of Industrial Research, and more recently plant manager of Thermal Products Corp., is now employed in the Technical Division of the Rayon Department, E. I. du Pont de Nemours & Co., Inc., Wilmington, Del.

Robert H. Morse, Jr., who has been branch manager successively of Fairbanks, Morse & Co.'s offices at Cincinnati, Dallas, and Boston, has recently become assistant sales manager to **A. C. Dodge,** vice president and sales manager at Chicago. **John Elmburg,** formerly manager of the Diesel Engine Department at St. Paul, Minn., fills the vacancy left by Mr. Morse, at Boston.

M. E. Parker, manager of production, Beatrice Creamery Co., Chicago, Ill., has been appointed adviser to the Resources Division, Office of the Quartermaster General, War Department, Washington, D. C., in the production and quality control of dairy products.

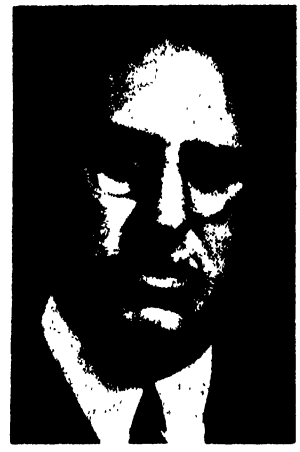
Ira Pullman, who received the degree of chemical engineer from Columbia University in June, is now a junior chemical engineer in the Chemical Engineering Research and Development Division of TVA at Wilson Dam, Ala.

Guillermo Rivas, Nataniel 758, Santiago, Chile, S. A., wishes to correspond with students of chemistry in the United States and to exchange stamps with them.

Daniel B. Rivkin has accepted a position in the War Department as an explosive chemist and has been granted leave of absence by Southwestern Institute of Technology, Weatherford, Okla., where he was head of the Chemistry Department. He is now stationed at the Oklahoma Ordnance Works, Pryor, Okla.

S. C. Rothman, formerly chief engineer of the Silicosis Research Division, West Virginia Workmen's Compensation Commission, has been commissioned a captain in the Sanitary Corps of the United States Army and attached to the Preventive Medicine Service, Occupational Hygiene Division of the Surgeon General's Office in Washington, D. C.

The Messel Medal was presented to **Sir John Russell,** director of the Rothamsted Experimental Station and the Imperial Bureau of Soil Science, at the annual meeting of the Society of Chemical Industry at the Royal Institution on July 10. At this meeting **William Cullen** was re-elected president.



William J. Sartori

William J. Sartori has joined the staff of Mann Fine Chemicals, Inc., 2702 43rd Ave., Long Island City, N. Y., as chief chemist. He will continue active interest in the Chemistry Department of the Brooklyn Polytechnic Institute, where he has been since 1939.

Wilbur C. Shand has completed requirements for his master of science degree in chemistry at Illinois Institute of Technology. Mr. Shand is now employed at Universal Oil Products Co., Chicago.

Stephen M. Shelton has been appointed regional engineer for the eastern and southern states under the reorganisation program of the U. S. Bureau of Mines. He will have headquarters in College Park, Md., and will be in charge of one of the three new regional offices.

W. S. Shipley

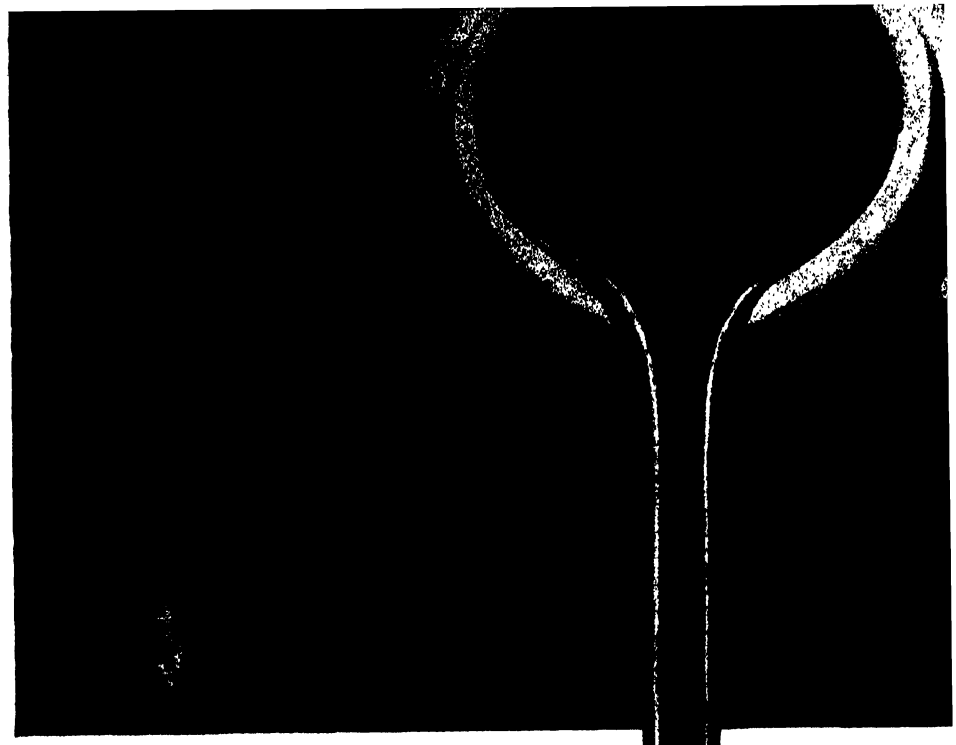
William S. Shipley, chairman of the board of the York Ice Machinery Corp., York, Penna., has been appointed director and vice chairman of the WPB Small War Plants Corporation.

Alexander Silverman, head of the Department of Chemistry, University of Pittsburgh, addressed the New England Chemistry Teachers Association at Durham, N. H., August 14, on "Glass and the War".

Frank M. Stephens, Jr., has been named a research engineer on the technical staff of Battelle Memorial Institute Columbus, Ohio, and has been assigned to the Materials Beneficiation Division. Mr. Stephens is a recent graduate of the Colorado School of Mines.

K. G. Stern

Kurt G. Stern, for the past seven years a member of the Department of Physiological Chemistry, Yale University, has accepted a position as chief chemist at The Overly Biochemical Research Foundation, New York, N. Y., a nonprofit organization devoting its activities to problems related to the war effort.



J. C. Tweedell

James C. Tweedell, export manager of the York Ice Machinery Corp., York, Penna., has been appointed general sales manager for the duration, succeeding **John R. Hertzler**, who will undertake a special assignment with the Army-Navy Munitions Board in Washington, D. C.

Junior Chemical Engineers Choose Officers

JUNIOR CHEMICAL ENGINEERS of New York City, an organization founded in 1937, have elected the following officers: president, John R. Callaham, *Chemical & Metallurgical Engineering;* vice president, Howard Ten Broeck, Socony-Vacuum Oil Co.; secretary-treasurer, Albert K. Ackoff, Westvaco Chlorine Products Corp.; and assistant secretary-treasurer, Alvin S. Weiss, Schenley Distillers Corp.

BLENDED at 280 Degrees

Scientific sampling and blending of molten metal at 2800° F. may seem like needless "fussiness" in the making of pipe fittings. But it's the type of extra care that gives you *extra service* values in every piping product made by Grinnell.

Chemical analysis of metal from every heat, physical tests of samples, and photomicrographs of actual metal structure keep a constant check on production quality. Grinnell *Air Furnace* Malleable Pipe Fittings are stronger and more uniform because of such precautions.

It's this rigid quality-control from start to finish that gives you better-than-standard quality in any Grinnell product . . . automatic sprinkler fire protection systems, prefabricated piping, Amco humidification systems, Genspring pipe hangers or pipe fittings. Grinnell Company, Inc., Executive Offices, Providence, R. I. Branch offices in principal cities.

Daily chemical analysis

Daily physical tests

GRINNELL

WHENEVER PIPING IS INVOLVED

Optical Methods of Chemical Analysis. *Thomas R. P. Gibb, Jr.* 1st ed. 391 pages. McGraw-Hill Book Co., Inc., 330 West 42nd St., New York, N. Y., 1942. Price, $5.00.

THIS is a long-awaited volume bringing compactly into one place the description of various optical instruments used for chemical analysis, a suitable amount of the fundamental theory back of each, and a very practical explanation of how each is used in performing an analysis. Arranged as a textbook for the practical analyst and for advanced students of analytical chemistry, the contents are indicated by the following chapter titles: Spectrochemical Analysis; The Spectrophotometer; The Colorimeter, Turbidimeter, Nephelometer, and Fluorophotometer; The Microscope; Elementary Crystallography; Identification of Crystals with the Polarizing Microscope; The Refractometer; and The Polariscope.

The chapter on Spectrochemical Analysis is typical of the volume as a whole. No attempt has been made to give an exhaustive treatment of any one phase of the subject, but the necessary groundwork for an understanding of the practical aspects of the entire subject has been ably presented. A very clear treatment on spectrographs, particularly the grating spectrograph, has been given. Methods of excitation mentioned include most of those to be found in the literature, and the section on quantitative spectroscopy presents all of the accepted quantitative techniques in approximately the chronological order of their development.

The description of instruments in the two chapters on the Spectrophotometer and on the Colorimeter, Turbidimeter, etc., is rather complete but the discussion of methods and uses has been somewhat neglected. However, as can be said of the volume as a whole, the bibliography of references to more specialized texts and original papers is quite extensive. Included in the chapter on the Spectrophotometer is a discussion of infrared spectroscopy which, judged on the basis of the rapid increase in importance of this method, is painfully brief.

Elementary Crystallography is the only subject of which the discussion appears to be overlengthy in relation to what is needed for an understanding of the following chapter on identification of crystals. On the other hand, this discussion would be a very useful prelude to a treatment of the extremely powerful x-ray diffraction method of crystal analysis which, in the reviewer's opinion, constitutes the only important omission in this volume.

The book is quite authentic and accurate, although occasional small errors have been noted. The aims set forth by the author in the preface have been well achieved. The volume should serve as a compact reference for the practical analyst and student, should offer a general background in the field, and be a guide to more detailed information through a well-chosen bibliography.

N. WRIGHT

Protective and Decorative Coatings, Volume II. Edited by *Joseph J. Mattiello.* 1st ed. 658 pages. John Wiley & Sons, Inc., 440 Fourth Ave., New York, N. Y., 1942. Price, $6.00.

THIS is the second volume of a projected four-volume series being prepared by collaboration of a number of specialists under the editorship of Dr. Mattiello. The first volume, covering principally the film formers and solvents of the finishes and ink industries, was reviewed in the November 25, 1941, issue of the NEWS EDITION, page 1370. The present volume deals principally with the pigments of these industries. Altogether there are 28 individual chapters, with a total of 29 collaborators. The subjects covered include discussions of pigment classification; various organic pigments; phospho-toners and lakes; phthalocyanines; iron oxide, lead, zinc, titanium, and antimony pigments; extenders; various nonmetallic blacks; metallic powders used as pigments; and metallic soaps.

Of particular interest is the chapter on the Chemistry of the Synthetic Organic Pigments by L. S. Pratt, which summarizes this complex subject in a most helpful manner.

Many of the comments in the review of the first volume apply equally to this one. Since it is a compilation and largely written from the pigment manufacturer's viewpoint, there is little comparison of means of arriving at a given end. Also there is the natural minor overlapping of subjects. At times emphasis seems misplaced.

Taken alone, this volume is an encyclopedia of modern pigments and is extremely valuable as a reference book. As a textbook on the pigment portion of the finishes industry, its value will not be completely developed until the publication of Volume III which will cover the manufacture and use of finishes and which should depend strongly on the present volume for its factual background.

JOHN MARSHALL

Alcoa Antitrust Suit

THE opinion of Hon. Francis G. Caffey in United States of America *vs.* Aluminum Co. of America *et al.*, which was filed March 12, is now available to a limited extent in the form of a reprint copyrighted by the West Publishing Co. This publication of 311 pages contains a great deal of useful information, besides being an opinion rendered in an unusual case.

This was a suit in equity under the Sherman Antitrust Act. It was tried in the United States District Court of the Southern District of New York, and the judgment was in favor of the defendants on all counts. It was the longest legal trial in history. The Government filed suit April 23, 1937, the actual trial began June 1, 1938, and the final written decision by the court was filed March 12, 1942. The actual trial of the case required 26½ months. Testimony in the case filled 40,708 pages. The 1,803 exhibits filled another 4,787 printed pages. There were 155 witnesses.

The corporate life of the Aluminum Co. of America throughout its more than 50 years of existence was thoroughly probed and, because the technical progress of the company depended to such a great extent upon the application of science, scientists generally and chemists particularly were much interested in the progress of the suit. This final opinion of Judge Caffey has been distributed to attorneys and law libraries.

Nutrition Reviews

A NEW journal in the nutrition field is *Nutrition Reviews*, established by the Nutrition Foundation, Inc., and edited by Frederick J. Stare, assistant professor of nutrition and biochemistry at Harvard University. The first issue is to appear October 15.

The purpose of the journal is "to bridge the gap between basic research findings and their acceptance with confidence, on the part of those who deal with the public, to enable them to keep abreast of current progress and to have available an unbiased, authoritative review of current research literature".

Production and Sales of Synthetic Organic Chemicals

A PRELIMINARY report on United States production and sales of synthetic organic chemicals in 1941, issued by the United States Tariff Commission, includes statistics of production and sales of coal-tar dyes, other finished coal-tar chemicals, and synthetic noncoal-tar organic chemicals. The report shows that 1941 sales of all synthetic organic chemicals were the highest on record, $724,000,000, an increase of 50 per cent over 1940 sales. The value of sales of coal-tar finished products and intermediates was 60 per cent greater than in 1940, and that of sales of noncoal-tar synthetic organic chemicals, 42 per cent greater.

Figures of production are considerably larger than those of sales because a large part of the total output of synthetic organic chemicals is consumed in further processing by the producing companies. In the more important groups, the increases in production in 1941 over 1940 were intermediates, 25 per cent; dyes, 32 per cent; coal-tar medicinals, 64 per cent; coal-tar resins, 50 per cent; and all noncoal-tar synthetic organic chemicals, 27 per cent.

Statistics concerning coal-tar crudes, plasticizers, various pharmaceuticals, intermediates, and solvents, included in the reports for previous years, are omitted from the 1941 report to avoid disclosure of information that might aid the enemy. Copies of the report may be obtained from the United States Tariff Commission, Washington, D. C., or from the commission's office in the Custom House, New York, N. Y.

Traffic in Opium

THE U. S. Treasury Department, Bureau of Narcotics, has issued a report on the traffic in opium and other dangerous drugs for the year ended December 31, 1941. Copies are available from the Superintendent of Documents, Washington, D. C., at 15 cents each.

In 59 pages the booklet gives information on laws, administration, control of international trade, international cooperation, illicit traffic, raw materials, manufactured drugs, and statistical tables, with a very complete index.

Cadmium Poisoning

A REPORT on cadmium poisoning has been prepared by the Division of Industrial Hygiene, National Institute of Health, and is available at 5 cents per copy from the Superintendent of Documents, Washington, D. C., as Reprint No. 2371 from *Public Health Reports*. It discusses industrial exposure, toxicology, therapeutic uses of cadmium, and measures for the prevention of industrial cadmium poisoning.

Carey HEAT INSULATIONS

DRAFTED FOR WAR SERVICE
in largest POWDER PLANT

In one of the nation's mammoth powder plants, CAREY Heat Insulations are rendering vital service—aiding in the efficient and economical production of explosives for our armed services.

The insulation requirements for this project included many miles of pipe covering for outside lines ranging in size from ½" to 30" in diameter, and additional miles of insulation for inside lines. Apart from the piping, numerous other pieces of processing equipment—stills, vapor columns, condensers, concentrators, etc.—required adequate insulation.

In hundreds of plants throughout the nation, CAREY Insulations are helping industry win the battle of production. Their high efficiency; their ability to withstand extreme temperatures and pressures; their toughness and durability; their variety, covering all service conditions; are qualities known to leading engineers the country over. For details, address Dept. 64.

Whatever your insulation requirements, you're SAFE *with* CAREY. *A nation-wide organization is at your service.*

THE PHILIP CAREY MFG. COMPANY • Lockland, Cincinnati, Ohio

Industry Americanized

Editor, Chemical and Engineering News:

In an editorial appearing in the April edition of *Industrial and Engineering Chemistry* (**34**, 385) you announced the seizure of the formerly I. G.-operated General Aniline & Film Corp. by the United States Treasury and the placing of the corporation under the control of the Alien Property Custodian. You have also announced the appointment of the board of directors to reorganize and operate the corporation as an American concern.

It may be of interest to your readers at this stage to know something of the scientific problems which confront those charged with this duty of reorganization.

Under the former management, as now appears, while the factories of the corporation were efficiently staffed and operated, research and development activities in their broader aspects were retained in Germany under the control of the I. G. It becomes, therefore, one of the major tasks of the new management to create, as quickly as conditions allow, an integrated research organization adequate to the immediate and future needs of the corporation as an American enterprise. This is vital not only to ensure maximum contribution by the corporation to the war effort but to prepare foundations for continuing development after the war.

The General Aniline & Film Corp. controls, among other assets, a considerable number of U. S. patents granted to the I. G., the contents and value of which are largely untested. These in themselves represent a portfolio of great potential industrial importance, as examination of only a few patents has already revealed. Many of these represent the latest products of I. G. research which have not hitherto been developed to useful ends. The scientific appraisal of these patents and the selection for early development of those which can immediately contribute to the war effort is in itself a considerable and urgent task.

It is unique in industrial history that research opportunities of such magnitude have been created by the fact of a large and efficient manufacturing organization being suddenly deprived of the scientific foundations necessary to its healthy progress and to its powers of new creation.

To rectify this is one of the urgent tasks now confronting the directors and officers of the corporation, particularly of E. C. Williams, chemical director, and of W. F. Zimmerli, vice president in charge of patents and research. It presents a challenge and an opportunity for service and accomplishment to a large number of experienced scientific workers and of those starting on their careers.

Although public announcements regarding the corporation have already led to many applications being received, it is the management's wish (in order that there may be no thought of improperly competing for men with other industries active in the war effort) that the nature and full scope of its needs be realized both by individual scientists and by company executives.

We hope that we can successfully establish in times of exceptional difficulty and with the wholehearted good will of other industries, the kind of research organization that is needed to perform the important tasks assigned to us. It is our purpose so to do.

Robert E. McConnell, *President*

General Aniline & Film Corp.
230 Park Ave.
New York, N. Y.
August 18, 1942

Registry of Rare Chemicals Grows

Approximately 2,940 rare chemicals have been registered to date by the Armour Research Foundation National Registry of Rare Chemicals, Martin H. Heeren, registry director, has announced. Two thousand of the 2,500 industrial and educational laboratories from whom file data were requested have responded.

Some of the chemicals registered are such rare organic materials that they are to be had only in quantities as small as 0.5 gram. Such rare chemicals are not on the general market and are reserved for research purposes. Dr. Heeren said that the registry is expected to include approximately double the present number of chemicals when it is finally completed.

Tobacco Diversion Program Boosts Insecticide Supplies

Diversion of low-grade tobacco to the manufacture of nicotine sulfate and other by-products is provided in a program approved by the Secretary of Agriculture. Supplies of insecticides for the 1943 Food for Freedom production goals are expected to be substantially supplemented by this diversion program.

The Agricultural Marketing Administration will make payments to nicotine producers. These payments will equal the difference between the price the processors must pay for the grades of tobacco involved and a fixed amount representing the price they can afford to pay for this raw material and still sell the finished product at ceiling prices. Payments vary on the different types of tobacco covered by the program, which applies principally to dark types. These not only have the highest nicotine content, but also have been the hardest hit by curtailment of export markets. The total quantity of tobacco to be diverted is not to exceed 25,000,000 pounds, and total expenditures under the program are not to exceed $1,750,000.

Because imports of raw materials, such as derris root and pyrethrum, for other insecticides have been materially reduced by the war, the program for diversion of low-grade tobacco to nicotine insecticides has been considerably expanded. During the 1942 fiscal year 8,500,000 pounds of tobacco were diverted to nicotine by-products.

Westvaco Chlorine Products Adds to Staff

Additions to the staff of the research and development department of Westvaco Chlorine Products Corp., 405 Lexington Ave., New York, N. Y., include:

Frank P. Byrne, M.S. in chemistry from Creighton University in 1938. Prior to coming to Westvaco, he held a position on the teaching staff of St. Joseph College, Hartford, Conn.

Richard W. Cummins, B.S. in chemistry from University of Michigan, 1942.

Bradford C. Hafford, Ph.D. in chemistry from University of Wisconsin, 1942.

Ward M. Hanson, B.S. in chemical engineering from University of Minnesota, 1942.

John M. Lenoir, B.S. in chemical engineering from University of Illinois, 1942.

Edwin P. Plueddemann, Ph.D. in organic chemistry from the Ohio State University, 1942.

William G. Strunk, B.S. in chemistry from University of South Dakota, 1942.

Robert M. Thomas, Ph.D. in chemistry from Purdue University, 1942.

Dean D. Watt, B.S. in chemistry from University of Idaho, 1942.

George S. Baldry, formerly connected with the Harvard School of Public Health, has been appointed director of the Division of Industrial Hygiene for the Province of Manitoba. He will be located with the Department of Health and Public Welfare, Division of Industrial Hygiene, Winnipeg, Manitoba, Canada.

Bernard Bettman has resigned his position of research chemist with the National Aniline Division, Allied Chemical and Dye Corp., to become senior supervisor of the inspection division, West Virginia Ordnance Works, in West Virginia.

After receiving the Ph.D. degree in chemistry at Ohio State University in June, **Irving I. Bezman** accepted a position as assistant chemist in the Research Section of the Research and Development Division, Department of Chemical Engineering, TVA, Wilson Dam, Ala.

At the annual meeting of the Society of Chemical Industry, held July 10 in London, honorary membership in the society was conferred upon **Marston Taylor Bogert** and **James Bryant Conant**. Scrolls were presented and accepted by a representative of the American Embassy for transmission to the scientists thus honored.

New *Heatless* Method of Purifying Water

REPLACES DISTILLED WATER

at fraction of the cost in

CHEMICAL PLANTS
AIRCRAFT PLANTS
DISTILLERIES
PHARMACEUTICAL HOUSES
SYNTHETIC RUBBER PLANTS
PORCELAIN ENAMELING PLANTS

The ILLCO-WAY method of purifying water is one of ion exchange, using Amberlite synthetic resins to produce a final effluent which compares very favorably with heat distilled water. The water is not evaporated, so no heat is used in the process which is daily meeting the exacting standards of industrial and technical concerns requiring purified water.

1,000 gallons for less than a dollar!

LOW COST — The cost of the treated water is amazingly low — *less than a dollar per thousand gallons*, on the average water supply. And when the supply is low in dissolved solids, the cost may be considerably less.

No heat used—No fuel required!

Operation is completely automatic (between periodic regenerations). Pipes will not lime up. Maintenance costs are reduced to a minimum. A unit delivering 300 gallons an hour occupies a space about 4 x 10 feet. Made of finest materials to protect the purity of water. Available in units affording from 120 gallons an hour to 50,000 gallons an hour.

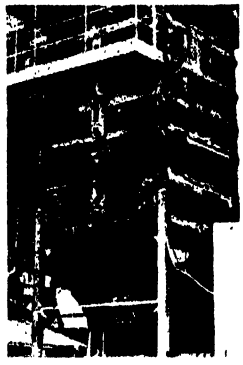
TESTED IN THE LABORATORY · ILLCO-WAY · PROVED IN THE FIELD

Sales of the **Goodyear Tire & Rubber Co.** for the first six months of 1942 were larger than in any previous half year in the company's history. The company deducted $6,751,247 for Far East losses and $1,500,000 for contingencies, equivalent to about $4.00 a share on common stock, and has set up a reserve amounting to $13,320,855 to cover war losses in investments in Singapore, Sumatra, Java, and the Philippines. Provisions for income and excess profits taxes for the first half of 1942 amounted to $12,008,724 as compared with $11,483,840 in the first half of 1941.

The **Procter & Gamble Co.** reports that gross sales for the year ended June 30, 1942, were $282,202,502, compared with $225,116,299 in the previous year, a 4 per cent increase in tonnage and a 25 per cent increase measured in dollars. Current assets on June 30, 1942, amounted to $106,263,971 and current liabilities to $32,779,556, compared with $90,887,132 and $20,306,847 on June 30, 1941.



Sylvania Electric Products

THE Hygrade Sylvania Corp., 500 Fifth Ave., New York, N. Y., manufacturer of incandescent lamps, fluorescent lighting products, etc., has changed its name to Sylvania Electric Products, Inc.

New Tool Bit

A NEW line of tool bits for machining hard, tough steels and copper or aluminum alloys recently has been made available by the Black Drill Co., Cleveland, Ohio.

For *Positive* collection of gas-borne critical materials – specify COTTRELL . . .

• For more than 35 years Cottrell Electrical Precipitators have been cleaning air and commercial gases, recovering values and eliminating the nuisance of gas-borne dust. In metallurgical plants, cement plants, gas plants, paper mills, power plants, oil refineries and acid plants, Cottrell Precipitators are self-liquidating investments free from recurring maintenance charges and obsolescence reserve. Many Cottrells more than 30 years old are still in operation with efficiencies approaching 100%.

• Now more than ever before, selection of the correct collection equipment is of paramount importance in plant construction and enlargement. Critical material shortages make it imperative to specify the method which will, over a period of time, maintain the highest efficiency at lowest power, operating and maintenance costs.

• The collection problems faced by Industry today—whether simple purification, collection of values, nuisance abatement or combinations of all—can be solved quickly and efficiently by Cottrell Electrical Precipitators.

The VERSATILITY OF COTTRELLS

is shown from the following valuable materials collected in a single day's operation.

1. *6 tons of soda salts at a paper mill.*
2. *55 tons of smelter dust containing 20 per cent copper.*
3. *13 tons of sodium sulphate.*
4. *3 tons of antimony dust from a silver refinery.*
5. *208 tons of 12 per cent copper dust.*
6. *1100 pounds of dust ahead of mercury condensers.*
7. *10 tons of arsenic.*
8. *3 tons of wet tar.*
9. *800 pounds of dry tar.*
10. *4½ tons of alumina.*
11. *5500 pounds of concentrated sulphuric acid.*
12. *220 tons of cement dust.*
13. *120 tons of fly ash.*
14. *6 tons of blast furnace dust.*

Send for descriptive Bulletins.

Varnish Technology Course Offered by Mattiello

JOSEPH J. MATTIELLO, technical director, Hilo Varnish Corp., and editor-in-chief of the four-volume treatise, "Protective and Decorative Coatings", is offering a course in Varnish Technology in the Evening Graduate School of the Polytechnic Institute of Brooklyn. This course, meeting on Monday evenings, will be continued throughout the year and will cover the physical-chemical theories, the application of scientific methods to the development of improved products, and the manufacture, use, and testing of all types of varnish and varnishlike materials.

The course is one of the offerings of the Department of Chemical Engineering, and further information may be obtained from the Dean of Graduate Studies. Registration week is September 14 to 25.

Ammonia in War

AMMONIA is an indispensable war material. There are at least 2,000 industrial uses for this chemical. It is an ingredient basic to the manufacture of explosives for bombs, torpedoes, shells, and cartridges. It hardens metals for vital parts of airplanes, tanks and guns; helps vulcanize important rubber articles; is used in making nylon; enters into the manufacture of fertilizers; and is employed in one process for the manufacture of Lucite methyl methacrylate plastic for the noses, gun turrets, navigation "blisters", and other transparent sections of fighting airplanes.

Data on New Products Wanted

IN A revision of the Standard Chemical and Technical Dictionary, the editor is seeking data on new products, pilot plant products, and products that are substitutes or alternatives for scarce materials. Information should be sent before October 1 to H. Bennett, 230 King St., Brooklyn, N. Y.

Who Makes It?

SOURCES of the following chemicals are wanted by Armour Research Foundation, National Registry of Rare Chemicals, 35 West 33rd St., Chicago, Ill.

Alpha-phosphoglycerol, *d*-3-phosphoglyceraldehyde, *d*-3-phosphoglyceric acid, quinone dioxime dimethyl ether, diquinoyl dioxime, diquinoyl tetroxime, 2,4,6,2′,4′,6′-hexachlorodiazoaminobenzene, quinone - *bis* - beta - naphthylimine, prophyrindien, and alpha-ketoglutaric acid.

ANALYSIS

CHAS. PFIZER & CO., INC. has always regarded the careful and intelligent examination of all products as not only a necessary but also an important part of its manufacturing processes. We believe that the uniformity and high purity of our products cannot be assured without thorough examination and that it involves more than just the routine checking of materials against certain specifications.

The personnel of our Analytical Department is of the highest caliber and every effort has been made to make the most modern equipment available. Through thorough and careful analysis it has been possible for this department to make many suggestions which have resulted in improved products and improved methods of manufacture.

The research division of this department is constantly striving to improve or devise new techniques for the examination and analysis of our materials. New products, too, have always occasioned considerable analytical research, it often having been necessary to revise existing analytical methods to a great extent, or even to devise entirely new procedures. Needless to say, all of this would be impossible if analysis were considered to be merely a routine matter.

We feel that the reputation for dependability and high quality which our products enjoy is due in no small measure to our Analytical Department.

SARGENT
***Fluorescent* TITRATION LAMP**

Supplies soft, glareless fluorescent illumination of daylight quality, correct intensity and color characteristics to beakers in which titrations are being carried out.

A parabolic reflector in which is mounted a General Electric daylight fluorescent tube, directs light against a flat, white vitreous enameled inclined background—eliminating direct illumination and so preventing glare and undesirable illumination intensities. The outer surface of the lamp is finished in a dark blue vitreous enamel. Fitted with snapswitch, connecting cord and plug. Length, 12½"; height, 8"; depth, 4½". Complete with fluorescent tube, type T5, No. S-44285. For operation from 115 volt, 60 cycle circuits.

Fluorescent Titration Lamp S-44290 $13.00

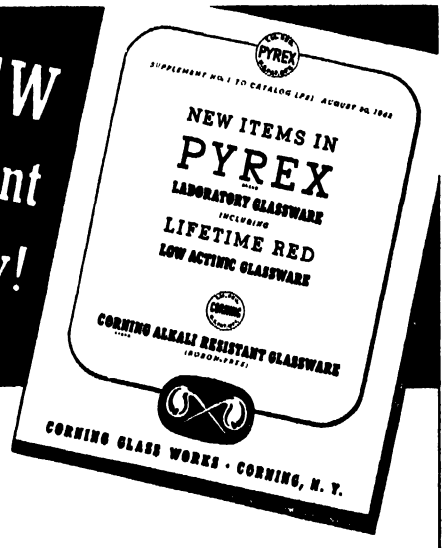
of the Conservation Division urges that fullest use be made of existing reclaiming facilities and has compiled a list of solvent and oil reclaimers.

Tannic Acid. To limit the use of tannic acid U. S. P. to essential purposes, the War Production Board has issued Order M-204 establishing complete control of the acid and of nutgalls, its raw material source. According to the order, nutgalls must of so processed so as to obtain the maximum production of tannic acid meeting U. S. P. specifications. Tannic acid U. S. P. may be used only for the treatment of burns or the manufacture of products used exclusively for the treatment of burns, as an analytical reagent for laboratory use, for internal administration in the treatment of poisoning, and in the extemporaneous compounding of prescriptions.

Stocks of nutgalls amounting to less than 5 pounds and nutgalls or tannic acid U. S. P. which had been combined with any other material before August 8 are exempted from the restrictions. The order does not apply to the householder who uses the acid for his own medicinal purposes, but the person who sells to the householder must observe the restrictions.

Thermoplastics. An illustration of the speed with which military production is taking available supplies of materials is provided by action of the Director General for Operations in regard to thermoplastics. M-154, which set up a ladder of uses for thermoplastics was issued on June 27 and provided for scheduling of operations by manufacturers to begin on July 15. That later was postponed until August 15 to give manufacturers time to change operation schedules. So greatly has military demand risen in the meantime that M-154 no longer provides proper control for all types of thermoplastics.

The most recent amendment changes the order to a limitations order and extends the date for scheduling until October 1, pending revision of thermoplastics control which will take into account the altered conditions in demand. Issued at the same time were two supplementary orders, M-154-a and M-154-b. M-154-a restricts the use of polyvinyl butyral, a rubber substitute, to war orders, except by special authorization of the Director General. M-154-b provides that methyl methacrylate sheet scrap cannot be disposed of except to reprocess into sheeting. The material is widely used for gun turrets and navigators' domes in military aircraft.



Tungsten ores or concentrates may be delivered by any producer, dealer, or processor to dealers or processors for concentration or beneficiation without specific authorization by WPB, according to Amendment 1 to General Preference Order M-29, as amended June 30, 1942. Control over tungsten is exercised by WPB when delivery is made to consumers. The amendment also extends from 60 to 120 days the period during which dealers may hold stocks of tungsten ores and concentrates.

Turbo-blowers. Strict WPB control over distribution of turbo-blowers has been ordered. Turbo-blowers, which are made largely of alloy steel and cast iron, are necessary in the operations of blast furnaces, coke furnaces, and in operations connected with the manufacture of synthetic rubber, ammonia, toluene, and other programs designed to increase the country's output of war goods. Under Limitation Order L-163 no one may place or accept orders for turbo-blowers covered by the regulations unless specific authorization is granted on Form PD-616A. Application for authorization to place orders must be made on Form PD-616.

None of the restrictions in the order apply to turbo-blowers to be delivered to the Navy or Maritime Commission for shipboard use, or to any privately owned shipyard or plant for installation in ships

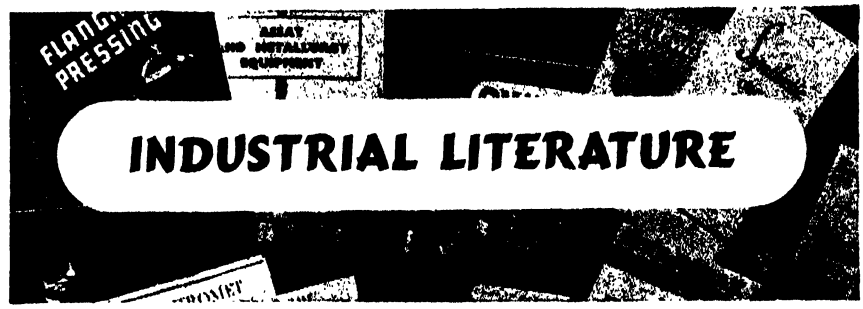
U. S. Sources of Aluminum

A special committee of the National Academy of Sciences has approved new processes that may make the United States independent of foreign sources of aluminum. Its advisory committee on metals and minerals has recommended that the War Production Board provide materials for more experimental work on extracting alumina from domestic ores and clays that could not be used a few years ago.

Shipments of bauxite from Dutch Guiana have declined considerably with the U-boat sinkings, and the reserves of high-grade ore in Arkansas are limited. The committee recommended a study of the tailings left when high-grade bauxite is treated in the usual way to secure additional alumina by a sintering or baking process; that a test plant be constructed to permit further work on another sintering process for extracting alumina directly from low-grade ores and clay; that the pilot plants now at work on extracting alumina from clays be expanded (one is operated in the Northwest by the Bureau of Mines and one in Utah by Kalunite, Inc.); that vigorous prospecting go forward to discover new domestic deposits of bauxite; and that the known deposits be appraised as to grade, tonnage, and minability.

Urea



Urea, a synthetic chemical, which was not even manufactured in this country until recent years, today is helping to make an important farm-grown product more useful for both war and peacetime purposes.

It is being widely used to inhibit splitting and checking of lumber during seasoning or drying, and to treat wood so that it may be bent and shaped for specific war uses.

The Navy is using thousands of feet of treated lumber for decks, ribs, frames, and other structural parts of ships.

The Army is purchasing treated lumber in clear and structural grades for stringers, planks, and rails on Army pontoons used for bridges. Without urea it would have been almost impossible for the lumber industry to supply all the lumber requested for Army pontoons. Some mills that tried to dry this material without urea experienced seasoning degrades of 40 to 60 per cent of the stock dried, and in addition tied up their dry kilns for an unreasonably long time. These seasoning difficulties were largely solved by the use of ures, and kiln degrade of this important farm-grown crop of lumber was reduced to around 3 per cent.

Listed publications should be requested directly from the company concerned. Use business stationery, mention bulletin numbers, and refer to this journal. Publications will be sent free unless otherwise noted.

American Filter Papers. A 4-page bulletin describes a line of filter papers developed for qualitative as well as for the most accurate quantitative work. A little card in the bulletin serves as a selector guide for the proper choice of filter papers. This compares the numbers of British, Swedish, and the American line of papers. *American Filter Papers Bulletin CEN.* Carl Schleicher & Schuell Co., 116-118 West 14th St., New York, N. Y.

Bronze Valves. This 6-page bulletin presents brief working data on a line of bronze valves for Silbraz joints. The preinserted rings of Sil-Fos, a silver brazing alloy, in the port openings of these valves make it possible to braze a one-piece piping assembly between valve and pipe with an oxyacetylene flame. A table of working data and sectional pictures show the making of Silbraz joints. *Bronze Valves Bulletin CEN.* Fairbanks Co., 393 Lafayette St., New York, N. Y.

Burets. This 16-page bulletin describes a line of inter-joint burets. The types described range from the student grade to precision research models. In describing each type the manufacturers list capacity and graduated intervals as well as prices. *Bulletin 41-55 CEN.* Scientific Glass Apparatus Co., Bloomfield, N. J.

Carriers for Drums and Barrels. A well-illustrated bulletin describes the actual service use of this convenient type of carrier. The bulletin points out that the device is designed to permit easy one-man handling of even very heavy loaded containers. *Drum and Barrel Carrier Bulletin CEN.* Ernst Carrier Sales Co., 1456 Jefferson Ave., Buffalo, N. Y.

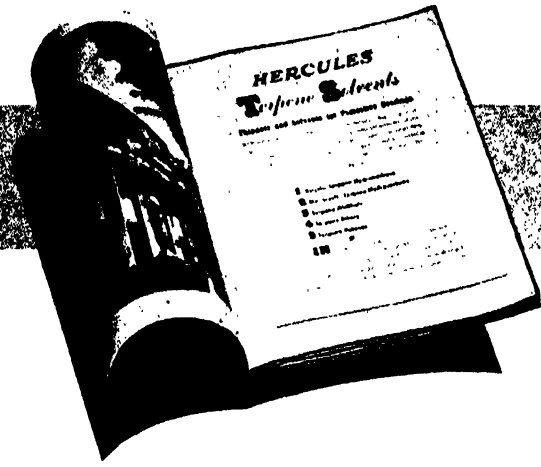
Centrimax Flowmeters. These flowmeters are designed primarily for steam and water service and are urged by the manufacturers where flow measurement of unusual accuracy is required either because of power efficiency reasons or because accounting is done on the base of flow readings. *Catalog N-28-160 CEN.* Leeds & Northrup Co., 4907 Stenton Ave., Philadelphia, Penna.

"Concealment Coatings" deals especially with the camouflage of industrial plants. Shatterproofing of glass and fire-retarding paints are also discussed. The camouflage paints meet or exceed Army specifications. *Pamphlet CEN.* Devoe & Reynolds Co., Inc., 1 West 47th St., New York, N. Y.

Coupling Head Thermoswitch. Similar to the Hex type switch, this new type is designed for insertion into a closed liquid or gas system by means of a 0.5-inch standard pipe thread. The new coupling head feature facilitates permanent wiring connection, quickly and neatly, with many types of condulets, such as waterproof or explosion-proof fittings. *Catalog Section 95 CEN.* Fenwal Inc., Ashland, Mass.

Forged Steel Fittings. A well-illustrated, complete reference book, shows the advantages of this type of fitting especially in high-pressure, high-temperature work. Section 1 includes pictures of forged steel screw fittings with information on the type of unit and uses. Section 2 performs the same function for forged steel socket welding fittings. Section 3 gives vital engineering data. *Forged Steel Fittings, Bulletin A-3 CEN.* Watson-Stillman Co., Roselle, N. J.

Fuse Clips and Screw Terminals. Made of a new beryllium-copper alloy these items give low-contact resistance and great conductivity, and possess high fatigue resistance and tensile strength plus other necessary qualities. Valuable technical information is also included. *Folder CEN.* Littlefuse, Inc., 4757 Ravenswood Ave., Chicago, Ill.



Gages. This bulletin describes a line of gages for pressure, vacuum, and compound service. Internal working mechanism of these gages is well illustrated, and the bulletin carries brief physical specifications for the various models. The manufacturers point out that they have fitted these gages with a new and improved type of gearing in the form of a patented cam and roller movement. *Gages Bulletin CEN.* Certified Gauge & Instrument Corp., 34-18 Northern Blvd., Long Island City, N. Y.

Graphic Instruments. New uses, such as checking arc welding, recording high temperatures, inspecting pipe, and spotting power disturbances are described in this bulletin which includes several charts. *Bulletin 1241 CEN.* The Esterline-Angus Co., Inc., Indianapolis, Ind.

Heat Transfer through Metallic Walls. Engineers recognize that the thermal conductivities of metals used in fabrication of various processing units are frequently poor indexes of what may actually be accepted. This 16-page catalog has been prepared by the Development and Research Division of the manufacturer to supply the information so urgently needed for successful design work. The booklet includes information in formulas for determining over-all heat-transfer rates, various factors influencing heat transfer through metallic walls, and thermal conductivities of metals and alloys commonly used in the construction of process equipment. To the original data there has been added a number of illustrations

You can blend Terpene solvents to produce the properties you need

By properly selecting and blending terpene solvents, it is possible to vary solvent strength, volatility, flash point, odor, stability, drying time, and other characteristics. Such blends may be further modified and extended with mineral thinners and other solvents, opening the way to worthwhile improvements in protective coatings.

These varied possibilities for making important new solvents

HERCULES
TERPENE SOLVENTS INCLUDE
Bicyclic Terpene Hydrocarbons
Monocyclic Terpene Hydrocarbons
Terpene Alcohols • Terpene Ethers
Terpene Ketones

are explored in a booklet, "Hercules Terpene Solvents," just issued. It contains data on the individual terpenes and on typical blends developed by the Hercules Experiment Station. This will provide paint chemists with a starting point for their own investigations. Just mail the coupon for your copy.

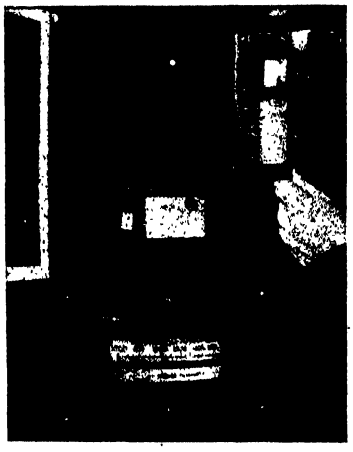
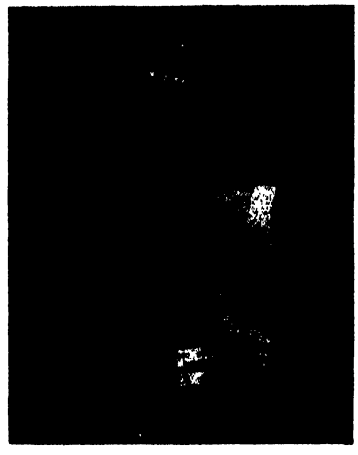
Here's what

UNIVERSAL TEMPERATURE CONTROLLERS



mean to you



1 Temperature Control Adjustment easily made from front of Controller. Control Setting may be locked inside case if desired.

2 Removing plug-in relay. Relay interchangeability permits conversion to other types of control circuits or back.

3 Plug-in Control Chassis is easily removed for inspection, replacement or interchanging for other types of control circuits. Plug sockets may be seen above relay.

4 Interchangeable Measuring Sections permit choice of scale range or type of temperature measuring system (Potentiometer, Millivoltmeter or Resistance Thermometer).

Instantaneous control action with the famous "Electronic Principle" control system and extreme accuracy of temperature measurement, plus interchangeability of all component parts, interchangeability of scale ranges, ready accessibility of all parts for individual checking and many other features. Wheelco UNIVERSAL Controllers include Capacitrols, Potentio-trols, Limitrols and Resistance Therm-otrols.

Industrial Literature

CONTINUED FROM PAGE 1134

showing several types of equipment which are characteristic of process units that depend on the transfer of heat through metallic walls for normal operation. *Heat Transfer Bulletin CEN.* THE INTERNATIONAL NICKEL CO., INC., 67 Wall St., New York, N. Y.

Hydrite Lubricant. A new, all-purpose, colloidal, natural graphite, 22 per cent by weight in water suspension is described in this bulletin. This lubricant is said to be particularly adaptable where an oil-free, nondrip, long-wearing material is required. It is unaffected by acids, acid fumes, or vapors and is electrically conductive and chemically inert. *Bulletin No. 3A CEN.* NATIONAL GRAPHITE CO., INC., 17 John St., New York, N. Y.

Industrial Subzero Machines. The Kold-Hold freezing machine for maintaining predetermined temperatures as low as −90° F. is fully described in this folder. The units come in a variety of sizes and styles, all designed to withstand heavy-duty factory operation. Important applications are in the chemical and pharmaceutical processing industries and for testing instruments and materials. *Bulletin S-Z 42 CEN.* KOLD-HOLD MFG. CO., Lansing, Mich.

Kjeldahl Equipment. This new fully illustrated bulletin describes possible modifications and combinations of Kjeldahl equipment for digestions and distillations, adaptable for small and large laboratories. There are three basic models from which to choose. The fume exhausts are of tellurium lead or Duriron. The multihood digestion units are described as well as the multitube distillation apparatus. All units are available for either electricity or gas. *Bulletin 515 CEN.* PRECISION SCIENTIFIC CO., Chicago, Ill.

Koroseal, its nature and chemistry, physical properties, and mixing and processing procedures are discussed in a new handbook of technical information. Included are six charts, a flow diagram, and other important data, plus a general discussion on the many industries in which this product may be used. Physical properties, physical constants, and many photographs are included. This is the first section of a three-section handbook on this important product. *Handbook of Technical Information, Section 1 CEN.* THE B. F. GOODRICH CO., Akron, Ohio.

Mills Plastic Tubings and Fittings. A complete description of a new thermoplastic especially designed to replace metal is included in this bulletin. The tubing is practical owing to its adaptability under high-bursting and working pressures, insulation qualities, and resistance to most chemicals. Complete technical data and physical properties, effect of reagents on the material, charts on bursting and working pressures *vs.* temperature, and other interesting information are included. *Bulletin CEN.* ELMER E. MILLS CORP., 812 West Van Buren St., Chicago, Ill.

Rip-Cord Closures. A new type of closure for bags, which saves labor, bags, storage, and materials is described in a new folder. A sharp pull opens the bag,

eliminating cutting and waste. This closure may be applied to any type of textile bag and seems especially adaptable for animal foods, seeds, dry chemicals, cement, starch, and similar products. *Folder CEN.* BEMIS BRO. BAG CO., 431 Poplar St., St. Louis, Mo.

Spray Nozzles. A new, nonclogging, flat-spray nozzle for washing, cleaning, cooling, and descaling is described. These nozzles come in three sizes and in a variety of metals and are so designed as to give maximum impact and uniform spray, with a saving in the volume of water used. *Bulletin 409 CEN.* CHAIN BELT CO., 1600 West Bruce Street, Milwaukee, Wis.

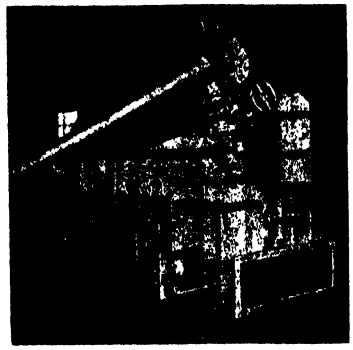
Steam-Jet Ejectors. A new type CTH, double element, two-stage steam-jet ejector, with combined surface inter- and aftercondenser is described. Sectional views are given plus details of construction and dimensions. *Bulletin W-205-B5A CEN.* WORTHINGTON PUMP AND MACHINERY CORP., Harrison, N. J.

Suspended Separation Magnets. An illustrated 8-page bulletin describes the design, construction, and materials embodied in these suspended magnets and their various applications. Specifications on the circular and rectangular types also are included. *Bulletin 25-C CEN.* STEARNS MAGNETIC MFG. CO., Milwaukee, Wis.

Ultraviolet in Science and Industry. The present-day useful applications of the quarts mercury vapor lamp and ultraviolet radiation are described. Illustrations show the various types of lamps available and results of ultraviolet photography. Physical, chemical, and industrial applications are taken up fully. The use of photoelectric cells is also discussed. *Booklet CEN.* HANOVIA CHEMICAL AND MFG. CO., Newark, N. J.

Vibrating Screens. A 12-page illustrated bulletin describes Vibrex screens with dimension data and properties. *Bulletin CEN 122.* ROBINS CONVEYING BELT CO., Passaic, N. J.

Ethyl cellulose to Replace Rubber



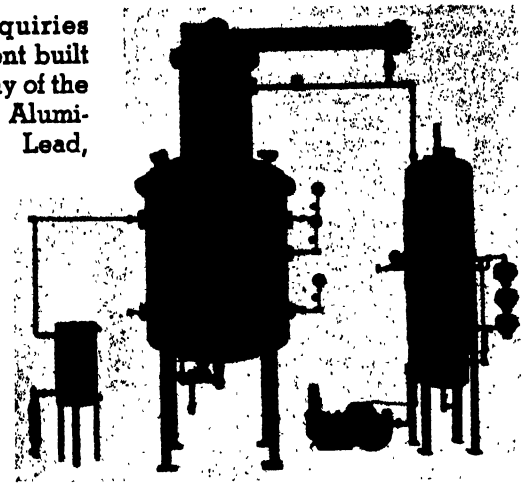
NEW formulations of ethyl cellulose plastic designed to replace rubber have been found suitable for many uses of the now scarce material, the Hercules Powder Co. has announced.

Soft formulations of this plastic can be used instead of rubber in gun covers, electrical tape or "friction tape," water tubing to replace brass, raincoats, hospital sheeting, garden hose, and other kinds of rubber hose, mason jar rings, surgical tape, wire insulation, golf balls, baby pants, gloves, impregnated fabrics, coated fabrics, washers, and footwear. It is also described as resistant to mustard gas.

Ethyl cellulose is now produced by the Hercules Powder Co. at a plant in Virginia, which is also the largest chemical cotton plant in the world.

ADMIRAL WILLIAM CARLETON WATTS, U. S. N. (retired), as a special representative of the Secretary of the Navy, made a complete inspection recently at the Jessop Steel Co., Washington, Penna., and highly praised officials for the efficiency with which the mill is being operated.

ARTISAN WORKS FOR VICTORY



Horizontal tube evaporator — all welded construction

Artisan's complete facilities for fabricating equipment for the Chemical Process Industries are working day and night to meet wartime requirements. Artisan is proud of the esprit de corps of its workmen, engineers, and administrative staff that makes possible this service to the nation in wartime.

ARTISAN DESIGNS AND BUILDS SPECIAL EQUIPMENT FOR THE CHEMICAL PROCESS INDUSTRIES

Artisan invites your inquiries when in need of equipment built to a special design from any of the following metals or alloys: Aluminum, Copper, Everdur, Lead, Monel, Nickel, Inconel, Steel, Stainless Steel, Clad Steels, and Hastelloy. Experienced Artisan engineers are qualified to work on special problems in cooperation with your plant engineers and executives on a confidential basis.

THE FLYING FORTRESS
—BOEING'S FAMED B-17-E

Out-flying, out-fighting and out-bombing anything it meets in the air—on any front, the Flying Fortress has a reputation of proven superiority. It is a masterpiece of skillful engineering born of wide research and countless experiments. To such war equipment Americans pay thankful and admiring tribute.

But for men who build such planes, those who train to fly them—and for millions of people at home, there must be an abundance of water. To a water system the name Layne is as famed as that of Boeing to long range bombers. Layne has built thousands of water systems—the very biggest in the United States. Layne likewise builds pumps—the kind that outpump, out-last and out-perform any deep well water producing equipment in any territory—on any task.

Layne's reputation, like that of the Flying Fortress has been proven the hard way—on the field of action. Layne Wells and Pumps by the hundreds are producing millions and millions of gallons of water for manufacturers, cities, railroads and the army and navy. For late catalogs, bulletins and detail information, address

built or repaired for the Navy or Maritime Commission. The order, although in the L series, does not limit production directly but provides for allocation of finished products.

Vegetable Oil Seeds. Allocation and other authority of the WPB has been delegated to Commodity Credit Corporation in respect to vegetable oil seeds and oil seed products in Directive 7. The purpose is to give to a single government agency necessary authority to handle problems arising out of this year's bumper crop of cottonseed, flaxseed, peanuts, and soybeans.

Procedure for Sale of Fats and Oils

PROCEDURE to be followed by importers on and after August 18, 1942, in submitting offers to sell fats, oils, and oil-bearing materials to the Commodity Credit Corporation for importation under provisions of WPB general order M-63 has been announced jointly by the Board of Economic Warfare, the War Production Board, and the Commodity Credit Corporation.

Offers will be considered only if submitted to the Director of Foreign Purchases, Commodity Credit Corporation, U. S. Department of Agriculture, Washington, D. C., by 4:00 P. M., Eastern Wartime, on designated days of the week as shown in the accompanying table. Importers or United States representatives of foreign firms must make offers via telegram or letter only, and must include the date of validity of the offer. Offers telegraphed will be subject to receipt of a letter of confirmation postmarked not later than midnight of the date of the offer.

Offers will be considered in force for acceptance or rejection until noon of the day following the date for which the offer was submitted. Free of all commissions and brokerage to the CCC, offers will be made (1) f. o. b. ship, point of shipment; or (2) cost and freight; or (3) cost, insurance, and freight (c. i. f.). All offers made to the Director of Foreign Purchases will be recorded, and all purchases will be made from the recorded list.

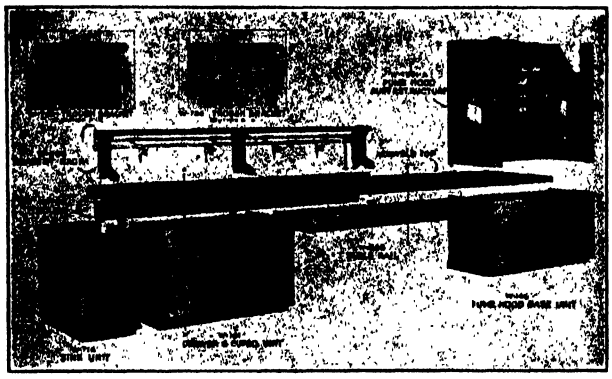
Aluminum Salt Supply Increases

ALUMINUM salts shipped in the United States in 1941 increased 22 per cent in quantity and 35 per cent in value over 1940, according to the U. S. Bureau of Mines. Producers reported the shipment of 626,384 short tons valued at $17,382,675, compared with 513,520 tons valued at $12,882,578 in 1940. Shipments of aluminum sulfate, principal product of the aluminum salts industry, gained 21 per cent in 1941 compared with 1940. Sales of aluminum chloride advanced 48 per cent. Shipments of alumina in 1941, excluding that used by the aluminum industry, increased 113 per cent in quantity and 108 per cent in value over 1940.

LEO T. CROWLEY, Alien Property Custodian, has announced the seizure by his office of the holdings of Leonardo Cerini, an Italian, in R. A. C. E., Inc., of Cleveland, Ohio, a company engaged in the design and manufacture of chemical equipment.

Specify EIMER AND AMEND TESTED PURITY REAGENTS

Electrometric Titrations Employed



E & A Tested Purity Reagents are prepared and analyzed by the latest approved methods. They comply with the A. C. S. Specifications for purity, and the exact analysis of each lot is stated on the label.

The reliability provided by E & A Tested Purity Reagents has caused them to be adopted for analytical work in many leading laboratories.

P2681

THE EKERT CONDENSER

A new condenser, compact and extremely efficient which will out-perform any condenser four times its length in condensing power. Originally designed as a reflux condenser, it has also shown its adaptability as a superior vertical distillation condenser.

Especially recommended in the refluxing or distillation of volatile liquids to eliminate the use of extra long condenser of the usual type.

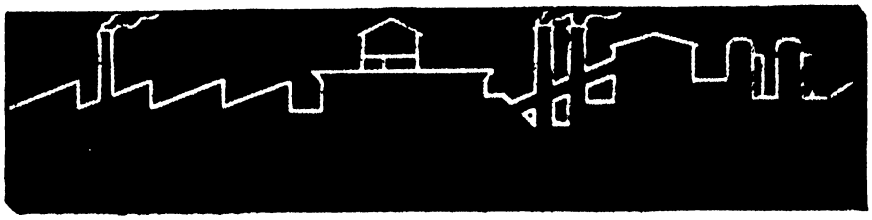
Experiments carried out with ether, alcohol and steam under intensified conditions not normally encountered, showed exceedingly fine results.

To test its performance as a distillation condenser, live steam was entered directly into the tubulation at the top of the 800 mm size, with the result that the condensate ran cold.

Both the reflux and distillation condenser are identically constructed, in the lengths listed below. Vapors to be condensed travel along a system of water cooled coils which are wound about a water cooled internal cylinder, all of which are finally encased in another large surfaced water cooled external cylindrical jacket. The construction permits cooling of the entire unit with one single continuous circuit of water.

Invented by Mr. W. Ekert of Fritzsche Bros., who has had long experience in reflux condensing, this condenser has already found immediate acceptance by chemists in the essential oil and soap laboratories, both for its compactness and its efficiency.

Obtainable in the following sizes:



P2681	Condenser, Ekert Reflux, Made of Pyrex glass, Pat. Pending, 200 mm Jacket	$15.00
P2682	Condenser, Ekert Distillation, Pat. Pending, 400 mm Jacket	30.00

These condensers can be supplied in larger or intermediate sizes; also with standard taper or spherical connections as ordered at additional cost of the joints only.

THE EMIL GREINER COMPANY

161 SIXTH AVENUE

NEW YORK, N. Y.

Portable Water Purifier

A SELF-CONTAINED water purification unit that uses no chlorine or other chemicals has been designed by the Technicraft Engineering Co., 5610 South Soto St., Los Angeles. The unit, known as the Sterozone Model B, is light enough to be dropped by parachute in remote areas.

The unit sterilizes water, killing all bacteria, controls taste and odor, and reduces color. Advantages claimed by the manufacturer are complete water purification without use of chlorine or other chemicals now on the restricted list, automatic operation that does not require supervision by highly trained technicians, and extremely low-cost operation.

Cast Iron Grid Unit Heater

TO COOPERATE with the war effort in using substitute materials the Grid unit heater of the D. J. Murray Manufacturing Co., Wausau, Wis., is being made with cast iron instead of aluminum heating sections. Being constructed of cast iron, this new unit is also free from electrolysis that causes corrosion, leaks, and breakdowns, as only one type metal comes into contact with steam or hot water. For the present the unit will be made in eight sizes. Since it is of a special design, application for patent has been filed by the manufacturer.

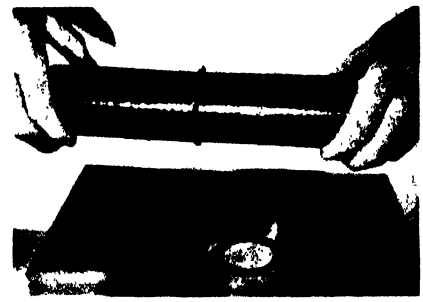
Army-Navy Production Award to Bowser

THE joint Army-Navy E production award has been given to S. F. Bowser & Co., Inc., Fort Wayne, Ind., and its subsidiary, The Fostoria Screw Co., Fostoria, Ohio, for exceeding all production expectations in view of the facilities at their command.

J. F. PRITCHARD & Co. have moved their offices to 2200 Fidelity Bldg., Kansas City, Mo.

Chrome Leather Finger Cots

IN ANNOUNCING production of three chrome leather finger cots, American Optical Co., Southbridge, Mass., points out that sturdy finger protectors are more and more replacing the use of makeshift strips of gummed paper, bits of cloth, and adhesive tape.

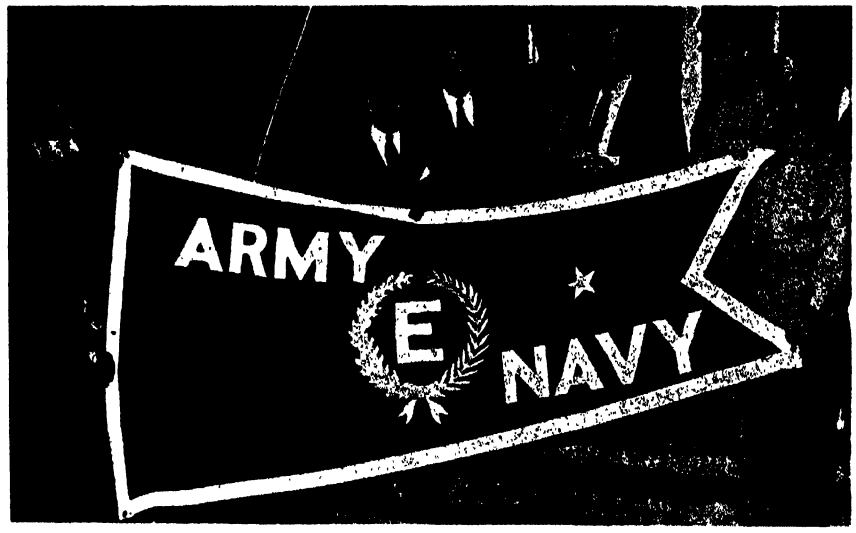


The No. 1000 chrome leather finger cot (short type) is recommended for operations in which only one or two fingers need to be protected or where there is only an intermittent finger hazard. The second type, the No. 1001 chrome leather finger cot (tie-on type), is unusually large, and can be used as a dependable protection for a finger or thumb that is bandaged. The tie-on feature makes it applicable to a wide number of uses. The No. 1688 chrome leather two finger and thumb protector is recommended for operations where several movements require finger protection while succeeding movements require the accuracy and sense of touch of a bare hand.

Army-Navy Award to Monsanto

THE Monsanto Chemical Co. has been given the highest industrial award within the granting of the Army and Navy for achievements in the production of essential war materials. Three military-naval ceremonies for the presentation of the award were held simultaneously on August 17 at the executive headquarters of the company in St. Louis and at its plants in Monsanto, Tenn., and Anniston, Ala. The company is the first in Missouri, Tennessee, and Alabama to receive the high honor. It also was the first in Missouri and Tennessee and the second in Alabama to receive the Navy E.

Saran Pipe



A NEW plastic pipe, manufactured in the same dimensions as extra strong steel pipe of 2-inches outside diameter or less, has been announced by the Dow Chemical Co., Midland, Mich. This pipe is entirely unaffected by water, and only a few solvents exhibit any adverse effects. It is made of the thermoplastic resin, Saran. The base resin is odorless, tasteless, and nontoxic. The plastic does not burn, and its toughness and abrasion resistance are of high order. The pipe is nonscaling and withstands freezing. Heat resistance is said to be excellent up to 175° F.

Saran pipe is produced in smooth, round, accurately sized lengths having dimensions identical with those of strong iron pipe. It can be readily welded, heated, and bent, cut with a wood or hack saw, and threaded with ordinary iron pipe dies. The weight is naturally much less than comparable sizes of iron pipe, an advantage in shipping, general handling, and suspension.

Fittings for Saran pipe, except standard flanges, are not available at present, although they are expected to follow shortly. Molds are being constructed to make additional flanges, with threaded ells, tees, and couplings to be available in the near future

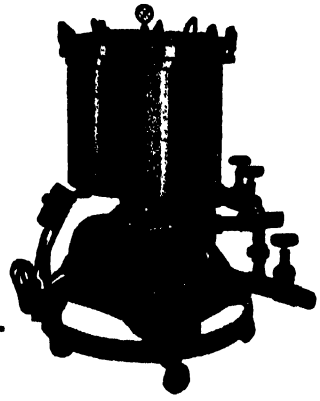
Monsanto Receives Army-Navy "E"

Officials of the Monsanto Chemical Co., St. Louis, Mo., are shown here receiving the Army-Navy production award from military officers at a ceremony held at the executive offices of the company August 17. Shown left to right receiving the burgee are Edgar M. Queeny, president; Gaston DuBois, vice president, and R. R. Cole, vice president and general manager of the Phosphate Division of Monsanto. Officers are Lieutenant Commander F. E. Deam, Lieutenant Colonel E. H. Sager, and Colonel Merle H. Davis, who personally made the presentation to Mr. Queeny.

filter facts

There are many reasons why Sparkler Filters appeal to the practical manufacturer —

1st — The laboratory pint-sized Filter gives a perfect sample of what any Sparkler Filter will do in production.



2nd — All Sparkler Filters use the exclusive horizontal plate method of filtration. The nests of Filter plates are interchangeable, taking a cake thick or thin as required, and using any of the various filter aids, diatomaceous earths, activated carbons, filter papers, wire cloths, asbestos, fuller's earths, bleaching or absorbent clays in proportions best suited for work to be done quickly and thoroughly.

How to keep your BARNSTEAD Water Still in good operating condition

It's a very simple matter to keep your Barnstead Water Still in good operating condition. First of all, keep its interior clean. This prevents scale formation from cutting down the still's efficiency. Second, use reasonable care in operating your still. If it is a gas or electrically operated still, make sure there is enough water in the evaporator before starting. This will prevent burnouts of heating elements. Also be sure ample water flows to the equipment while it is in operation.

Barnstead Water Stills are built for long, continuous service. There are Barnsteads, fifteen years in operation, that still produce the highest grade of distillate. You can get similar results with the right amount of care.

Barnstead

Victory DEPENDS ON FACTS

FACTS... gathered through systematic research . . . are absolutely necessary in making more deadly bombs, faster planes, and other tools of war. Into this hectic race for facts, the Elmes Hydraulic Laboratory Press fits like hand in glove. It is highly accurate . . . it is fast . . . it has "won its stripes" in literally hundreds of production laboratories.

Features of THE ELMES "LAB" PRESS

1. Maintains constant pressure without appreciable loss for a long period of time — achieved through a new valve and a specially designed packing.
2. Solves a variety of scientific and commercial laboratory problems.
3. Offers improvements not ordinarily available.
4. Entirely self-contained; precision built.

MANY APPLICATIONS

Some of the specific uses of this Elmes Laboratory Press are:

Blocking
Breaking Tests
Briquetting
Cake Forming
Forcing
Forming
Gluing
Laminating
Compression Tests
Dehydrating
Drawing
Embossing
Extrusion
Plastic Molding
Pressing
Spring Testing
Vulcanizing

FOURTH EDITION—Just off the Press!

COMPLETELY REVISED AND ENLARGED

INDUSTRIAL CHEMISTRY

by

Emil Raymond Riegel

Professor of Industrial Chemistry, University of Buffalo

IN the latest edition of this nationally famous textbook on industrial chemistry, the high standards set in the three previous editions have been consistently maintained. Aware of the war-imposed need for a volume which would include the latest developments in such strategically important fields as synthetic rubbers, synthetic fibers, explosives, chemical warfare and petroleum, to mention only a few, the author has been particularly painstaking in presenting these subjects completely, yet briefly, so that the reader may grasp the essential points with a minimum of effort. The greatest care has been exercised to include all material bearing on the part being played by industrial chemistry in winning the war; at the same time the thoroughness with which the fundamentals of standard practice were described in the earlier editions has not been diminished. The latest production figures are given in all the industries discussed, and the most recent developments are featured.

In line with present trends toward conservation of materials, the wordage on each page has been slightly increased, so that although the fourth edition contains the same number of pages as the third, there is actually the equivalent of 75 additional pages. In spite of this increase and of rising costs of manufacture, it has been found possible to offer this edition at a slight reduction in price. This fact is eloquent testimony to the success of its predecessors.

Besides its wide use as a text in hundreds of colleges and secondary schools throughout the Americas, this book is an indispensable requirement for reference in high schools, public libraries, and industrial laboratories. It is essential not only to the student entering upon the field of industrial chemistry, but to engineers, plant supervisors and business men who wish a quick access to the outstanding developments in fields other than their immediate interests.

Glauber's salt, bbls., c/l.	100 lbs.	1.05
Glycol phthalate, drums	lb.	.38
Stearate, drums	lb.	.26
Hexamethylenetetramine tech., drums	lb.	.32
Hydrogen peroxide, 100 vol., cbys., c/l	lb.	.16
Hydroquinone, kegs	lb.	.90
Indigo, synth., liq., bbls	lb.	.16½
Iodine, resubl., jars	lb.	2.00
Iodoform, drums, 100 lbs	lb.	3.95
Iron acetate, N. F. IV, cbys	lb.	.15
Iron chloride, tech., cryst., bbls., wks., frt. allowed	lb.	.05
Isopropyl acetate, tanks, frt. allowed	lb.	.10
Lead acetate, white, broken	lb.	.12½
Arsenate, bbls	lb.	.11
Metal, N. Y	lb.	.0650
Oxide, litharge, bbls, 20-ton lots	lb.	.0790
Peroxide, powd., tech	lb.	.23
Red, bbls., 20-ton lots	lb.	.09
Sulfate, bbls	lb.	.0725
White, basic carb., bbls	lb.	.0825
Lecithin, edible, drums, c/l	lb.	.34
Tech., drms., c/l	lb.	.28
Lime, lime, chemical, bulk, wks.	ton	7.00
Lime-sulfur, dry, bags, c/l	lb.	No prices
Lithopone, ordinary, bbls	lb.	.04½
Magnesite, calcined, dom., bags	ton	84.00
Magnesium carbonate, tech., bags, c/l	lb.	.06¼
Chloride, drums	ton	32.00
Fluosilicate, cryst., bbls	lb.	.18
Oxide, light, bbls	lb.	.26
Manganese chloride, bbls	lb.	.14*
Dioxide, 85-90%, bbls., c/l., wks.	ton	74.00
Sulfate, anhyd., bbls., wks	lb.	.11¼
Mannitol, commercial, bbls., wks.	lb.	.35
Menthol, nat., cans	lb.	13.00
Mercury bichloride, cryst., drums, 50 lbs. or more	lb.	2.39
Mercury, flasks, 76 lbs., mines	flask	191.00
Meta-phenylenediamine, kegs	lb.	.65
Meta-toluylenediamine, kegs	lb.	.70
Methanol, synthetic, drums, frt. allowed, c/l	gal.	.34½
Tanks, frt. allowed	gal.	.28
Methyl acetate, 97-99%, tanks	gal.	.09½
Chloride, cylinders	lb.	.32
Formate, l. c. l., drums	lb.	.89
Hexylketone, drums, tech., wks.	lb.	.60
Salicylate, drums	lb.	.35
Monoamylamine, drums, c/l., wks.	lb.	.61
Monobutylamine, drums, l. c. l., wks.	lb.	.51
Monoethanolamine, drums, wks.	lb.	.24
Naphthalene, crude, dom., 74 deg., bags, c/l., wks.	100 lbs.	2.75
Nickel salt, single, bbls.	lb.	.13
Niter cake, bulk	ton	16.00
Nitrobenzene, drums	lb.	.08
Nitrocellulose, alcohol-sol., bbls., wks.	lb.	.28
Nitromethane, drums, l. c. l., wks.	lb.	.25
Octanol, normal, drums	lb.	.85
Oil, castor, No. 3, tanks	lb.	.12¾
China wood, dms.	lb.	.39
Coconut, crude, tanks	lb.	.0835
Cod, Newf., bbls.	gal.	.90
Corn, crude, tanks, mills	lb.	.12¾*
Cottonseed, cooking, bbls.	lb.	.16¾
Linseed, raw, tanks	lb.	.1240
Menhaden, crude, tanks, f. o. b. Baltimore	gal.	.0890
Neat's-foot, pure, bbls.	lb.	.19¼
Oiticica, bbls.	lb.	.25
Oleo, No. 1, bbls.	lb.	.13¼
Olive oil, denat., bbls.	gal.	3.75
Edible, Calif., drums	gal.	4.10
Palm, Niger, bbls.	lb.	.0825
Peanut, crude, tanks	lb.	.12⅞
Perilla, drums	lb.	.2450
Rapeseed, denatured, c. i. f.	gal.	.1150
Red, bbls.	lb.	.11¾
Soy bean, crude, tanks	lb.	.12*
Sperm, 38°, bbls.	lb.	.1301
Whale, bbls., natural, refined	lb.	.1070*
Ortho-dichlorobenzene, drums	lb.	.06
Ortho-nitrochlorobenzene, kegs	lb.	.15
Ortho-nitrotoluene, drums	lb.	.09
Ortho-toluidine, bbls.	lb.	.19
Para dichlorobenzene, drums, c/l.	lb.	.11
Para-formaldehyde, drums	lb.	.23
Paraldehyde, tech., drums	lb.	.12
Para-nitraniline, drums	lb.	.45
Para-nitrochlorobenzene, drums	lb.	.15
Para-nitrotoluene, bbls.	lb.	.30
Para-phenylenediamine, bbls.	lb.	1.25
Para-toluidine, bbls.	lb.	.48
Paris Green, 250-lb. kegs	lb.	.24
Perchlorethylene, drums, c/l., wks.	lb.	.09
Phenol, drums, c/l., wks.	lb.	.12½
Phenolphthalein, yellow, drums, ton lots	lb.	.80
Phenylethyl alcohol, bottles	lb.	2.10
Phloroglucinol, tech., tins, wks.	lb.	15.00
c. p., tins, wks.	lb.	20.00
Phosphorus, red, cases	lb.	.40
Oxychloride, 175-lb. cylinders	lb.	.15
Trichloride, cyl.	lb.	.15
Phthalic anhydride, bbls., c/l.	lb.	.14½
Platinum, metal, solid	os.	36.00
Potash, caustic, solid, drums	lb.	.06¼
Potassium acetate, tech., bbls.	lb.	.28
Bicarbonate, gran., bbls.	lb.	.19
Bichromate, casks, c/l., wks.	lb.	.09½
Bromide, U. S. P., gran., bbls.	lb.	.27
Carbonate, 80-85%, calc., casks.	lb.	.06½
Chlorate, cryst., kegs	lb.	.11*
Chloride, tech., cryst., bgs.	lb.	.08*
Cyanide, drums	lb.	.55
Meta-bisulfite, bbls.	lb.	.18
Muriate, fert., bulk	K2O unit	.53½
Permanganate, tech., drums	lb.	.19¾
Prussiate, red, bbls.	lb.	.70
Yellow, casks	lb.	.17
Pyridine, denat., drums	gal.	1.71
Pyrocatechin, c. p., drums	lb.	2.15
Quinine, 100-oz. cans	oz.	.97½
Resorcinol, tech., kegs	lb.	.68
Rochelle salt, powd., bbls.	lb.	.43½
Saccharin, drums	lb.	1.45
Salt cake, bulk, wks.	ton	15.00
Saltpeter, gran., bbls.	100 lbs.	8.20
Silica, amorph., 96%, 325 mesh, bags, c/l., wks.	ton	17.00
Silver nitrate, vials	os.	.26½
Soda, ash, 58%, light, paper bags, contract, wks.	100 lbs.	1.05
Caustic, 76%, solid, drums, contract, wks.	100 lbs.	2.30
Sodium acetate, flake, 60%, bbls.	lb.	.05
Alginate, drums	lb.	.79
Antimoniate, bbls.	lb.	.15
Benzoate, U. S. P., bbls.	lb.	.46
Bicarbonate, U. S. P., powd., bbls., c/l., wks.	100 lbs.	1.85
Bichromate, c/l., wks.	lb.	.07½
Bisulfite, bbls.	100 lbs.	3.00
Bromide, U. S. P., bbls.	lb.	.27
Chlorate, cryst., bags	lb.	.06¼
Chloride, bags	ton	15.70
Cyanide, 96-98%, dom., drums	lb.	.14
Fluoride, white, 90%, bbls., c/l., frt. alld.	lb.	.08
Metallic, untrimmed bricks, drums, f. o. b. Niagara Falls	lb.	.15½
Metasilicate, gran., bbls.	100 lbs.	2.50
Naphthionate, bbls.	lb.	.50
Nitrate, crude, bulk, works	ton	27.00
Nitrite, bbls.	lb.	.06¾
Perborate, bbls.	lb.	.14¾
Phosphate, disodium, cryst., bags, c/l., wks.	100 lbs.	2.55
Phosphate, trisodium, bags, c/l., wks.	100 lbs.	2.70
Picramate, kegs	lb.	.65
Prussiate, yellow, bbls.	lb.	.11
Silicate, drums, c/l., 40°	100 lbs.	.80
Silicofluoride, dom., bbls.	lb.	.09
Stannate, drums	lb.	.33½
Sulfate, anhyd., bags	100 lbs.	1.70
Sulfide, cryst., bbls.	100 lbs.	2.40
Solid, 60%	100 lbs.	3.15
Sulfocyanide, c. p., bbls.	lb.	.55
Thiosulfate, reg., cryst., bgs.	100 lbs.	2.25
Tungstate, tech., kegs	lb.	No prices
Strontium carbonate, tech., bbls.	lb.	.25*
Nitrate, bbls.	lb.	.07¾
Sulfur, bulk, mines	ton	16.00
Chloride, drums	lb.	.03
Dioxide, commercial, cyl., wks.	lb.	.07
Tetrachloroethane, 50-gal. drums	lb.	.08
Thiocarbanilid, bbls.	lb.	.24
Tin, Straits	lb.	.52
Crystals, bbls.	lb.	.39
Oxide, bbls.	lb.	.55
Tetrachloride, anhydrous, drums, bbls.	lb.	No price
Titanium dioxide, bags	lb.	.14¾
Toluene, tanks	gal.	.28
Triamylamine, drums, c/l., wks.	lb.	.98
Triamylborate, drums, l. c. l., wks.	lb.	.33
Tributylamine, drums, c/l., wks.	lb.	.78
Trichloroethylene, drums, wks, frt. allowed	lb.	.08
Tricresyl phosphate, tech., drums.	lb.	.25
Triethanolamine, drums, c/l., wks.	lb.	.19
Triphenyl phosphate, barrels	lb.	.31
Tungsten, tech., powder	lb.	2.60
Urea, dom., 46 + % N., bags, f. o. b. wks. or seaboard	ton	80.00
Vanillin, 25-lb. tins	lb.	2.35
Whiting, comm., dry-grd., bags, c/l., wks.	ton	18.00
Xylene, 10°, tanks	gal.	.30
Xylidine, drums	lb.	.35
Zinc ammonium chloride, bbls.	lb.	.0565
Chloride, tech., fused, drums	lb.	.05
Dust, bbls., c/l.	lb.	.1035
Metal slabs, at N. Y.	lb.	.0865
Oxide, Amer., bags	lb.	.0725
Stearate, tech., bbls.	lb.	.30
Sulfate, cryst., bgs., c/l., wks.	100 lbs.	3.60

* Nominal.

EMPLOYMENT INFORMATION

RATES to be paid in advance. Standard setting 5c a word, minimum charge $2.00 each; include 8 words for box address. Exceptions see ⟶ Display, $10.00 per column inch 2 inches maximum, larger units at regular display unit rates. No discounts or allowances.
SEND advertisements with remittance to INDUSTRIAL AND ENGINEERING CHEMISTRY, 332 West 42nd St., New York, N. Y., to reach there not later than 10:00 A.M. on the 10th and 25th, closing dates for editions of CHEMICAL and ENGINEERING NEWS of the 25th and 10th, respectively. Insertions made in order of receipt provided necessary remittances are complete.
EMPLOYERS are requested to mention in their announcements the section of the country in which the open position is located to ensure replies only from those who are geographically available.
In printing these advertisements the SOCIETY assumes no obligations as to qualifications of prospective employees or responsibility of employers.

UNEMPLOYED members of the AMERICAN CHEMICAL SOCIETY seeking employment for themselves are allowed in one calendar year 3 announcements free (one per issue) set in standard style and limited to 50 words each, including 8-word box address, and 3 additional standard announcements at 50% of regular rate. Further announcements and excess words at full rate.

EMPLOYED members of the AMERICAN CHEMICAL SOCIETY seeking new positions are permitted 3 standard announcements during the calendar year at 50% of the regular rate—include 8 words for box address.

EMPLOYERS seeking chemists and chemical engineers are permitted 3 standard announcements, not to exceed 50 words each including box address and not more than one per issue, during the calendar year without charge, provided they agree in writing to acknowledge all replies (excess words 5c each), otherwise full rate applies.

The AMERICAN CHEMICAL SOCIETY is vitally interested in the welfare of its members and in seeing that the chemical industry is manned with competent chemists and chemical engineers. These pages are part of our service in that connection. In addition most of the larger sections of the AMERICAN CHEMICAL SOCIETY and several of the smaller ones have active employment committees. Local section secretaries in your area will inform you as to any employment aids that may be available locally.

An Employment Clearinghouse is operated at each national meeting of the SOCIETY for the purpose of bringing together representatives of industry looking for chemists and members and student affiliates in attendance wishing to make such contacts. For further details, consult the preliminary and final programs as printed in the NEWS EDITION prior to each meeting.

In the New York area, special employment facilities are offered by the Employment Bureau of the Chemists' Club, 52 East 41st St., New York, N. Y. In the Chicago area, the Chicago Section maintains an employment service at 505 N. Michigan Avenue, Chicago, Ill.

Those replying to announcements should be careful to send copies and not original documents. Advertising circulars will not be forwarded and to that end all letters will be opened at the forwarding office.

SITUATIONS OPEN

Those announcements in which the letter "P" is part of the address key have paid in full and are not committed to acknowledge replies. The Society regards acknowledgment by employers of all applications as an act of common courtesy but can assume no responsibility for their failure to do so.

EXECUTIVES, CHEMICAL ENGINEERS AND CHEMISTS with exceptional backgrounds of experience should use our confidential and individual method of contacting responsible employers. No limit to territory. We negotiate all overtures. Established 1915. The National Business Bourse, 20 W. Jackson Blvd., Chicago, Ill.

CHEMICAL ENGINEER excellent opportunity for man of outstanding qualifications in research laboratories located in the East. Please submit college record, experience, accomplishments, and small photo.
Box 75–TP–7, Ind. & Eng. Chem., Easton, Pa.

CHEMIST with good basic training and initiative, for work in dye laboratory in conjunction with production dyeing of stock and piece goods. Experience as dyer desirable but not essential. Must have good "color eye" and knowledge of color matching. In reply give full particulars of training, experience, draft status and salary desired. Eastern location.
Box 12–N–8, Ind. & Eng. Chem., Easton, Pa.

FOOD TECHNOLOGIST. Applications will be welcomed from men with outstanding records to serve as junior chemists in eastern Research Laboratory. Prospects for advancement excellent for men of right qualifications. Please submit record of training and experience, personal history and recent small photo.
Box 76–TP–7, Ind. & Eng. Chem., Easton, Pa.

WANTED—GRADUATE Chemist with laboratory and plant experience in paper coating. Location Middle West.
Box 28–NP–8, Ind. & Eng. Chem., Easton, Pa.

EDITORIAL ASSISTANT on Chemical and Engineering News to do editing, some rewriting, caption writing, proofreading, production details, and general office work. Several years' college training in journalism and chemistry desired, as well as a knowledge of typewriting and preferably of stenography. State qualifications fully and submit photo. Apply to Industrial and Engineering Chemistry, P. O. Box B, Woods Hole, Mass.

WANTED GRADUATE Chemist with experience in water paste and powder paints.
Box 66–NP–8, Ind. & Eng. Chem., Easton, Pa.

A CHEMICAL SALES organization handling chemical specialties used by numerous defense industries has an opening in New England for a salesman with a degree in chemistry. Opportunity to acquire part interest in organization. Give draft status, availability, education and sales experience.
Box 14–T–8, Ind. & Eng. Chem., Easton, Pa.

WANTED: ORGANIC Chemist by College for women located in South. M.S required, Ph.D. preferred. Rank and salary dependent on qualifications. Woman desired but will consider man. State qualifications and salary expected.
Box 37–T–8, Ind. & Eng. Chem., Easton, Pa.

CHEMIST CAPABLE of undertaking basic research work on textile fibres. Also technically trained graduate interested in textile development work. Excellent opportunities with well known New England textile company. Salary commensurate with ability and experience. Give all pertinent information and enclose recent photograph.
Box 43–TP–8, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER wanted by Mid-West manufacturer of refinery and gasoline plant equipment. Prefer man with operating or design experience. Permanent position open in company handling only high priority business. Reply stating training, experience, salary and include recent photograph. All replies confidential.
Box 49–T–8, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST with Bachelor or Master degree, desired in research laboratory of food manufacturer located in the East. Opportunity for man with sound training and superior college record. Supply details concerning training, experience, personal history and small photo.
Box 51–TP–8, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER or chemist interested in control and development work leading to plant supervisory positions; large plant, Aggressive Company, producing roofing felt, granules, asphalt roofing and asphalt specialties. Give details of education and past experience. Personnel Director, The Flintkote Company, New Orleans, Louisiana.

GRADUATE ASSISTANTSHIP, half time, in General Chemistry; woman's college near New York City; prefer woman with master's degree planning graduate work in New York City colleges. Salary $800–1000. Give details of education and experience.
Box 74–T–8, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST, B.S. in chemistry wanted for chemical laboratory in Niagara Falls, New York. Address: The Carborundum Company, Service Department, Niagara Falls, N. Y.

CHEMIST with some petroleum experience. Needed in Chicago area for development of petroleum products and rust preventives. State age, draft status, degree, and salary desired in opening letter.
Box 79–TP–8, Ind. & Eng. Chem., Easton, Pa.

CHEMIST to take charge of laboratory analyzing tool, stainless and special steels and alloys, part of time required for research work. In replying give full information concerning age, training, experience, family status, health, etc.
Box 10–NP–9, Ind. & Eng. Chem., Easton, Pa.

MIDWESTERN RESEARCH institution has opening for young woman, B.S., M.S., for bacteriological and analytical chemical work. Also open position for physical chemist, male, Ph.D. Give full details of training, experience, personal data, photograph and salary desired. Armour Research Foundation, 35 W. 33rd Street, Chicago.

CHEMISTRY TEACHER wanted. Must be able to teach elementary college physics courses. Position to be filled by September 20. Stockton Junior College, Stockton, California.

WANTED—EXPERIENCED chemical and metallurgical engineer capable of setting up new product research department for Western New York manufacturer. Excellent opportunity for right man. Write giving education, experience, references and salary requirements.
Box 15–NP–9, Ind. & Eng. Chem., Easton, Pa.

WANTED: CHEMICAL superintendent also a graduate chemist or engineer both with several years' recent experience in chemical operations, to work under manager in directing several inorganic heavy chemical operations all in same location. Experience with chemical equipment also in increasing production and efficiencies required. Residence at plant in South. Give full particulars as to education, experience and salary expected. Opportunity for good men.
Box 16–NP–9, Ind. & Eng. Chem., Easton, Pa.

WANTED—GRADUATE chemist, research experience with drying and semi-drying oils. Extensive knowledge of analytical oil determinations required.
Box 17–NP–9, Ind. & Eng. Chem., Easton, Pa.

CHEMIST WANTED: preferably in the field of metallic soaps, though a broad knowledge of organic may be substituted. Should be capable of research and development. Permanent position, aggressive concern, Ohio location. In reply state salary desired, draft status and education in detail.
Box 20–N–9, Ind. & Eng. Chem., Easton, Pa.

RUBBER CHEMIST, experienced in rubber laboratory. Should be recent graduate chemist or chemical engineer. Non-graduate with several years' experience will do if possesses initiative. State age, experience, draft status, salary desired, education, etc. Chicago section.
Box 22–N–9, Ind. & Eng. Chem., Easton, Pa.

WANTED—GRADUATE chemist for production and quality control. Successful American crude drug subsidiary in Buenos Aires. Selective Service deferment necessary. Give details of educational training, commercial experience, references and availability.
Box 23–NP–9, Ind. & Eng. Chem., Easton, Pa.

CHEMISTS, MALE or female for routine inspection and analysis on food products. Modern laboratories located in Mid-west.
Box 24–NP–9, Ind. & Eng. Chem., Easton, Pa.

CHEMIST or CHEMICAL Engineer wanted by laboratory supply house to travel Baltimore, Washington and Richmond territory. State education, experience and salary expected.
Box 47–NP–9, Ind. & Eng. Chem., Easton, Pa.

(See Box 50–NP–9 on p. 1148)

CHEMIST or CHEMICAL Engineer whose recent basic training in inorganic, organic and physical chemistry fits him for analytical and research work in problems dealing with the process industries. Prefer a recent graduate with B.S. or M.S. degree. Experience not essential. Include all personal reference data and recent photo in first letter. Woman would be considered.
Box 52–NP–9, Ind. & Eng. Chem., Easton, Pa.

GODCHAUX Sugars, Inc., New Orleans, La., desires chemist or chemical engineer for development work on by-products. Experience in plastics, fermentation, or lignin desirable. Position offers opportunity for man with initiative and practical ability. Give full information, references, photograph.
Box 53–NP–9, Ind. & Eng. Chem., Easton, Pa.

RESEARCH and DEVELOPMENT chemist experienced in paper and protective coatings, adhesives, and allied material. Excellent future. State complete qualifications, salary and when available. P. O. Box 23, Louisville, Kentucky.

(Continued on page 1146)

Address communications to the box number indicated and Mail to Easton, Penna.

The American Chemical Society has no information concerning the position advertised, or in regard to those seeking employment.

(Situations Open Continued)

EXCELLENT OPPORTUNITY in industry for a man with electro-chemical training, preferably Electro plating. Must have degree from recognised college or university. Married man with dependents preferred. All information will be held strictly confidential.
Box 58–N–9, Ind. & Eng. Chem., Easton, Pa.

PLASTICS-RESIN chemist needed for midwest manufacturer phenolic molding, plywood, adhesive resins. Thorough experience in formulation, production, and evaluation essential. Ability to demonstrate in customers' plants and knowledge of aminoplasts, polystyrene and other plastics also desirable. Send full particulars in first reply including details of academic training, industrial experience, salary expected, draft status and snapshot.
Box 60–N–9, Ind. & Eng. Chem., Easton, Pa.

PHARMACEUTICAL CHEMIST. Acquainted with analytical and control procedure for established pharmaceutical house in the New York area. State full details.
Box 62–NP–9, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST, American born, wanted for literature work in a library connected with a petroleum research laboratory situated in the Chicago area. Applicant must be thoroughly grounded in organic and physical Chemistry; and she should be able to read German and to type.
Box 63–NP–9, Ind. & Eng. Chem., Easton, Pa.

WANTED: Chemist, deferred on account of age or dependents, with sufficient education and experience to hold position as Chief Chemist in cement plant in California. Must have analytical ability. Some knowledge of chemical engineering desirable. State age, draft status education, experience, salary expected.
Box 66–N–9, Ind. & Eng. Chem., Easton, Pa.

CHEMIST or CHEMICAL engineer. Chemistry major preferably minor in mathematics or physics. Work concerns water analysis, oil tests, corrosion, drilling mud, and other problems of petroleum production. Additional salary in accordance with experience. Location in well-equipped laboratory, Midwest city.
Box 67–N–9, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER for electrical insulation work. Should have experience in both organic and inorganic chemistry. Also, some knowledge of resins. 30–35 years old. Location, Pittsburgh.
Box 68–NP–9, Ind. & Eng. Chem., Easton, Pa.

LATIN AMERICAN Chemist or chemical engineer or man entirely familiar with Spanish and Latin American business. Position offers opportunity to direct production of chemical plant in Latin America. Applicants should submit educational history, experience, age, and a recent photograph.
Box 72–N–9, Ind. & Eng. Chem., Easton, Pa.

CHEMIST with experience in formulation of paints and surface coatings. Knowledge of synthetic resins and their application to the textile industry desirable. Position offers opportunity to direct research. Applicants should submit education, experience, age and recent photograph.
Box 73–NP–9, Ind. & Eng. Chem., Easton, Pa.

A MIDDLE Western industrial organization is seeking one or two men, preferably under 35, for adhesive research. Actual industrial experience in this field is desirable but not essential. Excellent opportunity for one familiar with adhesives, starch conversion and raw materials, such as starch, dextrins, glues, gums, resins, etc.
Box 74–NP–9, Ind. & Eng. Chem., Easton, Pa.

EXCELLENT OPPORTUNITY for creative chemist-salesman. Old established firm marketing operating supplies nationally direct to industry desires to emphasize expansion in textile processing oils. Interested in contacting mature and experienced "chemist-salesman" with ability to sell personally and to train sales force to sell textile oils. Please write giving details of qualifications.
Box 75–NP–9, Ind. & Eng. Chem., Easton, Pa.

ENGINEER—Philadelphia manufacturer of recording control instruments desires to employ several application engineers for the chemical industries. Applicants should be familiar with the practice and theory of industrial chemical processes and with the construction and use of available instruments and control devices. Must be capable of foreseeing practical needs for devices not yet available. A good education in physics or in chemical engineering considered essential. Applicants must be U. S. Citizens. Address replies to K-32, P. O. Box 3414, Phila., Pa.

SITUATIONS WANTED
(A.C.S. MEMBERS)

FOOD CHEMIST with over twenty years' wide experience in the Food Industry, in direction, research, process development, quality control, and factory problems. Desires a responsible position.
Box 69–N–8, Ind. & Eng. Chem., Easton, Pa.

TECHNICAL MARKET ANALYST Ph.D. 1940. Well rounded graduate training in physical, organic and inorganic chemistry. Limited training in metallurgy. Two years' industrial research experience. Desires position as market analyst for research or technical divisions of well established progressive company. Married, draft status 3-A, Phi Beta Kappa, Sigma Xi. Available on reasonable notice.
Box 37–N–8, Ind. & Eng. Chem., Easton, Pa.

RESEARCH DIRECTOR Ph.D., formerly assistant at Kaiser Wilhelm Institute of Chemistry and University of Paris. 15 years' research experience in organic chemistry, synthetic pharmaceuticals, hormones, alkaloids, microanalysis. Patents and publications. Now director of research industrial laboratory. Desires similar position in large industrial research laboratory or university. Austrian, have first citizenship papers. Married, age 38.
Box 39–N–8, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST, B.Sc., M.Sc., several years' industrial experience with oils, soaps, waxes, polishes. Desires industrial research or teaching position offering opportunity for research. Masters in physical chemistry. Trained in micro-techniques, physical methods and new analytical procedures. Married, age 27, prefer Northeastern area.
Box 25–T–8, Ind. & Eng. Chem., Easton, Pa.

VISITING PROFESSOR, available for the duration. Experienced teacher of organic, biochemistry, general chemistry. Author of texts and laboratory manuals in general chemistry, qualitative analysis, D.Sc. University of Geneva. See Who's Who. Geo. W. Muhleman, 1450 Englewood Ave., St. Paul, Minn.

ORGANIC CHEMIST, Ph.D. 1940 would like teaching or research position in organic or biochemistry. Experience in chemistry of microorganisms, carbohydrates, organic synthesis, azo dyes. Employed. 2 years industrial. Phi Beta Kappa, Sigma Xi. Publications. Prefer Western U. S. Married, 3-A, age 31.
Box 29–T–8, Ind. & Eng. Chem., Easton, Pa.

MEDICAL CHEMIST, PH.D., Broad experience in technical and scientific research on food products, biologicals and pharmaceuticals. Ten years with medical and hospital supply firm. Research, development and business knowledge. New York State or East preferred. References. Available Sept. 1. Class 3-A.
Box 40–T–8, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, B.Ch., and Biochemist, Ph.D., 1942 from large midwestern university. Desire academic or industrial position. Special training in Colloid chemistry. Experience with nitrocellulose and ensymes. Six publications. Age 25, Single. Available immediately.
Box 41–T–8, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, M.S., 28, married, one child, 3-A. Personable, responsible. Excellent organic training. 3 years' research and industrial experience. Desires organic research or development position in Chicago area. Now available.
Box 70–T–8, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER (Ch.E.), young man, three years' laboratory and plant experience, sixteen years' industrial sales. Loyal, enthusiastic, industrious. Can translate technical data understandingly to the layman. Effective speaker, writer, organizer. Authority chemical defense. Available immediately. Desires position to serve Nation more effectively.
Box 71–T–8, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D., 1935, six years' hydrocarbon research and development: Gasoline finishing, blending. Product and process improvement. Semi-scale quality fractionation producing high octane blending agents. Group leader alkylation, isomerization. Directive ability. Married, age 35. Desires responsible position.
Box 77–T–8, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL and INDUSTRIAL microscopist, and metallographist. Would like to organise or supervise a microscopical laboratory for research, new products development and application, process and product improvement. Ph.D., major in physical chemistry, minor in microscopy, Cornell. Fourteen years in research laboratories of the largest companies in two industries, five as research chemist, nine as microscopist dealing with a great variety of problems and materials; shorter periods in two other industries; experience with metals includes thesis and recent work on magnesium alloys. Sigma Xi. Married, two children, 42. Employed.
Box 87–T–8, Ind. & Eng. Chem., Easton, Pa.

DIRECTOR, RESEARCH or laboratory. Executive ability to direct staff and to apply original work and processes, on products inorganic, organic, biological, etc., to ethical pharmaceuticals, Drugs and Allied Lines. Pharm.D. extensive training and long experience. Wishes director position or assistant to technical executive.
Box 102–T–8, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, M.S. 1941 Columbia. Organic Major. Analytical and synthetic laboratory experience. Age 23, single, Draft status 2-A. Wants position with industrial concern engaged in war work.
Box 12–N–9, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST—B.S. and graduate credits. Four years' industrial experience in standard analytical work and research. Desires position in essential industry. Available immediately. Class 2-A.
Box 14–N–9, Ind. & Eng. Chem., Easton, Pa.

INDUSTRIAL POSITION, preferably with small eastern or southern firm, wanted by Ph.D., physical chemistry 1940, with two years' research experience. Married, twenty-eight years old, draft classification 2-B. Sigma Xi. Protestant American. Now employed, available one month's notice.
Box 18–N–9, Ind. & Eng. Chem., Easton, Pa.

INORGANIC CHEMIST, Ph.D. 1941. Four years' experience in applied analytical chemistry. Excellent background in organic and physical. Employed in nationally famous research institution. Desires location in western or central New York. Sigma Xi, Phi Lambda Upsilon. Age 27, married, Protestant. Draft 3-A.
Box 21–N–9, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, PHARMACEUTICAL, Phm.B. (Pharmacy); B.Sc. and M.Sc. (Chemistry); wishes to change to progressive firm offering responsible position requiring a knowledge of pharmacy, pharmaceutical chemistry, manufacturing procedures and control, as well as ability to do investigating work with new products and with formula changes in existing products; administrative ability; two years' experience as chief chemist of small pharmaceutical house. Age 31, 2-A deferment, Canadian, first papers for U. S. citizenship, excellent references.
Box 26–N–9, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. 14 years' experience various fields. Organic, pharmaceutical, cosmetic bio-chemistry. Analysis, Research, Development, Production control. Three languages. Imaginative, inventive, adaptable worker. Married with child. Age 39. Immediately available. Desires position. Location anywhere.
Box 29–N–9, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, B.S., M.S., nine years' experience in water treatment, steam boiler problems, also corrosion control, pipe lines, ordnance equipment, etc. Five years in insulation, heat transfer and acoustic control. Two years' foundry practice, malleable and gray iron, control of mixes for furnace and cupola melts. Experienced in research development, control, technical field service. Best of references. American, age 37, married, family, draft 3-A. Desire permanent position with good future. Available October 15. Location, Southern California preferred.
Box 31–N–9, Ind. & Eng. Chem., Easton, Pa.

DIRECTOR of RESEARCH, now employed, contemplates change due to undesirable location of present company. Thoroughly experienced in complete organization of research laboratories, equipment and hiring and handling of personnel. Ten years' experience in thermoplastic and thermosetting resins, molding, adhesives, cements, emulsions, rubber, proteins, cellulose derivatives. Designed molding and other plastic handling machinery. Experienced in plywoods and plywood molding and machine design. Sixteen patents. Christian. Age 35. Citizen. 3-A. Formal training at Eastern universities in mechanical engineering and physical and colloid chemistry.
Box 32–N–9, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER—20 years' varied experience in research, development, design, and plant operations in the fields of synthetic rubber, plastics, and other organic chemicals. Development work preferred in Eastern U. S.
Box 34–N–9, Ind. & Eng. Chem., Easton, Pa.

CHEMIST Ph.D. 30 years old, married, dependents, 3½ years' experience development work on adhesives and surface coatings.
Box 37–N–9, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, M.A. Columbia, 1941; physical and organic. Recently resigned from non-essential research position. Age 21. Excellent scholastic background and record. One year's experience. Alert, intelligent, practical, versatile. Highest references. Research preferred but will consider other. Available immediately anywhere in U. S.
Box 39–N–9, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST: B.S. in Chemistry 1939, experienced in literature searching, abstracting, indexing, library cataloging, typing, and office methods, with knowledge of scientific German, desires position as research librarian.
Box 41–N–9, Ind. & Eng. Chem., Easton, Pa.

INDUSTRIAL RESEARCH wanted in a modern up-to-date laboratory by B.Ch. (Organic) with 5 years' catalytic cracking and recently organic polysulfide plastics researches. Patents. Knowledge of synthetic rubber. Supervisory experience. Age 32, married, draft 2-A.
Box 44–N–9, Ind. & Eng. Chem., Easton, Pa.

(Continued on page 1147)

(Situations Wanted Continued)

ORGANIC-INORGANIC Chemist. M.A. leading Mid-Western University. Six years' industrial research experience including organic and inorganic polymers. Knowledge of properties, reactions and uses of compounds of 91 elements beside carbon. Patents. Articulate, adaptable, independent, willing worker with insatiable curiosity. Aged 29, married. Employed but seeking research position with greater responsibilities.
Box 45-N-9, Ind. & Eng. Chem., Easton, Pa.

PROJECT ENGINEER—Chemical engineer presently employed by large chemical company desires responsible position with a future. Experience covers equipment design and purchasing; plant layout and construction. Thoroughly familiar with chemical and mechanical aspects of process equipment and especially well trained in heat transfer problems. Experienced also in pilot plant design, operation, process evaluation, and as shift engineer. Citizen, age 30, married, 3-A Draft status, Protestant. Salary required $5400 per year. Eastern location preferred.
Box 46-N-9, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST. August Ph.D.; minors, Physical and Chemical Engineering. Excellent scholastic record, publications, experienced teaching and fulltime research in isolation, identification and synthesis of organic acids and nitrogen heterocycles. Age, 28; dependents. Now available for teaching or research preferably in Southwest.
Box 49-N-9, Ind. & Eng. Chem., Easton, Pa.

CHEMIST Ph.D. Excellent, varied industrial experience, research and others. Available on reasonable notice.
Box 51-N-9, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST. Graduate from European universities, age 30, married, 2 children, Draft Class 3, Protestant, 3 years in research laboratory for plastics, desires employment in research to use his wide range of chemical education. Preferably Organic Chemistry or Physiology. Languages French, German and Scandinavian. Available immediately.
Box 54-N-9; Ind. & Eng. Chem., Easton, Pa.

INDUSTRIAL CHEMIST, with business and executive experience. University graduate, twenty years' excellent record in research, development, sales and service with State, Federal institution and corporation. Publications, patents, sales literature. Desires active employment. References from all employers. Listed in American Men of Science. Draft 3-B.
Box 59-N-9, Ind. & Eng. Chem., Easton, Pa.

INDUSTRIAL CHEMIST Ph.D. 25 years' experience synthetic organic chemistry, process development, plant management, research direction, plant design, experienced in synthetic chemicals, plastics, protective coatings. Capable of directing plant producing organic substances or taking charge of research program.
Box 65-N-9, Ind. & Eng. Chem., Easton, Pa.

CHIEF CHEMIST, Metallurgist & Ceramist, Plumbers' cast iron enamelware, 13 years. Shut down by WPB. Chief Chemist, enameled kitchenware and metallic coatings, 8 years. Research & development, heavy chemicals, 7 years. B.S. in Chemistry. Permanent position desired where supervisory experience in control and research work would be useful.
Box 71-N-9, Ind. & Eng. Chem., Easton, Pa.

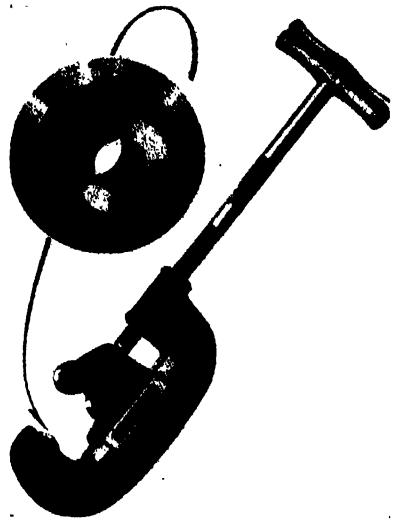
SITUATIONS WANTED (NONMEMBERS)

CHEMIST, MASTERS degree accredited Western college, now employed desires change. Three years' experience in raw materials and petroleum specialties. Age 27, single, white. Draft 4-F. Particularly interested in Northwest or Intermountain states.
Box 34-T-8, Ind. & Eng. Chem., Easton, Pa.

PATENT ATTORNEY Illinois bar; postgraduate degree, master patent law; working toward B.S. in Chemistry; recently admitted to practice before patent office; thirteen years' broad legal experience; intensive appellate experience; desires position with Chicago law firm or patent department specialising in chemical patents. Age 34. 3-A classification.
Box 25-N-9, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER—Design and cost estimating of process equipment experience. Experience in heavy chemicals plant layout, research and development. Will be available shortly.
Box 33-N-9, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, university degree, widely experienced analytical chemist. 14 years' industrial work, research, development operations. Many years gas & oil refining with all manifestations. Previous vegetable oils, fats. Recently accomplished process for Berylliumoxide. Age 44, single. Desires permanent connection anywhere.
Box 40-N-9, Ind. & Eng. Chem., Easton, Pa.



CHEMICAL ENGINEER, 12 years' experience organic chemical plant planning, layout, equipment design, piping, specifications, equipment selection, supervising plant operations, etc. Capable taking complete charge of products, or supervising production. Good practical knowledge of process operations. Desire permanent connection with responsibility. American, Protestant. Married. Age 37.
Box 43-N-9, Ind. & Eng. Chem., Easton, Pa.

FELLOWSHIP. Titanium chemistry research available September 15 to 30. Applicant with M.S. in chemical engineering, well trained in physical and organic chemistry. Submit complete data first letter including photograph, draft status, religious preference, experience, and certified transcript of record including grades to Arthur W. Hixson, Executive Officer, Department of Chemical Engineering, Columbia University, New York City. $2,000 per annum leading to doctorate.

Water-Hardening Tool Steel

Heavy-duty pipe cutter shown with cutter wheel made of Jessop RT tool steel

FOR many applications where extreme toughness is required above other characteristics, the Jessop Steel Co., Washington, Penna., is now furnishing a water-hardening tool steel under the brand name of Jessop RT. RT has enough ductility, even with its unusual hardness and strength, that it will stretch more than 4 per cent before it will break. For example, a tensile test on properly treated RT will show breaking strength of 323,000 pounds per square inch and elongation in 2 inches of 4.5 per cent. Jessop RT acquires a hard case and tough core when large and medium sizes are hardened. A $1^1/_2$-inch piece will have a fine-grained case approximately $^3/_{16}$ inch to $^1/_4$ inch deep with hardness of about C-61/63 Rockwell. The smaller sizes, under $^3/_4$ inch will harden throughout.

THE executive sales office of the Columbia Chemical Division of the Pittsburgh Plate Glass Co. has been moved to Pittsburgh from New York. Also involved in the transfer are the chemical division's traffic and advertising departments.

Service Record of Standard Oil of Indiana

TYPICAL of the experienced labor of Standard Oil Co. of Indiana producing fuels and lubricants for the armed forces, war industries, and the farm front are 11,993 active employees with a total of 175,010 years of service who will have been awarded gold pins in recognition of 10 to 40 years of service each by December 31 this year.

Ninety-five employees will have been awarded pins for 40 years of service, 607 for 30 years, 4,009 for 20 years, and 7,282 for 10 years. Of these, seven employees will be awarded pins for 40 years, 66 for 30 years, 285 for 20 years, and 326 for 10 years during the last six months of 1942. The 30-year employees who will be honored include Harry F. Glair, general manager of manufacturing and a director, and William C. Ewald, an assistant secretary.

Extinguishing Magnesium Fires

A NEW product developed by the Research Laboratory of the Philip Carey Mfg. Co., Lockland, Cincinnati, Ohio, for reducing losses incident to magnesium fires is called Carey MX granules. Tests are said to show that, when spread over the fire, the granules soften and seal the burning magnesium with an airtight blanket. It is also possible to reclaim much of the magnesium when this method of extinguishing fires is used. The product has been tested by the Underwriters' Laboratories, Inc.

Army-Navy E Award to Porter

THE H. K. Porter Co., Pittsburgh, Penna., has been selected by the Army and Navy Departments to receive the joint Army-Navy E Award, in recognition of high achievement in production of war equipment. The company, which turns out locomotives, process equipment, and special ordnance material, is one of the first locomotive manufacturers to receive this award. In further expanding production, the company will soon open another plant in Pennsylvania.

Cochrane Appoints Flowmeter Representative in Philadelphia

COCHRANE CORP., Philadelphia, Penna., announces appointment of the Energy Control Co. as flowmeter representative for eastern Pennsylvania, southern New Jersey, Delaware, and Maryland. Energy Control Co. is located at 3107 North Broad St., Philadelphia, and will also handle Hays combustion control and instruments and the Heacon damper. Energy Control Co. also represents these lines in New York City and vicinity, including western Connecticut and northern New Jersey.

Help Put Empty Cylinders to Work

PRODUCTION requirements today are such that there is an increased demand for oxygen and acetylene. This demand can be met if empty cylinders are returned promptly and if cylinder stocks in the hands of users of oxy-acetylene welding and cutting are maintained at a minimum.

MICRO-ELEMENTARY ANALYSES: C, H, N, S, P, Halogens, Methoxyl, Mol. wt., etc., U.S.P. and other official tests, Purity tests, Microinorganic assays, Spot tests, Micro-distillations, Toxicological investigations, and typical micro-chemical research work. Dr. Carl Tiedcke, 366 Fifth Avenue, New York, N. Y.

COLLOIDAL ASPIRIN
U. S. P. 2,293,359

The owner of this patent will entertain offers from firms having at least B-2 rating in Dunn and Bradstreet.

Box 89-T-8, Ind. & Eng. Chem., Easton, Pa.

COMPLETELY EQUIPPED analytical and research laboratory. Specializing on food, bacteriological work, brewing research and water analysis. Established clientel. Selling entire business including furniture, equipment, etc., account of illness.
Box 98-T-8, Ind. & Eng. Chem., Easton, Pa.

For Sale
CRESYLIC ACID
William D. Neuberg Company
420 Lexington Ave. New York, N. Y.
Telephone LE 2-3324

FOR SALE: From private library, chemical abstracts complete 1 to 34, including 1st and 2nd decennial indexes, bound in buckram, except 1st six volumes bound in half leather; J. A. C. S., 29 to 63 bound in buckram; Ind. and Eng. Chem. 16-33 unbound.
Box 19-N-9, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: showroom samples. Savings to 50%. Chemical centrifuge with perforated manganese bronze basket. Engler-Ubbelohde Viscosimeter. Silverman microscope illuminator. Motors: 1/3 HP, 110 V, AC; 1/8 HP, 110 V, DC. No priorities required. Schaar & Company, 754 West Lexington Street, Chicago, Ill.

FOR SALE: Annales Institute Pasteur Vol. 1—47, International Critical Tables, Bulletin Societe Chemique 1920—1933, 1935—1939, $135.00, Journal Institute of Petroleum Technologists 1924—1939, $100 00, Biochemisches Zeitschrift Band 1—77, 83—85, 92—100, 104—108, 115—120, 126—130, 176—190. Newly bound $625.00, Annales de Chemie et Physique.
Box 28-N-9, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Petrographic microscope. Unused Zeiss, model III-M. Asking price $650.00. Address Theodore Woodward, 43 Lowell Avenue, West Orange, N. J.

WE OFFER: Organic Alkyl Halides and Polyhalides, also Aliphatic Polyfluorides and Polychlorides of Propane—also Digitonin-Dulcitol-Sodium Cacodylate-Histamine and Histidine Compounds-Methionine-de-Ribose—also Cacodylic-Galacturonic-Levulinic-Mucic-Naphthalene Acetic Acids.
Box 35-N-9, Ind. & Eng. Chem., Easton, Pa

FOR SALE: Journal American Chemical Society Vol. 27-55 (1904-33) $200. Ind. & Eng. Chem. Vol. 1-33 (1909-41), with Analyt. Edition Vol. 1-13 (1929-41) $200. Unbound and excellent condition.
Box 42-N-9, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Chemisches Zentralblatt years 1868, 1869, 1897 to 1914. 1920 to 1932. Zeitschrift analytische Chemie vols. 34t o 54, Friedlaender, Fortschritte Teerfarbenfabrikation vols. 1 to 12. Wish to purchase: Chemical Abstracts cplt. set Intern. Critical Tables.
Box 48-N-9, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Amer. Chem. Soc. Journals Vol. 23-Vol. 54 incl. $200. First Decennial Index Chem. Abstracts 4 volumes $60. Jour. Soc. Chem. Ind. with Brit. Chem. abstracts yearly index. Vol. 22-48 incl. Any reasonable offer accepted. All unbound and in excellent condition. Location N. Y. C.
Box 69-N-9, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Chemical Abstracts, Volumes 1 to 27, Industrial & Engineering Chemistry, Volumes 1 to 23, Journal American Chemical Society, Volumes 27 to 55. Volumes are unbound but in excellent condition. Chemical Abstracts have annual indexes, but not decennial indexes. Location, Easton, Pa.
Box 70-N-9, Ind. & Eng. Chem., Easton, Pa.

FOR SALE—We are in the service to serve you with fully guaranteed laboratory equipment. We are serving government depts., war plants, institutions, industrial & research laboratories. We can serve you too. Check this list or send your lists and we will quote on your needs immediately if available. Gaertner Cathetometer, McMichaels Viscosimeter, Stormer Viscosimeter, Saybolt Viscosimeter, Cement Compression Tester, International Centrifuges, Schmidt & Haensch Precision Saccharimeters double wedge 200-400 mm, Zeiss Sugar Refractometers, Scott Testers, Suter single strand tester, Mullen Paper testers, Mullen Tensile tester, Stokes water stills, Bramhall & Deane size 2 autoclave, American horizontal autoclave 14 × 22, new Labtest Hydraulic presses 6 × 6, new drying ovens 12 × 12, New Incubators 10 × 10, B & L Dipping Refractometer, B & L Spencer Microscopes, B & L Chemical Microscope, Microscopic Accessories, Mechanical stages, Camera Lucida, Eyepieces, Micrometers, Dark Field Condensers, Weston Meters all ranges and types, Spencer Rotary Microtomes, Automatic Clinical Microtome, Pulp Balances (New) 150 gr capacity, 1 mg sensitivity $27.50 in Mahogany cases with drawer, colorimeters, Ross #66 Pulverizers 18" cages, Stokes Eureka single tablet press, Electric Hot Plates 3 heat two sizes 7" and 8" at $8.75 and $10.75 each, etc., all offerings are subject to prior sale and government regulations. Write or wire for immediate information and quotations, The Laboratory Exchange, 24 East 21st Street, New York City.

WANTED: 200 pounds Iron Cacodylate—also moderate amounts Asparagine, Alanine, Edestine, Phloridzin, Levulose, Orcinol, Tryptophane, Xylose; Aspartic Acid, Acrylic Acid, Rhenium Salts, Hafnium Salts. All rare earth salts including Dysprosium, Europium, Gadolinium, Scandium.
Box 36-N-9, Ind. & Eng. Chem., Easton, Pa.

WANTED: "Chemisches Zentralblatt": 1913, 1914, 1925-1927, 1933-1936, 1938-1941, paying per unbound year $18.00 or per bound year $22.00; "Zeitschrift fuer Elektrochemie": 1894-1926, or any year. Dr. G. H. Fransius, 201 East 82nd Street, New York, N. Y.

WANTED TO BUY. We urge you to sell us now those idle or surplus instruments which someone somewhere needs in a hurry on some vital production or research problem. Sell now and obtain the highest resale value ever possible. We are purchasing 99% of all equipment which has been offered us for the past 12 months. Offer us now by air-mail. Telegraph all equipment you can do without and obtain our immediate cash offer. We have definite orders on hand and are ready to purchase outright. Located anywhere in America. Such as Abbe Refractometers, microscopes, Polariscopes, Binocular microscopes, Metallurgical Microscopes, and testing instruments. Measuring microscopes, Balances, spectographic equipment, microscopic accessories, slide rules, Verniers, balance weights, Weston meters, shunts, instruments of every description, centrifuges, autoclaves, ovens, ball mills, Barnstead Stills, Cathetometers, and hundreds of other instruments too numerous to mention. Complete laboratories or plants containing laboratories write or wire description for immediate response. The Laboratory Exchange, 24 E. 21st St., New York City.

REFRACTOMETER, new or used, send full description, price, etc.
Box 61-NP-9, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL AND ENGINEERING NEWS

HARRISON E. HOWE, Editor

PUBLISHED BY THE AMERICAN CHEMICAL SOCIETY

VOLUME 20 SEPTEMBER 25, 1942 NUMBER 18

The A. C. S. Meeting in Buffalo

Directors' Minutes

THE Board of Directors of the AMERICAN CHEMICAL SOCIETY met in Parlor C of the Hotel Statler, Buffalo, N. Y., at 8:30 P. M., September 6, 1942. Thomas Midgley, Jr., Chairman of the Board, presided, and the following Directors were present: L. H. Adams, Roger Adams, Robert T. Baldwin, E. K. Bolton, Willard H. Dow, Wm. Lloyd Evans, Per K. Frolich, A. J. Hill, H. N. Holmes, Charles L. Parsons, R. E. Swain, Charles A. Thomas, and R. E. Wilson. H. E. Howe was present by invitation. The minutes of the last meeting, which had been distributed to each Director, were approved without being read.

An ad interim report of the SOCIETY'S activities was presented by the Secretary and approved for presentation to the Council.

Lawrence W. Bass gave a verbal report on the progress of the Committee on Economic Status. It was moved, seconded, and carried that the Editor be and is hereby authorized to use the necessary pages to print the report in CHEMICAL AND ENGINEERING NEWS, publishing it as a series. When completed, reprints are to be struck off and made available to the membership at a price estimated to cover cost of printing and distribution.

It was moved, seconded, and carried that the report of the Finance Committee be accepted and placed on file.

The Directors discussed the situation confronting the SOCIETY with regard to the general session on Wednesday afternoon, as announced in CHEMICAL AND ENGINEERING NEWS, and its relation to the activities of the Baruch committee on the synthetic rubber program. It was moved, seconded, and carried that the following statement be presented to the general assembly after the awarding of the prizes on Wednesday afternoon, September 9, 1942:

This meeting was planned in detail before the appointment of the Baruch Committee. The speakers were picked with care in the hope that their pronouncements, under the auspices of the AMERICAN CHEMICAL SOCIETY, would carry conviction to the public that American chemists can bring the production of synthetic rubber to a successful conclusion. The addresses were prepared with care and were released by high authority for presentation and publication.

The appointment of the Baruch Committee introduced an unexpected situation. Its personnel commands the respect of every intelligent chemist. The committee has not reported, but its findings are certain to carry conviction to every unbiased American citizen.

Under these conditions, the Board of Directors of the AMERICAN CHEMICAL SOCIETY, at the suggestion of E. R. Weidlein, has withdrawn his paper on "Progress of Synthetic Rubber Production" from presentation at this time, and it will not be published before the report of the Baruch Committee has been formulated and made public.

Both courtesy and ethics demand such action. No suggestion for or against such procedure has been made by the Baruch Committee.

The paper announced as "The Outlook on the Rubber Situation" was to have been an extemporaneous discussion by a prominent but unnamed official. He, for similar reasons, feels he should not appear. The papers by A. L. Elder and Willard H. Dow will be presented.

The Directors are confident that the members of the SOCIETY will understand and approve their decision. As the official program had been printed and distributed to 35,000 subscribers to CHEMICAL AND ENGINEERING NEWS, there was no possible way of giving advance notice of this action to the membership.

* * * *

It was moved, seconded, and carried that an additional appropriation of $3,000 be added to the 1942 budget for the office of the Secretary and Business Manager.

It was moved, seconded, and carried that the sum of $2,000, or as much thereof as may be necessary, be appropriated for the purchase of a bookkeeping machine, and that the Treasurer be authorized to make the necessary expenditure from funds not otherwise appropriated.

It was moved, seconded, and carried that a sum not to exceed $500 be appropriated for the expenses of an exhibit at the National Chemical Exposition to be held in Chicago, Ill., November 24 to 29, 1942, and that the Treasurer be authorized to make the necessary expenditure from funds not otherwise appropriated.

A communication received from Auburn A. Ross, Secretary of the Group of Local Section Officers, at the Memphis meeting, just after the Directors' meeting had adjourned, was read and discussed. It covered certain recommendations regarding changes in the method of administering commissions on new memberships. It was moved, seconded, and carried that the Directors could not approve the recommended change. The report was ordered placed on file.

A report on the inventory of paper with the Mack Printing Co. was read and ordered placed on file.

The Secretary gave a verbal report on the SOCIETY'S relations with the Export Censor.

The President reported on the activities of his office during the year.

At 12:03 A. M., just prior to adjournment, it was moved, seconded, and carried that the motions recorded above be approved. There being no further business, the meeting adjourned.

CHARLES L. PARSONS, *Secretary*

Buffalo Meeting Abstracts

ABSTRACTS of Buffalo meeting papers sold out at Buffalo and are now being reprinted. Send your orders without delay to A. C. S. News Service, 1155 Sixteenth St., N. W., Washington, D. C.

Council Policy Committee Minutes

THE Council Policy Committee met in Room 1002, the Hotel Statler, at 3:00 P. M., September 6, 1942. Harry N. Holmes presided, and the following members of the committee were present: Robert T. Baldwin, E. M. Billings, E. J. Crane, G. J. Esselen, Wm. Lloyd Evans, Per K. Frolich, H. E. Howe, Arthur B. Lamb, Thomas Midgley, Jr., Charles L. Parsons, and Walter Schmidt.

After discussion, the committee appointed a committee of six, as required by the Constitution, to nominate two individuals for the office of Director-at-Large to succeed Thomas Midgley, Jr., who is ineligible for re-election.

A communication was received suggesting that a national employment bureau be conducted by the SOCIETY. After discussion, the Secretary was advised to write Mr. Fetzer that the committee considers the present procedures of the Employment Information pages in CHEMICAL AND ENGINEERING NEWS and the Employment Clearing House are much better methods of operation and that these facilities are functioning with real accomplishment.

The President of the SOCIETY was asked to select three men to consider what the SOCIETY might do, if anything, to improve the present employment procedure, and after due consideration, to report their findings to the Council Policy Committee.

Two communications were received requesting the SOCIETY to undertake to direct the utilization of chemists in civilian defense. After discussion, it was decided that the communications already sent by the Secretary requesting the Local Sections to cooperate actively with the Chemical Warfare Service and the Office of Civilian Defense were all that is necessary at present. Since this work is being officially directed by the Chemical Warfare Service and the Office of Civilian Defense, it is the opinion of the committee that it is unnecessary to set up a third procedure.

There was a general discussion of other SOCIETY problems. No other action was taken.

The meeting then adjourned.

CHARLES L. PARSONS, *Secretary*

Council Minutes

THE Council of the AMERICAN CHEMICAL SOCIETY met in the Ballroom of the Hotel Statler, Buffalo, N. Y., at 9:40 A. M., September 7, 1942, with President Harry N. Holmes presiding and the following Councilors and substitutes present:

Councilors and Substitutes

Ex Officio. L. H. Adams, Roger Adams, Robert T. Baldwin, Edward Bartow, L. W. Bass, Shailer L. Bass, Erle M. Billings, E. K. Bolton, F. E. Brown, E. J. Crane, Willard H. Dow, Wm. Lloyd Evans, Per K. Frolich, E. E. Harris, E. H. Harvey, Arthur J. Hill, H. E. Howe, Arthur B. Lamb, S. C. Lind, Thomas Midgley, Jr., Ben H. Nicolet, Charles L. Parsons, G. L. Royer, Walter A. Schmidt, H. B. Siems, Lee Irvin Smith, Robert E. Wilson.

Councilors-at-Large. Geo. D. Beal, Gustav Egloff, Henry Gilman, H. B. Hass, Edward Mack, Jr., Carl S. Marvel, C. E. K. Mees.

The AMERICAN CHEMICAL SOCIETY assumes no responsibility for the statements and opinions advanced by contributors to its publications.
Published by the AMERICAN CHEMICAL SOCIETY, Publication Office, 20th & Northampton Sts., Easton, Penna. Editorial Office, 1155 16th St., N. W., Washington, D. C.; Telephone, Republic 5301; Cable, Jiechem (Washington). Advertising Department, 332 West 42nd St., New York, N. Y.; Telephone, Bryant 9-4430. Entered as second-class matter at the Post Office at Easton, Penna., under the act of March 3, 1879, as 24 times a year on the 10th and 25th. Acceptance for mailing at special rate of postage provided for in Section 1103, Act of October 3, 1917, authorized July 13, 1918.
Annual subscription rate, $2.00. Foreign postage to countries not in the Pan American Union, $0.60; Canadian postage, $0.20. Single copies, $0.15. Special rates to members.
No claims can be allowed for copies of journals lost in the mails unless such claims are received within 60 days of the date of issue, and no claims will be allowed for issues lost as a result of insufficient notice of change of address. (Ten days' advance notice required.) "Missing from files" cannot be accepted as the reason for honoring a claim. Charles L. Parsons, Business Manager, 1155 16th St., N. W., Washington, D. C., U. S. A.

Homer Adkins. *Wooster*, M. P. Puterbaugh (subs.).

It was moved, seconded, and carried that the minutes of the Memphis meeting be approved as printed.

The Secretary read the following list of members reported as deceased since the Council meeting at Memphis:

Deceased Members

Backus, Arthur A.
Bernhard, Adolph
Billheimer, Edward C.
Busch, Henry P.[1]
Carpenter, Harry A.
Caspari, Charles E.
Cone, Richard M.
Crawford, Ellis T., Jr.
Dearden, John R.
Fleming, Raphael Stuart
Glenn, Gustavus R., Jr.
Hall, Clarence A.
Hoover, Charles R.
Knight, Henry G.
Krister, William H.
Lee, Kenneth G.
Lewis, Herbert Samuel
McElroy, K. P.
Moyer, Laurence S.
Oltman, R. E.
Owens, Charles Robley
Pfanstiehl, Carl
Rogers, Burl G.
Rolfe, Geo. W.
Roy, Charles S.
Scherrer, John A.
Schlicting, Emil
Stanton, F. M.
Stewart, Andrew
Swisher, Donald P.
Taylor, Harold Leo
Thompson, Gustave W.
Wardell, Charles H., Jr.
Warmbrunn, David
Wikoff, Alan G.
Willstatter, Richard[2]

[1] Life member
[2] Honorary member

The Council stood a few moments in silent tribute to their memory.

By direction of the President, the Secretary read the following report on the condition of the Society, which statement had been read previously to the Board of Directors at its meeting on September 6:

Ad Interim Report on Condition of the American Chemical Society September 1942

The American Chemical Society still progresses, and in spite of the war and its many drawbacks will unquestionably more than balance its budget again in 1942. Naturally, the expenses have increased and are increasing, but the appreciation of the chemists and chemical engineers of America for the Society's work also means increased support. During 1942, up to September 1, 4,025 individuals have joined the Society. The total membership today is 31,423, against 28,551 on the same date last year; a net increase of 2,873 after deducting resignations, delinquencies, etc. Seven new student affiliate chapters have been added, but the number of student affiliates has decreased from 1,819 to 1,765. This is due to the decreasing number of students who have been allowed to remain in college as candidates for scientific and technical degrees.

There has been a very severe but expected drop in foreign subscriptions, especially of nonmembers. There has naturally been an increase in membership subscriptions, but these would have been considerably greater except for the war. The total subscriptions to the *Journal of the American Chemical Society* have decreased 126; *Chemical Abstracts* shows a decrease of 680; but *Industrial and Engineering Chemistry* has increased by 413 and Chemical and Engineering News has increased by 1,667 subscriptions.

The Secretary's office has been literally swamped with problems of real import. His time has been given not only to matters of normal Society policy and business, but especially to strenuous attempts to see that chemists are placed or retained where they can be most useful in the war effort. He has received full cooperation from Selective Service Headquarters but not always from the Local Boards. Still, a fair record has been made, and it is believed that at least nine out of ten, when information has been obtained and furnished to headquarters, have been deferred and retained in the Production Army where they properly belong.

The Secretary's time has also been taken up, as might be expected, with questions of censorship, especially as to the exportation of our journals to foreign countries. While certain issues have had to be held, as announced in the June 25 issue of Chemical and Engineering News, on the whole the Society has no complaints regarding the treatment it has received. The censor has a duty to perform, and is making every effort to carry it out without undue hardship on the part of the American Chemical Society.

The Employment Clearing House is functioning successfully again at this meeting. The operations at the Memphis meeting were described on page 659 of the May 25 issue of Chemical and Engineering News. This has become one of the most valuable and helpful facilities of the American Chemical Society, not only to employees but also to employers.

Many of the Local Sections, to whom suggestions were sent from the Secretary's office regarding cooperation with the Office of Civilian Defense, have responded and are functioning vigorously and intelligently.

The other functions of the Society are proceeding in an extremely satisfactory manner and need no special comment. The members are all familiar with the continuously improving quantity and quality of the published material they are receiving.

Charles L. Parsons, *Secretary*

A petition for the formation of a Local Section with headquarters at Kalamazoo, Mich., signed by 38 members of the Society, with territory comprising the counties of Allegan, Kalamazoo, Kent, Ottawa, and Van Buren in the State of Michigan, to be known as the Kalamazoo Section, was approved unanimously by the Council.

Arthur B. Lamb was re-elected Editor of the *Journal of the American Chemical Society;* E. J. Crane was re-elected Editor of *Chemical Abstracts;* Harrison E. Howe was re-elected Editor of *Industrial and Engineering Chemistry* and Editor of Chemical and Engineering News—all for a term of three years, beginning January 1, 1943.

C. S. Marvel and George Scatchard were elected Associate Editors of the *Journal of the American Chemical Society* for a term of five years beginning January 1943, succeeding R. C. Fuson and Farrington Daniels, each ineligible for re-election.

W. A. Noyes, Jr., and George O. Burr were elected Associate Editors of the *Journal of Physical Chemistry* for a term of two years beginning January 1, 1943, and succeed W. H. Rhodebush and I. M. Kolthoff.

R. L. Shriner and T. B. Drew were elected to the Editorial Board of *Chemical Reviews* for a term of three years, beginning January 1, 1943. They succeed R. C. Elderfield and E. R. Gilliland.

Bruce K. Brown, W. T. Read, and Charles A. Thomas were re-elected associate editors of Technologic Monographs for a term of three years, beginning January 1, 1943.

M. G. Mellon and R. H. Müller were elected members of the Advisory Board of the Analytical Edition of *Industrial and Engineering Chemistry* for a term of three years, beginning January 1, 1943.

Erle M. Billings was re-elected a member of the Council Policy Committee for a term of three years, beginning January 1, 1943.

J. Sam Guy presented the following report of the Committee to Encourage and Foster Research in American Colleges through the use of advisors:

Report of Committee to Encourage and Foster Research in American Colleges through Use of Advisors

This committee has as its objective an effort to mesh any unused talent of the members of the Society, especially retired directors of research, with the departments of chemistry among the smaller colleges and universities where the staff is not sufficiently large or well equipped to carry on such work alone.

The committee believes that there are many unsolved chemical problems which could be "farmed out" under the direction of visiting professors who have had wide experience in directing research. Such problems could be placed in the hands of the better college students where they would serve both as an inspiration to the student and a definite service to the subject. There are many retired or

emeritus teachers who would be vitally interested in doing a great service to education.

The committee, consisting of Messrs. Evans, Willard, Reid, Lind, Hopkins, Brinkley, and Guy, Chairman, would be glad to contact both college and university departments who may be interested in such a program. This may be done through contacting the chairman.

J. SAMUEL GUY, *Chairman*

DEPARTMENT OF CHEMISTRY
EMORY UNIVERSITY, GA.

The Secretary was instructed to send the unanimous thanks of the Council to the Local Section officers, committees, and individuals who, under very great difficulties, have contributed to the splendid success of the Buffalo meeting.

The selective service situation with reference to chemists and chemical engineers was discussed.

There being no further business, the Council adjourned.

CHARLES L. PARSONS, *Secretary*

Awards in Chemistry

NOMINATIONS for awards administered by the AMERICAN CHEMICAL SOCIETY must be made under the conditions of the awards and must be in the hands of the Secretary of the SOCIETY, 1155 Sixteenth St., N. W., Washington, D. C., on or before January 1 of the year of the award. These awards include the AMERICAN CHEMICAL SOCIETY Award in Pure Chemistry, the Eli Lilly and Company Award in Biological Chemistry, the Borden Award in the Chemistry of Milk, and the Women's Award in Chemistry.

Full details were printed in the September 10, 1941, NEWS EDITION, page 969.

Nelson Allen, Local Committee Chairman

A. C. S. Meeting Registrations

Chemical Abstracts Luncheon

IN ENDEAVORING to live up to its slogan "Key to the World's Chemical Literature" during these war-disturbed days, *Chemical Abstracts* is having enough difficulties to qualify as model for a radio serial. Nevertheless, this journal is managing with considerable success to maintain its world-wide scope. The means which have been found to do this provided the keynote of the discussion at the abstractors' luncheon in Buffalo. Editor E. J. Crane announced that *Chemical Abstracts* has dropped only 22 per cent in size to September 1, 1942, from the corresponding size before war broke out in Europe in 1939 and only 10.5 per cent from the size at the corresponding date last year. Most of the reduction is attributable to the wartime decrease in chemical publication.

Former Editor Austin M. Patterson and President-Elect Per K. Frolich, once an abstractor, were the luncheon speakers.

At Buffalo under Priorities

VITALITY and determination of chemists to get together were demonstrated again at Buffalo where priorities on transportation and limits to housing capacity were the immovable bodies met by the irresistible force of near-record attendance of chemists.

* * *

GREGARIOUSNESS with serious purpose and active interest in the rubber program pushed registration at the 104th meeting of the A. C. S. into third place on the list of records. Only New York and Atlantic City hold their places and Detroit and Baltimore drop back one place each to let Buffalo into third place.

* * *

TRANSPORTATION difficulties in getting to the meeting were forgotten in the pride of arrival, but from then on the impression gained rapidly as the week progressed that Buffalo and the Western New York Section were in league with the transportation companies to make the temporary increase in the frontier's chemical census permanent. Mass exodus over crowded rail lines presented new challenges to chemical ingenuity, and new tests of the patience of transportation company employees.

* * *

HOUSING became stringent when all available rooms in the selected hotels were reserved two months before the meeting. Some relief was afforded by commandeering private homes and Canada helped by allowing some chemists to use hotels across the border.

* * *

BUS and taxi transportation in connection with the meeting, especially for sightseeing to Niagara Falls, added to the troubles of the local committee when freezing orders canceled advance arrangements. Again Canada proved a good neighbor by providing busses on regularly scheduled runs to take sightseers to the Falls.

* * *

THE Division of Paint, Varnish, and Plastics Chemistry solved its transportation problem during a rainy part of the meeting by utilizing the "Black Maria" of the Buffalo Police Department (the police had supplied the division's meeting place) to

shuttle members to and from the Statler. Whether this extraordinary service by the police indicates excessive rectitude on the part of the division's members or the contrary had not been decided at the close of the meeting.

* * *

MEETING rooms overflowed often. The court stenographer to record two of the papers before the Symposium on Research Management could not get into the room to do his job on account of the crowd. Food, too, interested an unexpected number and overcrowded the Symposium on methods for the Preservation of Foodstuffs and Their Application in the War Effort with double the capacity of the room. Agriculture and Food had to move to larger quarters on another floor, and thanks to the smooth arrangements of the local committee, the move was made (complete with audience) in 15 minutes between papers.

* * *

EXCHANGING rooms between divisions was almost the order of the day to meet the needs of unexpectedly large attendances.

* * *

CENSORSHIP required the deletion of several papers from the program at various points and may become an even more important factor in arranging future programs.

* * *

MEDALS to the local committee members and divisional officers who conducted an outstanding meeting under the most trying and changeable conditions.

* * *

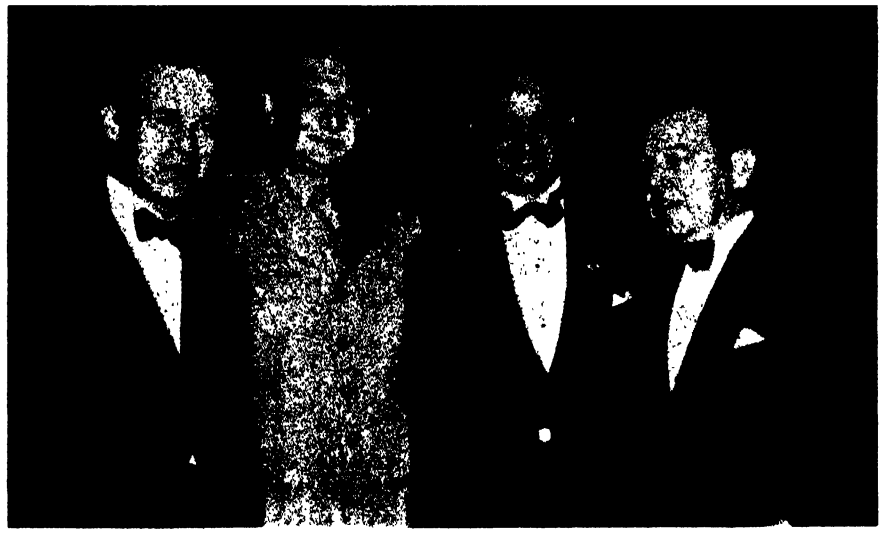
MEDAL, also, to Florence B. Seibert—Women's Award in Chemistry (Garvan Medal); and AMERICAN CHEMICAL SOCIETY Award in Pure Chemistry (sponsored by Alpha Chi Sigma) to John Lawrence Oncley, who is a member of the fraternity.

* * *

REGISTRATION got off to a good start on Sunday to the apparent surprise of many who seem to forget that high registration on Sunday has become the rule.

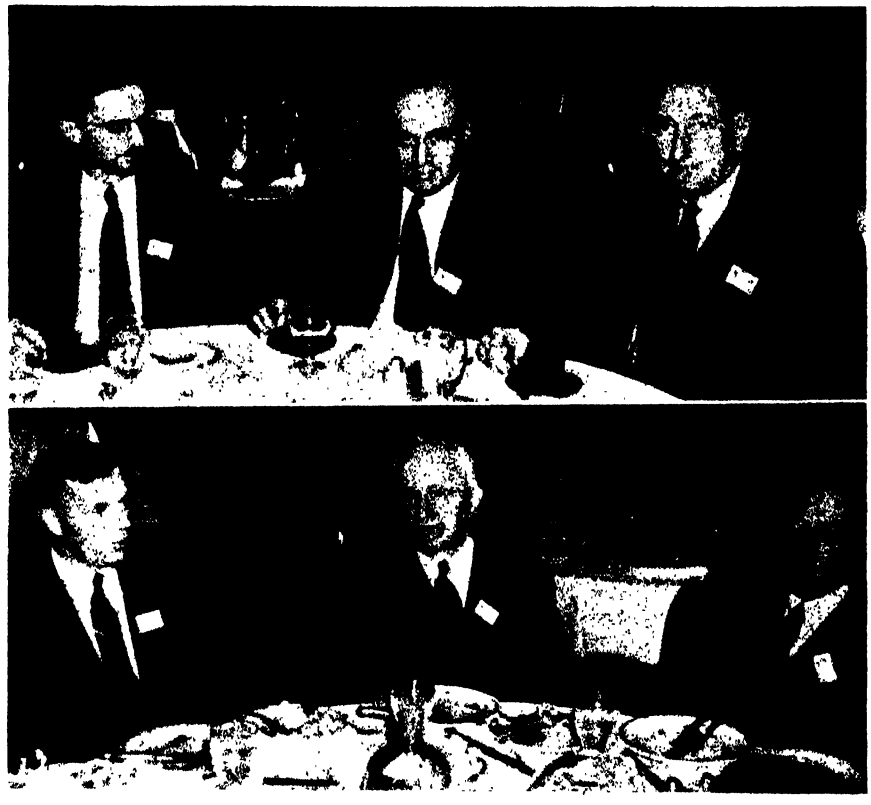
* * *

FOR the record: divisions meeting, 17; papers, 425; authors, 693; symposia, 14.



* * *

MONDAY'S Council meeting approached another record of peace and expedition in handling its business without serious argument on any points.



* * *

DIVISIONAL meetings got off to a flying start on Monday afternoon and continued through the week with the Division of Rubber Chemistry winding up the program with two sessions on Friday.

* * *

At the subscription dinner Wednesday night ***Left to right:*** **President Harry N. Holmes, Lieutenant General W. S. Knudsen, Local Committeeman R. L. Murray and E. R. Weidlein**

Top. **E. J. Ritchie, Eagle Pitcher Lead Co., J. H. Calbeck, consultant, and A. F. Brown, Imperial Paper and Color Co.** ***Bottom.*** **Harry Outcault, St. Joseph's Lead Co., W. L. Evans, Ohio State University, and W. A. Bush, California Flaxseed Products**

Left to right: **N. D. Scott, F. S. Pratt, P. J. Carlisle, L. M. White, du Pont Electrochemicals Division**

THE strange sound evident in the Statler on Wednesday afternoon at 8:14:30 P. M. was the sigh of sincere relief by the local committee when registration passed the 4,000 mark. The sigh was based on changes of plan and uncertainty of most things connected with the meeting before and after Pearl Harbor. First estimates of attendance hovered around 5,000. Later these were revised several times to fit circumstances, even the possibility of no meeting at all, and final commitments and arrangements were made with some trepidation on the basis of 4,000.

* * *

GROUP meetings and meals continue an important part of the functioning of national meetings. Seventy-five such events were scheduled on the Buffalo program, each well attended, in addition to numerous less formal affairs in all parts of the frontier territory.

* * *

Top. Dr. and Mrs. G. Symons. *Center.* E. Bartow, Iowa State, and W. J. Karslake, National Aniline & Chemical Co. *Bottom.* L. C. Rubin and H. O. Forrest, The M. W. Kellogg Co., and M. De Simo, Great Lakes Carbon

Buffalo Historical Museum facing Delaware Park Lake

PUBLIC address systems in the Statler being interconnected through a central switchboard provided relief for heavy listening to papers. One of Monday's sessions included a swing band interlude of the current "I've got spurs...", and the speaker at one luncheon was similarly interrupted with unexpected music. The hilarity accompanying each outbreak was too great, and the embarrassment too evident, to permit names to be given here.

* * *

MONDAY evening's entertainment took place in the gigantic, carefully calculated megaphone comprising the principal auditorium of Buffalo's magnificent Kleinhans Music Hall. Opening the program were three familiar compositions rendered with finished artistry by the Buffalo Philharmonic Orchestra under the baton of Franco Autori. Honorable Alan D. Drake, substituting for Buffalo's Mayor Kelly, welcomed chemists. President Harry N. Holmes and C. M. A. Stine dipped into the present and the future to show the vital effect of chemistry and of science in national survival in the present world turmoil and in molding a better future. Nonchemical Buffalonians as well as chemists were stimulated and inspired by the two significant addresses.

* * *

A NURSERY, fully equipped with toys dear to the very youthful and in charge of a trained kindergartner, was at the disposal of chemists at the Statler. No children showed up to utilize it and one chemist hearing of that attempted to crash the nursery gate but refused to stay when he found that the toy selection was not complete enough to include an electric train. Obviously a thwarted attempt to circumvent the transportation shortage.

* * *

TUESDAY evening again demonstrated the avidity of chemists for gambling on the long chances when the County Fair at Buffalo's huge Memorial Auditorium provided plenty of stage money and attractions where it could be gambled away. Circus attractions on a stage in the center of the arena drew attention and interest for most of the evening and winners at the gambling were hard to find afterward. Prizes were War Bonds and proceeds from various concessions went to the U. S. O.

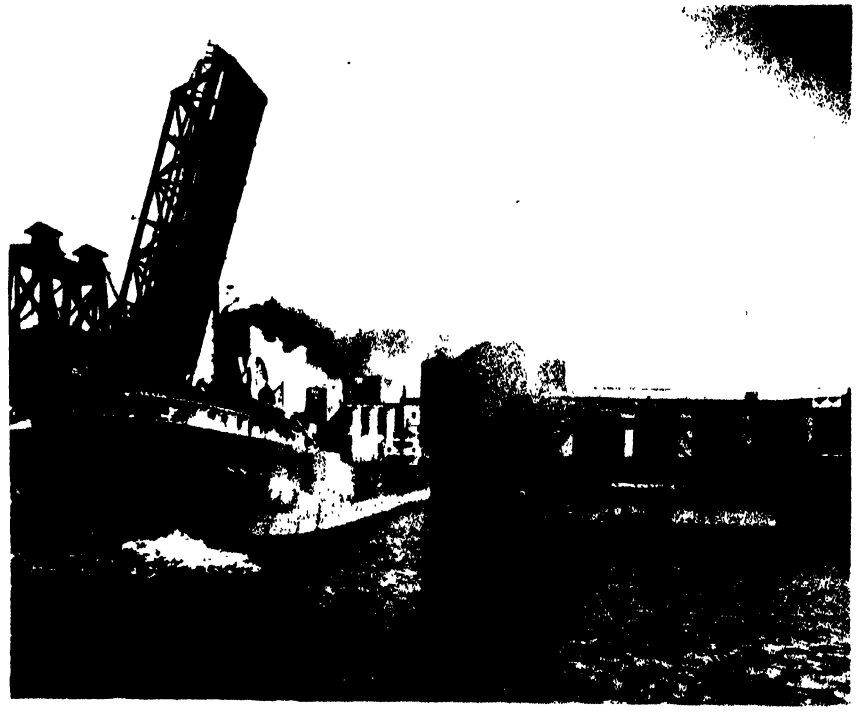
* * *

DANCING vied with circus stunts and gambling as the high point of Tuesday evening's fun.

* * *

WEDNESDAY afternoon's general meeting high spotted the interest of the week with the synthetic rubber program as the subject. The arena of the Memorial Auditorium (total capacity, 18,000) comfortably held a crowd estimated at around three thousand gathered to learn what could be known of this vital production problem. Albert L. Elder, of the War Production Board, described "Progress of Butadiene Production" and outlined the present status of this phase of the synthetic rubber program in some detail. "Progress of Styrene Production" was described by Willard H. Dow, president of the Dow Chemical Co.

* * *



COMPLETING the synthetic rubber picture from a chemical point of view were papers occupying three sessions of the Division of Rubber Chemistry.

* * *

LIEUTENANT-GENERAL WILLIAM S. KNUDSEN told Wednesday evening's subscription dinner of the progress made in the production of planes, tanks, arms, and ships to equip our fighting forces to win over our enemies.

* * *

UNITED Nations Dinner" was the name given the subscription dinner

On the Buffalo waterfront

by the local committee, an idea borne out by decorations consisting of the flags of all our allies and a menu printed in the various languages represented by them.

* * *

FELICITATIONS from Brazilian chemists at the United Nations Dinner were presented personally by E. R. Falcao of Rio de Janeiro. Russian chemists sent their greetings by cablegram. Both were heartily received by the assembly.

* * *

LIMITATIONS on attendance at the United Nations Dinner placed by the available space in the Statler Ballroom left many attending the meeting without places. No vacancies were discoverable in the Ballroom where everyone possible was accommodated. The original number of tickets (800) was increased by an added hundred without satisfying demand. At the last minute, a veritable "black market" in tickets thrived briefly to help those whose plans were changed to let them dine elsewhere.

Edmund Hayes Hall on the University of Buffalo campus

At the Wednesday evening banquet: E. Falcao, W. L. Evans, Mrs. Oncley, and E. Bartow. Mrs. B. Morey, N. Allen, F. Seibert (medal winner), and P. K. Frolich. Mrs. Harry N. Holmes, Lieutenant General Knudsen, and Harry N. Holmes

EATING at Buffalo was seldom simple, but never did it reach real difficulty. That was described for the Division of Agricultural and Food Chemistry by Professor Laird, recently returned from captivity in Hong Kong.

* * *

EVERY kind of thing, including shirts, badges, opportunities, wallets, and even sense of humor and patience, was reported lost or found or both during the meeting. The only known exception was pants and they were lost by one of the performers at Tuesday's County Fair!

* * *

OBVIOUSLY Holmes and Stine did not enter into collusion or conspiracy on their two papers in advance of Monday evening's Public Meeting, since both discussed many of the same important factors in our present problems and future destiny. Fortunately, even though both are Johns Hopkins alumni, their treatments were quite different and both were heard with rapt interest.

* * *

THE Employment Clearing House encountered and solved new problems at Buffalo. Originally designed to assist unemployed chemically trained persons, this growingly useful feature of national meetings currently handled efficiently the avid demand of employers for help. Applicants, of whom very few indeed were even temporarily unemployed, were outnumbered in the ratio of 4 to 3 by employers seeking workers. The average was somewhat more than five interviews per applicant. Unique among the applicants was a husband-and-wife team, both well trained chemists.

* * *

ONE light spot in the synthetic rubber picture was the verse read by President Holmes at the United Nations Dinner. The history of the verse is not completely known, nor has it been possible to discover the author's name. Presumably it should be accompanied by an apology to Joyce Kilmer. Here it is:

I THINK that I shall never see
A tire unsired by a tree
A tube without a patch or hole
Whose ancestry is THIOKOL,
Or heels to ease pedestrian stress
Well wrought from good old Buna-S.
Our streets with grass soon will be green,
While Congress argues butadiene.
To dream of tires made from Butyl,
Is pleasant, but it's also futile.
Let's rubber seize from Japanese,
Not vainly wait for RFCs.

County Fair Scenes. *Top right.* **The County Fair Tuesday night was replete with "guess your weight" artists and penny games.** *Below.* **Specializing in glamour and music, circus scenes, and general dancing**

AT THE Public Meeting Monday evening, the chairman pointed out that the stage decorations were rubber trees—synthetic.

* * *

MEMBERSHIP in the A. C. S. was reported at the Council Meeting to have reached 31,423. That is a lot of chemists.

* * *

THE Captain E. J. Crane among the first U. S. Marines to land on the Solomon Islands was not his namesake, the honorable Editor of Chemical Abstracts, nor even a member of his family.

* * *

TOLD at the meeting: James B. Conant approached a guarded door in Washington and was told by the watchman to "Keep out". Thereupon, the doctor intent upon getting to an important meeting, explained that he was president of Harvard. The watchman said, "Excuse me. You are not permitted to enter here."

* * *

THE SOCIETY now boasts 99 local sections and with the coming of universal gas rationing many of them are likely to adopt the custom, already adopted by a few, of becoming peripatetic and meeting where even a few members can be gathered together.

* * *

RESTRICTIONS on transportation may have the effect of encouraging meetings of divisions individually in the future, at least for the duration.

* * *

A LARGE group of chemists from the Buffalo meeting took Tuesday afternoon off to help the Hooker Electrochemical Co. and its more than a thousand employees celebrate the award of the Army and Navy "E" for excellence in production. The pride of both the employees and the officers of the company in this recognition of their accomplishment and effort was evident in spurring all to break their own records, for work was resumed even before visitors were all gone.

* * *

THEN there is the story of the lady at the Hooker celebration who asked a plant guard to direct her to the "Powder Room". The guard was nonplussed because, he said, "Hooker don't make powder".

* * *

SWING was provided for official dancing by Jack Valentine and by Dick Kuhn, but no census of purveyors of music in the modern manner at unscheduled dance spots could be made.

* * *

IN VIEW of everything, particularly restricted transportation, the standard farewell at Buffalo was: "See you at Indianapolis, if. . . ."

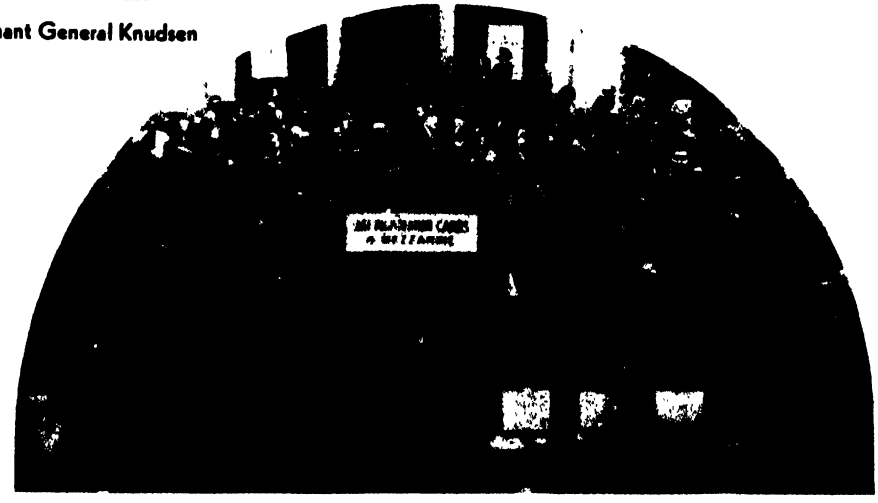
Divisional Officers Breakfast

HOWARD I. CRAMER was elected chairman of this group to succeed C. R. Hoover, and Arthur C. Cope was elected secretary.

Dr. Parsons discussed the difficulties involved in having the Indianapolis meeting and suggested the possibility of combined divisional meetings. This is to be decided by the Directors and will be announced by January 1, 1943.

A motion was passed to the effect that in the author index of the meeting program the current connection be given and not the institution at which the work was done.

It was also suggested that the divisional secretaries send three copies of their program to the secretary's office in the future and also use greater care in following directions sent them in the preparation of the program.



A symposium is being considered by the Division of Water, Sewage and Sanitation Chemistry in cooperation with the Division of Industrial and Engineering Chemistry. The Division of Biological Chemistry is planning a symposium with the Division of Agricultural and Food Chemistry on Biological and Chemical Methods of Assay.

G. L. ROYER, *Acting Secretary*

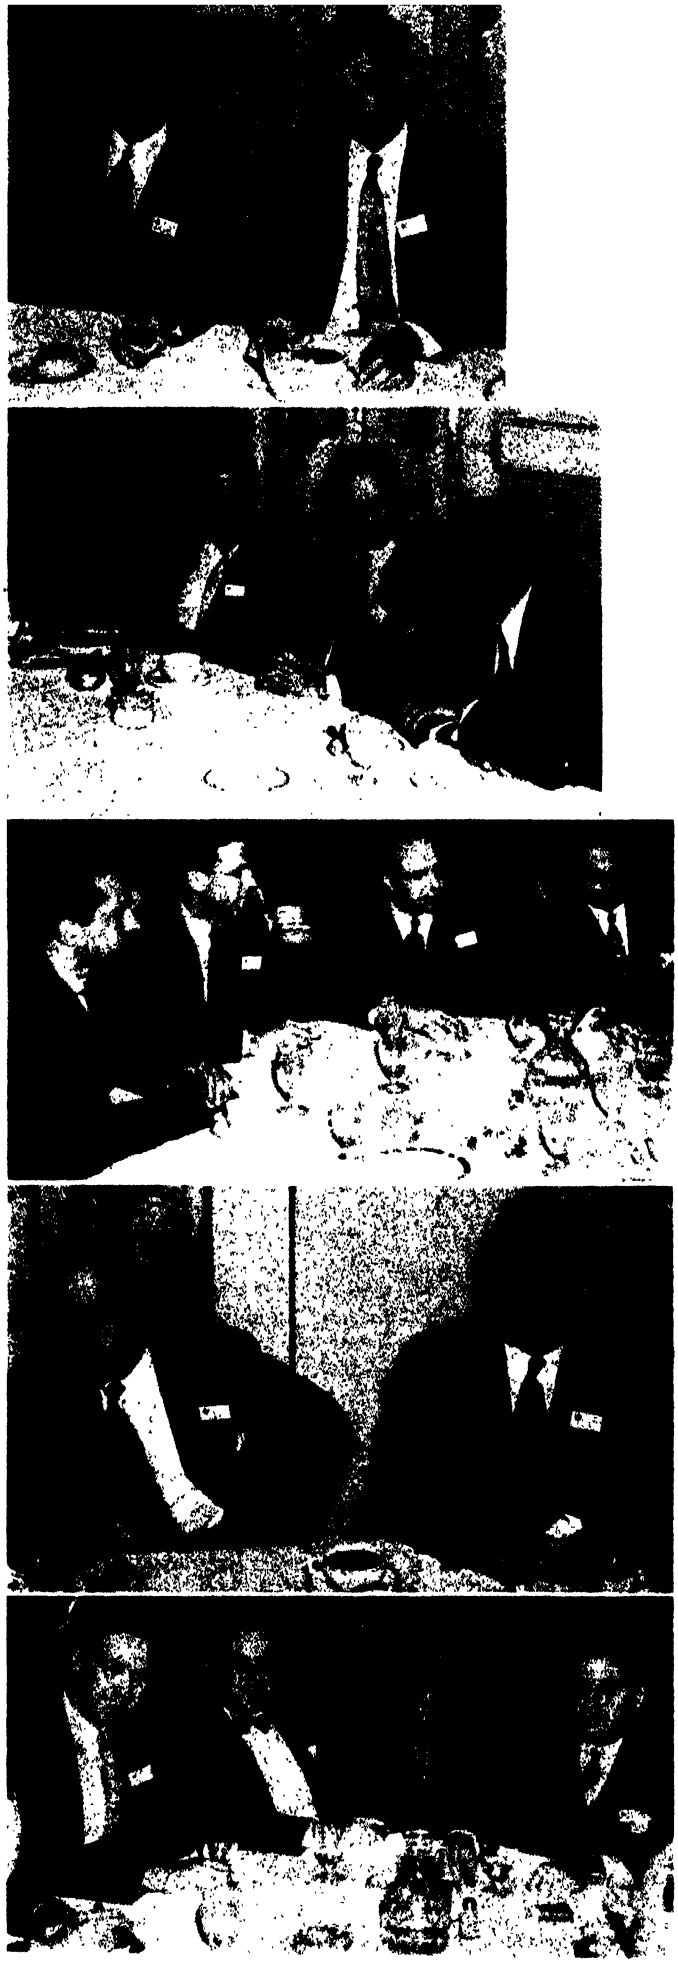
140th Anniversary of Du Pont Co.

Commemorating the 140th anniversary of the founding of E. I. du Pont de Nemours & Co., Inc., a special issue of *The Du Pont Magazine* has been brought out. Walter S. Carpenter, Jr., president, referred to the war work entrusted to the company, but pointed out that of the 140 years of its history less than fifteen had been devoted to wartime production.



Raymond J. Carey, technical salesman of the General Dyestuff Corp., has been granted a leave of absence to accept a commission as first lieutenant in the U. S. Army. He has been assigned to the Chemical Warfare Service.

Scientific Advisory Committee of Minnesota War Industries

Governor Harold Stassen recently appointed a Scientific Advisory Committee for Minnesota War Industries. The following individuals were named members of the committee: I. M. Kolthoff, chemistry; L. F. Miller, physics; F. B. Rowley, engineering; T. L. Joseph, metallurgy; R. E. Montonna, chemical engineering; M. B. Visscher, physiology; and L. H. Reyerson, chemistry and committee chairman. It will be the duty of the committee to give scientific and technical advice to the war industries of the State. Already members have been of real assistance in problems connected with production for war.

From left to right. H. I. Cramer, Sharples Solvents Corp.; J. N. Street, Firestone Tire and Rubber Co.; and A. L. Elder, WPB

Divisional Reports

Agricultural and Food Chemistry

At Buffalo the Division of Agricultural and Food Chemistry enjoyed one of the most successful meetings in its history. All the sessions attracted unusual interest, the attendance far surpassing all expectations and in several cases exceeding the capacity of the meeting rooms. At the Monday session the number in attendance represented almost 20 per cent of the total registration on that day.

All sessions, except three, were devoted to a Symposium on Methods for the Preservation of Foodstuffs and Their Application in the War Effort. The timeliness of the subjects and the character of the papers presented proved attractive to the representatives of many groups interested in food processing, food machinery, and the manufacturers of packaging materials as well as those whose primary interest falls in the fundamental chemistry underlying nutrition and food processing. Of especial interest were the papers presented by officers of the Quartermaster Corps, the Sanitary Corps, and the Chemical Warfare Service. Timely were the several papers on dehydration, preservation by freezing, and the effect of wartime conservation on food packages. Also outstanding were papers on the stabilization of fats, preservation of fruits and vegetable juices, the aldose-protein condensation partially responsible for the browning of evaporated milk, and one on a method for preventing the degradation of chlorophyll in canned vegetables. Z. I. Kertesz presented the report of the Committee on Pectin Nomenclature. In all, 44 papers were presented, including one on vitamins on which the division collaborated with the Division of Biological Chemistry.

The large attendance at the divisional luncheon honoring Lucius M. Tolman, who served as chairman of the division more than 25 years ago, was particularly gratifying. Mr. Tolman was presented with an engraved certificate commemorating the occasion. Mary E. Pennington and H. R. Kraybill were called upon to recall some of the highlights of Mr. Tolman's history in the chemical field.

The membership of the division numbers 283. Approximately 100 were in attendance at Buffalo.

Plans for the Indianapolis meeting are yet incomplete but probably will include further consideration of food dehydration and a program of papers dealing with a comparison of biological, microbiological, and chemical methods for vitamin assay. Roger H. Lueck, *Secretary*

Analytical and Micro Chemistry

Two sessions were held. Eight papers were classified as "micro" and nine as "analytical". At the Micro Chemistry Session, C. J. Rodden, National Bureau of Standards, presented a report of the Divisional Committee on Microbalances, in which he announced the results of a cooperative test of the reproducibility of weighings, conducted by members of the division. It is planned to publish these results later. He also announced that his committee was studying a set of specifications for design, materials, and construction which should prove of interest to American manufacturers of microbalances.

Division of Industrial and Engineering Chemistry luncheon, Tuesday noon. *Reading from top to bottom.* Lawrence Bass, New England Industrial Research Foundation, Inc., and T. Chilton, du Pont Co. W. Weinrich, Gulf Research and Development Co.; H. E. Howe; R. Norris Shreve, Purdue University; M. L. Crossley, Calco Chemical Co. C. Steffens, General Printing Ink; R. M. Lawrence, Atlas Powder Co.; W. H. Bowman, Westvaco Chlorine; and A. G. Richards, Dewey & Almy Chemical Co. C. Thomas, Monsanto Chemical Co., and O. A. Hougen, University of Wisconsin. H. S. Gardner, University of Rochester; F. J. Curtis and D. M. Sheean, Monsanto Chemical Co.

Other papers that seemed of more than usual interest were those of Wernimont on the Karl Fischer method for moisture, using a dead-stop end point determined by a simple electrical hook-up, and the papers of Rieman on calcium determination. The attendance varied from about 50 to 100.

A joint Symposium on the Teaching and Practice of Analytical Chemistry with the Division of Chemical Education attracted an audience of about 150 who were well repaid by the uniform excellence and interest of the three papers. It was unfortunate that time did not permit discussion from the floor.

The business meeting was conducted at the divisional luncheon at which 85 members and guests were present. The outgoing chairman announced that the divisional Committee on Microchemical Apparatus had completed a set of drawings and specifications of the apparatus recommended for the determination of sulfur and halogen. Since the specifications had been agreed on by the committee and by representatives of the manufacturers the division approved them for early publication in the Analytical Edition.

The roster of the division contains approximately 190 names.

FRANCIS W. POWER, S.J., *Secretary*

Cellulose Chemistry

THE Division of Cellulose Chemistry held its sessions on Thursday, during which 10 papers were presented. About one hundred people—the average attendance—were comfortably accommodated. Active discussion followed most of the papers and added materially to the value of the meeting.

An annual report of the Committee on Standards and Methods of Testing, under the chairmanship of Fred Olsen, indicated that considerable progress has been made by this committee toward development of standard methods for many tests of importance in the commercial use of cellulose.

The division has 226 members.

The annual business meeting was held during the afternoon session.

The division plans to hold sessions for presentation of general papers at the spring meeting in Indianapolis.

CHARLES R. FORDYCE, *Secretary*

Chemical Education

OF A total membership of 136, a goodly number attended the three sessions, comprising 15 papers, held by the division and the joint symposium with the Analytical and Micro Chemistry Division on Teaching and Practice of Analytical Chemistry.

Of the three separate sessions, the program planned for students proved so attractive that many past the student age attended and felt well repaid because all the papers were excellent and helpful.

Over 100 were present at the student breakfast, presided over by N. W. Rakestraw, who was also the speaker at the divisional luncheon the preceding day.

PAUL H. FALL, *Secretary*

Colloid Chemistry

THE present membership of the division is 130 and of this number 65 attended the Buffalo meeting. Many from other divisions also were present, especially for the Thursday afternoon symposium.

Thirteen technical papers, mostly of a physical chemical nature were presented in addition to the symposium of four papers. The outstanding feature was the symposium which reviewed fields of application of colloid science in nontechnical language. The crowded audience overflowed into the adjoining room and corridor.

No meeting will be held at Indianapolis if the Colloid Symposium is to meet as planned in June 1943.

J. W. MCBAIN, *Secretary*

Fertilizer Chemistry

THE divisional meetings were exceptionally well attended. Approximately 200 were present and 27 papers were presented. The papers covered new developments in manufacturing processes, utilization of waste products, effect of fertilizer on soil salt concentration, boron in agriculture, and new horizons in nitrogen. Of particular interest was a paper on the present status of plant hormones.

A potash symposium consisting of 15 papers was of exceptional interest. Among other things it was shown that the present known potash reserves of the United States are adequate to supply the needs of this Nation for at least another 200 years. The role of potash in agriculture was discussed in a series of 12 papers. About 200 members attended the sessions.

CHARLES A. BULL, *Secretary*

Paint, Varnish, and Plastics Division is taken home by Buffalo Police Department in paddy wagon. The crime wasn't serious though. The division found itself stranded at the Police Academy by a sudden rainfall and a drought of cabs, so the police substituted Black Maria for the yellow peril.

Gas and Fuel Chemistry

THE total membership of the Division of Gas and Fuel Chemistry is 115 and of this number it is estimated that 50 were in attendance at Buffalo. Seventeen papers were presented.

The program included a half-day general session and a Symposium on Uses of Coal by Various Industries. The seven papers presented at the general meeting dealt with producer gas formation, burner flames, corrosion of metals by flue gases, and various phases of coal oxidation.

H. J. Rose, of Mellon Institute, presided at the symposium at which nine papers were presented. Of greatest interest were the papers dealing with the utilization of coal and coal products in the plastics and synthetic rubber industries, and the prospective new uses of coal in the production of new chemicals.

Attendance averaged 50 and reached a maximum of 125. No special plans have been made for the Indianapolis meeting.

G. R. YOHE, *Secretary-Treasurer*

Medicinal Chemistry

APPROXIMATELY 200 persons attended the session of the division, though the total membership of the division is only 150. The average attendance was about 75 and 14 papers were presented.

The papers covered a wide range of interests, including a most interesting discussion of a new theory to account for the activity of sulfanilamide-type drugs, and designed to permit prediction of activity of new compounds from certain simple measurements of physical properties. This theory was presented from two different points of view by two completely independent speakers whose work was quite unknown to each other (papers 11 and 14). The Divisional Luncheon was featured by the presentation of the movie, "Malaria", loaned by the Shell Oil Co.

Plans for Indianapolis include the usual session for general papers, and a symposium on a topic of live current interest if the appropriate speakers are in a position to speak publicly at that time.

JOHN H. SPEER, *Secretary*

Organic Chemistry

A TOTAL of 50 papers was presented before the Division of Organic Chemistry at the Buffalo meeting. Divisional Chairman Lee I. Smith presided at each of

the four half-day sessions. His record of introducing each speaker and listening to every paper can never be surpassed. Both audience and speakers enjoyed the acoustics, visibility, and comfort provided by the Statler Terrace Room.

At the meeting of the Executive Committee plans were made to hold the Tenth National Organic Chemistry Symposium on December 28, 29, and 30, 1943, at Boston, Mass., unless war conditions make it impossible or inadvisable to hold a symposium at that time.

ARTHUR C. COPE, *Secretary*

Paint, Varnish, and Plastics Chemistry

OWING to the preoccupation of most of our members with the war effort, only 10 papers were submitted at the Buffalo meeting. As usual the plastics papers attracted particular attention. Among the papers of the Protective Coatings Group, that by Dr. Freeman, of the Pittsburgh Plate Glass Co., dealing with solvent fractionation of oils was received with considerable interest and gave rise to numerous questions.

At the business meeting it was decided, after considerable discussion, to reduce the number of meetings to one a year for the duration of the war. The next meeting, therefore, is to be held in the fall of 1943 in conjunction with the meeting of the national SOCIETY. Members of the division who wish to present papers at that meeting are urged to submit them as early as possible, and preferably not later than the middle of June 1943.

The attendance at the Buffalo meeting was surprisingly good and amounted to about 300 during the presentation of some of the papers. The division now has 479 members.

At the close of the Tuesday afternoon session the members of the Division of Paint, Varnish, and Plastics Chemistry were marooned in the Police Academy because of a very heavy shower until the "Black Maria" of the Buffalo Police Department was pressed into service. The next day one of the Buffalo papers published a photograph showing one of our members running from the police wagon to the entrance of his hotel. His friends are still wondering what explanation he will offer.

A. C. ELM, *Secretary*

Attending the dinner of the Division of Paint, Varnish, and Plastics Chemistry Tuesday night. 1. J. Broker, Krebs Pigment, and G. W. Ashman, New Jersey Zinc Co. 2. A. Schuster, Durez Plastics, A. E. Hay, Pratt and Lambert, speaker, and S. L. Bass, Dow Chemical Co., and chairman of the group. 3. J. De Bell, De Bell Bros., and J. A. Kenney, Barrett Co. 4. Speakers' table: W. H. Lutz, Pratt and Lambert, W. W. Bauer, Pittsburgh Plate Glass Co., and M. Catena, McDougal Bros. 5. Also at speakers' table: A. C. Elm, New Jersey Zinc Co., Robert J. Moore, Bakelite Corp., Gustav Egloff, Universal Oil Products Co., G. G. Sward, National Paint and Varnish Association

Petroleum Chemistry

APPROXIMATELY 150 to 200 out of a total membership of 700 attended the session at which 14 papers were presented. A highlight of the Division of Petroleum Chemistry dinner was a talk by Peter Honig, formerly director of the Sugar Experimental Station of Java and director of the Rubber Institute of Java. He talked on "My Impressions of Java".

L. W. HENDERSON, *Secretary*

Physical and Inorganic Chemistry

THE Division of Physical and Inorganic Chemistry met for 10 half-day sessions, at which 58 papers, 18 invited and 40 contributed, were presented. There were three symposia, one on Kinetics Using Tracer Isotopes, organized by W. F. Libby, of the University of California, a second on Flow under Abnormal Conditions, organized by H. Mark, of the Polytechnic Institute of Brooklyn and the Society of Rheology, and, finally, one on Low-Temperature Phenomena, organized by D. H. Andrews, Johns Hopkins University. The Low-Temperature Group met for a special luncheon on Thursday.

A highlight of the division's sessions was the presentation of the address of the recipient of the A. C. S. Award in Pure Chemistry, J. L. Oncley. He gave a stimulating paper on "Physical Chemical Properties of Crystalline Serum Albumins from Human and Bovine Plasmas".

The usual dinner was held on Monday evening. The speaker was H. J. Barrett, of the Electrochemical Division of the du Pont company. He gave an interesting talk on "Unique Chemicals Derived from Salt". Dr. Oncley was also a guest of honor. The Secretary reported that the membership of the division was 506.

The Annual Symposium, which would normally be held in December, 1942, has been canceled. Plans for the Annual Symposium for 1943 are being held in

abeyance. It may be postponed until the summer of 1944, or may be canceled altogether, depending upon circumstances. Plans for the spring meeting at Indianapolis are, however, going forward, and arrangements for two symposia are being made but are not quite completed.

O. K. RICE, *Secretary*

Rubber Chemistry

THE Division of Rubber Chemistry enjoyed one of the most successful meetings in its history. This fact assumes added significance when it is recalled that the formation of this division was authorized by the Council of the AMERICAN CHEMICAL SOCIETY during the convention held in Buffalo in April 1919.

The total current membership of the division is approximately 975. Of this number, 500 to 600 were at the Buffalo meeting. The attendance at the technical sessions, including members of other divisions, varied between 600 and 750. Approximately 625 attended the divisional banquet held at the Hotel Statler on Thursday evening.

Twenty-nine papers were presented during the technical sessions. Of this number nine were of a general nature and 20 were devoted to theoretical and applied phases of the synthetic rubber development. Particularly interesting at the general session were those papers dealing with the potentialities of growing rubber in the United States, improved methods for the production of a new type of crude rubber possessing unusually uniform properties, and a new technique for the photographing of colloidal systems using the ultraviolet microscope. The Friday session was devoted to a symposium on the Compounding and Properties of Synthetic Rubbers now being developed in this country. It is planned to publish the papers in this group, along with those given before the general meeting dealing with butadiene and styrene, in the November issue of *Industrial and Engineering Chemistry*.

The division is planning to meet with the SOCIETY at Indianapolis next April. Although plans for this meeting are at present tentative, it is probable that the keynote of that meeting will again be synthetic rubber.

H. I. CRAMER, *Secretary*

Sugar Chemistry and Technology

THE papers presented in this division were not perhaps such as to bring newspaper notoriety but they did largely contain practical implications and indicate that a fundamental concept of the starch molecule and of the products of its breakdown have been pretty generally expanded and that all sugars and the starch derivatives are about to become of more economic value as bases for organic synthesis and the production of commercially important products.

The total membership of the division is now 194 and of this number approximately 45 were present. Nonmembers swelled the average attendance to approximately 80.

The executive committee has given much thought to the apparent difficulties in listening to all the presentations on the carbohydrates at our general meetings because of the wide distribution of such papers throughout the divisions and the hitherto unavoidable conflicts in the times of their presentation. It was proposed at the business meeting of this division that an agreement be entered into with the Division of Cellulose Chemistry that our meetings should hereafter follow each other, the order being reversed on successive meetings, and be held in the same room so that no conflict can possibly occur between these divisions. If this works out satisfactorily there will be a carbohydrate series of papers which will be arranged by the two divisions separately but which will nevertheless blend into a continuous program. It is hoped that this idea can be expanded in the future in some way until most conflicts have been eliminated.

E. WHITMAN RICE, *Secretary*

Water, Sewage, and Sanitation Chemistry

THE division held two sessions on Tuesday, September 8, at which time 15 papers were presented, one being in the form of a round-table discussion in which four men discussed different phases of the problem. The highlight of the meeting was this round-table discussion, entitled "The Detection of Poisons and Chemical Warfare Agents in Water Supplies".

The papers that aroused the most discussion were those dealing with the superchlorination of water for bottling carbonated beverages; demineralizing solutions by a two-step ion exchange process; the relationship between the fusain contents and the exchange capacities of sulfonated coal fines; prevention of microbiological slimes with phenol derivatives; and acid waste treatment. The latter paper dealt with the treatment of acid trade wastes from five different types of industries.

A business session was held Tuesday afternoon.

The Divisional dinner was held Tuesday evening at the Hotel Touraine and was attended by 33 members.

The Buffalo sewage works was visited Wednesday morning. This is a new and unique plant, in that its chief function is to disinfect the sewage, clarification being of secondary importance.

A joint symposium on industrial water uses is planned with the Division of Industrial Chemistry for the Indianapolis meeting in the spring. There will also be a general meeting of the Division at that time.

H. GLADYS SWOPE, *Secretary*

Local Section Officers Breakfast

THE breakfast meeting of the Local Section Officers Group was held at Hotel Touraine on Tuesday morning, September 9, with 37 present. Chairman F. O. Rice presided.

W. P. Yant, Mine Safety Appliances Co., Pittsburgh, was introduced as chairman for next year. Harry L. Fisher, U. S. Industrial Chemicals, was selected as Chairman-Elect and L. A. Underkofler, Iowa State College, was made Secretary.

Alden H. Emery reported on the speaker touring service, stating that less difficulty than had been anticipated was being experienced in arranging tours for the coming season. A considerable number of tours have already been arranged and others are almost completed. There remains, of course, the probability that conditions may arise making it necessary to cancel certain tours.

It was voted to continue the L. S. O. G. Exchange column in CHEMICAL AND ENGINEERING NEWS with Ed. F. Degering retained as Editor. Considerable discussion ensued as to suitable contents for contributions to the column. Special activities of the Local Sections and their defense activities were considered especially appropriate for inclusion.

The remainder of the meeting was devoted to discussion of section problems. A paramount problem is that of transportation for members to meetings of the Local Sections.

L. A. UNDERKOFLER, *Secretary*

Hooker Awarded Army-Navy "E"

NO SHORTAGE of will and determination hampers America's use of her most potent secret weapon: free men working in a free country", said Ralph Binkley, chairman of the Hooker Employees' Representation Association, speaking at the ceremonies of presentation of the United States Army-Navy Production Award to the Hooker Electrochemical Co. and its 1,019 employees at the company's Niagara Falls plant on September 8, 1942.

Presentation of the Army-Navy Production Award "E" Flag was made by Major General William N. Porter, chief, Chemical Warfare Service, and accepted for the company by its president, Harry M. Hooker.

Commander R. S. Smith, Jr., U. S. Navy, presented "E" pins to Hooker employees which were accepted by Mr. Binkley and four other employees of more than 30 years' service: George W. Stone (38 years), Joseph J. Bellegia (36 years), William Hayes (35 years), and Julius Bellegia (30 years).

Also participating in the ceremonies were: Alan Valentine, president of the University of Rochester, who presided; Chaplain J. W. Hrdlicka, of Fort Niagara; Eugene Butler, Mayor of Niagara Falls; Edwin R. Bartlett, executive vice-president of Hooker; John Sturgess, vocalist; and the Niagara Falls Concert Band, Edward D'Anna, leader.

In addition to Hooker employees and their families, representatives of the Army and Navy, and citizens of the Niagara Falls frontier, a large delegation of prominent chemists from the 104th meeting of the AMERICAN CHEMICAL SOCIETY were present at the ceremonies as guests of the company. Following the formalities at the plant, guests were given a buffet supper by the Hooker company at Hotel Niagara.

Federal Trade Stipulation on Termite Repellent

THE Reilly Tar & Chemical Corp., Indianapolis, Ind., engaged in the manufacture and sale of various coal-tar products, including one designated as "Reilly Transote", has stipulated with the Federal Trade Commission that in advertising its product it will discontinue any representation conveying the belief to purchasers that the repellent effectiveness of its product is of such permanence as to assure against all future termite infestations and decay, or to afford permanent or complete protection against termites and decay, irrespective of the lapse of time. "Reilly Transote", formerly known as "Reilly Transparent Penetrating Creosote", is recommended as a treatment for wood building construction and for the soil on which a termite-infested building stands.

The corporation also agrees to cease any representation implying that tests of the product have been made by the Termite Investigations Committee of California which were of such scope or time coverage as to warrant the inference that the effective value of the product would remain unimpaired or endure as complete protection against termites, irrespective of the lapse of time.

The corporation further agrees to discontinue the use of the word "creosote" either alone or in connection with the words "coal-tar product" as descriptive of the product, and the use of the word "creosote" in any way so as to imply that the product is creosote, as that term is understood in the wood-preserving trade.

Robert L. Warfel has been named a research engineer on the staff of Battelle Memorial Institute, Columbus, Ohio, and has been assigned to the Division of Analytical Chemistry. Mr. Warfel formerly was associated with the Carnegie-Illinois Steel Corp., Gary, Ind.

Buffalo Makes the Tools for the Chemist

EMIL RAYMOND RIEGEL, University of Buffalo, Buffalo, N. Y.

THE name of the Buffalo Dental Manufacturing Co. hardly suggests the high position it has always occupied among manufacturers of "tools for the chemist"; yet the industrial section of its wholesale department is concerned largely with items destined for the chemical industries.

The company was founded in 1867 and from the beginning imported various types of Fletcher's gas burning appliances from Worthington, England. After a few years the company manufactured these articles in this country, having acquired the American patents of Fletcher. The name of the firm came about in this way: Their biggest business was the manufacture of vulcanizers used by dentists for vulcanizing the rubber plates which, in the early days, embedded the artificial teeth. A large amount of business, however, was with laboratories and supply houses which bought their furnaces, gas burners, foot blowers for blowpipe work, rotary blowers, tweezers, and alcohol lamps. Their foot blowers were found in every laboratory. Many chemists still prefer them to air from the compressor because of the ease with which the pressure can be varied without calling for the use of the hands. It is believed that the firm was the first to introduce domestic gas stoves to the citizens of Buffalo.

Times have changed and some items manufactured at the beginning have become obsolete. But to this day the Buffalo Dental Manufacturing Co.'s blowpipes and furnaces are standard equipment in laboratories all over the United States. Gas-brazing blowpipes of various sizes, autoclaves for high and low pressure, boiling burners, and water heaters are among the items which still furnish an excellent business. L. E. Menge is president.

To the works chemists who were active 30 years ago, the Taber pump was a synonym for a sliding vane pump with everlasting life. When the vanes wore, they were replaced by new ones, and the reassembled pump continued its function. If the rotor became worn, it was replaced, and the pump continued to work; even the casing might be exchanged for a new one and made to function with used rotor and vanes. The Taber sliding vane pump was and is able to handle suspensions, slurries, and dissolved melts containing lumps of coal, or other solids.

The Taber Pump Co. is one of the oldest manufacturers of specialized pumps. It is probably the oldest concern to have manufactured the vane or blade type of rotary pumps. The company was founded by B. F. Taber, a tanner, in about 1859. Mr. Taber needed a pump which would not become clogged with pieces of bark and hide when transferring the tan liquors in the yard from one place to another. He set about to build a rotary pump which would not clog, and succeeded in doing so with the help of a mechanic. This was the foundation on which the Taber company was built, and even today this type of pump is in general use throughout the tanning industry.

From this modest beginning the company has developed a wide variety of centrifugal and rotary pumps for processing industries, foodstuffs, paints and varnishes, breweries, and heavy chemicals. At this time specialized pumps for the explosive and chemical warfare plants keep the shops working overtime. The Taber pumps include leakproof pumps, vacuum pumps of an improved type, and vertical centrifugals.

The president of the company, William F. Traudt, has been active for many years in dispelling the notion held by some people that a pump is "just a pump". There is a science of pumping, and different designs, different types, different clearances furnish special services with high efficiency; the pump must be suited to the requirements.

The firm of Pierce and Stevens, Inc., is primarily engaged in manufacturing lacquers and special solvents of all kinds, but it markets also special devices such as a scale which automatically shuts off the liquid being weighed when the container is filled. Many of these devices are patented.

The Buffalo Scale Co. holds an important place in its line; it was founded by one of Buffalo's well-known families.

The Consolidated Packaging Machinery Corp. manufactures automatic scales and packaging machinery which are distributed nationally and internationally. Packages may be automatically sealed or sewed, besides being filled and weighed. A six-scale automatic unit packages solid materials at the rate of 40, 60, or 100 per minute. A number of the products of the plant are the well-known Hoepner automatic machines, mainly scales. Among other activities, the company designs, manufactures, and installs scales and scale controls with panel board for the automatic mixing and delivery of six (or more) different materials in different amounts destined to form a batch for feeding a furnace or storage silo.

A final bit of history: The first Pyrex thermometers were made at the Corning Glass Works in 1919 by F. Kraissl, and they had been ordered by Mr. Hough, to be used in "dynamite pots" which the Buffalo Foundry and Machine Co. was manufacturing at that time.

[1] Supplement to the article appearing in the July 10 issue, pages 841–3.

Creation of Research Organization Presents Problem

To assume the responsibility for the operation of a complex and going chemical industry without an organization for basic fundamental and applied research imposes, according to R. E. McConnell, president of the General Aniline & Film Corp. of New York, unique and pressing problems of management.

Mr. McConnell pointed out that the creation of such a research organization necessarily involved seeking the services of some men already employed in essential war industries. He was sure that, because of the wide appreciation of the problems to be solved and of the importance of their solution in the national interest, this could be achieved with the entire good will and cooperation of these industries with whom the corporation might indeed come in competition.

General Aniline & Film is now wholly American owned and managed by a board of directors appointed by the Alien Property Custodian. Provisions will be made, according to Mr. McConnell, to prevent its reversion to alien ownership at any future time. Presently the corporation is engaged in production essential to the war effort through its three manufacturing divisions, Agfa Ansco Division (photographic materials and apparatus), General Aniline Works Division (dyestuffs, intermediates, and chemical products), and Ozalid Division (reproduction processes).

While no final plans have been announced for the disposition of the ownership now held by the Alien Property Custodian, Mr. McConnell pointed out that the interlocking nature of the operations suggested the wisdom of maintaining the unity and integrity of the property as a whole. Present operations are now so integrated as to make the company a self-sustaining unit of sufficient size and resources as to be logically and profitably operated independently. Clearly the anti-trust laws would prevent the passing of many of its operations under the control of its principal competitors.

In addition to its three major divisions, General Aniline & Film Corp., with Sterling Products, Inc., owns Winthrop Chemical Co., Sterling performing the functions of management.

Lectures on Modern Chemical Theories

The Department of Chemistry of the Polytechnic Institute of Brooklyn announces that Henry Eyring, of Princeton University, will join its staff during the coming academic year as visiting professor of physical chemistry. Professor Eyring will lecture in the Graduate School on "Modern Chemical Theories", on alternate Fridays, beginning October 2, 1942.

Bauxite Deposits in the United States

Carrying forward the war program of the Department of the Interior, engineers and geologists of the Bureau of Mines and the Geological Survey have blocked out more than 500,000 tons of valuable bauxite in two Georgia counties. Some of the bauxite may be used immediately. The deposits are located in the Andersonville district of Sumter and Macon Counties, in west central Georgia. As soon as the exploratory work is completed, all essential information will be turned over to the owners of property on which drilling was done. It is anticipated that the bauxite will be mined promptly.

Extensive investigations indicate that, out of 500,000 tons of bauxite deposits in the area, over 200,000 tons contain better than 50 per cent alumina and rate as a Grade B ore, which is next to the best quality ore for yielding metallic aluminum. Existing industrial processing plants can handle this grade of ore immediately after it is removed from the ground, and it is probable that the remaining 300,000 tons of Grade C Georgia bauxite may be utilized through methods now being studied or developed both by the Bureau of Mines and private industry.

Sponge Iron Pilot Plant

The commercial-size pilot plant for the production of sponge iron, to be built by the Bureau of Mines under a recent authorization by Congress, will be located at Laramie, Wyo., on a site made available to the Government. This location was chosen mainly because of its nearness to available sources of iron ore, natural gas, and coal. On the basis of its studies to date, the Bureau of Mines has concluded that sponge iron can be utilized as a suitable substitute for scrap iron to mix with ordinary pig iron in manufacturing steel.

While the construction of the pilot plant is progressing, the Bureau of Mines will make a thorough investigation of various processes for producing sponge iron in small-scale pilot plants which are owned by private companies. Three of the processes to be investigated are reported to have produced sponge iron successfully on a pilot-plant scale.

Chemical Production in Sweden

Efforts of Sweden's chemical industries to fill the gap caused by stoppage by war of former sources of supply are reported from abroad.

Increased production has made advances in this direction, it is stated, production of sodium sulfate, nitric acid, and hydrochloric acid being reported. Output of sulfuric acid is now meeting domestic demand, while chlorine, organic chlorine derivatives, and various electrochemical products are becoming available in larger quantities. Zinc salts, chromic acid, chromium compounds, certain phosphates, and potassium permanganate are replacing former imports of the same type.

WPB Changes in Personnel

E. W. Reid, chief of the Chemicals Branch of the War Production Board, has announced the appointment of Lawrence Brown as assistant branch chief in charge of Staff Sections. He will coordinate the functions of the five Staff Sections of the branch.

New chief of the Aromatics and Intermediates Section is Hugh D. Hughes, formerly with Carbide and Carbon Chemicals Corp., New York, N. Y. He succeeds James Raynolds, who becomes assistant chief of the Chemicals Branch. This section takes over the Plasticizers and Glycols Unit, which was formerly in the Plastics and Resins Section.

A new Transportation and Packaging Section has been established within the Chemicals Branch, with Donald C. Knapp as chief. A new Plastics and Synthetic Rubber Section has also been set up, replacing the two sections heretofore operating separately in these fields. Frank Carman, former chief of the Synthetic Rubber Section, is in charge of the new section. The former chief of the Plastics and Resins Section, Arthur Petersen, heads the Products Advisory Section of the branch, while James Lawson, formerly with WPB's Special Industrial Machinery Branch before its abolition, is new chief of the Projects, Machinery, and Facilities Section of the Chemicals Branch.

Training for Prospectors

As part of its program of encouragement to prospectors for chromium, manganese, and other metals, the Canadian authorities are conducting special courses for prospectors, while geological parties sent out by the government will assist prospectors, who also receive tax concessions.

Canadian Control of Lead

Canada now exercises close control over buying and selling of all lead and lead-base alloys, it is reported by the Department of Commerce. Such control is said to have been necessitated by increased demand for lead as a substitute for more critical materials.

William M. Jeffers, president of the Union Pacific Railroad, has been appointed rubber administrator by the War Production Board and wil have full control over all phases of the rubber program.

John H. Nair has resigned from the Borden Co. after 23 years and has become associated with Continental Foods, Inc., Hoboken, N. J., where he is doing research work on dehydrated foods.

Insecticides for Control of Cotton Insects

R. C. ROARK

Bureau of Entomology and Plant Quarantine, U. S. Department of Agriculture, Washington, D. C.

In 1940 (*15*) there were in cultivation in the United States 24,871,000 acres of cotton, of which 23,861,000 acres were harvested, producing 12,566,000 bales of 500 pounds gross weight each. The greatest acreage, 44,608,000, was harvested in 1926, but the highest production, 18,946,000 bales, was obtained from 33,623,000 acres in 1937 when the yield was 270 pounds per acre.

This enormous production would not be possible without the use of large quantities of many insecticides and fungicides designed to combat specific insect and fungus pests. The cotton plant is unusually attractive to insects, among which are some of the most destructive pests of agriculture. The principal insects attacking the cotton plant in the United States, arranged approximately in the order of decreasing importance, are the following:

COLEOPTERA
- Boll weevil
- Cowpea curculio
- May beetles
- Thurberia weevil
- Wireworms

LEPIDOPTERA
- Bollworm
- Cotton leaf perforator
- Cotton leaf worm
- Cotton square borer
- Cutworms
- Fall armyworm
- Garden webworm
- Pink bollworm
- Salt-marsh caterpillar
- Yellow-striped armyworm

HEMIPTERA
- Cotton dauber
- Cotton flea hopper
- Cotton stainer
- Rapid plant bug
- Stinkbugs
- Tarnished plant bug

HOMOPTERA
- Cotton aphid
- Root aphids
- Sharpshooters

ACARINA
- Common red spider

ORTHOPTERA
- Crickets
- Grasshoppers

In addition, cotton may be attacked by leaf-cutting ants (Hymenoptera), and thrips (Thysanoptera), as well as many additional species of the orders mentioned. Of all these insect pests the boll weevil is the most destructive. It is conservatively estimated that on an average one tenth of the cotton crop is destroyed by it. A heavy toll is also exacted by many other pests.

The principal insecticides and fungicides used to combat pests attacking cotton and the estimated annual consumption of each are:

	Pounds
ARSENICALS	
Calcium arsenate (includes some London purple, which is calcium arsenate plus calcium arsonite)	40,000,000
Lead arsenate	1,400,000
Paris green	500,000
White arsenic	100,000
FLUORINE COMPOUNDS	
Cryolite	400,000
CONTACT POISONS	
Nicotine sulfate solution (40 per cent nicotine)	32,000
Rotenone dusts (1 per cent rotenone)	250,000
Sulfur	20,000,000
FUNGICIDE	
Organic-mercury seed disinfectants	600,000

Calcium Arsenate

The consumption of calcium arsenate, which is used chiefly against the boll weevil, fluctuates widely from year to year because of the fluctuations in the abundance of this insect. In 1941 when damage by boll weevils was unusually severe, most of the 70,000,000 pounds of calcium arsenate sold that year was used on cotton. Commercial calcium arsenate is a variable mixture of several arsenates of calcium and calcium hydroxide. Smith and Murray (*13*) in 1931 reported analyses of 16 commercial calcium arsenates as follows:

Molecular quotient or molar ratio CaO/As_2O_5	3.0 to 4.1
$Ca(OH)_2$	1.52 to 12.66
CaO as arsenate	31.49 to 40.59
Total As_2O_5	40.32 to 44.39
Water-soluble As_2O_5 (A. O. A. C. method)	0.06 to 2.37

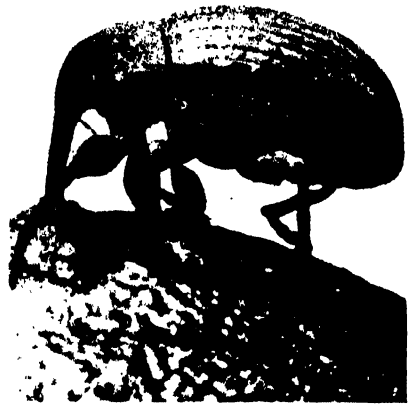
They concluded that these samples consist of mixtures of $3CaO.As_2O_5$ and $4CaO.As_2O_5$. The common assumption that the arsenic in commercial calcium arsenate is all present as tricalcium arsenate [$Ca_3(AsO_4)_2$] is erroneous.

In 1937 Nelson and Cassil (*7*) examined 22 brands of commercial calcium arsenate and found, on comparing their analyses with previous ones, that there is considerable variation in the chemical composition and in the molar ratio CaO/As_2O_5 in the same brands from year to year as well as among the various brands.

Calcium arsenates with five definite CaO/As_2O_5 ratios are known, forming a series from the soluble, acidic monocalcium salt, $CaH_4(AsO_4)_2$, to the insoluble, basic tetracalcium salt, $Ca.CaOH.AsO_4$. In addition there is evidence for the existence of solid solutions in the region between tricalcium and tetracalcium arsenate, wherein the tricalcium salt is capable of dissolving large quantities of tetracalcium arsenate. In the manufacture of commercial calcium arsenate the formation of the acidic monocalcium salt is impossible because of its high solubility, and the presence of the basic tetracalcium salt in the final product is unlikely because, although readily formed at 20° to

25° C., this salt appears to be unstable at temperatures of 62° C. and above, such as are used in practice. This leaves the calcium arsenates varying in acidity from the dicalcium salt to the solid solution of tri and tetra salts as the only ones likely to be found in commercial preparations.

Phase-rule studies by Nelson and Haring (*8*) in 1937 failed to verify the existence of the compound $10CaO.3As_2O_5.xH_2O$, which was reported by Tartar *et al.* (*14*) and also by Pearce and associates (*9*, *10*).



Nelson (*6*) in 1939 reported that calcium arsenates of low solubility can be prepared by atomizing a dilute solution of arsenic acid into a suspension of hydrated lime according to the process of Henninger (*5*). By proper control of conditions, calcium arsenates can be prepared that are uniform in composition, basicity, and soluble arsenic (As_2O_5). The mechanism of the reaction in a process such as this, wherein a dilute solution of acid reacts with a saturated solution of calcium hydroxide, appears to be the formation of the most basic salt first, which upon further addition of acid goes over into the less basic solid solution.

Goodhue (*3*) in 1936 determined the particle-size distribution, the loose bulking value, the true density, and the angle of slope for 22 samples of commercial calcium arsenate. The particle-size distribution and loose bulking value varied greatly, but the density and the angle of slope showed less variation. Special grades produced by some of the companies were, in every case, finer than their standard grades. A comparison of the loose bulking values and the particle size by sedimentation showed less correlation. The bulking value, so often used as an indication of fineness, is unreliable and often entirely misleading. A correlation between density and particle size exists, the finest samples having the highest densities.

The complexity of commercial calcium arsenates was further shown by Goodhue and Cassil (*4*). They separated a commercial sample into several fractions by an air classifier. Since analyses of these fractions showed a great variation in chemical composition, a chemical as well as a mechanical separation was accomplished. The water-soluble arsenic (As_2O_5), when determined by the method of Pearce *et al.* (*11*), ranged from 3.0 per cent in the fine particles to 18.8 per cent in the coarse.

The principal use of calcium arsenate is to combat the boll weevil, but it is also recommended against the cotton leaf worm and the bollworm. The rates of application are against the boll weevil, 4 to 6 pounds per acre applied three or more times; against the bollworm, 8 to 10 pounds per acre applied three or more times; and against the cotton leaf worm, one application of 5 pounds per acre.

The calcium arsenate is applied to the plants as a dry dust from ground machines or airplanes. For combating the boll weevil a mixture of 1 pound of calcium arsenate, 1 gallon of water, and 1 gallon of molasses may be daubed on the plants with a homemade rag mop when the cotton begins to square. This procedure is employed mostly in North and South Carolina and is not so effective as dusting.

Enlargement of boll weevil on cotton boll

It is obvious that the total quantity of calcium arsenate manufactured yearly (58,000,000 pounds is the maximum) would be insufficient to control those insects if the entire cotton-growing acreage were infested and were treated according to recommendations. Fortunately the abundance of insects varies markedly from year to year, depending on floods, drought, abnormally high or low temperatures, etc., and not all the acreage need be treated in one season.

Substitutes for Calcium Arsenate

Fluorine Compounds. Of the raw materials used to make calcium arsenate, lime derived from limestone is abundant, but arsenic is in increasing demand for the manufacture of lead arsenate, Paris green, sodium arsenite, and glass, for the hardening of lead, and for other purposes. Of the possible substitutes for arsenic for use in poisoning insects, fluorine seems to be the most promising. Fluorine is present in phosphate rock to the extent of about 3.7 per cent. Only a part of this can be profitably recovered in the process of making superphosphate. In 1940, 2,564,844 long tons of phosphate rock were mined in the United States, sufficient to yield about 21,000 tons of economically recoverable fluorine. There is potentially available, therefore, an amount of fluorine compounds sufficient to replace most of the arsenical insecticides, assuming their use at the same rates of application.

Tests made by the Chemical Warfare Service in 1924–26 with the fluosilicates of sodium, barium, and calcium were reported by Walker (*16*). A special light sodium fluosilicate containing 80 per cent of Na_2SiF_6 and 20 per cent of colloidal silica was as toxic as calcium arsenate to the boll weevil and caused no damage to the cotton plant, but because it is easily washed off by rain it was less effective than calcium arsenate in the field. Walker surmised that the addition of an adhesive would overcome this deficiency, but no tests of stickers were made. Tests of cryolite, Na_3AlF_6, against the boll weevil by the U. S. Bureau of Entomology and Plant Quarantine have indicated that it is only about half as effective as calcium arsenate. Cryolite is effective against the bollworm. Many of the commercial fluorine insecticides are too coarse for good distribution by the machines used for applying calcium arsenate. Finer powders would doubtless dust better and also adhere more tenaciously to vegetation.

Special Calcium Arsenate. A special calcium arsenate containing only 20 per cent of arsenic (calculated as As_2O_5) was reported by Walker (*17*) about 15 years ago to be about as effective as commercial calcium arsenate containing twice this quantity of arsenic when tested in cages and in the field upon boll weevils. This material was prepared by heating white arsenic and precipitated chalk at 650° C. from one quarter hour to one hour in a forge furnace using an oxidizing flame from a gas burner. Almost complete conversion of the arsenic to the pentavalent state was obtained, but the loss of arsenic by volatilization was about 20 per cent. This process of making calcium arsenate has never been adopted by insecticide manufacturers, and no further tests with such a product are recorded. Ordinary calcium arsenate diluted with an equal weight of hydrated lime to an arsenic pentoxide content of 20 per cent has proved somewhat inferior to the 40 per cent product, but it is sufficiently toxic to control a moderate infestation of boll weevils and is recommended for use on light, sandy soils where it is necessary to add as little arsenic as possible.

London Purple

To enhance the killing value of commercial calcium arsenate, white arsenic may be added to the reaction tank during the process of manufacture. The finished product, containing 4.6 to 5.8 per cent of As_2O_3 present as calcium arsenite, is now marketed under the name "London purple" (*12*). White arsenic is sometimes mixed mechanically with dry calcium arsenate or hydrated lime, and such mixtures are sold under proprietary names for quick control of the cotton leaf worm.

Lead Arsenate

Lead arsenate ($PbHAsO_4$) is but little used for control of the boll weevil because it usually costs about twice as much as calcium arsenate and contains one fourth less arsenic, but it is applied as a spray against the cotton leaf worm.

Paris Green

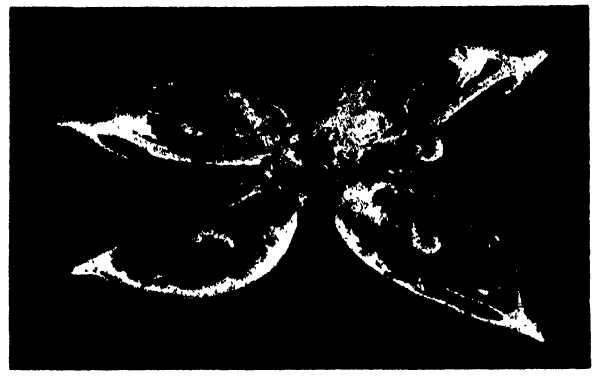
Paris green [$Cu(CH_3COO)_2.3Cu(AsO_2)_2$], although higher priced than lead arsenate, has the advantage of containing nearly twice as much arsenic. Moreover, this arsenic is present in the trivalent state, and trivalent arsenic is considered more toxic than pentavalent arsenic. Paris green is sometimes added to calcium arsenate to step up its toxicity, especially when quick control is needed against large larvae of the cotton leaf worm. Usually 10 or 15 pounds of Paris green is mixed with 90 or 85 pounds of calcium arsenate. Paris green may be used also in a mixture of 1 part of Paris green, 1 part of flour as a sticker, and about 5 parts of lime to prevent burning. From 12 to 14 pounds of this mixture should be applied per acre.

The principal use of Paris green, however, is in admixture with dusting sulfur for the control of the cotton flea hopper and other hemipterous insects. T. P. Cassidy and H. G. Johnston recently reported (unpublished) that in Arizona during 1941, 72,688 acre-applications of such a mixture containing 7.5 per cent of Paris green were made on 29,924 acres of cotton, at the rate of 15 pounds per acre-application. Before Cassidy and associates showed that dusting with insecticides may be profitable in Arizona, practically no cotton in that State was dusted. In 1941, 16.6 per cent of the cotton acreage in Arizona was dusted.

Sulfur

Sulfur alone, applied at the rate of 12 to 15 pounds per acre, is effective against the cotton flea hopper. Two or three applications four or five days apart are usually sufficient. Where boll weevils as well as flea hoppers are prevalent, a combined application of 8 pounds of sulfur and 4 pounds of calcium arsenate per acre should be used. The mixture of sulfur and calcium arsenate is more effective against the adult flea hopper than sulfur alone, and large quantities are used in Texas.

Sulfur is also effective against the common red spider, which sporadically is a destructive cotton pest in the Southeast. Sulfur and mixtures of sulfur and arsenicals are also relied upon to control all the Hemiptera that attack cotton. It is estimated that 20,000,000 pounds of sulfur are used annually as dusts upon cotton, mostly in Texas. For use as an insecticidal dust the sulfur must be finely ground and mixed with 1 or 2 per cent of a conditioner, such as magnesium carbonate or tricalcium phosphate. The function of the conditioner is to prevent the sulfur from lumping and to make it free-flowing when fed from the dusting machine.



Gooden (*1*) recently determined the average particle diameters of 54 samples of commercial insecticidal powdered sulfurs by means of the self-calculating air-permeation apparatus of Gooden and Smith (*2*). The surface mean diameters of the particles in 14 samples of ground conditioned sulfurs—the kind used for dusting cotton—ranged from 8 to 14 microns. All were much smaller than the openings in a standard 325-mesh screen (45 microns).

Rotenone

Dusts made by mixing 20 pounds of powdered derris or cube root (5 per cent of rotenone) with 80 pounds of calcium arsenate have been used to prevent the increase of aphids on cotton plants that often follows dusting with calcium arsenate. Since commercial calcium arsenate may contain up to 10 per cent of free hydrated lime and the insecticidal value of derris and cube is destroyed in an alkaline environment, such mixtures should not be used after they have stood for several months. It is estimated that 50,000 pounds of derris and cube powders were used in dusting cotton in 1941. Rotenone can also be used to control aphid infestations not caused by the application of calcium arsenate.

Nicotine

Nicotine sulfate solution (40 per cent nicotine) is also used to combat aphids on cotton. For this purpose it is mixed with calcium arsenate or hydrated lime in the proportion of 6.25 pounds to 93.75 pounds. The lime reacts with the nicotine sulfate, forming free nicotine, which is volatile. For this reason these dusts should be applied soon after mixing or else be preserved in tight metal cans. About 32,000 pounds of nicotine sulfate solution (equivalent to 427,000 pounds of tobacco of 3 per cent nicotine content) are used annually on cotton. This is sufficient to make 512,000 pounds of nicotine dust.

KIRKPATRICK

Boll weevil pupa and larvae in a cotton boll

Fungicides

No fungicide is applied to growing cotton, but in many places the seed is treated to prevent seedling diseases and stimulate growth of the small plants. It is estimated that there are used annually for this purpose 600,000 pounds of organic-mercury seed disinfectants, the metallic mercury content of which ranges from 1.5 to 4 per cent.

Supply of Cotton Insecticides during the War

Sulfur appears to be the only material of which an abundant supply is likely to continue to be available. Supplies of copper (an ingredient of Paris green), lead (a constituent of lead arsenate), and mercury (used to make seed disinfectants) are already short. It may become necessary to ration arsenic, which is going in increasing quantity into the manufacture of glass now needed in greater amount to replace tin for containers. All rotenone is imported, and the 1943 supply promises to be one half of normal. More nicotine can be had only by using leaf tobacco, a procedure which is likely to boost the price beyond the reach of most farmers. It is imperative that insecticides be applied to cotton as effectively as possible to conserve the supply.

BILLETT

A close-up of three green cotton bolls. The center boll shows the pink bollworm crawling out of the hull. The boll to the right has the hull cut but webbed over just prior to the exit of the larva.

Future Research on Cotton Insecticides

The Boll Weevil Conference for the Southeastern States, at its meeting in Atlanta, Ga., January 8 and 9, 1942, adopted recommendations of its Committee on Research Needs that investigations be made "of dusting machinery to increase efficacy and permit of uniform low dosages so as to conserve supplies of insecticides, reduce the cost, and lessen danger of soil injury, to adapt orchard and other available dusters to use on cotton"; and "of insecticidal dust and dust mixtures with reference to the relations between their efficacy and physical and chemical properties". These recommendations appear to the writer to be eminently practical. There seems little likelihood of finding a new insecticide as efficient and as cheap as calcium arsenate. Certain synthetics may replace rotenone and nicotine in part, but their use against cotton insects is not very extensive. On the other hand, proper timing and the more effective application of known insecticides will permit adequate insect control with decreased dosage, thus effecting a saving of materials vital to war needs.

Robert S. Aries has been appointed research Engineer of the Connecticut Hard Rubber Co., New Haven, Conn., where he is engaged in the development of synthetic resins. Mr. Aries was formerly doing research and development on a project of the Northwood Chemical Co. of Phelps, Wis., at the Polytechnic Institute of Brooklyn.

A. C. S. Student Membership Awards for 1942

Donor	Recipient
Alpha Chi Sigma Fraternity	
Alpha Chi Chapter. This award is presented to the highest ranking male senior student in chemical technology or chemical engineering at Iowa State College.	**Donald Alonzo Robinson**
Alpha Kappa Chapter. This award consists of membership and a subscription to one journal to the senior in chemistry or chemical engineering having the highest scholastic average at the University of Virginia.	**Robert W. Alfriend**
Rho Chapter. This annual award consists of membership and a subscription to one journal to the outstanding senior receiving a B.S. degree in chemistry at the University of North Carolina.	**John Mitchell Sorrow, Jr.**
Gamma Sigma Epsilon Chemical Fraternity. These memberships are awarded annually by the fraternity to the most outstanding student in each chapter.	
Beta Beta Chapter, John B. Stetson University.	**Wilbur Irving Kaye**
Kappa Alpha Chapter, St. Lawrence University.	**Robert C. Kunz (for 1941)**
	Sylvia Gunderson
Lind, Samuel Colville. This award consists of a membership in the American Chemical Society to that candidate for the B.S. degree in chemistry having the best standing in chemistry at the end of the first semester of his third or fourth year in chemistry at Washington and Lee University.	**Robert S. Rosenfeld**
Syracuse Section, American Chemical Society. This award is presented annually to a high ranking senior in chemistry or chemical engineering in one of the colleges in the territory of the Syracuse Section.	**William H. McPherson, Jr.,** Syracuse University
Lehigh Valley Section, American Chemical Society. The chemical faculties of the colleges within the Lehigh Valley Section select as winners of these awards the outstanding students in chemistry or chemical engineering, based on their three and one-half years of college work.	
Albright College	**Leon R. Steckley**
Cedar Crest College	**Marion S. Reichard**
Lafayette College	**Norman A. Exley**
Lehigh University	**Richard M. Luckring**
Muhlenberg College	**Milton N. Donin**

A Preface for Scientists

ORLANDO ALOYSIUS BATTISTA

American Viscose Corp., Marcus Hook, Penna.

Scientists should be the most conservative people on earth. They should be the last people to be too sure of themselves. They never should assume an authoritative mannerism or develop overconfidence because of the superficial prestige of degrees.

They should be very careful never to underestimate the inventive mind of youth. The age of an exponent never should be permitted to prejudice the evaluation of experimental facts, and the whiteness or length of a beard never must be misconstrued as a basis for scientific integrity.

Scientists who forget how little they know, relatively, about their own field and speak dogmatically, with a tone of infallible finality, expose themselves to invincible elements.

True scientists concern themselves only with the discovery and establishment of facts, reserving speculation as a source of amusement and relaxation. Their preface to every dissertation, every thesis or lecture, might read: "We do not present these data as the inviolable truth, but only wish to state that the details recorded represent the observations we know we made and think we saw".

Course Offered in Reading Chemical Russian

The Polytechnic Institute of Brooklyn will offer a course in the reading of chemical Russian in the fall of 1942–43. This will be given on Tuesday evenings throughout the year. It is designed to give a mastery of the grammatical principles and the vocabulary necessary for the translation of technical articles from Russian reference books and periodicals. Registrants need not have had previous experience with Russian but must have studied some other modern foreign language.

The work will involve supervised study and translation from chemical journals. It will be taught by Karl Steik, a well-known consulting chemist and an accomplished linguist.

Details may be had by writing Raymond E. Kirk, Department of Chemistry, 99 Livingston St., Brooklyn, N. Y.

Development, Manufacture, and Utilization of Peanut Flour[1]

DONALD S. PAYNE

Agricultural Marketing Administration, United States Department of Agriculture, Washington, D. C.

PEANUTS have been grown in the United States since colonial times, but they did not become of commercial importance until about 60 years ago. In the succeeding 40 years production increased to about 1,000,000 acres, and in the past 20 years it further increased to about 2,000,000 acres which produced annually around 600,000 tons.

For 1942 production goals are about 5,000,000 acres with indicated production of around 1,800,000 tons of peanuts. Approximately 600,000 tons may be shelled for customary use in confections, peanut butter, and out-of-hand eating. After deducting the quantity which probably will remain on the farm for feed and seed, this may leave available for crushing into oil and the by-product press cake, approximately 1,000,000 tons of peanuts.

Since the beginning of the peanut crushing industry, the press cake has been accepted as an excellent protein supplement in the feeding of farm animals. In late years scientists have established the excellence of peanut protein as a human food. Reduction of the peanut into oil and cake can be accomplished by hydraulic or expeller press or by solvent extraction methods. By certain modifications of any of these processes a sizable portion of the cake can be made suitable for human food. Peanut flour is a high quality, easily digestible, protein concentrate and is comparatively low in cost.

Early Efforts

There was a great deal of interest in peanut flour during the first World War. An honest effort was made to prepare an acceptable product, but because of the lack of proper processing equipment and food plant engineering technique, those peanut flours were not satisfactory.

Early in 1937 the Surplus Marketing Administration, now a part of the Agricultural Marketing Administration, in connection with its peanut marketing programs was requested to purchase peanut flour and donate it for relief purposes. This request was favorably received, and various agencies were asked to submit samples for testing so that specifications could be drawn and a program inaugurated. The samples examined by the laboratories of the Bureau of Home Economics and the Bureau of Agricultural Chemistry and Engineering indicated that these flours really were no more than slightly refined peanut meals containing approximately the same quantities of grit, hair, hulls, and other foreign material usually present in such products. The flavor and color were not acceptable. As a result a program to encourage the distribution of these peanut flours was not undertaken, but work was begun with cooperating agencies to develop a desirable product (*1*).

In 1938 a company attempted to develop an edible peanut flour. It started with 1 ton of farmers' stock peanuts which were shelled at a local shelling plant. The shelled peanuts were hand picked by farm labor and blanched by a local candy company. The blanched nuts were crushed at a distant oil mill and the cake processed into flour in a local mill by rolling and bolting. From this 1 ton of farmers' stock peanuts a yield of 40 pounds of a 90-mesh flour and 200 pounds of a 40-mesh material was obtained. Extreme difficulty was experienced in bolting the flour due to blanking of the bolting cloth. It was the consensus of those interested in this development that the cost of producing an edible peanut flour by this method would be prohibitive. Because of the difficulty in processing and the extremely low flour yields, this project was abandoned (*1*).

In 1939 state experiment stations cooperating with the Surplus Marketing Administration produced small quantities of peanut flour of rather nice flavor and of good color. The processing methods used in the manufacture of this flour were again prohibitive in cost (*1*). Later in 1939 a cotton oil mill company, which had successfully overcome similar difficulties in the manufacture of cottonseed flour, was requested to undertake the development of processes necessary to manufacture a peanut flour that would meet the requirements of flavor, color, freedom from foreign materials, nutritional characteristics, and processing costs (*1*).

The Process

In earlier attempts to manufacture peanut flour apparently three factors prohibited success—insufficient cleaning of the raw material, lack of proper cooking technique, and uneconomical methods of preparing flour from the press cake.

Experience to date indicates that peanut flour can be produced by the expeller or hydraulic press or by solvent extraction methods. Such methods have been used in the past in the processing of peanuts for the production of oil and the by-product press cake or flakes. But such processes do not require the exclusion from the press cake of sticks, stems, hulls, insect remains, decomposed kernels, and various other foreign materials commonly present in farmers' stock peanuts. Such materials do not normally adversely affect either the quality of the peanut oil, as it is amenable to highly efficient methods of refining, or the use of the press cake in animal feeding. These foreign materials, however, make the press cake or flakes wholly unfit for use as human food.

The manufacture of such press cake or flakes as a food product, therefore, necessitates a major departure from usual oil mill practice, in that the raw material must be of the best quality and thoroughly cleaned before crushing. In the processing of flour from peanuts the oil no longer can be considered the primary product and the press cake the by-product. Rather the press cake must assume the position of the product controlling the operation of the various processes.

In two of the usual methods of crushing peanuts, the hydraulic and expeller press, a more or less severe heat treatment is given the decorticated nuts in order to facilitate the pressing of the oil. This heat treatment induces many changes in the non-oleaginous portion of the peanut. In terms of peanut flour production, certain of these changes are desirable and others highly undesirable. A certain amount of cooking is necessary to facilitate the reduction of the oil content, to improve the flavor, and to reduce the moisture content. A very minimum of cooking is desirable in that even slight cooking adversely affects color, induces changes in the proteins, and causes destruction of significant quantities of thiamin. It has been possible to reach a compromise between overcooking which causes a loss in nutritional value, and undercooking which limits the removal of the oil and makes more difficult the further processing of the cake into flour.

One of the factors limiting the early production of peanut flour was the difficulty in sizing the ground cake. The only method described was that of bolting, the

[1] Presented at the Symposium on Utilization of Agricultural Products of the South during the 103rd Meeting of the AMERICAN CHEMICAL SOCIETY, Memphis, Tenn., April 20 to 23, 1942.

same method by which wheat flour is produced. This proved highly unsuccessful since the peanut flour blinded the bolting cloth, necessitating frequent cleaning and excessive cloth area. The sizing operation has been successfully and economically accomplished with mechanical air separators which float the flour fraction from the coarser ground portion by means of an air stream.

Many problems not mentioned in the literature were encountered and had to be solved before the production of peanut flour could be called a success. All such problems have been successfully worked out, and production of an excellent grade of peanut flour is now past the laboratory and pilot-plant stage.

Properties

Tentative specifications of the peanut flour available from the process now in use are as follows:

LOW FAT PEANUT FOOD FLOUR. Hulls and skins removed; free from particles of hair, insect fragments, or other foreign material; light in color; bland and free from any bitter or raw taste; less than 3 per cent fiber; not less than 5 per cent or more than 9 per cent fat; not less than 55 per cent protein with protein content specified; not more than 10 per cent moisture; and not less than 95 per cent through 120-mesh U. S. standard screen.

The proximate composition of such peanut flour made from white Spanish-type peanuts is as follows:

		RANGE
Protein	60.0%	55-62%
Fat	7.0%	5- 9%
Fiber	2.5%	2- 3%
Water	6.0%	2-10%
Thiamin	4.0 I. U./g.	
Riboflavin	5.0 γ/g.	
Niacin	350.0 γ/g.	

Utilization

For a long time peanuts and peanut food products have been recognized as having a very high nutritive value. Most of us are so familiar with them as food that we no doubt forget what an inexpensive and valuable contribution they can make toward good nutrition in our everyday diets. Peanuts are especially rich in highly digestible and desirable proteins and are excellent sources of vitamins and minerals.

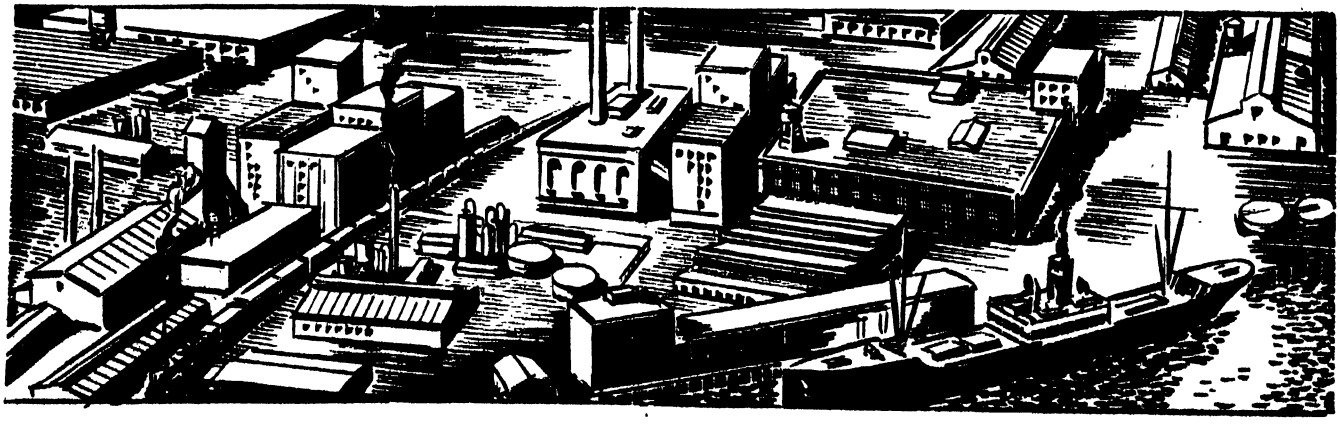
As early as 1920, the Bureau of Agricultural Chemistry and Engineering secured a patent on a bread made from 68 per cent of white wheat flour and 23 per cent of peanut flour and butter, salt mixture, and yeast. Rats, when fed this bread, showed a normal growth as compared with a very poor growth obtained from bread made from white flour in a similar manner. Similar soybean and white flour bread was fed as a check. The rats made about the same growth on the soybean bread as on the peanut bread (*3*).

Information recently obtained about the German army ration indicates that it contains a large proportion of soybean flour used in different recipes. The soybean flour is added to soups, breads, pastries, macaroni, and is used as a substitute for meat products. The soldier thus is supposed to obtain his balanced needs of protein, fats, mineral salts, and vitamins without the use of meat, eggs, or other ordinarily used protein concentrate foods (*2*).

The excellent keeping qualities of the soybean flour and its concentrated form greatly simplify the problems of packing and transporting. Such products are supplemented with dried or frozen fruits and vegetables, such as apple sauce, tomatoes, and peas. In campaign the soldiers also carry highly concentrated foods containing these products. These diets perhaps would not be considered particularly palatable according to American standards, but they apparently are nutritionally adequate (*2*).

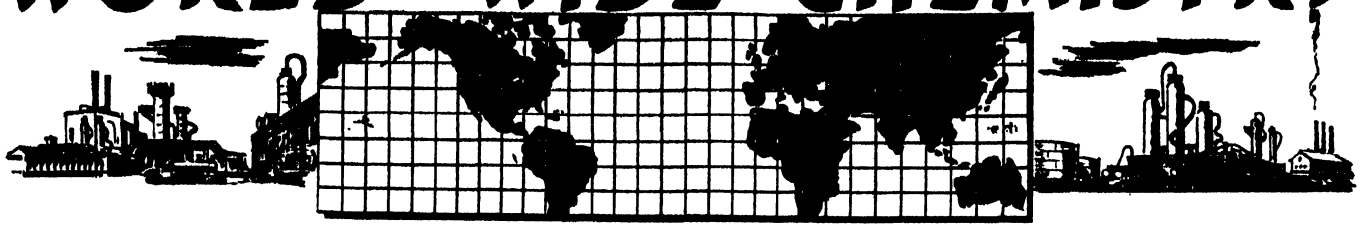
The peanut flour and grits made from the oil-press cake now being manufactured, as well as soy flour, can be utilized to improve the protein level of the food supply.

The proteins of soybeans and peanuts also present some striking contrast to those of other legumes. Chemical analysis and scientific tests show that soybeans and soybean products contain a goodly proportion of proteins, but they are efficient only after they have been heated, while raw peanuts contain proteins of high nutritive value nearly equal to those of milk, meat, and eggs, which are not only highly digestible but rank among the highest in quality (*4*).



Peanut flour may be used for blending with cereal flour in baking to increase the protein content; as an extender and binder in meat loaves, sausage, and other meat products to maintain or increase the protein content; as a base material in dry soup concentrate; and for blending with cereals such as wheat, corn meal, hominy grits, rolled oats, farina, and various prepared dry cereals. Recently dry soup concentrates containing peanut flour have been receiving wide recognition, and consideration is being given to the use of peanut products in cereals for undernourished groups.

Outlook



There is much scientific information to indicate the high nutritive value of peanut flour. This, together with its excellent keeping qualities and highly concentrated form, makes its use for defense purposes and for undernourished peoples particularly advantageous. The present interest in fortified foods and plans to improve the health of the Nation are focusing attention on protein concentrates made from peanuts, soybeans, and cottonseed. Not only is it important to have available at this time ample and low-cost sources of protein, but it may be of even greater importance after the war when world markets are reopened. There will probably be an extreme need for protein foods on the part of nations and people with little purchasing power. As the potential supply of peanut flour is almost unlimited and as the product is ideally suited in color, flavor, and nutritional characteristics, it is a most logical food to fill this need.

WORLD-WIDE CHEMISTRY

Continental Europe

Germany

German pharmaceutical manufacturers have stressed the difficulties created by the shortage of imported drugs and the need to change over to alternative raw materials for the production of medicinal products. Recent reports say that important adjustments have become necessary, and only by an increase of sales to other countries of Continental Europe was the turnover maintained. In German pharmaceutical markets an increasing scarcity of essential drugs has been noticed. As from July 1 ration cards for insulin have been issued to diabetics, not because the drug is in short supply, it is stated, but to prevent hoarding. Pharmacists must apply to the authorities for allocations of other drugs in short supply. The change in diet is reported to have increased the demand for vitamin products and other tonic foods, which are sold only on a doctor's prescription. Demand for certain narcotics also has greatly increased. In particular, barbituric acid and its homologs are said to be used in "uncontrolled quantities bordering on mania". Similarly, demand for quinine preparations has risen. Numerous restrictions have been placed on the distribution and sale of pharmaceutical products, reportedly not so much because of an immediate shortage but rather as a precautionary policy and also in the belief that drug consumption before the war had already reached proportions which were not in the best interest of the patients. A large consumer of pharmaceutical products is the army. Lately the authorities have also reduced the production of medicinal products with a view to saving manpower for more urgent war work.

Rayon Industry Adjusts to Wartime Production Needs

With the government-supported expansion of cell-wool production the importance of rayon for the textile industry has relatively declined, even though the quantities made available for technical purposes may have increased. German rayon factories have had to make important adjustments to meet wartime requirements, according to a statement by Vereinigte Glanzstoff-Fabriken, the leading producing company. New types involving much work and great financial sacrifices, have been developed, and further adjustments will be needed. New investments, on the other hand, have been comparatively small because existing plants were used to produce the fibers needed for technical and industrial purposes. This, however, was accomplished only at the cost of quantity and quality of civilian supplies. The changes have reduced the profitability of operations.

War Damage and Decreased Imports Hurt Guano Works

Guano-Werke A.-G., Hamburg, the German guano manufacturer who used to rely mostly on raw material from South America, reports for 1941 that the plant was operated on a limited scale only. The chief income item consists of interest on funds which were not employed in the company's normal business, while the amount set aside for depreciation had to be increased one half because of damage resulting from partial closing of the factory. While plant and equipment are valued at 1,400,000 marks, a reconstruction reserve is shown in the balance sheet for the first time at 1,470,000 marks. The company's works are situated in an industrial part of Hamburg which has been the target of many air raids.

Cellulose Manufacturers Study Waste Sulfite Liquor Utilization

Vereinigung Sulfitablauge G. m. b. H. has been founded as a joint enterprise of all German cellulose producers using the sulfite process for the development of new methods to utilize the waste sulfite liquor. About nine tenths of the total German cellulose production is obtained by the sulfite process, and utilization of the waste liquor is a problem of considerable economic importance. Heretofore some alcohol has been produced from the waste liquor, and it is hoped that in the future a variety of different products, including cleansing agents, tanning materials, adhesives, and fillers, will be obtained. It is intended that each factory shall concentrate on one or a few of these products so as to keep costs as low as possible.

A new process for recovery of valuable products from the waste liquor, which is claimed to be promising, starts with the drying of the liquor at temperatures of 1,000 to 1,200° C. by fumes. The resulting powder is then treated according to the special requirements of the subsequent utilization. The tanning materials prepared from sulfite liquor are said to be equivalent to quebracho extract and economically preferable because tanning takes a shorter time, the color of the leather is lighter, and the labor cost is smaller. Products recovered from the waste liquor can be added to washing agents and are said to result in a saving in fat content by 50 per cent without reduction of the cleaning power.

Copper Smelter Slag Utilized as Fertilizer

Copper slag from Norddeutsche Affinerie, Hamburg, formerly regarded as a waste product and disposed of in the form of paving stones, has been tried out as a fertilizer. The material consists largely of silica and iron and contains 0.413 per cent of copper as well as traces of manganese, molybdenum, arsenic, and lead. When the slag was applied to ordinary crops, no adverse effects were observed. It is claimed that the material may be used with advantage on soils deficient in copper, although its effect is not equal to that of copper sulfate. About 18 cwt. of copper slag are recommended instead of 1 cwt. of $CuSO_4.H_2O$.

Pyrite Recovered at Coal-Dressing Plants

Experience gained in World War I in the recovery of pyrite from coal-dressing plants is being used again in this war. Before the war one plant of this type was already in operation, and more installations have been made since. New machinery, including a new hydraulically operated jig washer, has been introduced, but the high consumption of fresh water placed a limit on use of these machines. They are now used only for concentration, and experiments have been carried out jointly by

the Association for Mining Interests and I. G. Farbenindustrie for improved methods of pyrite recovery. It is claimed that a practical process has been developed and, to give a stimulus for its more extensive application, the price paid for pyrite has recently been raised. Production of sulfur material from this side is expected to increase further.

High-Grade Motor Spirit Can Be Produced from Peat

Investigations at the Institute for Chemical Technology, Munich, have shown that it is possible to obtain a high-grade motor spirit from peat by the combination of low-temperature carbonization and high-pressure hydrogenation. Low-temperature carbonization yielded a highly reactive peat tar which changed color and consistency soon after distillation. Hydrogenation of the peat tar under pressure in the presence of molybdenum oxide catalysts produced a high-grade motor spirit. Hydrogenation was carried out at 465° and 485° C. At the lower temperature approximately 50 per cent of motor spirit of 0.738 specific gravity and an octane number of 63 was obtained; this required further refining. At the higher temperature 95 per cent of the tar was recovered as a fuel of 0.8 specific gravity and octane number 97. The remaining 5 per cent is described as gas oil.

No information is available about the economic side of the process. The principal difficulty in the chemical treatment of peat, which has been attempted in various experimental stations in Germany, arises from its physical condition and the need to dry it beforehand and use comparatively large vessels of corrosion-resistant metal.

Machinery Developed for Processing Igelit Resin

Synthetic resins of the polyvinyl chloride type, known in Germany under the trade name "Igelit", present some special problems in processing because they cannot be hardened or vulcanized like other rubberlike materials and have no sharply defined smelting point, so that they cannot be cast in the ordinary way. A new machine which is now used extensively for the manufacture of simple forms, like heels for shoes and handles for bicycles, consists of two parts. The Igelit powder is fed into a screw which is heated to 160° C. When the powder has been plasticized at this temperature, it is pressed into forms cooled by water and remains in these for one half to one minute until the temperature has been reduced to 60° to 70° C. The machine is capable of an output of 30 to 125 kg. per hour, and no plasticizer is required. For more complicated parts the powder is fed into a tube which is 4 feet long and heated by oil to 180° C. From this it is transferred in a viscous state to the forms, where it remains under pressure until the press cylinder is withdrawn. This method is also said to result in a substantial saving of time.

Waste Pickling Water Used in Paint Manufacture

Increased attention is being paid to the ferrous chloride liquors obtained in galvanizing shops and other works of the iron and steel industry, and several new outlets have been developed. Most important at present is their use in the paint trade. About 6,000 tons of the waste pickling liquor are said to be sent to paint factories every year. Iron sulfate salts obtained from it are used against charlock in agriculture, as catalysts in the production of motor spirit, and for the desulfurization of gases. In the future the total output of iron sulfate from this source is to be worked up into sulfuric acid and iron suitable for the furnace. Ferrous chloride liquors and iron sulfate salts are recommended also for the chemical precipitation of town and industrial sewage.

Substitutes for Coal-Tar Pitch Used in Briquetting

The shortage of coal-tar pitch has caused German coal firms to look for alternative materials for coal briquetting. Synthetic resins, hydrogenation residues, sulfite liquor, and cellulose pitch are mentioned among materials which may be used for briquetting coal, and a new process has been developed for making coal briquets without binder. None of the material mentioned, however, is available in adequate quantities, so a combination of the various substitutes seems to be more promising. At present hopes are based mainly on a combination of coal-tar pitch and sulfite liquor of which there is a growing output in cellulose plants.

Prussian State Enterprise Leases Alsatian Potash Mines

Preussische Bergwerks- und Hütten-A.-G., a company owned by the Prussian Federal State, has now obtained the lease of the entire Alsatian potash industry. It previously had the trust management of the mines. The Alsatian potash industry will be operated by Elsässische Kaliwerke G. m. b. H., a company formed for this purpose with a nominal capital of 50,000 marks. The new company has full control not only of the former German mines which were in the hands of Mines Domaniales de Potasse d'Alsace, the French official enterprise, but also of Mines de Kali Ste. Thérèse, the private potash company. The Alsatian potash salts are distinguished by a comparatively high average potash content (23 per cent) and absence of magnesium chloride which facilitates processing. While the Preussag subsidiary will be responsible for production, the marketing side will be under the control of the German Potash Syndicate. Owing to the transportation shortage, greater use is being made of Alsatian potash in France, the Low Countries, and western Germany, whereas potash from the mines in central Germany is used to a larger extent in eastern consuming areas.

I. G. Farbenindustrie in the "Protectorate"

Chemische Werke Aussig-Falkenau G. m. b. H., a company which has taken over the plants of the Aussiger Verein, the large Czecho-Slovakian chemical producer, at Aussig and Falkenau, has raised its capital from 4,000,000 to 14,000,000 marks. I. G. Farbenindustrie and another German chemical company, Chemische Fabriken von Heyden A.-G., are interested in the enterprise which by the capital increase becomes one of the largest chemical firms in central Europe.

Dynamit Nobel Doubles Turnover

The expansion of industrial activity in the eastern territories is reflected by the annual report of Dynamit Nobel, the leading chemical producer in Slovakia, which is also under the control of I. G. Farbenindustrie. Extension of the plant was continued according to plans, it is stated in the report for 1941. At the end of the year 1,000 employees were serving the company. The value of sales was doubled in 1941.

Sweden

The Physicochemical Institute at Upsala, which is directed by the Nobel prize winner, The Svedberg, has concentrated on the synthetic production of rubber, resin, and similar materials since the war cut off its usual overseas supplies. Last November Professor Svedberg was asked by the State Industrial Commission to work out as soon as possible a process for artificial rubber production. After a few weeks a first test consignment of a substance resembling the American artificial rubber neoprene was sent to the commission, and experiments have gone on since in cooperation with the Swedish rubber works which will later take up the manufacture on a large scale.

Indigenous Motor Fuels Are Developed in Sweden

To overcome the shortage of imported mineral oils, the Swedish Government has paid particular attention to development of producer gas plants for use in road vehicles and coastal vessels which can be operated on charcoal or wood, fuel materials which are available in almost unlimited quantities. Lately the tendency has been in favor of producer gas plants using wood rather than charcoal because the latter material is required in large quantities for iron smelting. Agricultural tractors are also converted to use of producer gas, and the government assists by development of a standard model and interest-free loans for farmers who wish to convert.

As far as smaller tractors are concerned, use of a liquid fuel prepared mainly from indigenous materials has been found more attractive. This is marketed under the name Xotyl and consists of 85 per cent of sulfite alcohol and 15 per cent of ordinary gasoline. Liquid fuels obtained from oil shale are reserved mainly for the needs of the navy and mercantile marine. The total number of motor cars in Sweden has declined from 248,854 before the war to 74,131 last April.

Distribution of Chemical Fertilizers Meets Difficulties

According to the program of the Swedish Food Commission, announced last November, farmers were to have been provided in 1941-42 with 80 per cent of their normal supplies of phosphatic fertilizers and 85 per cent of their requirements of nitrate of lime, while no restrictions were envisaged for cyanamide and ammonium sulfate. Considerable difficulties in the distribution of chemical fertilizers have been experienced in recent months, however, and energetic and speedy measures for an improvement of the fertilizer position are demanded by agricultural interests. It seems likely that more drastic restrictions will have to be imposed on the use of fertilizers generally. Bones which were used to a large extent for agricultural purposes as well as for the manufacture of glue are now used mainly for other purposes, so that, according to a report by Stockholms Bemmjölsfabrik A.B., the bone glue factories in Sweden will have to reduce employment substantially

Finland

Production of alcohol from residues of the cellulose industry has made considerable progress in Finland since the beginning of the war. All sulfite cellulose plants are now equipped with alcohol recovery apparatus, since the Alcohol Monopoly has undertaken to buy the entire output for at least five years. Were production of sulfite cellulose equal to prewar figures, alcohol output would be sufficient to cover about 40 per cent of the total Finnish motor fuel requirements. Cellulose production, however, has declined substantially because of the curtailment of the export business and, since the supply of sulfite alcohol has naturally been affected by this decline, it is now proposed to erect a plant for the saccharification of wood by a process which has been developed by the Finnish chemist, Dr. Ant-Wuorinen. This would, it is reported, result in very large supplies of alcohol irrespective of the market conditions for other forestry products.

The Netherlands

A considerable part of the business of the Dutch pharmaceutical industry before the war was based on the treatment of imported raw materials and drugs from the Dutch colonies in the West and East Indies. Since Holland has been cut off from these sources of supply, Dutch pharmaceutical manufacturers have endeavored to make up for the loss by use of raw materials obtained from other European countries. The results have not been satisfactory in general. N. V. Koninklijke Pharmaceutische Fabrieken v. h. Brocades-Stheeman & Pharmacia reports that its plant at Meppel operates almost normally most of the time, but the factory at Nimwegen suffers from reduced raw material supplies and difficulties encountered in the use of substitutes. The turnover during the first half of 1942 was unsatisfactory. Wages and taxes have substantially increased.

Belgium

A scheme for the distribution of chemical fertilizers to the whole country under uniform regulations in 1942-43 has been prepared. Supplies of nitrogen are to be retained at the figure of 60,000 tons recorded for 1938-39. Most of this quantity will be obtained in the form of ammonium sulfate from local factories. Consumption of phosphatic fertilizers is to be reduced from 68,000 to 30,000 tons (of phosphoric acid), and most of the supply will be obtained in the form of basic slag from local iron works. Use of potash salts is to be greatly increased, especially for the cultivation of wheat and potatoes, and is expected to reach 105,000 tons of K_2O (against 55,000 tons in 1938-39). The supply will come from the Alsatian mines.

France

Schneider-Creusot, the French armament combine, which like other French companies with extensive foreign interests sold to German firms finds itself in possession of large liquid funds, has acquired a controlling interest in Etablissements Barbet, a company with a capital of 10,000,000 francs which specializes in the construction of chemical apparatus and operates several distillation plants.

Colorado Beetle Campaign to Be Extended to Whole Country

The campaign against the Colorado beetle will be extended to the whole of France during the current year. In 1941, 3,500 tons of arsenical lime were used in 38 départements over an area of 300,000 hectares. Most of the material was obtained from Germany, and small quantities of arsenical lime will still be supplied by German factories this year. The bulk of the 20,000 tons which are to be used in the 1942 campaign, however, will be produced in France. The campaign is likely to be held up by the shortage of spraying instruments.

Distributing Office for North African Phosphates to Be Formed

Distribution of chemical fertilizers to French farmers has met with considerable delay owing to difficulties in production and transportation. Distributing centers in the départements have been instructed to inform the fertilizer factories about the requirements to be met, and growers of some crops, such as sugar beets, which are required in large quantities have been assured that they will receive larger allocations of mineral fertilizers.

For the supply of phosphates France depends mainly on rock phosphates from North Africa, and a new office is to be established for distribution of this fertilizer because available supplies are substantially below demands.

Decline of Chemical Output Stimulates North African Industries

The difficulty of obtaining chemical products from French factories has stimulated new industries in North Africa. A company which was formed recently intends to produce copper sulfate from cuprous pyrites found in French Morocco. Increased interest is also shown for certain salt deposits in Algeria, and a project is on foot for the establishment of a caustic soda factory to use this raw material. The manufacture of soaps from vegetable oils, of which there is now a surplus production because of export and shipping difficulties, has also been studied. Groundnut oil has been used experimentally as a locomotive fuel in three trains operating on the first portion of the Transsahara railway which was opened to traffic a short while ago.

Portugal

Companhia Uniaon Fabril and Sociedade Anoniao Portugues have been authorized by the government to import duty-free plant and equipment for the manufacture of ammonium sulfate on condition that such a plant cannot be supplied by local manufacturers within a certain period. The supply of chemical fertilizers to Portuguese farmers has met with considerable difficulties recently and, while it is still hoped to obtain larger supplies from abroad, increased efforts are to be made for the manufacture of fertilizers in the country.

Spain

Several schemes for the production of nitrogenous fertilizers have been announced in Spain during the past 12 months, mostly in conjunction with plans for the extension and modernization of existing iron and steel plants. It is now possible to give a survey of the actual developments.

Sociedad Espanola de Fabricaciones Nitrogenadas (Sefanito) was formed by Altos Hornos de Viscaya at Bilbao. Its plant is scheduled to produce 125,000 tons of ammonium sulfate, the raw material being the furnace gases of the iron plant at that town. Sefanito has a capital of 150,000,000 pesetas and also intends to build a plant for 60,000 tons yearly of ammonium sulfate at Sagunt. Nitrato de Castilla (Nicas) is a subsidiary of Saltos de Duero, the electrochemical combine, and intends to build a plant for 60,000 tons of nitrogenous fertilizers to be produced by electrolysis at Valladolid. Hidroelectrica Espanola is another company which is to use the electrochemical process for the production of 40,000 tons of nitrogenous fertilizers. Finally Sociedad Iberica del Nitrogeno has recently raised its capital in order to extend its plant at La Felguera where furnace gases of the iron works are used.

This and other projects are to yield another 600,000 tons of nitrogenous fertilizers, so that Spain will have an additional supply of about 175,000 tons of nitrogen when all the current schemes have been carried out. This quantity would be sufficient to replace the bulk of the fertilizer imports before the civil war, but at that time Spain was still one of the most backward countries of Europe in the matter of chemical fertilizers, although she had a local potash industry at her disposal and could obtain phosphates from North Africa.

Cellulose Sources Used in Synthetic Fiber Industry

Lack of the normal sources of cellulose for use in synthetic fiber plants has encouraged research in other cellulose materials in Spain. Fabricacion Espanola de Fibras Artificiales S. A. (Fefasa) has recently commenced production in a 10,000-ton plant at Miranda del Ebro where straw is used as a raw material. This plant is to be expanded so that it will later be capable of an annual output of 27,000 tons. Sociedad Nacional Industrias Aplicaciones Celulosa Espanola (Snisace) is interested in a process for the use of eucalyptus wood, of which there are large supplies in the Provinces of Santander, Asturia, and Huelva. S. A. Lana Linera Espanola is engaged on the construction of two plants at Aranda de Duero and Miranda del Ebro where cellulose is to be obtained from potato tops. S. A. de Industrias de la Paja del Aroz (Saipa) is to build a plant for the production of cellulose from rice straw at Sueta. A number of other projects are under consideration.

Italy

Ente Zolfi Italiana, the Italian central organization for the sulfur industry, reports for 1941 that the total production was 7 per cent below the preceding year's figure. Substantial sales have been reported for carbon sulfide, but exports of sulfur declined as a result of the war and smaller quantities of rock sulfur were sent to the refineries.

The financial position of the Italian sulfur industry seems to have improved, for the Italian Government did not pay any subsidies. Ente Zolfi Italiana has made further efforts for modernization of the sulfur mines and improved organization of marketing. Great difficulties, however, resulted from the lack of transportation and labor, obstacles which are known to have grown more serious lately. No improvement in the export position can be expected for the current year, since Germany, the principal foreign customer in recent years, has taken further steps for an increase in the production of sulfuric acid from local raw materials.

Bemberg Company Draws on Stocks to Meet Demand

S. A. Bemberg, Milan, the Italian company which uses the Bemberg process for the production of artificial silk, reports that the production of rayon and cellwool was maintained at 1940 levels during the past year. Further satisfactory development is expected despite continuing raw material difficulties. The demand for the company's products increased in 1941 and was met only by withdrawals from stocks, while the export business had to be neglected.

New Methane Gas Producing Company Formed In Southern Italy

Societa Anonima Meridionale Metano (Samet) has been formed with a capital of 900,000 lire at Naples for the development of methane gas deposits in southern Italy.

Southeastern Europe

The shortage of mineral oils and other liquid fuels in Continental Europe has encouraged the search for natural gas. It is reported that at present 40 deposits of natural gas in various parts of southeastern Europe are being exploited. About 1,500 gas wells are in production and yield an annual output of approximately 2,000,000,000 cubic meters of natural gas.

In Rumania the semiofficial Sonametan company is leading. The company has made arrangements for the supply of natural gas to various industrial plants using gas either as fuel or as raw material. In Hungary a company has been formed for the production of electric power on the basis of natural gas. The government has taken up 10,000,000 pengö of the shares, and the municipal council of Budapest has also taken a financial interest in the enterprise, which is to supply local industries with power and fuel. Natural gas deposits are also to be developed in Croatia. Even in Switzerland a concession for natural gas has been granted for a deposit supposed to exist in the canton of Schwyz.

Hungarian Nitrogen Plant to Be Expanded

The Nitrogen Works at Pet are to be extended at a cost of 6,000,000 pengö. A new artificial fertilizer plant is to be built by the company in the northern part of Transylvania where natural gas is to be used as a fuel.

Montecatini Acquires Interest in Bulgarian Chemical Industry

Montecatini, the Italian chemical combine, has acquired a financial interest in the chemical factory Amonal in Bulgaria. Amonal changed its name to Montecatini-Amonal and raised its capital to 3,000,000 lewa. It will act mainly as a marketing organization for Montecatini products in Bulgaria, but it is not impossible that the company will engage in manufacturing activities.

Germany Interested In Metal Mining Industry of Yugoslavia

Yugoslavia is by far the most important of all the German-occupied countries from the point of view of nonferrous metal

supplies. The mines of Bor are the largest copper producers in Europe, and the lead-zinc mines of Trepca and other deposits are of considerable interest. Nevertheless German official and semiofficial sources have been reticent about the progress made in developing these mines, and now it is stated that a systematic investigation of the mineral resources of Yugoslavia has still to be made. The work seems to have been held up by the administrative changes, establishment of a Croatian state, and transfer of important districts to Italy, Hungary, and Bulgaria. In Serbia, the remaining part of the Yugoslavian kingdom, a commissioner-general has been appointed for all sections of industry, and systematic exploration work is to be carried out under his control in conjunction with Balkan Metall A. G., a semiofficial company formed for this purpose. Adjustment of diverging interests to the changed conditions is said to be one of the more urgent tasks still awaiting the attention of the commissioner-general.

Petroleum Legislation in Rumania Changed to Push Local Production

A new petroleum bill has been passed by the Council of Ministers in Rumania. Its main provision is the redivision of perimeters handed over for exploration and exploitation to private firms. These are to include larger areas than was formerly the case so that connected geological structures can be worked under comprehensive plans. Where the perimeters are too large for smaller firms, several companies may cooperate in the development work.

Another important change in Rumanian petroleum legislation is a reduction in the amount of royalties to be paid to the government. These will vary between 2 and 14 per cent of the production, so that it will be possible to reopen closed wells.

The bill provides further that the entire crude oil production must be refined in Rumanian plants. Exports even of semi-finished products will be prohibited in the future. The petroleum companies are to join forces with existing technical institutes in a new National Petroleum Institute for the promotion of petroleum engineering. The government will supervise work in the oil refineries in order to ensure full use of modern processes. The refineries may be ordered to amalgamate to permit more economical operations. All oil pipes serving the export trade will be taken over by the government, but pipe lines connecting oil fields with refineries will be returned to private ownership. To increase Rumanian interest in the petroleum industry, it has been decided to grant substantial privileges to firms which are more than 75 per cent owned and managed by Rumanian nationals.

Growth of Medicinal Plants in New Zealand Is Encouraged

EXPERIMENTAL cultivation of such medicinal plants as foxglove or digitalis, thornapple, henbane, and others, is being undertaken in New Zealand through encouragement of the British Government, in order to replenish decreasing stocks of various important drugs, according to a consular report from New Zealand.

The dried leaves of foxglove, thornapple, henbane, and roots of nightshade are frequently sent to England for extraction of essential drugs, it is stated. Other plants which may be grown in New Zealand for extraction of medicines and flavorings include poppy, peppermint, caraway, coriander, fennel, and licorice.

Italian Production of Chemicals Hampered by Shortage of Electricity

ITALIAN chemical production is hampered by shortages of electric current and coal, official reports from that country indicate.

Although nitrate-producing capacity, for instance, is stated to be ample for both military and agricultural needs, actual production is lowered by the shortages mentioned, coupled with transportation problems and scarcity of raw materials. The result has been an enforced reduction in fertilizer use, in turn an important factor in holding back Italy's attempts to expand agricultural production.

Shortage of copper is said to be one cause for heavy cutailment of copper spray manufactures, some plants being idle for lack of this metallic ingredient. New sprays requiring a minimum of copper are being tested.

Shifting of important chemical works to locations said to offer more favorable basic raw materials is under consideration.

Switzerland Rations Copper in Spraying Solutions

SWITZERLAND has inaugurated scrap copper collections on account of dwindling imports and copper supplies becoming exhausted.

Rationing of copper to 690 tons for use in spraying liquids, compared with normal consumption of 1,550 tons, has been ordered for this year, according to food value of crops. Some 180 tons of copper were used in the last prewar year to combat fruit tree pests, compared with 50 tons allowed this year.

A NEW machine, said by British paint-spray equipment makers to require only 10 days to build, is reported from England to be capable of painting 5,000 shells in 8 hours and to do the work of 120 people by the use of only three workers. Two watchers and a loader are the only labor required, it is stated.

Canada Produces First Pure Magnesia

PRODUCTION of pure magnesia for the first time in Canada, is reported by the Aluminum Co. of Canada, Ltd., from its new plant in Quebec. The raw material used is brucitic limestone from the Gatineau Valley. The first 50 tons of hydrated lime produced at the plant were presented to the Dominion's experimental farm.

Venezuela Plans to Produce Quicksilver

PLANS for development of quicksilver production in Venezuela, to a monthly output of about 200 tons of 8 per cent ore, equivalent to about 100 flasks, are reported by U. S. Bureau of Mines. An order has been placed in the United States for empty flasks, indicating that treatment at the mine may begin during the current year.

Canada Is Important Producer of Mercury

CANADA has become an important producer of mercury since discovery in 1937 of mercury deposits in northern British Columbia. Canada now supplies the United Kingdom with a large part of its requirements in addition to meeting domestic needs. Production started in 1940, with further geological work the following year. Prior thereto little mercury was produced in Canada.

A CHANGE of name from the former S. A. pour Industrie Chimique to Chemische Werke Dornach G. m. b. H., is reported for this Alsatian firm formerly connected with the Kuhlman group and now under German control, making dyestuffs, pharmaceuticals, and other chemical products.

ITALY is reported to be expanding its aluminum output to an extent that is meeting national needs and allowing a surplus for export. The country is said to have an abundance of laucite, yielding potassium salts as a by-product and furnishing raw material for the metal output

GERMAN experiments with the use of sulfite lye as a binder in production of fuel briquets are reported from British sources to be still in progress, and are said to promise good results. Experiments are in the hands of the Zellstoffabrik Waldohof, of Mannheim.

EXPANSION from 30,000 to 40,000 tons capacity is reported for a Swedish factory producing calcium nitrate. The increased production was necessitated by present conditions but still does not meet demand, despite increased output at an old factory as well.

Survey of Postwar Prospects

More than eight thousand manufacturers are cooperating in a survey now under way to determine postwar employment and reconversion prospects. Wholesale and retail trades also are being queried as to their after-the-war outlook, as will other segments of industry within the next few weeks.

This survey is a part of the research project which the Chamber of Commerce of the United States has undertaken to develop facts as to consumer demands, and the means of industry to fill them when full peace-time production is resumed. The project is designed to assist management, labor, agriculture, and the government in planning for quick reconversion and quick employment after the war.

The broad national canvass of the postwar consumer market was initiated by the Chamber several weeks ago. The consumer analysis was undertaken on a comprehensive national scale when a preliminary pilot survey indicated that war's end will bring a tremendous demand for the products of American industry.

The specific industry research, participated in by manufacturers and other segments of industry, is to analyze plant capacity needed for a continuation of "defense" needs after the war; plant capacity available for production of civilian goods; machine tools needed for reconversion; labor needed for reconversion and for production after the war; and time required for reconversion.

War Risk Insurance Rates

The War Shipping Administration has announced that following advices received from the OPA, the War Shipping Administration has withdrawn nominal war risk insurance rates covering the importation of certain commodities, including industrial chemicals. Effective September 1, these shipments take the rates which prevailed under insurances granted by the War Shipping Administration in the month of July.

Characteristics of Gas Flames

Pointing the way to development of more efficient gas and oil burners for home and industrial use, technicians of the Bureau of Mines and the Carnegie Institute of Technology, Pittsburgh, Penna., have evolved a method which should permit increased accuracy in determining the characteristics of gas flames under various controlled conditions. The experiments indicate that simple, inexpensive tests can be developed for determining the proper mixture for gas burners and the method by which it is fed, so that the burners will operate at maximum efficiency.

The research is one phase of a study intended to eliminate guesswork in the design and operation of burners and to produce flames of definite physical dimensions with a minimum waste of fuel.

New Biochemistry Journal

Archives of Biochemistry, new journal in biochemistry, is announced by the publishers, The Academic Press Inc., 125 East 23rd St., New York, N. Y. The first issue will appear about the middle of October.

The purpose of the new journal is to provide a medium of publication for scientific papers in the widening scope of biochemistry. The fields to be represented are: proteins, hormones, vitamins, viruses, enzymology, biochemical and biophysical research in chromosomes, metabolism, nutrition, photosynthesis, plant chemistry, organic chemistry as far as related to living organisms, colloid science in its biological application, and chemotherapy.

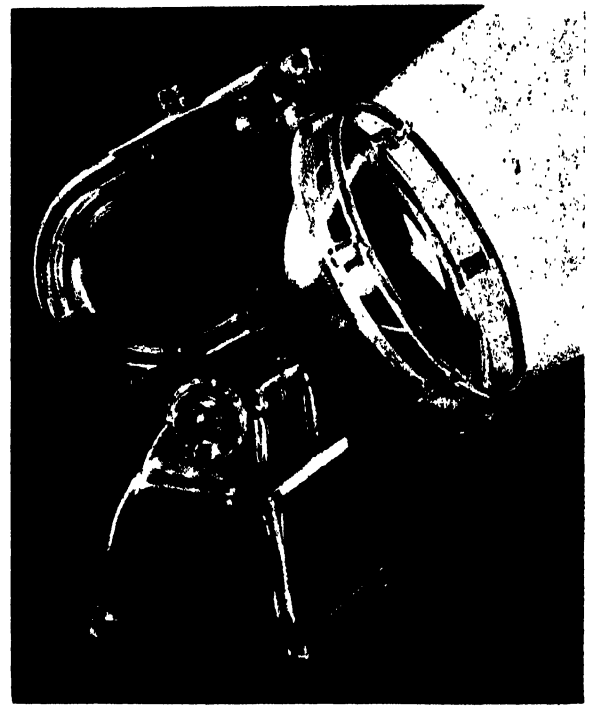
The editorial board is composed of: M. L. Crossley, American Cyanamid Company; R. A. Gortner, University of Minnesota; F. C. Koch, Armour and Co.; C. M. McCay, Cornell University; F. F. Nord, Fordham University; F. W. Went, California Institute of Technology; and C. H. Werkman, Iowa State College.

Two volumes per year are planned, each volume at $5.50.

Union Catalogs

A plan of the Social Science Research Council and the Joint Committee on Materials for Research of the American Council of Learned Societies, through the aid of the Carnegie Corp., has borne fruit in the form of a 409-page volume, Union Catalogs in the United States, published by the American Library Association, 520 North Michigan Ave., Chicago. The volume gives a complete picture of the status, planning, cost, administration, use, limitations, and possibilities of an instrument to which research workers are turning in increasing numbers for the location of the literatures of their respective subjects. Its price is $5.00.

University Microfilms



Among the abstracts of doctoral dissertations recently made available by University Microfilms, 313 North First St., Ann Arbor, Mich., are the following: "The Heat Capacity of Nickel Nitrate Hexammoniate from 54° K. to 300° K., the Transition at 243° K., and the Anomalous Energy Absorption below 85° K." by F. C. Toettcher, University of Missouri, 213 pages, price $2.66.

"Liquid-Vapor Equilibrium in Hydrocarbon-Water Systems", by R. E. Chaddock, University of Michigan, 120 pages, price $1.50. Paper enlargements, 6 × 8 inches, are available at 10 cents per page.

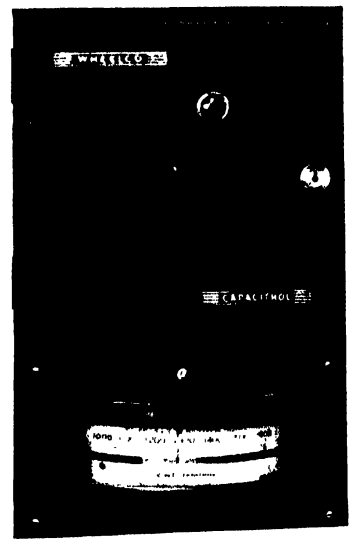
Alcohol for War Use Only

All 128 distilleries in the United States are to be converted to the production of war alcohol by November 1, when manufacture of whisky, gin, and other beverage spirits will cease. It is predicted that 476,000,000 gallons of alcohol will be needed for war purposes in 1943, more than half of it in the manufacture of butadiene.

R. J. Laidlaw has been appointed manager of the Cleveland district office of the Worthington Pump and Machinery Corp., succeeding A. J. Klug.

Utility Lantern

A new type of general utility lantern with an all-Tenite housing has recently been developed. This FocOlite lantern features an adjustable focal length and a small light bulb on an extension cord that may be used to illuminate objects not made visible by the larger beam. The product is manufactured by the Focal Co., Downey, Calif., and the housing is molded of Tennessee Eastman Tenite by the Modern Plastics Co., Los Angeles, Calif.



Wheelco is still FIRST . . .

. . . in pioneering new applications for engineered electronics in temperature control.

The famous Wheelco "Electronic Principle" Control System provides faster, more accurate control than any other type of control and is constantly being applied to more control problems.

In 1941, Wheelco incorporated the instantaneous control action of the "Electronic Principle" and extreme accuracy of temperature measurement into the UNIVERSAL Temperature Controllers, which are the first to provide such plus values as interchangeability of all component parts, interchangeability of scale ranges, ready accessibility of all parts for individual checking and many other features. UNIVERSAL Controllers include Capacitrols, Potentio-trols, Limitrols and Resistance Therm-otrols.

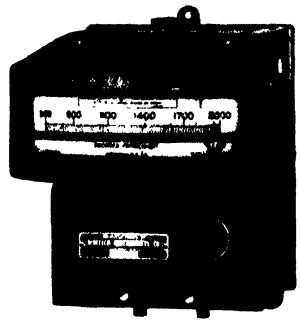
In 1942, Wheelco continues to pioneer new control applications for the "Electronic Principle."

Universal Controller

UNIVERSAL controllers can be furnished as Capacitrols, Potentio-trols, Limitrols or Resistance Therm-otrols. Write for FREE Bulletin No. Z6000.

1935

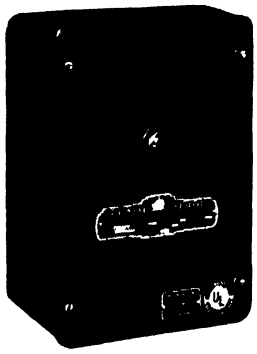
"Electronic Principle" Temperature Control *(D2).



Limitrols *(D202).

Indicating Pyrometers *(D302).

"ELECTRONIC PRINCIPLE" TEMPERATURE CONTROL since proved superior to other types of controllers.



Capacitrol

Potentio-trol

★

Flame-otrol

1936

Flame-otrol *(L2).

Portable Indicating Pyrometers *(D602).

FLAME-OTROL – only combustion safeguard for all fuels approved by both Underwriters' Laboratories and Factory Mutual Laboratories.

1937

Proportioning Control *(D2).

Portable Potentiometers *(A502).

Heat-eyes *(S2).

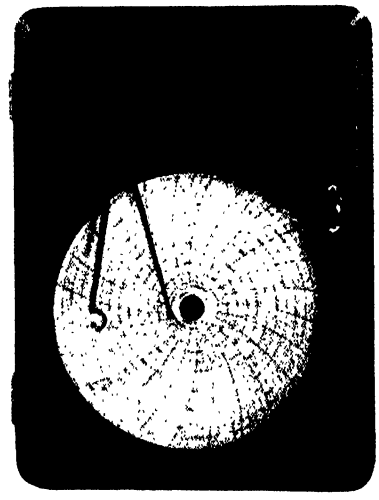
Time Delay Relays *(S302).

PROPORTIONING CONTROL for continuously varying fuel input to maintain constant temperature — applied to "Electronic Principle" Controllers.

★

1938

Potentio-trols *(A2).
Program Control *(D2).
Rheotrols *(J302).
Flame-eyes *(L302).
Automatic Ignition Flame-otrols *(L2).



POTENTIO-TROLS potentiometric method of temperature measurement combined with "Electronic Principle" Control.

1939

Indicating Therm-otrol *(G502).
Indicating Thermometers *(G303).
Recording Thermometers *(G403).

"ELECTRONIC PRINCIPLE" INDICATING THERMOMETER CONTROLLERS – for low temperature applications.

★

Recording Therm-otrol

1940

Recording Therm-otrol *(G502).

The THERM-OTROL, Recording Control Thermometer. Available in any type of measuring and control system for ranges from 50°F. to 1000°F.

851 W. HARRISON STREET CHICAGO, ILL.

Wheelco Originator of "Electronic Principle" Temperature Controls.

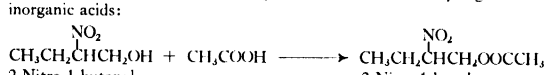
Treasures

...more precious than Gold

Today there are important materials which America needs and cannot buy . . . for all the gold in the world. This is a challenge that American chemists are meeting with new and better materials.

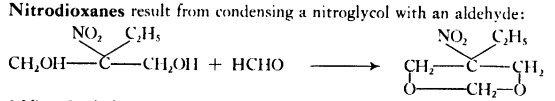
The Nitroparaffins and their derivatives have proved to be starting points for producing many of these new materials. Note the possibilities for synthesis with just one group of NP derivatives—the Nitrohydroxy Compounds.

TO ADVENTUROUS CHEMISTS...



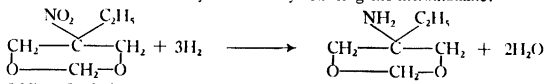
these reactions will suggest many others:

Aminohydroxy Compounds are made by reducing the corresponding nitrohydroxy derivatives:



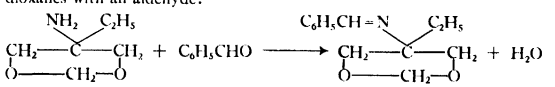
2-Nitro-2-methyl-1-propanol → 2-Amino-2-methyl-1-propanol

Nitro Esters are made by reacting nitro alcohols with many organic and inorganic acids:



2-Nitro-1-butanol → 2-Nitro-1-butyl acetate

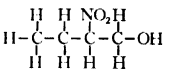
Nitrodioxanes result from condensing a nitroglycol with an aldehyde:



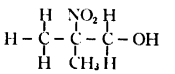
2-Nitro-2-ethyl-1, 3-propanediol → 5-Nitro-5-ethyl-1, 3-dioxane

Aminodioxanes are easily obtained by reducing the nitrodioxane:

5-Nitro-5-ethyl-1, 3-dioxane → 5-Amino-5-ethyl-1, 3-dioxane

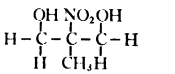


N-substituted Iminodioxanes may be made by condensing aminodioxanes with an aldehyde:



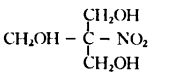
5-Amino-5-ethyl-1, 3-dioxane → 5-Benzylidenimino-5-ethyl-1, 3-dioxane

The Nitrohydroxy Compounds



produced by condensation of the Nitroparaffins with aldehydes

2-Nitro-1-butanol

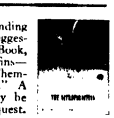


2-Nitro-2-methyl-1-propanol

2-Nitro-2-methyl-1, 3-propanediol

2-Nitro-2-ethyl-1, 3-propanediol

Tris (hydroxymethyl)-nitromethane



COMMERCIAL SOLVENTS

Corporation

The Nitroparaffins at Work will be featured in our exhibit at the National Chemical Exposition in Chicago, November 24th to 29th. You are cordially invited to visit our Booth.

17 East 42nd Street, New York, N. Y.

Chemists are finding many helpful suggestions in the Data Book, "The Nitroparaffins—New Worlds for Chemical Exploration." A copy will gladly be mailed you on request.

New Course in Plastics

THE Polytechnic Institute of Brooklyn is offering a new graduate course in the technology of resins and plastics. Prominent specialists in each of the important resins and plastics in current use will give the lectures, following the plan so successfully used in such courses as organic synthesis and petroleum refining.

The program includes phenolic, urea, acrylic, vinyl, and styrene resins, as well as cellulose esters and ethers, regenerated cellulose, casein and shellac plastics. Sources of raw materials, use of fillers, plasticizers, dyes, lubricants, and accelerators will be discussed, and the techniques of manufacture of the resins, compounding, molding, impregnating, laminating, and coating. Production of synthetic fibers and elastomers is included, also an introduction to the design of products fabricated from plastics.

The course consists of 28 lectures, on Thursday nights at 8:00 P. M., beginning October 1.

Seminar on Mechanism of High Polymeric Reactions

THE Department of Chemistry of the Polytechnic Institute of Brooklyn, Brooklyn, N. Y., has arranged a series of seminars on "The Mechanism of High Polymeric Reactions", to be held alternate Saturdays from 11:00 A. M to 1:00 P. M. beginning October 3. The seminars will be under the direction of H. Mark and C. E. Waring.

Officers of Junior Chemical Engineers of New York

NEWLY elected officers of the Junior Chemical Engineers of New York are: president, John R. Callaham, *Chemical and Metallurgical Engineering;* vice president, Howard Ten Broeck, Socony-Vacuum Oil Co.; secretary-treasurer, Alvin S. Weiss, Schenley Distillers Corp.; assistant secretary-treasurer, Edward T. Maples, M. W. Kellogg Co.; chairman of publicity committee, George M. Hain; chairman of program committee, Raymond P. Devoluy; chairman of membership committee, Frank Melaccio; intersociety activities, Frank B. White.

War Training Courses in Radio and Chemistry

WESTERN Reserve University, Cleveland, Ohio, in cooperation with the U. S. Government is offering war training courses in "Chemistry in the Service of War", "Industrial Chemical Analysis", "Fundamentals of Radio", "Industrial Electrochemistry", and "Synthesis and Use of Strategic Organic Chemicals".

Mellon Institute Technochemical Lectures

A SERIES of lectures on recent advances and current trends in the American chemical industry will be presented by technologic specialists of the Mellon Institute, Pittsburgh, Penna., during 1942–43 on alternate Wednesdays.

Price Regulations

All distributors selling chemicals or drugs covered by specific price regulations were licensed August 11 by the Office of Price Administration through Supplementary Order 11. The order, which also makes the holding of a license a required condition for selling, contains the usual provision on suspension of licenses. Retailers are excluded from the licensing order, since they are already licensed under the General Maximum Price Regulation. Manufacturers, except those who redistribute or operate at the distribution level through subsidiaries, affiliates, or branches, are also excluded, as are laboratories operated by nonprofit educational institutions.

In his statement of considerations accompanying the order Price Administrator Leon Henderson explained he had "deemed it necessary to extend licensing to the chemical and drug industry . . . because of the vital role which chemicals and drugs play in our national life. Chemicals are essential to the war effort. Drugs are vital to public health. It is important to the Nation that prices of these commodities remain stable, and that there be no evasion of existing and forthcoming price regulations dealing with these commodities."

The order lists the price regulations, issued for the chemical and drug industry, which cover the products whose distributors are now licensed. The order provides also that licenses shall be required of distributors selling chemicals or drugs which may be covered through regulations issued in the future, which make applicable by reference the provisions of the order.

Supplementary Order No. 11 supersedes the licensing provisions of the General Maximum Price Regulation, insofar as they apply to distributors of chemicals or drugs licensed by the supplementary order.

Butyl Alcohol and Acetone. The effective date of Maximum Price Regulations Nos. 36 and 37, substantially reducing the maximum prices for normal butyl alcohol and acetone produced by both fermentation and synthesis, has been postponed from September 3 to October 3, the Office of Price Administration has announced.

This delay is necessary due to a change in market conditions for fermentation acetone and fermentation butyl alcohol. Fermentation acetone is a by-product from the manufacture of fermentation butyl alcohol. Due to the joint-product nature of fermentation acetone and fermentation butyl alcohol—fermentation acetone represents about 20 per cent of total acetone production, the remaining 80 per cent being produced synthetically—the prices of the two products are closely related.

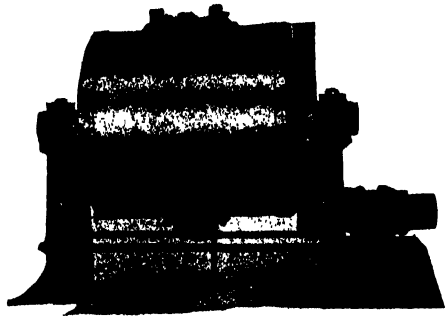
Maximum Price Regulation 37 sets a maximum price of 12½ cents per pound for the butyl alcohol produced by fermentation, while Maximum Price Regulation 36 establishes a price of 8½ cents a pound for fermentation acetone. Under Revised Price Schedules 36 and 37, which have governed these products up to the present, the maximum price for both fermentation butyl alcohol and acetone is 15.8 cents a pound.

Cotton Linters and Hull Fibers. Sales of cotton linters and hull fibers by the United States or any of its agencies are not subject to the pricing provisions of Maximum Price Regulation 191 according to Amendment 1, effective September 10.

This exemption was made, the Office of Price Administration explained, in order to facilitate the carrying out of plans made by the War Production Board and the Commodity Credit Corporation for the orderly marketing and conversion into chemical cotton pulp of cotton linters. In order to prevent any interference with the continuous supply of cotton linters necessary to maintain maximum production of chemical cotton pulp, the War Production Board has authorised the Commodity Credit Corporation, and the Commodity Credit Corporation has undertaken, to purchase all cotton linters for resale to the producers of chemical cotton pulp. To assure the greatest possible speed in the execution of these plans, OPA has exempted sales of cotton linters and hull fibers by the United States or any of its agencies from the price regulation governing cotton linters and hull fibers.

Sulfate of ammonia—one of the most important agricultural fertilizers—is brought under a specific dollars and cents price ceiling on all sales by producers, importers, and primary jobbers.

Maximum Price Regulation 205. Maximum prices that may be charged are a base price of $28.20 per ton at inland oven plus the transportation charges to buyer's destination from the inland oven nearest the buyer's destination, or a base price of $29.20 per ton at port, plus the transportation charges to buyer's destination from the port nearest to the buyer's destination.



With the exception that no separate differential is granted in the regulation for "spot sales", these prices are at approximately the same level requested in May 1941 and again last February of the producers by the Price Administrator.

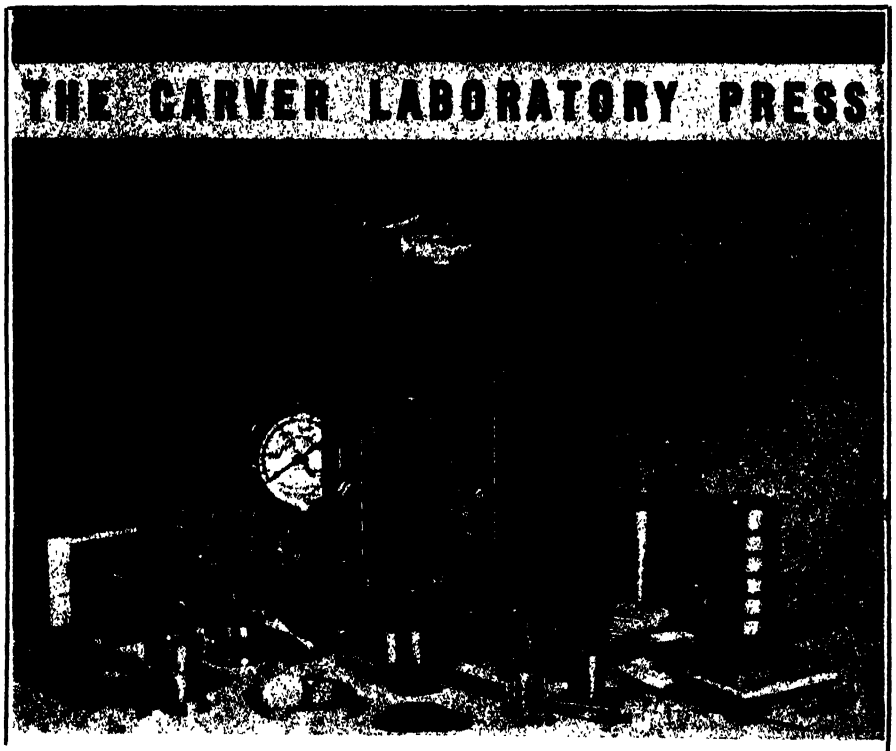
Only that sulfate of ammonia which contains 20.5 per cent or more of nitrogen and which is directly applied to the soil as a fertilizer or used in mixed fertilizers is affected by the regulation.

Vitamin A Oils and Concentrates. Prices of the natural oils and concentrates from which vitamin A is obtained have been stabilized at levels substantially lower than those prevailing during the speculative flurry of late 1941. Maximum Price Regulation 203 applies to all persons who sell the oils or concentrates, and removes these products from the provisions of Revised Price Schedule 53 (Fats and Oils).

The specific dollars-and-cents maximum prices contained in the regulation for vitamin A oils and concentrates are slightly higher than the average prices of 1941, although they are lower than the prices charged during the fall and winter of last year when prices increased sharply. In general, the maximum prices are high enough to permit producers, and concentrators of the oils to operate at their average 1941 margins and to purchase fish livers at the average prices paid during last year.

Volatile Oils. Sales and deliveries of volatile oils—the most important of which are peppermint and spearmint—by the growers of the plants from which these oils were distilled are exempted from the provisions of the General Maximum Price Regulation.

As most growers did not make sales during March 1942, the base pricing period of the general regulation, it has been deemed advisable to exempt their sales of these oils from the provisions of the regulation.



Two midwestern dealers in peppermint and spearmint oils have been authorized by OPA to adjust their maximum prices under the General Maximum Price Regulation in line with those of their competitors to enable them to carry out their contracts with the farmers.

The OPA also announced that the prices of peppermint and spearmint are being closely scrutinized and, if desirable, a separate maximum price regulation covering them may be issued in the next few months. Sales of these oils, other than sales by growers of the plants from which the oils were distilled, are covered by the General Maximum Price Regulation.

Wood Waste. The maximum price for veneer mill wood waste when sold to the Ford Motor Co. for use as a raw material at its Iron Mountain, Mich., wood distillation plant has been adjusted.

This adjustment, which exempts veneer mill wood wastes used for this purpose from provisions of the General Maximum Price Regulation until November 1, 1942, was contained in Amendment 22 to Supplementary Regulation 1 and became effective August 14. Up to the present this particular plant, which produces important war chemicals such as wood alcohol, methyl acetone, and acetic acid, has used wood waste, along with chemical logs and bolts—small logs from 3 to 18 feet long and 3 inches and up in diameter—as raw materials. The logs are exempted from the General Regulation and, as a result, the company has been able to pay a high enough price to obtain enough logs to operate at full capacity.

Currently the plant is dependent upon the wood waste as its main raw material as floods in the area have reduced the supply of logs. Present prices established for the wood waste under the General Regulation are not sufficiently high to assure an adequate supply. Any increases in price for the wood waste which may result from the exemption will not be reflected in the price of the chemicals produced at the plant.

Standard equipment for **research** and small scale experiments in laboratories throughout the world...furnished with accessories, including steam or electric hot plates, cage equipment, bearing plates, test cylinders, filter pads, etc. *Catalog on request.*

Complaint Filed against Molybdenum Producers

THE Department of Justice has announced the filing of a complaint and the entry of a consent decree in the U. S. District Court for the Southern District of New York against the five principal American producers and distributors of molybdenum, charging violation of the Sherman Antitrust Act.

Named as defendants were the Climax Molybdenum Co., Greene Cananea Copper Co., Anaconda Sales Co., Molybdenum Corp. of America, and Kennecott Sales Corp., all of New York, N. Y.

The consent decree would enjoin the defendants from dividing up world markets and fixing resale prices, thus effectively breaking up an international molybdenum cartel which was in operation from 1929 to the outbreak of the war in Europe in 1939.

Chemical Manufacturers Indexes

THE June index of the value of chemical manufacturers' shipments, according to the monthly industry survey of the Department of Commerce, was 170 compared with the same figure for May and 164 in June of last year taking the average month of 1939 at 100.

The department's figures show also that the May 1942 index of the value of chemical manufacturers inventories was 162.4 compared with 159.9 in May 1941 and 119.5 in June 1941 again taking the average month of 1939 at 100.

Natural Rosins profitably replaced by

New, high-melting, Pale Resin!

Poly-Pale* Resin (from WG to X on the rosin scale) is more widely and more completely soluble than natural rosins. It has a higher melting-point, lower acid number, higher viscosity, and is substantially free of metals.

Moreover, applications for this new resin extend beyond replacements for rosins. It avoids rosin's well-known tendency to crystallize in certain processes.

AMONG PRODUCTS IMPROVED BY POLY-PALE RESIN ARE—
Protective Coatings · Resins
Linoleum · Inks · Petroleum
Adhesives · Core Oils
Metallic Resinates and Dryers

Descriptions of the physical and chemical characteristics of Poly-Pale, and extensive information of value in formulating, are contained in the revised 2nd edition of the booklet "Poly-Pale Resin." Mail the coupon for your copy.

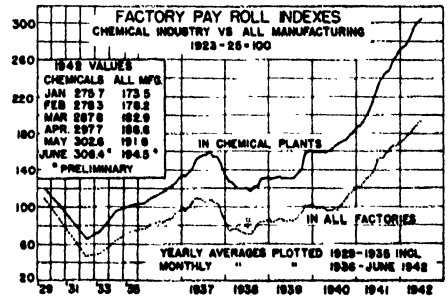
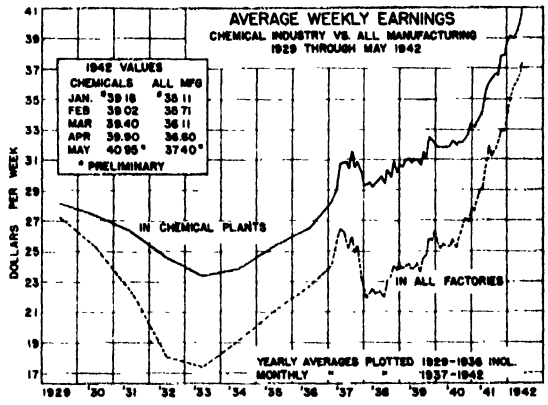
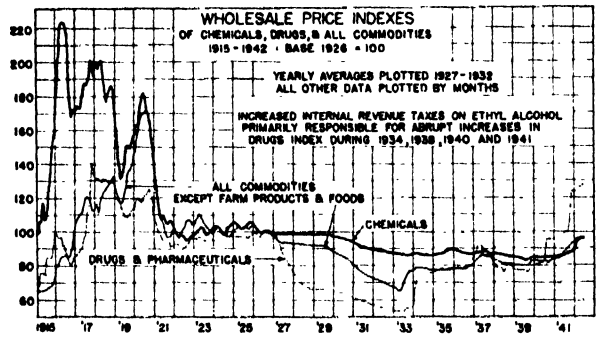
Wage, Hour, Employment, and Price Trends

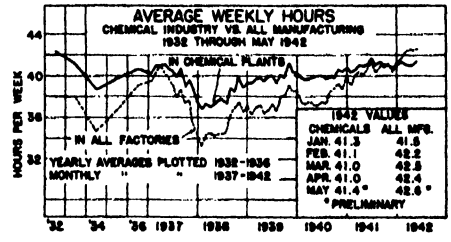


The Chemical Industry Compared with All Industry



STATISTICS in these graphs were compiled from official sources by the Manufacturing Chemists' Association, 608 Woodward Bldg., Washington, D. C. Chemical graphs in this M. C. A. Statistical Report No. 21 show only the data listed by the U. S. Department of Labor under "chemicals" and do not include soap, explosives, petroleum refining, rayon, drugs, fertilizers, cottonseed oil, cake or meal, and paints and varnishes.





Engineering Data on Plywood

OF INTEREST to users, manufacturers, and specifiers of plywood is a series of tables on "Strength and Deflection of Douglas Fir Plywood Under Loads Applied at Right Angles to Face", by Charles B. Norris, Forest Products Laboratory, published by I. F. Laucks, Inc., Seattle, Wash. The tables are the results of a cooperative project between I. F. Laucks, Inc., and Forest Products Laboratory. The charts are devoted to Douglas fir plywood, but the method for adaptation to other woods is provided.

This information is reprinted as a 16-page booklet from Mr. Norris' "Technique of Plywood", a handbook of 250 pages just issued by I. F. Laucks, Inc. ($2.50 postpaid). Copies of the booklet are available from I. F. Laucks, Inc., at 10 cents each.

Frank L. Campbell, has taken leave of absence from the Ohio State University to perform advisory service on insecticides in the Chemicals Division, Office for Agricultural War Relations, U. S. Department of Agriculture, Washington, D. C.

By-Product and Beehive Coke

THE Bureau of Mines, U. S. Department of the Interior, has prepared report MMS 1015 on the distribution of by-product and beehive coke in 1941, showing the greatest output of coke in the history of the country, thanks to unprecedented activity in the iron and steel industry during the year. The report gives statistical data, including consumption by states, comparative consumption, source of coke consumed, destination of coke produced in each state, breeze and screenings, and exports.

Soda Ash is a weapon
Solvay Soda Ash has its place in the Victory Program as an important basic material required in the manufacture of equipment and other products for our armed forces. Listed below are a few of the many essential war materials produced with the help of Solvay Soda Ash.

NEWS-MAKERS

F. T. **Carson** of the National Bureau of Standards Paper Section received the degree of doctor of science at his alma mater, Hardin-Simmons University, in June in recognition of his achievements in research on physical properties of paper.

James R. Connell has been appointed vice president in charge of sales of the Fibre Conduit Co., Orangeburg, N. Y.

M. H. Corbin has been appointed manager of industrial sales and director of research for Standard Varnish Works, Chicago, Ill., in the eastern territory. Mr. Corbin succeeds the late **Paul Sommer**. Mr. Corbin was formerly in charge of the lacquer and research departments of Ault and Wiborg and The Arco Co. He has been with Standard since 1937, specializing on sales and technical service in the lacquer field.

Captain James B. Cordiner, Jr., is now attending the Ninth General Staff Course of the Command and General Staff School at Fort Leavenworth, Kans. After completion of the course, he is to assume the duties of assistant supply officer at the Anti-Aircraft Training Center at Camp Stewart, Ga.

Lowell V. Coulter has received appointment as instructor in the Department of Chemistry, Boston University. Since receiving his Ph.D. degree from the University of California, he has been teaching at the University of Idaho.

Graduates of the Incarnate Word College, San Antonio, Texas, who have recently taken technical positions, include the following: **Jean Craig**, technician in Army Hospital, Fort Sam Houston; **Mildred Schlosser**, laboratory technician in Nix Hospital, San Antonio; **Linette Goldman**, technician, Santa Rosa Hospital; **Mary Libert**, assistant chemist, Kincaid Steel Co.; **Ann Dalmas**, laboratory assistant in private laboratory; **June Pike**, junior chemist, Biochemistry Laboratory, Randolph Field, San Antonio; **Dorothyhe Freman**, assistant chemist, Longhorn Cement Co.

Ralph E. Davis, Jr., has joined the Sales Department of the Hooker Electrochemical Co., Niagara Falls, N. Y. For the past six years he had been superintendent of the tannery of Maylender Bros., Johnstown, N. Y.

Robert A. Diehm, since 1929 doing research and technical sales work with Röhm & Haas, has been appointed technical director of the Container Corp.

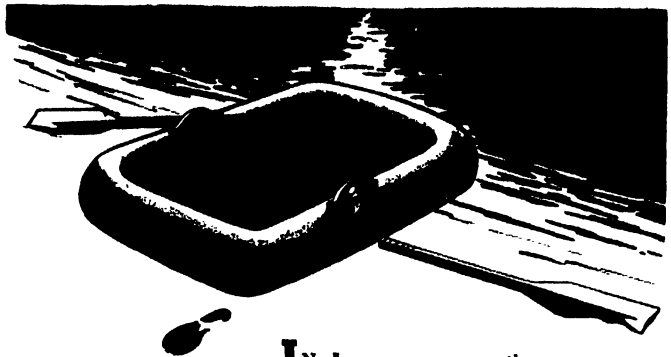
R. Edson Emery, president of Jessop Steel Co., Washington, Penna., is celebrating his 42nd anniversary of service in the steel industry. Mr. Emery started in 1900 with the Crucible Steel Co. and has served as president of Superior Steel Co. and as vice president of the Colonial Steel Co.

Clifford S. Garner, assistant professor of chemistry at the University of Texas, is on leave of absence doing research at the University of California in Berkeley on a project under the National Defense Research Committee.

George Gibson has been appointed assistant professor of chemistry at the Illinois Institute of Technology, Chicago, Ill. He received his Ph.D. degree from the institute in 1942.

Neil E. Gordon has resigned as chairman of the Chemistry Department of Central College, Fayette, Mo., to accept the position as chairman of the Chemistry Department at Wayne University, Detroit, Mich.

Richard H. Grimm has been appointed chief of the Industrial Alcohols Unit of WPB's Chemicals Branch. Mr. Grimm, formerly president of the American Commercial Alcohol Corp., had been in retirement since 1933 except for a term as president of the Industrial Alcohol Institute in 1935.



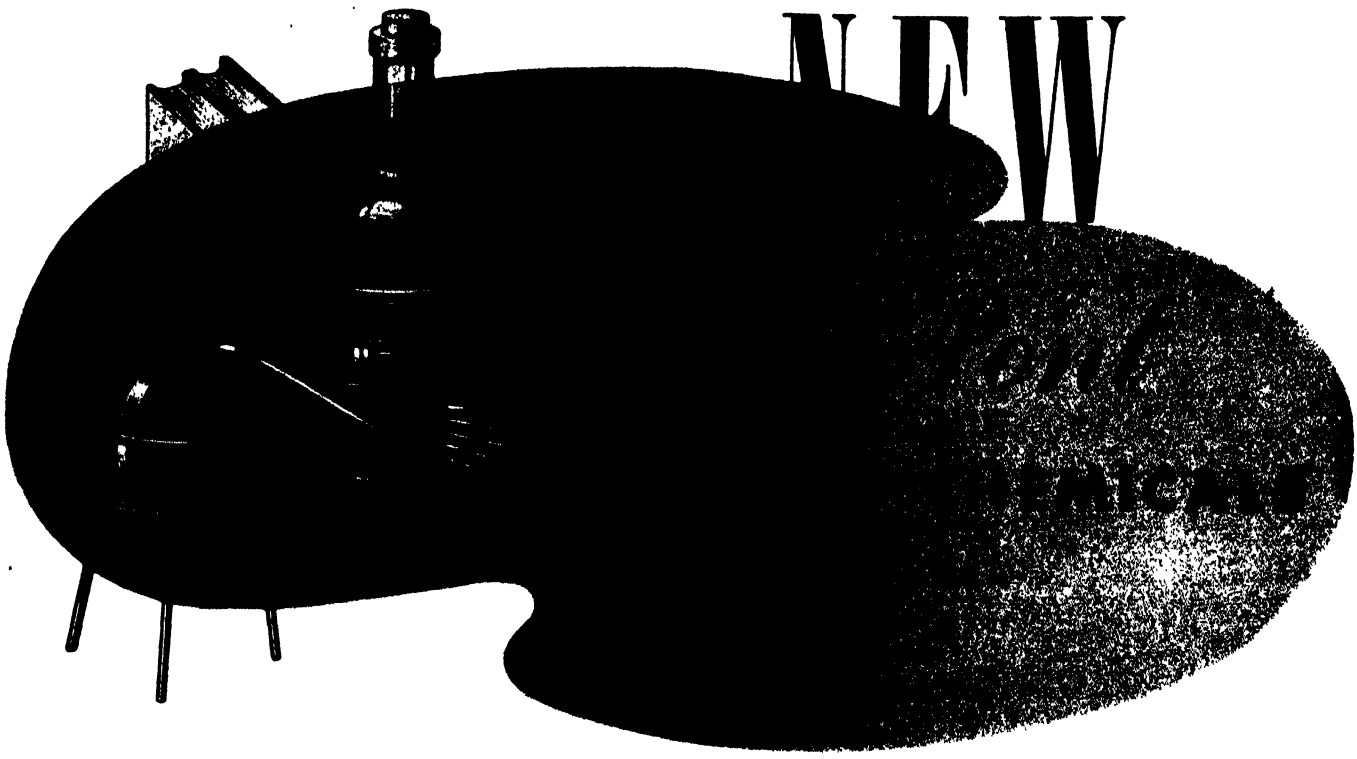
Major Albert N. Holcombe is on military leave from the Shell Chemical Co., Shell Point, Calif. He has been transferred from the Weldon Spring Ordnance Works to the Kentucky Ordnance Works as commanding officer.

M. R. Hoppe, vice president and technical director of the Parr Instrument Co., Moline, Ill., with which he has been associated for the past six years, has been commissioned a Captain in the Army Specialist Corps and assigned to Edgewood Arsenal for duty with the Chemical Warfare Service.

Captain Clarence W. Huffman has been placed in command of the Chemical

CONTINUED ON PAGE 1194

waste is a *Saboteur*



IN A war economy, the recovery and reclamation of by-products is not only a profitable operation, but, because of shortages caused by war production is often a patriotic duty. Many chemical manufacturers, who in normal times allowed valuable chemicals to flow to the sewer because the cost of reclaiming them was too high to be considered, are now finding it practical and economical to reclaim acid, alkali, dye and other liquors by treatment with NUCHAR Active Carbon.

Here are some of the chemical products being either recovered or reclaimed by simple, low-cost treatment with NUCHAR Active Carbon: Acetic Acid, Formic Acid, Muriatic Acid, Sulphuric Acid, Phenol, Glycerin, and Sodium Glutamate.

Write to our nearest office for further information on the reclamation or recovery of your process liquors.

NUCHAR INDUSTRIAL CHEMICAL SALES

These new chemicals have been produced by du Pont research laboratories. The properties of these products may suggest interesting possibilities for the manufacture of new essential materials.

SODIUM METHYL SULFATE ($NaCH_3SO_4$)

is a methylating agent. It should be of particular interest in methylating operations where convenient physical form, high solubility and lack of volatility are desirable. This product is available in sample quantities as a 50% aqueous solution.

SODIUM CHLOROSULFONATE ($NaClSO_3$)

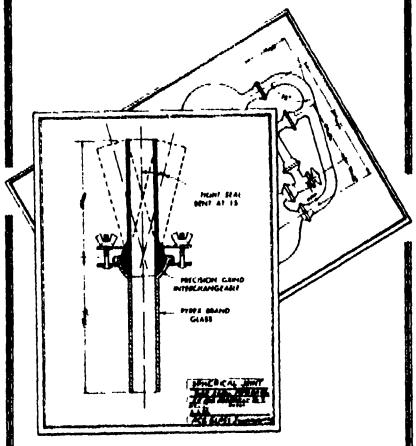
is a finely divided crystalline powder which hydrolyzes rapidly to liberate hydrochloric acid. With the application of heat, the dry salt decomposes to yield chlorine and sulfur dioxide. It has possible use in the manufacture of materials in which sulfonation and chlorination reactions would be involved. The chlorosulfonates of calcium, magnesium, aluminum, iron, copper and lead can also be made available in sample quantities in case of special interest

GLYOXAL SULFATE ($SO_4CH-CHSO_4$)

is a white crystalline powder soluble in the lower alcohols and ketones. It is also markedly soluble in water at somewhat elevated temperatures (about 50°C) although slow decomposition takes place under these conditions. This material is of interest as a possible source of glyoxal, the simplest dialdehyde, which may be useful in reactions involving insolubilization and cross-linking.

SULFUR PENTOXYDICHLORIDE ($Cl-SO_2-O-SO_2-Cl$)

is a straw-colored liquid boiling at 150°C. It is only slowly soluble in cold water but reacts violently with water on warming. It is miscible with a variety of organic liquids and readily reacts with the ethylene linkages, hydroxyl groups and amine groups. Of interest is its possible use in the solubilization of petroleum, vegetable and fish oils.



Although only limited quantities of these new chemicals are available at this time, special consideration will be given to the commercial production of any of these products which may have immediate use in war production.

use
A C E
SPHERICAL
JOINTS
U. S. Pat. No. 2,190,220

Made to ACE specifications, these spherical joints will meet your performance specifications.

They permit considerable angle changes without the need for complicated adjusting devices.

They eliminate breakage of equipment and joint leakage resulting from inaccurate alignment.

It's easy to install spherical jointed equipment, too. Just approximate your locations, slide the sections together and clamp them. The ACE clamp connects the members simply and effectively.

For final adjustment, align the parts to desired positions and tighten the clamps firmly.

Write for the Ace General Catalog 40 which includes a wide selection of spherical jointed apparatus.

Warfare Service Company which operates a testing ground for chemical agents. He was formerly with the Research and Development Division, Edgewood Arsenal, Md.

Glen William Kilmer, B.S., M.S., Pennsylvania State College, and Ph.D. Harvard, and then post-doctorate fellow in biochemistry in Cornell University Medical School, has been appointed Instructor in Organic Chemistry in the University of Pittsburgh.

Robert C. Kuder, who obtained the Ph.D. degree at Northwestern University in June, is employed as an organic chemist on the research staff of the Whiting refinery of the Standard Oil Co. (Ind.).

Milton Kutz

Milton Kutz, who started work as an office boy 45 years ago and is now assistant to the general manager of the Electrochemicals Department, E. I. du Pont de Nemours & Co., Inc., was given a testimonial dinner by his associates on August 3, at the Hotel du Pont, Wilmington, Del.

Donald MacGillavry, Jr., University of Amsterdam, Holland, and Columbia University, who has also been Research Fellow at the University of Cambridge, England, has been appointed instructor in organic and analytical chemistry in the University of Pittsburgh.

John D. McCluer has left his position as research chemist with the Vanadium Corp. of America, Bridgeville, Penna., and has been associated for the past year with the Southern Asbestos Co., Charlotte, N. C., as research engineer.

J. P. Margeson, Jr., has been appointed vice president in charge of the Potash Division of the International Minerals & Chemical Corp., Chicago, Ill., and will continue in charge of the Magnesium Division. **John T. Burrows** has resigned as vice president of the company and will devote full time to the executive direction of the Phosphate Recovery Corp. **A. Norman Into** has been made sales manager of the Potash Division.

J. K. Missimer, formerly with the Standard Paper Manufacturing Co., Richmond, Va., has joined the staff of the Paper Section, National Bureau of Standards, as papermaker. With **M. J. O'Leary** who has served for a number of years as papermaker, he will operate the semicommercial papermaking equipment of the bureau.

S. A. Montgomery has been appointed manager of the Whiting, Ind., refinery of the Standard Oil Co. of Indiana, succeeding **E. J. Shaeffer** who has retired because of ill health. **W. J. McGill,** general superintendent of the Wood River refinery, will succeed Mr. Montgomery as manager, and will be succeeded by **T. C. Stockdale.**

Joseph E. Moody has been appointed manager of industrial relations for the York Ice Machinery Corp., York, Penna.

Irving E. Muskat resigned from the Pittsburgh Plate Glass Co. on May 15, and has accepted a position for half time as director of research with the Vulcan Detinning Co., Sewaren, N. J., where a new laboratory is under construction. Dr. Muskat is also working on the establishment of an independent company for research and development in synthetic resins.

Lieutenant Leroy C. Nelson has been called to active duty with the Engineer Corps and can be reached at A. P. O. No. 948, % Postmaster, Seattle, Wash. He was formerly employed as a technical service engineer with the Columbia Chemical Division of Pittsburgh Plate Glass Co., Barberton, Ohio.

Jack M. Noy has left the Foote Mineral Co., Philadelphia, to accept a position as chemical engineer in the Production Department of Climax Molybdenum Co., Langeloth, Penna.

Stiles M. Roberts has joined the staff of General Aniline and Film Corp., Process Development Department, New York, N. Y. He was formerly research chemist for the Texas Co., Beacon, N. Y.

Ernest Scheller has been appointed assistant to the president and general

manager of the Foil Division of Reynolds Metal Co., Louisville, Ky. Mr. Scheller, associated with the company since 1925, was formerly research director.

Chester W. Smith has joined the staff of the Detroit Rex Products Co., 13,005 Hillview Ave., Detroit, Mich., as research chemist in the Alkali Division. He was formerly affiliated with the J. C. Miller Co. as chief chemist.

Grant W. Smith has resigned his position as assistant professor of chemistry at the University of Kansas City, where he taught for the past seven years, and has joined the research staff of the B. F. Goodrich Co., Akron, Ohio. He is a research chemist in the Koroseal Division, working in polymerization research.

C. M. Suter has been made professor of chemistry at Northwestern University and has been appointed chairman of the department, succeeding **Murray A. Hines**, who becomes professor emeritus.

F. C. Todd

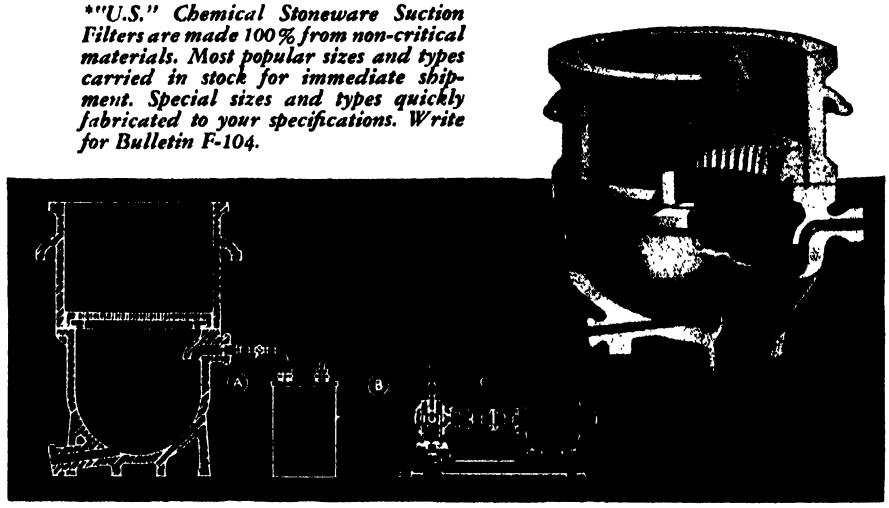
F. C. Todd, formerly a member of the faculty of the Pennsylvania State College, has joined the technical staff of the Battelle Memorial Institute, Columbus, Ohio, and has been assigned to research in industrial physics.

Richard K. Toner has joined the faculty of Princeton University as assistant professor of chemical engineering.

Edward F. Wagner, formerly associated with the Standard Oil Co. of Ohio, has joined the staff of the Illinois Institute of Technology, Chicago, Ill.

Victor E. Williams, assistant general manager of sales of the Organic Chemicals Division of the Monsanto Chemical Co., has been promoted to the position of director of sales of the division. **Frederick C. Renner**, assistant general manager of sales, has been made general manager of sales of the Organic Chemicals Division, with offices in St. Louis, Mo.

Available Now!



"U. S." STANDARD CHEMICAL STONEWARE

SUCTION FILTERS

ACID-AND-CORROSION-PROOF all the way through, "U.S." Chemical Stoneware Suction Filters assure a perfectly clear filtration. Strong, sturdy, they will withstand a complete vacuum.

"U.S." Chemical Stoneware Suction Filters are lower in cost than metal, metal clad, or lined metal filters; are resistant to *all* corrosives except hydrofluoric acid; cannot possibly contaminate the most sensitive solutions; and, with reasonable care, will last indefinitely.

**"U.S." Chemical Stoneware Suction Filters are made 100% from non-critical materials. Most popular sizes and types carried in stock for immediate shipment. Special sizes and types quickly fabricated to your specifications. Write for Bulletin F-104.*

The above sketch shows a simple and effective way of connecting vacuum equipment to suction filters. The lines from the filter to the chemical stoneware surge pot "B", and from the surge pot to the vacuum pump "C", are of glass, with rubber stoppers and sleeve connections. "A" is a three-way release valve. All connections should be treated with shellac or rubber cement. The capacity of the surge pot "B" should be one-fifth the volume of the lower section of the filter, and should be kept one-third filled with water.

●

Of the many outstanding synthetic, ceramic, rubber and alloy corrosion-resistant materials made by The United States Stoneware Company, "U.S." Chemical Stoneware is one of two that is made entirely from non-critical materials, and for which priorities are not necessarily a pre-requisite to obtain. The substitution of "U.S." chemical stoneware for synthetic, metal and rubber process equipment means more planes, more tanks, more guns . . . and a quicker victory.

NECROLOGY

Francis J. Arend

FRANCIS J. AREND, founder and president of the De Laval Steam Turbine Co., Trenton, N. J., died August 24. He was also president of the De Laval Separator Co.

Stuart L. Crawford

STUART L. CRAWFORD, consulting chemist and president of the National Testing Laboratories, died in Rochester, N. Y., on September 2, at the age of 60.

Mr. Crawford founded the National Testing Laboratories 20 years ago, after being associated as industrial and consulting chemist with various industries. He was president of the New York State Vinegar Association, and since 1909 had been a member of the AMERICAN CHEMICAL SOCIETY.

James M. Doran

JAMES M. DORAN, former prohibition commissioner, died September 8 in Washington, D. C.

Mr. Doran was born in Grand Forks, N. D., August 17, 1885, and received the B.S. degree from the University of Minnesota in 1907. He was a graduate student at George Washington University in 1912–13. In 1907 he became chemist with the Internal Revenue Bureau, United States Treasury, was made head of the chemical and technical division in 1920, and from 1927 to 1930 was commissioner of prohibition. He became commissioner of industrial alcohol in 1930, and later took up the duties of secretary of the Distilled Spirits Institute.

He had been a member of the AMERICAN CHEMICAL SOCIETY since 1906.

Martin L. Griffin

MARTIN L. GRIFFIN, retired consulting chemist and pioneer in paper chemistry, died August 28 in his 84th year.

Mr. Griffin was graduated from Amherst College in 1883 with the B.A. degree and received the M.A. three years later. He then opened a laboratory in Holyoke, Mass., for the paper industry, being one of the first chemists employed by the industry. Later he entered more closely into the employ of the larger manufacturers, including the West Virginia Pulp and Paper Co., Oxford Paper Co., and Champion Fibre Co. In 1919 he went to the Mt. Hope Finishing Co., North Dighton, as chief chemist and remained there until he retired from active work in 1928.

He had been a member of many technical societies, including the AMERICAN CHEMICAL SOCIETY, Society of Chemical Industry, Technical Association of the Pulp and Paper Industry, American Society of Textile Chemists and Colorists, and the American Institute of Mining and Metallurgical Engineers. He was a frequent contributor of scientific papers to the technical literature.

Robert E. Oltman

ROBERT E. OLTMAN, chief chemist of the Minnesota Valley Canning Co., died suddenly on July 24, 1942, at the age of 33 years. His passing removed from the canning industry one of its most brilliant young scientists. Dr. Oltman's researches in the fields of plant physiology and chemistry as pertaining to the canning industry have yielded noteworthy results.

Dr. Oltman was born in Cleveland, Ohio, December 5, 1908, and was educated in the public schools of Cleveland. In 1927 he entered the service of the U. S. Department of Agriculture in its campaign for the eradication of the corn borer, and during the next four summers became successively inspector, field scout foreman, assistant field supervisor, and field supervisor, with large crews of men under his supervision.

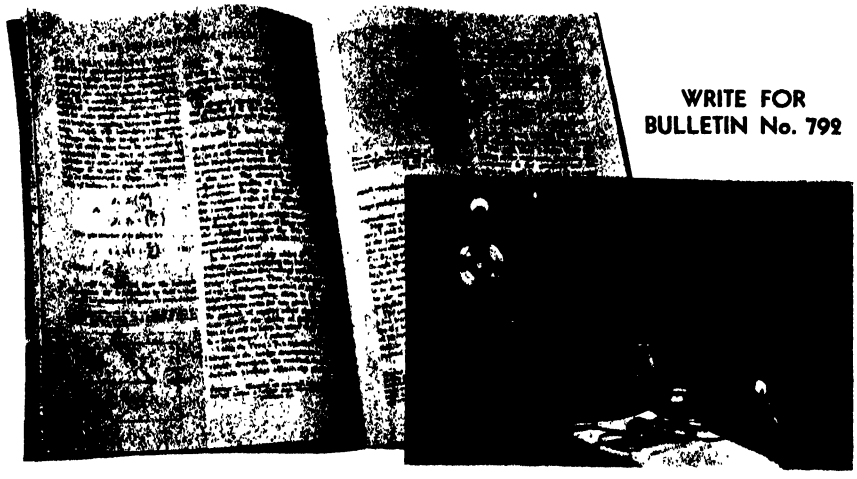
After a year at Western Reserve University, he entered Oberlin College from which he was graduated in 1932. There he showed an unusual capacity for research and invention. After graduation he entered the University of Minnesota as a graduate student and assistant (later instructor) in plant physiology, receiving his Ph.D. degree in 1936.

He then joined the Research Department of the Minnesota Canning Co. for a year, after which he was for two years director of research for Fine Foods of Canada, Ltd, Toronto. Returning to the Minnesota Canning Co. he was made chief chemist, although the research which he carried on and directed ranged widely over the methods of growing, harvesting, processing, packing, and shipping of the company's products.

Dr. Oltman had been a member of the AMERICAN CHEMICAL SOCIETY, of the American Association for the Advancement of Science, and a fellow of the Canadian Institute of Chemistry.

Jacob F. Schoellkopf

JACOB F. SCHOELLKOPF, SR., pioneer in the aniline color industry in the United States, died September 9 at the age of 84.



Mr. Schoellkopf was born in Buffalo, February 27, 1858, and studied chemistry in Stuttgart and Munich. In 1880 he

"IMPEDANCE BRIDGES ASSEMBLED FROM LABORATORY PARTS"

In certain branches of chemical research — studying the process of ionization in electrolytes, for example — a-c impedance measurements are very useful. Bridges for this type of measurement can easily be assembled from standard laboratory parts — resistors, inductors, capacitors.

How to set up and use impedance bridges was discussed in a series of articles entitled "Impedance Bridges Assembled from Laboratory Parts," which appeared in the General Radio *Experimenter*. These articles have been reprinted in the 24-page booklet illustrated below. Much information not usually found in text books is included, as, for instance, how to choose the best bridge circuit for a particular type of measurement, and how to determine the magnitude of residual impedance errors.

A copy is yours for the asking. This book will also be found helpful in familiarizing chemistry students with the construction and use of impedance bridges. Copies for classroom instruction and use are available in reasonable quantities.

WRITE FOR BULLETIN No. 792

Series-resistance capacitance bridge assembled on a laboratory bench.

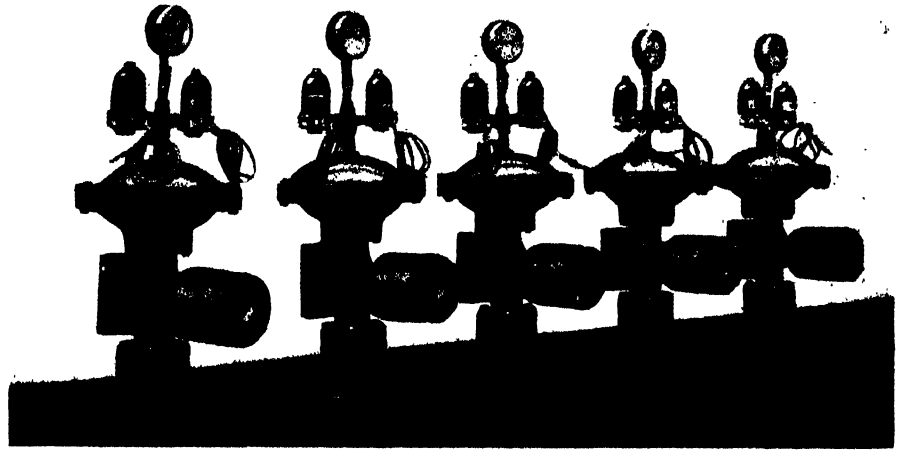
GENERAL RADIO COMPANY • Cambridge, Massachusetts

entered the aniline business in Buffalo, pioneering in making dyes in this country. He became president of the firm when it was incorporated in 1900 as the Schoellkopf Aniline and Chemical Works. At the time of the first World War the company was expanded and merged with other companies to form the National Aniline and Chemical Co., Inc., and Mr. Schoellkopf served as president until 1918.

In 1931 he founded the Jacob F. Schoellkopf Gold Medal, presented annually by the Western New York Section of the AMERICAN CHEMICAL SOCIETY to honor major advances in chemistry.

John Arthur Wilson

JOHN ARTHUR WILSON, consulting chemist and authority on leather chemistry died September 10 in New York after an illness of six months. He was 52 years old.



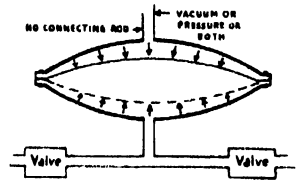
Dr. Wilson was born in Chicago, and studied at New York University and the University of Leeds, England. He received the honorary degree of doctor of science from Lehigh University in 1929. He began his scientific career as chemist in the Edison Chemical Works, Silver Lake, N. J., and was chief chemist of the A. F. Gallun & Sons Corp., Milwaukee, Wis., from 1912 to 1929. In 1915 and 1916 he served as honorary research assistant at the Procter International Research Laboratory in Leeds, England. He was president of the Security Management Co., Milwaukee, from 1926 to 1929, the International Security Management Co., Chicago, in 1929 and 1930, and the Wisconsin Investment Co. from 1930 to 1938. After serving as technical director of Bona Allen, Inc., Buford, Ga., from 1938 to 1940, he opened offices as a consulting chemist in New York.

In 1931 Dr. Wilson was the winner of the William H. Nichols Medal of the New York Section of the AMERICAN CHEMICAL SOCIETY for "outstanding achievement in colloid chemistry, applied particularly to leather and sanitation". He had been a member of the AMERICAN CHEMICAL SOCIETY since 1918 and had served as Divisional Chairman, Local Section Chairman, and Local Section Councilor of the SOCIETY. He was also a member of a considerable number of other scientific societies.

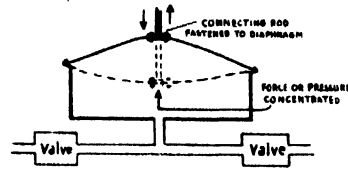
Dr. Wilson was the author of numerous scientific publications, including an AMERICAN CHEMICAL SOCIETY monograph on the chemistry of leather. With Procter in 1916 he developed a quantitative theory of molecular mechanism of protein-swelling in electrolytes, followed by similar theories on absorption, electrically charged surfaces, and interfaces. He had done much work on sanitation and water treatment.

THE O-D-S WAY TO PUMP SLURRY

. . . *is the Non-Mechanical Way and a very Low-Cost Way, Too*



BY "non-mechanical" we mean "no mechanical linkage to diaphragm." This, in turn, implies low maintenance cost . . . an advantage which is being enjoyed in many plants using the Oliver Diaphragm Slurry Pump and handling such products as: caustic salt crystals; manganese, titanium and gypsum slurries; sink-float concentrates; ground cocoa bean shells; acetic and propionic acid in hot wood oil; hot 60% hydrofluoric acid; calcium carbonate.



Action in the O-D-S Pump is induced by vacuum or pressure, or a combination of both, with automatic timers controlling the impulse and cycle. Pressure on the O-D-S diaphragm is uniform over the whole surface, in contrast with pumps linked mechanically where the pressure is concentrated. And fewer holes have to be punched in the O-D-S diaphragm.

See for yourself. Ask for O-D-S literature and facts. We know you will be convinced the O-D-S Pump is what you want in a diaphragm pump.

War jobs helped by HOOKER CHEMICALS

Materials of construction destruction & reconstruction

We manufacturers of chemicals are fortunate in our opportunity to develop the answer to many a post-war problem even while serving the Nation at war.

HOOKER CHEMICALS

help to produce most of the materials of war and the materials that will be needed to reconstruct the world when the victory has been won . . . playing an important part in the production and production-control of most metals, synthetic rubber and plastics. HOOKER Chemicals daily aid the many industries by adapting plentiful alternates for service in place of scarce materials. In promoting metal conservation and equipment protection, in making new alloys and non-metallic construction possible, HOOKER Chemicals are invaluable.

On every front — fighting, farm and fireside — HOOKER Chemicals contribute to the American Standard of living — and by making better materials and equipment possible, we manufacturers of chemicals are preparing for victory even while helping to win the war. HOOKER takes pride in being among those who thus serve the Nation.

2810

Melamine Resins

Two new applications of melamine resins for widely different purposes, announced by the American Cyanamid Co., New York, N. Y., are breaking production bottlenecks. Buttons molded of melamine resin plastic have withstood the gruelling tests prescribed by the Quartermaster Corps for use on cotton garments, heretofore met only by buttons machined from pearl and from imported vegetable ivory. The second new application of melamine resins opens the way to greater production of paper having high strength when wet and at the same time substantially increased resistance to folding.

Melamine resin plastic is the only synthetic material unaffected by the stringent tests of laundering, ironing, fading, decontamination, and impregnation imposed by the Army on buttons for cotton underwear and similar items of issued apparel subjected to the most severe conditions in service. Because buttons can be molded of synthetic resins without machining, their cost is materially reduced.

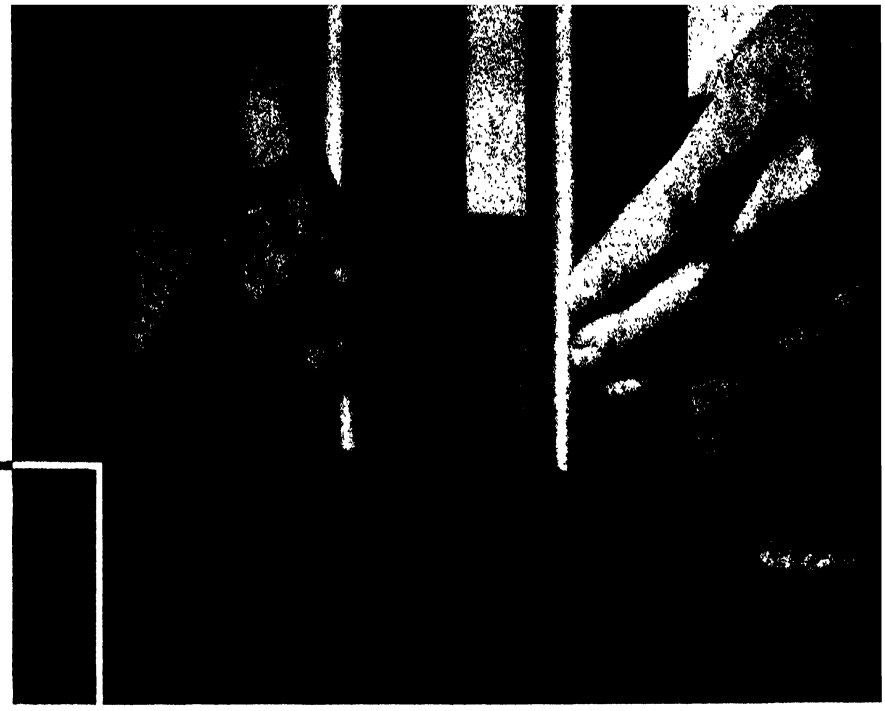
Melamine resin is the basis of a new treatment for paper pulp that imparts extraordinary wet strength to the sheet made from it and at the same time increases resistance to folding. Previous methods of raising the wet strength of paper have required special equipment to treat the sheet after it is formed and the treated sheet has been characterized by lowered resistance to folding. The new treatment is applied to the paper pulp before the sheet is formed, requiring no additional special equipment beyond that usual in every paper mill. The fold resistance of the sheet made of pulp treated by the new method is approximately doubled and no diminution in wet strength or fold resistance occurs on prolonged storage even under unfavorable conditions.

Tinless Cans

Tinless tin cans, grown on the farm and cattle range, have been announced by Raymond S. Macmillan, president of the Macmillan Petroleum Corporation, Los Angeles, Calif., as he made public the development through chemical research of the first all-fiber plastic-lined container which is impervious to oil. The tinless container is produced by direct processing of such surplus crops as corn, other grains, flaxseed, tallow, animal tissues, bone and clay; and the basic fiber is made from straw and waste paper.

The all-fiber containers represent a 10 per cent reduction in weight over cans previously used, thus permitting more oil to be shipped per freight carload. They also eliminate the need for tank cars and for the return shipment of empty drums in the distribution of lubricating oil.

Sales of Industrial Chemicals



Sales of industrial chemicals as reported by 19 manufacturers to the Bureau of Census for the month of July amounted to $997,000, which is about 1 per cent less than sales made in June, and approximately the same volume as sales made in July a year earlier. Total sales for the first seven months of this year amounted to $13,633,000, a 20 per cent increase over sales for a comparable period in 1941.

Collection percentages, obtained by dividing the collections by accounts receivable, are reported by 19 establishments as 83 per cent in July, compared with 77 per cent for June, and 76 per cent for July 1941.

A report by the Department of Commerce on sales of wholesalers in 35 trades show a 9 per cent advance in July 1942 over the same month a year ago. The gain reported in June of this year as compared with June 1941 was 11 per cent. An increase of 5 per cent occurred between June and July 1942, as against the increase of 7 per cent recorded between these months in 1941. Sales for the first seven months of 1942 were 21 per cent above the corresponding period of 1941.

Try THIS on your PIPE!

SARAN PLASTIC WELDED IN LESS THAN 1

HERE IS A genuine aid to plant engineers —made possible by the latest development in plastics—new SARAN* pipe.

Now, a two-inch pipe can be completely welded in less than one minute! Here's how it's done—two lengths of SARAN pipe are placed on a nickel surfaced hot plate—then pressed together—allowed to cool for a few seconds—and the entire operation is completed! The welded joints become equal in strength to *any other portion of the pipe itself.*

SARAN pipe is designed for many uses in chemical and general industrial plants. Its amazing chemical resistance and wide adaptability suggest countless applications, saving not only strategic rubber and metals, but valuable time as well.

A free booklet "SARAN Pipe" is now available. It contains many facts on properties, applications, special fittings and installations. Write to the Plastics Sales Division today for your copy.

Industrial Furnaces. Volume II. *W. Trinks.* 2nd ed. xiii + 351 pages. John Wiley and Sons, Inc., 440 Fourth Ave., New York, N. Y.; Chapman and Hall, Ltd., London, 1942. Price, $5.00.

PROFESSOR TRINKS is an outstanding authority on the design and operation of furnaces, especially the many different types used in the metallurgical industry. His years of experience and broad knowledge of American and European practice were reflected in the first edition, published in 1925 and subsequently translated into French, German, and Russian. Although Volume II is a continuation of Volume I (now in its third edition), it is complete in itself. As stated in the preface of the first edition, Volume I contains a great deal of theory and appeals mainly to the designer of furnaces, whereas Volume II is devoted primarily to practice and should appeal to coördinators of existing designs. In that class are men who must decide on the type of fuel or heat energy to be used in a specific case, those who select furnace equipment, sales engineers of furnace equipment, men who install furnaces, and furnace operators. The designer of furnaces also will find much that is helpful in the present volume.

In general, the plan and scope of the second edition are the same as in the first edition. However, large sections of the book have been rewritten to include new types of furnaces and new fuels, and to modernize furnace practice. Approximately half of the illustrations are new.

A great deal of equipment is described, but no manufacturers' names are mentioned, and fundamental types are selected for description as far as possible. The subject matter is treated in six chapters: Fuels and Sources of Heat Energy, Combustion Devices and Heating Elements, Control of Furnace Temperature, Control of Furnace Atmosphere, Labor Saving Appliances, and Critical Comparison of Fuels and Furnace Types.

Probably no other book contains so much practical information essential to a comprehensive review of the different types of furnaces, burners, and heat-control equipment available for industrial heating with solid, liquid, or gaseous fuels, or by electricity. The wealth of descriptive matter is presented clearly and is illustrated with numerous simple diagrams. Critical comments are made throughout the book on the suitability, advantages, and disadvantages for the purpose in hand of the fuels or types of equipment under discussion. Although much of the subject matter relates to metallurgical furnaces, especially those used in the steel, metal fabrication, and ceramic industries, this volume will be very useful to any technologist confronted with the problem of selecting or designing a furnace for any special purpose

The brief chapter on fuels and sources of energy should have been revised more extensively to bring it up to date Table I, on properties of fuels, gives analyses of different types of fuel which in some cases are not the most typical of American practice. No mention is made of the Standard Specifications for the Classification of North American Coals, adopted in 1937 by the American Standards Association and the American Society for Testing Materials. On page 27 the author states that "In general, the high-volatile coking and gas coals are caking coals, while the low-volatile or semi-bituminous coals are noncaking". The first part of this statement is correct, but the latter part is wrong; low-volatile coals, such as the Pocahontas and New River coals of West Virginia, are strongly swelling and caking.

The book is well printed in easily read type and the illustrations are clear cut.

A. C. FIELDNER

Industrial Camouflage Manual. *Konrad F. Wittmann.* 128 pages. Reinhold Publishing Corp., 330 West 42nd St., New York, N. Y., 1942. Price, $4.00.

THIS manual describes an industrial art which had its inception in the previous world conflict, and which has developed into a major technical problem due to the increased importance of aerial warfare. We whose activities center on the earth's surface are incapable of visualizing our familiar cities and industrial districts as does the bombardier whose eyes see chimneys, fuel tanks, and plants as masses or distinct shapes emphasized by the shadows they cast on the earth below him. Wittmann, in collaboration with the faculty of Pratt Institute, has done an excellent piece of work in a field new to most of us and yet essential to the war effort and to future industrial planning.

This book should be of major interest to managers of industrial plants, to city planners, and to architects. As befits a new industrial art, it treats the subject of camouflage from a viewpoint sufficiently elementary to interest even the average layman. We are given the perspective of the bombardier seeking his natural tar-

PETROPOL NEWS

PURE

Be sure with Pure

1. **Due to possible confusion with a somewhat similarly named petroleum product, PETROPOL has been re-named PETROPON. The new designation is trade-marked and we hope it will become synonymous in your mind with petroleum "drying oils."**

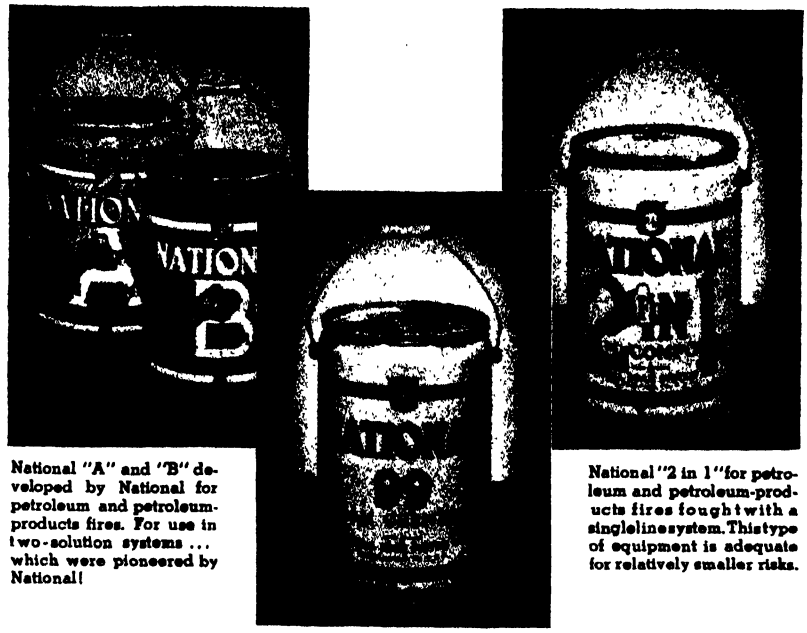
2. **PETROPON in its various grades, has assumed great importance in the war effort, and therefore the supply is restricted to vital offense uses.**

3. **Samples are still available and will gladly be furnished to any organizations which are planning now the products they will offer when the war is won.**

Specialty & Technical Sales Division

THE PURE OIL COMPANY, 35 E. Wacker Drive, Chicago, Illinois

gets—plants, transportation lines, military objectives—all the complex make-up of our industrial civilization. The fallacies of the former World War conception of camouflage, described as "dazzle painting", are brought out; this method served its purpose when most military activity took place on land and sea surfaces. However, with modern aerial warfare, the necessity of achieving the effect of three dimensions and a complete change of contour for the protection of vital objectives is stressed.



The different problems involved are well illustrated by aerial photographs and sketches; the methods of accomplishing the necessary deception are carefully described and depicted in camouflaged models. In addition to practical instructions for the successful diversion of air attack from existing plants, the basis for a new conception of industrial planning is developed. In future construction, we may have to discard our laboriously evolved ideas of efficiency—many departments centered under one roof. Such a complete change in planning would see the development of the art of industrial camouflage which entails the breaking down of our large industrial units into small ones, the decentralization of cities with their accompanying dislocations in transportation, housing, and retail business. Notwithstanding the fact that such a theory involves major changes, the whole subject is logically presented; the adjustments suggested for the present emergency are sound, and cost figures of materials, labor, and overhead are given. The diagrams are simple, and the ingenuity employed in the use of low-cost materials commendable. Although Europe has already accomplished a great deal in this field as illustrated by several photographs of Hamburg, we are certain to improve upon their record.

The manual is attractively put together in a loose-leaf binding on heavy paper, and the print is satisfactory. A major asset of the book lies in its form—a series of photographs or sketches explained in a direct manner with a minimum of words, each page covering one division of the subject. In addition to the industrialists involved in the problem, any person interested in the new questions raised by the war will read this publication with profit.

J. J. Healy, Jr.

Molecular Films, the Cyclotron, and the New Biology. *Hugh Stott Taylor, Ernest O. Lawrence,* and *Irving Langmuir.* 111 pages. Rutgers University Press, New Brunswick, N. J., 1942. Price, $1.25.

This is No. 4 of a series of books containing addresses delivered at the 175th anniversary of the founding of Rutgers University. It contains the following:

National "A" and "B" developed by National for petroleum and petroleum-products fires. For use in two-solution systems ... which were pioneered by National!

National "2 in 1" for petroleum and petroleum-products fires fought with a single line system. This type of equipment is adequate for relatively smaller risks.

National "99" ... the only chemical foam that will extinguish polar organic-solvent fires! For use on alcohol, ether, ketones, esters and other mixed polar solvents.

FOAMS FOR *any* FIRE

A foam that successfully fights one type of fire can be as good as nothing on another! No one knows this better than National—which looks at fires and fire-hazards with an engineer's eye.

National designs fire-fighting systems—built-in and portable—to meet each specific fire need. And the foam that's chosen is the foam that National has developed for *that* type of fire!

National's engineering and laboratory facilities are at your service—without obligation to you. Write today for Bulletin E3.

Fire-Protection Specialists in the Chemical and Metallurgical Fields

PHILADELPHIA NEW YORK CHICAGO

"EVERY INGREDIENT OF NATIONAL IS AMERICAN"

Fundamental Science from Phlogiston to the Cyclotron. H. S. Taylor.
Molecular Films in Chemistry and Biology. Irving Langmuir.
Nuclear Physics and Biology. E. O. Lawrence.

In the short space of 23 pages Taylor gives a bird's-eye view of science over a couple of centuries, the study centering "largely around advances in chemistry, physics and physiology". The names quoted may well serve as the basis of a scientific *Information Please:* Newton, Black, Scheele, Cavendish, Priestly, Lavoisier, etc., down through Svedberg, Tselius, Stanley, Schroedinger, Heisenberg, Dirac, de Broglie, etc., in this polyglot, polyscientific, international survey which begins and ends with a truly sociologic and philosophic point of view.

Langmuir's paper epitomizes some of his valuable work on surface films, including the behavior of proteins and enzymes when expanded in films. A peculiar "edge effect" observed with supposedly very pure trypsin, is attributed to an impurity: In spreading a protein you change the shape of the molecule from that of the globular protein, which is approximately 25 or 30 Å. in diameter, to something which is perhaps a quarter of that or less, 8 or 10 Å. in thickness, which means that the original shape has been broken down. . . .The cause of spreading must be the presence of hydrophobic groups. The proteins themselves, like insulin and egg albumin, are highly soluble in water. The films are completely insoluble in water. You cannot get them back into solution by compressing them or, in fact as far as I know, in any way unless you degrade them still further. That difference is best accounted for by saying that in the proteins themselves the hydrophobic groups which are present in the side chains are buried in the interior of the molecule, and that in the spreading process those are brought to the surface, and it is the presence of those hydrophobic groups that cause the spreading phenomena. I think, in general, the best picture of this structure is Dr. Wrinch's theory of the cyclol structure. (Linus Pauling, among others, does not accept Dr. Wrinch's theory.)

Lawrence discusses work emerging from the discovery of the cyclotron, followed by commentaries by Leslie A. Chambers and J. R. Dunning, and by 16 pages of illustrations showing the cyclotron and what is being done with it. The giant instrument, now under construction at Berkeley, includes 3,700 tons of steel and 300 tons of copper. It will throw a neutron beam of 100 million electron volts about 140 feet, whereas the 225-ton medical cyclotron at the Crocker Radiation Laboratory throws a 16 million volt beam 4.5 feet.

Taylor says: "Of necessity, in the ideal human society to which we must look forward, the scientific aspects of life must be assigned their due proportions—they must not be 'cribbed, cabined, and confined', but neither must they be permitted to crowd out from our lives the humanistic, the social, and the spiritual values that are equally necessary and indispensable".

In the presence of this book the *Advocatus diaboli* is stricken dumb. In a perfunctory way he observes that there is a slight typographical error (carcinogenec) and also that the ultraviolet microscope is meant instead of the ultramicroscope, for this latter increases visibility rather than resolution.

The book should be read by all chemists, physicists, biologists, and physicians.

JEROME ALEXANDER

Occupation of the Industrial Chemist

A LEAFLET prepared by Occupational Index, Inc., New York University, Washington Square East, New York, N. Y., discusses the occupation of the industrial chemist, what is done in this occupation, women in the field, abilities essential to success, preparation necessary, entrance and advancement, earnings, number and distribution of workers, advantages and disadvantages, and future trend of employment, with recommended readings. Single copies may be obtained at 25 cents each.

Common Hazardous Chemicals

AN UP-TO-THE-MINUTE table of Common Hazardous Chemicals, sixth edition, has been released by the N. F. P. A. Committee on Hazardous Chemicals and Explosives in cooperation with the AMERICAN CHEMICAL SOCIETY.

The column on fire fighting phases gives the best extinguishing methods for fire in the chemicals listed. The latest information on shipping containers and storage safeguards, fire and life hazards is given for individual flammable chemicals.

This latest edition includes all the amendments adopted since 1931; also additional chemicals and information on fire fighting phases and a new paragraph on oxygen breathing equipment or helmets. Other paragraphs cover flammable limits and explosive range, ignition temperature, propagation of flame, and flash point. Price is 20 cents, post paid by National Fire Protection Association, International, 60 Batterymarch St., Boston, Mass.

National Emergency Steels

NATIONAL Emergency Steels, promulgated by the War Production Board in order to use American alloying metals to best advantage, and to conserve the scarcer imported metals, are described in a 36-page pamphlet prepared by the American Society for Metals, 7301 Euclid Ave., Cleveland, Ohio, and available for 25 cents per copy. Much of the material has already been published in *Metal Progress*.

These NE8000 steels are already in production. The pamphlet presents descriptions, tables of data, and photomicrographs to enable users of alloy steel to apply them.

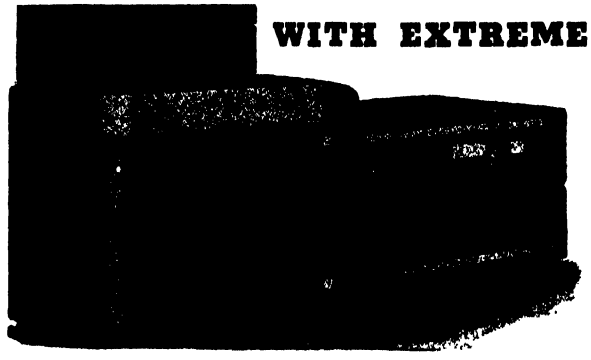
Public Water Supplies in Georgia

GEOLOGICAL Water-Supply Paper 912, "Industrial Quality of Public Water Supplies in Georgia, 1940", has just been made available by the Geological Survey, U. S. Department of the Interior, in cooperation with the Division of Mines, Mining, and Geology of the Georgia Department of Natural Resources. It is an 83-page publication, available from the Superintendent of Documents, Washington, D. C., for 15 cents per copy.

The paper contains 157 analyses of the mineral content of the waters of 66 public water supplies which serve places with a total population of 1,098,819 or 35.2 per cent of the population of the state. For places where the water received chemical treatment, other than chlorination, analyses are given for both the raw and finished water. The systems are described in detail as to sources, treatment, rated capacity of treatment plants, and storage.

Depreciation of Group Property

IN THE light of new income tax legislation and the necessity for cooperation between business and government, American industry in the future must concern itself more and more with knowing its production costs, particularly depreciation, according to Robley Winfrey, valuation engineer of the Iowa Engineering Experiment Station. Mr. Winfrey has completed an intensive study of methods of depreciation of group properties, published in Bulletin 155, "Depreciation of Group Properties".



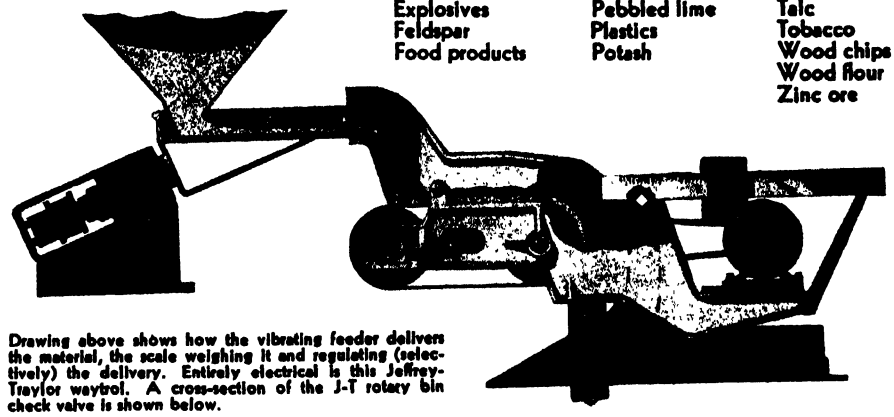
Copies of Bulletin 155 may be obtained without charge from the Iowa Engineering Experiment Station, Ames, Iowa. Bulletin 156, which contains depreciation tables for 18 types of life curves and at 0, 2, 4, 6, and 8 per cent interest, is available at $3.00.

Proceedings of Second Annual Water Conference

THE papers presented before the Second Annual Water Conference of the Engineers' Society of Western Pennsylvania have been printed under one cover, and are available at $2.15 per copy from the society, William Penn Hotel, Pittsburgh, Penna.

CONTINUOUS FEEDING

WITH EXTREME GRAVIMETRIC ACCURACY



Jeffrey-Traylor electric vibrating waytrols (Patented) give a much different conception to continuous feeding when extreme gravimetric accuracy is required. They will deliver a continuous uniform flow of a given weight per hour — eliminate the effect of bin load, material size and density variations, and other outside factors contributing to inaccurate feeding. May be remotely controlled, interlocked with processing equipment. Investigate.

Type 100 Jeffrey-Traylor waytrol complete with dust-tight housing.

PARTIAL LIST of materials being fed with J-T waytrols:

Activated carbon, Alum, Ammonium sulphate, Bauxite, Cement clinker, Chemicals, Clay, Coal, Explosives, Feldspar, Food products, Fullers earth, Gypsum, Cullet, Iron ore, Limestone, Pebbled lime, Plastics, Potash, Salt cake, Sand, Shale, Soda ash, Starch, Talc, Tobacco, Wood chips, Wood flour, Zinc ore

Drawing above shows how the vibrating feeder delivers the material, the scale weighing it and regulating (selectively) the delivery. Entirely electrical is this Jeffrey-Traylor waytrol. A cross-section of the J-T rotary bin check valve is shown below.

Jeffrey-Traylor electric vibrating equipment includes economical units for feeding, weighing, conveying, cooling, drying, packing and screening . . the basis for all is balanced high frequency vibration under absolute control. They provide a new conception to feed control — rate can be changed when unit is running — no mechanical adjustments required. Let us send you literature.

THE ALL-METAL THERMOMETER

stands shaking up...without breaking down

The reason why the WESTON Thermometer can "take it" is found in its simplified, all-metal construction. There is but one moving element, and even that part is made of enduring metal. There is no gas or liquids . . . no capillary . . . no fragile members. Thus the WESTON not only resists ordinary breakage but it also stands up in applications where vibration is present . . . maintaining its high initial accuracy (within 1% over entire scale) over far longer periods. Available in types, sizes, ranges and stem lengths for Diesel and many industrial applications Descriptive literature available on request. Weston Electrical Instrument Corporation, 660 Frelinghuysen Avenue, Newark, N. J.

WESTON all-metal temperature gauges are available in both angle and straight stem types; scale diameters up to 6"; stem lengths from 2" to 24".

Assistant Professor of Botany, University of Minnesota

and

Manuel H. Gorin
Chemical Research Supervisor, Field Research Department, Magnolia Petroleum Company

The surface chemistry of living cells — in particular the investigation of proteins by electrophoresis — has made such rapid advances in recent years that it has attracted the attention of workers in nearly all fields of biological science. This volume presents all phases of the subject in substantially complete form; both theoretical and practical aspects are fully discussed. This concise and readable description of the behavior of proteins in solution, adsorbed at surfaces, and oriented at the limits of crystal lattices will result in a clearer understanding of how proteins act in living cells.

The principles described apply to many diverse fields: to the treatment of allergies, which is the particular interest of the authors; to the study of blood and skin chemistry, which is of concern to dermatologists, physicians and cosmeticians; as well as to such industrially practical substances as wool, rubber latex, and other complex molecules in which proteins are involved. A glance at the table of contents will show the variety of subjects touched upon in this able study of protein behavior.

For Laboratory *and* Industrial PULVERIZING

RAYMOND 12″ MILL

Small enough for laboratory use in running tests

Large enough for commercial grinding

This popular size unit fills a definite need in many plants for an *intermediate capacity machine* . . . 50 to 200 pounds per hour, depending upon the kind of material and the fineness of grind.

USES . . . For pulverizing and classifying small batches of chemicals, pigments, cosmetics, plastics, resins, clays, food products and similar dry materials.

FINENESS . . . Controlled by changing to different size screens, furnished with machine

DRIVE . . . Swing hammer rotor driven by constant speed motor with V-belt. Screw feeder by motorized variable speed unit, permitting easy adjustment for feed rate.

CONSTRUCTION . . . Precision made and equipped with ball bearings. Easily taken apart for cleaning or changing screens. Mounted on a metal base with corner sockets for pipe legs.

Be sure to visit our Booth #111 at the Chicago Chemical Show and see Raymond Pulverizing and Separating Equipment

Silver for Lining Containers

THE American Silver Producers' Research Project for investigating and developing industrial uses of silver, under the direction of Handy & Harman, New York, N. Y., has investigated the use of silver linings for containers of chemicals. Silver-lined containers are being seriously considered for foodstuffs, high-grade beverages, beer, cola sirup concentrates, condensed milk, evaporated milk, salves and other antiseptic materials, ether, aluminum chloride, and other chemicals. Silver is resistant to many products that attack tin, and has already found wide use in chemical manufacturing plants.

The work of the project has indicated that pore-free deposits of silver 0.001 inch on deep drawing steel are readily obtainable; on suitable base metal, such as electroplated copper, pore-free silver deposits as thin as 0.0001 inch can be produced; deep drawing steel electroplated with ductile deposits of copper, nickel, or silver, or any combination of these metals, can be subjected to severe plastic deformation, cold rolling, press-forming, and heating operations, without perforating initially pore-free deposits that have a total thickness of at least 0.002 inch. Silver-plated steel and objects fabricated from it may be joined or assembled by the use of low-temperature silver brazing allows and induction heating, without recourse to a protective atmosphere. It is practicable to manufacture relatively low-cost silver-lined containers, such as barrels, drums, and cans.

Work on silver-lined containers is now ready to be carried forward by industry in the plant, on pilot and full-scale commercial operation.

Copper Recovery

A NEW method for recovering copper by deplating it from iron and steel scrap has been announced by the Electroplating Division of E. I. du Pont de Nemours & Co., Inc., Wilmington, Del. Virtually 100 per cent of the copper is recovered in a form satisfactory for direct use in electroplating important metal parts for military equipment, and large quantities of strip steel and iron may be made available for reuse.

Symbol of Quality

Each bottle of E & A Tested Purity Reagents bears this trade mark on the label to symbolize its careful preparation and analysis.

The "T.P." symbol, which represents reliability, is well known in laboratories where accurate analyses are made.

Motion Pictures on Aluminum

THREE new films for training aluminum workers have been prepared by the Aluminum Co. of America, 801 Gulf Bldg., Pittsburgh, Penna., and are available in black and white, sound, in 16 mm. and 35 mm. These are how-to-do-it motion pictures, each requiring approximately a half hour to run. Prints are loaned free, or may be purchased at cost. "How to Weld Aluminum" describes and demonstrates the essentials of torch and arc welding, brazing, and resistance welding. "How to Rivet Aluminum" portrays the making and testing of rivets, preparation of the work, actual rivet-driving techniques, and inspection. "How to Machine Aluminum" discusses alloys usually used, the kind and shapes of tools, cutting compounds, speeds, and feeds.

Clearinghouse for Consultants

A CLEARINGHOUSE for consultants has been established by the Association of Consulting Chemists and Chemical Engineers, Inc., 50 East 41st St., New York, N. Y., as a free service to industry. Within the past year the association has received about three hundred requests covering many different fields, and has been successful in referring inquirers to specialists.

Low Cost Combustion Boat Makes One-time Use Practical

Boats retain their original shape and will not fuse to tubes. Thick base prevents penetration of fused sample. Large inside area permits free flow of sample to form uniform thin layer. Boats are die formed and so have perfectly smooth surfaces, straight sides and excellent dimensional uniformity.

Boats with cover fit ¾" combustion tube. Large flat ends stabilize boat, so facilitating insertion or removal. Outside length, 77 mm; outside width, 12.5 mm; outside height, 9 mm; inside length, 72 mm; inside width, 8mm; inside depth, 5 mm.

S-21850 Sargent High Temperature Combustion Boat without cover.	S-21900 Cover only for Sargent High Temperature Combustion Boat.
Per 100 ..... $ 7.75	Per 100 ..... $ 7.75
Per 500 ..... 31.00	Per 500 ..... 31.00
Per 1000 ..... 45.00	Per 1000 ..... 45.00

Write for a sample combustion boat and cover.

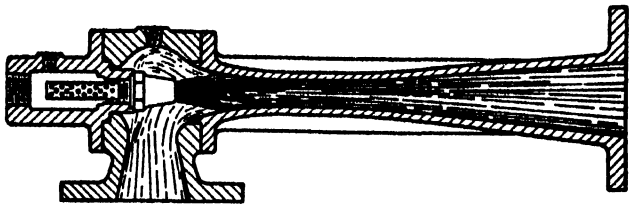
Sulfamate Weed Killer

ON PAGE 792 of INDUSTRIAL AND ENGINEERING CHEMISTRY (Vol. 34, 1942) appears an article by Cupery and Gordon, E. I. du Pont de Nemours & Co., Inc., regarding ammonium sulfamate as a weed killer. Search of the literature shows that this compound is rarely mentioned as such.

Lange's "Handbook of Chemistry", 1939 edition, describes sulfamic acid as "amino sulfite (acid)". Partington's "Inorganic Chemistry" describes it as "Hydroxylaminemonosulfonic acid". Hofmann's "Lehrbuch der anorganischen Chemie" describes it as "Amidosulfonsäure".

Henry P. Treffers has resigned as instructor in biochemistry at the College of Physicians and Surgeons, Columbia University, to accept an appointment as assistant professor of comparative pathology and biochemistry at the Harvard Schools of Medicine and Public Health.

Nutrition Values of Canned Foods



A RESEARCH program for the study o nutrition values of canned foods, developed by a committee representing the National Canners Association, Washington, D. C., has been inaugurated with the placement of financial grants with the Universities of Arizona and Wisconsin. Other grants will be made later. The program will be financed jointly by the National Canners Association and the Can Manufacturers Institute.

Who Makes It?

SOURCES for the following chemicals are wanted by The National Registry of Rare Chemicals, Armour Research Foundation, 35 West 33rd St., Chicago, Ill.

5-Amino nicotinic acid, diallyl succinate, diethyl oleyl amid phosphate, hexamethylene diisocyanate, fused titanium rod, 99 per cent pure, calcium silicide, 2-furane acetic acid, lichenin, and pepsinogen.

KEEP 'EM FLOWING!

We refer to the vapors being removed from thousands of Condensers and Processing Vessels by Croll-Reynolds Steam Jet Evactors. Production Equipment for this apparatus is being pushed to keep up with what seems to be an ever-increasing demand. Now, even more than ever, we are eager to help the operators of the many thousands of Croll-Reynolds Evactors get the maximum performance from existing equipment.

In some cases vacuum can be increased by merely changing the nozzles. Capacity can often be increased by changing the nozzles and throats or by re-machining them. It is our policy to keep in stock rough castings for throats and suitable materials for nozzles which can be promptly machined for individual conditions on prevailing priorities. Complete new Evactors for vacuum to a small fraction of 1 mm. are still being made subject to crowded conditions on ordnance equipment.

Pinch VALVES

for Abrasive or Corrosive Pulps and Liquids

No metal contacts pulp or liquid

Made with rubber or synthetics, the Massco-Grigsby Pinch Valve is more resistant to wear than metal valves. Shuts tight even on solid particles... withstands freezing. Useful for solutions which are highly corrosive or which crystallize at normal temperatures and must be handled hot; for solutions or solids which are both corrosive and abrasive. Sizes from 1" to 12". *When writing please state your problem.*

Send items to Ed. F. Degering, Department of Chemistry, Purdue University, Lafayette, Ind.

THE Western Connecticut Section of our SOCIETY was organized in the spring of 1936 and has been extremely successful since its beginning. With headquarters at Stamford, which is less than an hour by rail from the heart of New York, it includes in its roster not only many commuters who are among the most prominent members of our profession, but also many chemists whose business and social activities are carried on almost entirely in Fairfield County. The section, therefore, serves as a nucleus for the scientific and social contacts of chemists with fellow chemists and their families. From the beginning social values have been emphasized, and as a result the dinners preceding the meetings have become very popular with the wives of our various members, with a gain for all concerned in true friendliness and neighborliness.

We have found that, to keep the activities of the section on the highest possible plane, a division of responsibility among three active committees has produced most gratifying results. Since the prime object of the section is to promote active interest in the progress of chemical science, an able Program Committee has always been deemed of paramount importance by the elected officers of the section. In order, however, that the section's work shall continue to go forward under the most favorable circumstances we believe it to be absolutely essential to have active, vigorous Entertainment and Membership Committees as well. It has been found an excellent policy to have our Program Committee headed by an older member who has wide acquaintance among scientists, with younger men as assistants, who are being trained to handle the programs while they attend to such details as meeting the speaker and making him comfortable on his arrival in Stamford, and checking routine arrangements for the meeting.

The Entertainment Committee is under the direction of a member who likes good cheer and who is thoroughly familiar with the seating capacity, ventilation, and culinary standards of the various places in our locality where meetings may be held. The best results have been obtained from our Membership Committee when one member of that committee is appointed from each of the larger establishments in our section's territory, with a few "members-at-large".

The geographic location of the Western Connecticut Section and its own membership list have combined to make it relatively easy to secure excellent, well-known speakers for all of our meetings. We have always had the policy of assessing local dues against our members, and this has given us a reserve fund which has not only enabled us to pay traveling and hotel expenses for speakers invited from a distance but also to procure for the section's use a projector and screen.

Finally, the Board of Directors of this section has consistently adopted the policy of appointing younger members to committees. Their interest in the section's affairs is thus developed and encouraged so that they will be able to carry on in the future the work so auspiciously begun in 1936.—WILLIAM CABLER MOORE, *Western Connecticut Section.*

J. Mitchell Fain has been granted leave of absence for the duration from his duties as chemical engineer at Foster D. Snell, Inc., Brooklyn, N. Y., and has been called to active duty in the Chemical Warfare Service.

INDUSTRIAL LITERATURE

Listed publications should be requested directly from the company concerned. Use business stationery, mention bulletin numbers, and refer to this journal. Publications will be sent free unless otherwise noted.

Butterfly Valves. A 4-page bulletin featuring heavy-duty butterfly valves which have sufficient face-to-face dimensions to permit the mounting of ball bearings for high-pressure service. These valves come in sizes for 150, 300, and 600 pounds pressure. The chief advantages, applications, and general operating characteristics are discussed. Complete dimension tables are included. *Bulletin 15-B CEN.* R-S Products Corp., Wayne Junction, Philadelphia, Penna.

Compressors. A new booklet on maintenance of two-cycle, gas-engine-driven compressors includes information on when such maintenance should be done, troubles operators sometimes encounter, and the method of solving these problems. A Do and Don't Section helps reduce maintenance and repair costs. *Booklet CEN.* Clark Bros. Co., Inc., Olean, N. Y.

Crane Operation. A safety manual on the safe operation of overhead cranes contains rules for the guidance of crane operators and hookers-on and for men working in the crane-operating area. Available are posters on safety, giving standard signals, and standard practice for operating cranes. *Manual CEN.* The Whiting Corp., 157th St. and Lathrop Ave., Harvey, Ill.

Direct-Fired Heaters. This bulletin carries tabulations showing comparative savings in metals, weight, etc., of this type of heater, as well as the smaller amount of floor space necessary, based on the same required B. t. u. output per hour. Oil-, gas-, and coal-fired models are compared with units of conventional design. Principles of combustion chamber, heat transfer, and fuel economies are fully explained. *Bulletin 506 CEN.* Dravo Corp., 300 Penn Ave., Pittsburgh, Penna.

Filter Papers. This bulletin gives complete information on a new line of laboratory filter papers claimed to be better than any from the European market. Applications of each grade, sizes, and specifications are included, both for qualitative and quantitative work. *Bulletin 65 CEN.* Carl Schleicher and Schuell Co., 116 West 14th St., New York, N. Y.

Floor Scales. A 4-page leaflet, profusely illustrated, shows typical floor-scale installations and sketches of structural features. *Form CEN 2410.* Toledo Scale Co., Toledo, Ohio.

Glues. "Laucks Glues for War" is the title of a 4-page broadside that describes how wood and glue are alternating for steel in the production of war materials. *Broadside CEN.* I. F. Laucks, Inc., Maritime Bldg., Seattle, Wash.

Heat Exchanger. A 12-page bulletin outlines the distinctive features and advantages of the G-R Tubeflo section; and includes a concise tabular comparison between its design characteristics and those of shell-and-tube exchangers. *Bulletin CEN 1621.* The Griscom-Russell Co., 285 Madison Ave., New York, N. Y.

Horizontal Single Piston Pumps. This specification bulletin packs a wealth of information into its 4 pages. A line drawing showing internal design, a capacity table, and detailed specifications, plus a dimension table give the complete story on this type of pump. *Bulletin W-111-B 51 CEN.* Worthington Pump & Machinery Corp., Harrison, N. J.

Industrial Dust Recovery. This new book is a compendium of facts and data on dust control. It uncovers the major problems of modern dust recovery and gives practical methods for their solution. Excellent illustrations show the inner workings of these collectors which have a special "double eddy current" feature, including graphs and charts and typical installations in the process industries. Arrangements of more than 100 different sizes are given, especially for flue dusts, with a partial list of applications, from abrasives to sugars. *Book CEN.* Buell Engineering Co., Inc., 70 Pine St., New York, N. Y.

Inspection Laboratory. A new booklet on the establishment of inspection laboratories in production plants, both large and small. The selection of essential material for such a laboratory, the use of gage blocks, comparators, projectors, and other equipment are discussed. *Booklet CEN.* George Scherr Co., 128 Lafayette St., New York, N. Y.

Magnetic Separators. This new bulletin takes up magnetic separators and separation, concentration, reclamation, and purification of materials. Types of separator are described with the advantages of each and their most profitable and efficient use. It is written for engineers and factory officials and includes material not usually found. *Bulletin 800 CEN.* Stearns Magnetic Mfg. Co., Milwaukee, Wis.

Maximum Load Finder. This is a patented calculator for finding maximum loads, at various distances in front of bumper for single, double, and triple reeving of cranes. Avoids twisted boomheads and wasted hours from overloading. A separate calculator is available for each of three crane models, covering 3-, 5-, and 7, ton capacities. Distinctive colors identify the load finder for each crane. The calculator is durable and made to fit the pocket. *Bulletin CEN.* Mercer Engineering Works, Inc., 30 Church St., New York. N. Y.

Mounted Wheels. A new booklet describes time-saving accessories for use with portable equipment, including steel cutters, drills, small wire brushes, and polishing wheels. A selection guide on the use of mounted wheels is included. *Booklet CEN.* Chicago Wheel and Mfg. Co., 1101 West Monroe St., Chicago, Ill.

New Employees' Manual. The employment of thousands of new workers is the reason for this manual, written in the language of the worker and containing interesting cartoonlike illustrations. Sections covered are health and safety, employment, general, and so on. *Booklet CEN.* Manning, Maxwell, Moore, Inc., Bridgeport, Conn.

pH Equipment. This new booklet tells what is new in modern pH control equipment. It lists and describes more than sixty different electrodes and electrode assemblies for chemical, biological, research, and industrial process control. *Beckman Bulletin 86 CEN.* National Technical Laboratories, South Pasadena, Calif.

Straight and Angle Swivels. This bulletin introduces a new line of straight and 90° angle swivels for making oil, grease, air, and other connections between stationary and revolving, oscillating, or other moving surfaces. These swivels are available in two constructions, ball bearing and light duty. Dimensions and other details are included. *Engineering Bulletin 424 CEN.* Trabon Engineering Corp., Cleveland, Ohio.

Terpene Solvents. A 21-page booklet, discussing properties and applications of a series of terpene solvents, includes technical graphs, structural formulas, and tables of typical analyses. *Booklet CEN.* Hercules Powder Co., Inc., Wilmington, Del.

Utility Conveyor. An offset data sheet illustrates and describes a new model of utility conveyor offered to those who can supply suitable priority ratings. The model supersedes the one offered last year and is said to incorporate many improvements and advantages not possible with the earlier design. *Data Sheet 501163 CEN.* Lamson Corp., Syracuse, N. Y.

Vinylite Resins. A new 20-page booklet describes the forms, properties, and uses of these resins. It takes up the four major types of vinyl resins and the plastic materials produced from them including rigid sheets, flexible sheeting and film, molding and extrusion compounds, adhesives, and resins for surface coating. Tables of properties and charts showing principal applications are added. *Booklet CEN.* Plastic Division, Carbide and Carbon Chemicals Corp., Unit of Union Carbide and Carbon Corp., 30 East 42nd Street, New York, N. Y.

Specify Florite Desiccant

For Efficient Dehydration of GASES and LIQUIDS

FLORITE, the new granular drying agent, is now being used successfully for dehydrating natural gas, propane, gasoline, air, nitrogen, carbon dioxide and other gases and liquids where high drying efficiency is required.
It selectively adsorbs 4 to 20% of its weight in water, depending upon the particular application, and is regenerated by heating to 300–350°F. FLORITE is hard, stable, non-corrosive, non-poisonous, and is available in a variety of particle size classifications.

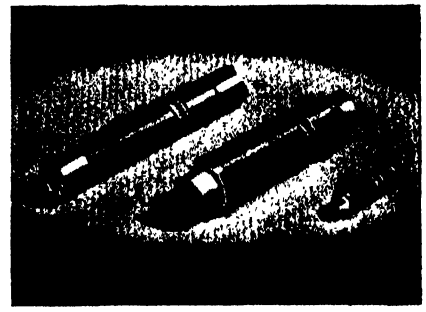
Aneroid Manometer for Flow or Liquid Level

ABSENCE of mercury or other liquid from the flow and liquid level manometer of the Taylor Instrument Co., Rochester, N. Y., removes the possibility of product contamination and the hazard of mercury being blown. Sealing liquids are rarely required and mercury is released for the war effort. Replacing the stuffing box is a new torque tube assembly which gives a completely closed system, is designed to eliminate friction and lubrication, and does away with the lost time involved in maintenance. Friction, lost motion, and wear are reduced by the absence of internal pivots and springs.



Quick Drying Paints

RESEARCH chemists in the paint field are easing a serious brake on war production by drastically reducing paint drying time. A du Pont development has been the short-bake synthetic finishes of the urea-formaldehyde resin variety. The same laboratories that produced the quick-drying Duco nitrocellulose lacquer which made possible the mass production of automobiles and put the Dulux synthetic resin enamel on 9,000,000 refrigerator cabinets have perfected a type of the latter as a camouflage airplane finish. First adopted by the British Government, the synthetic product, which does not rely on imported resins and gums, is now used largely by the U. S. Army and Navy Air Corps.

In addition to the fast-drying quality typical of synthetic finishes, the Dulux type camouflage paint for planes is highly resistant to the destructive action of deicing fluids.

Ferrule Resistors

THE Ohmite ferrule resistor has been designed for easy interchangeability without the use of tools by the Ohmite Manufacturing Co., 4835 Flournoy St., Department

9B, Chicago, Ill. An even winding of resistance wire on a ceramic core is protected by an Ohmite vitreous enamel coating. The wire is terminated on metal bands or ferrules which permit mounting in fuse clips. Ferrules are cup, sleeve, or cartridge type. Special ceramic cores are available which, with special coating, will withstand the temperature shock test of repeated im-

SO

Closing dates advanced

Publication and closing dates of Chemical and Engineering News

Issue of the 10th closes—20th of preceding month; **mails 7th of month.**

Issue of the 25th closes—5th of the month; **mails 22nd of month.**

We urgently ask that advertisers make it a point of having complete copy in our hands *before* the closing dates shown to enable prompt publication and mailing.

EMPLOYMENT INFORMATION

RATES to be paid in advance. Standard setting 5c a word, minimum charge $2.00 each; include 8 words for box address. Exceptions see ⟶ Display, $10.00 per column inch. 2 inches maximum, larger units at regular display unit rates. No discounts or allowances.
SEND advertisements with remittance to INDUSTRIAL AND ENGINEERING CHEMISTRY, 332 West 42nd St., New York, N. Y., to reach there not later than 10:00 A.M. on the 5th and 20th, closing dates for editions of CHEMICAL and ENGINEERING NEWS of the 25th and 10th, respectively. Insertions made in order of receipt provided necessary remittances are complete.
EMPLOYERS are requested to mention in their announcements the section of the country in which the open position is located to ensure replies only from those who are geographically available.
In printing these advertisements the SOCIETY assumes no obligations as to qualifications of prospective employees or responsibility of employers.

UNEMPLOYED members of the AMERICAN CHEMICAL SOCIETY seeking employment for themselves are allowed in one calendar year 3 announcements free (one per issue) set in standard style and limited to 50 words each, including 8-word box address, and 3 additional standard announcements at 50% of regular rate. Further announcements and excess words at full rate.

EMPLOYED members of the AMERICAN CHEMICAL SOCIETY seeking new positions are permitted 3 standard announcements during the calendar year at 50% of the regular rate—include 8 words for box address.

EMPLOYERS seeking chemists and chemical engineers are permitted 3 standard announcements, not to exceed 50 words each including box address and not more than one per issue, during the calendar year without charge, provided they agree in writing to acknowledge all replies (excess words 5c each), otherwise full rate applies.

The AMERICAN CHEMICAL SOCIETY is vitally interested in the welfare of its members and in seeing that the chemical industry is manned with competent chemists and chemical engineers. These pages are part of our service in that connection. In addition most of the larger sections of the AMERICAN CHEMICAL SOCIETY and several of the smaller ones have active employment committees. Local section secretaries in your area will inform you as to any employment aids that may be available locally.

An Employment Clearinghouse is operated at each national meeting of the SOCIETY for the purpose of bringing together representatives of industry looking for chemists and members and student affiliates in attendance wishing to make such contacts. For further details, consult the preliminary and final programs as printed in the NEWS EDITION prior to each meeting.

In the New York area, special employment facilities are offered by the Employment Bureau of the Chemists' Club, 52 East 41st St., New York, N. Y. In the Chicago area, the Chicago Section maintains an employment service at 505 N. Michigan Avenue, Chicago, Ill.

Those replying to announcements should be careful to send copies and not original documents. Advertising circulars will not be forwarded and to that end all letters will be opened at the forwarding office.

SITUATIONS OPEN

Those announcements in which the letter "P" is part of the address key have paid in full and are not committed to acknowledge replies. The Society regards acknowledgment by employers of all applications as an act of common courtesy but can assume no responsibility for their failure to do so.

CHEMICAL ENGINEER excellent opportunity for man of outstanding qualifications in research laboratories located in the East. Please submit college record, experience, accomplishments, and small photo.
Box 75–TP–7, Ind. & Eng. Chem., Easton, Pa.

FOOD TECHNOLOGIST. Applications will be welcomed from men with outstanding records to serve as junior chemists in eastern Research Laboratory. Prospects for advancement excellent for men of right qualifications. Please submit record of training and experience, personal history and recent small photo.
Box 76–TP–7, Ind. & Eng. Chem., Easton, Pa.

A CHEMICAL SALES organisation handling chemical specialties used by numerous defense industries has an opening in New England for a salesman with a degree in chemistry. Opportunity to acquire part interest in organisation. Give draft status, availability, education and sales experience.
Box 14–T–8, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER or chemist interested in control and development work leading to plant supervisory positions; large plant, Aggressive Company, producing roofing felt, granules, asphalt roofing and asphalt specialties. Give details of education and past experience. Personnel Director, The Flintkote Company, New Orleans, Louisiana.

ANALYTICAL CHEMIST with Bachelor or Master degree, desired in research laboratory of food manufacturer located in the East. Opportunity for man with sound training and superior college record. Supply details concerning training, experience, personal history and small photo.
Box 51–TP–8, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST, B.S. in chemistry wanted for chemical laboratory in Niagara Falls, New York. Address: The Carborundum Company, Service Department, Niagara Falls, N. Y.

CHEMIST with some petroleum experience. Needed in Chicago area for development of petroleum products and rust preventives. State age, draft status, degree, and salary desired in opening letter.
Box 79–TP–8, Ind. & Eng. Chem., Easton, Pa.

CHEMIST to take charge of laboratory analysing tool, stainless and special steels and alloys, part of time required for research work. In replying give full information concerning age, training, experience, family status, health, etc.
Box 10–NP–9, Ind. & Eng. Chem., Easton, Pa.

WANTED—GRADUATE chemist, research experience with drying and semi-drying oils. Extensive knowledge of analytical oil determinations required.
Box 17–NP–9, Ind. & Eng. Chem., Easton, Pa.

CHEMIST WANTED: preferably in the field of metallic soaps, though a broad knowledge of organic may be substituted. Should be capable of research and development. Permanent position, aggressive concern, Ohio location. In reply state salary desired, draft status and education in detail.
Box 20–N–9, Ind. & Eng. Chem., Easton, Pa.

CHEMISTS, MALE or female for routine inspection and analysis on food products. Modern laboratories located in Mid-west.
Box 24–NP–9, Ind. & Eng. Chem., Easton, Pa.

CHEMIST or CHEMICAL Engineer wanted by laboratory supply house to travel Baltimore, Washington and Richmond territory. State education, experience and salary expected.
Box 47–NP–9, Ind. & Eng. Chem., Easton, Pa.

(See Box 50–NP–9 on p. 1212)

CHEMISTS and CHEMICAL Engineers wanted for Pilot Plant Development and Research work in the Synthetic Organic field. Location metropolitan area. Please give complete details of training and experience.
Box 17–TP–9, Ind. & Eng. Chem., Easton, Pa.

GRADUATE FELLOWSHIP, The University of Texas, established by major oil company. Research on drilling muds leading to industrial position. Applicant must have engineering degree, knowledge of colloidal chemistry. Half-time allowed toward M.S. degree in petroleum engineering. Stipend, scholastic year 1942–43, $600.00.
Box 18–T–9, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST or Physicist for research study and measurement of pasting characteristics of starch. This research sponsored by Corn Industries Research Foundation. Submit full particulars of training, experience, draft status and small recent photograph to Research Department, Penick & Ford Ltd., Inc., Cedar Rapids, Iowa.

CHEMIST with good basic training for work on adhesives. Adhesive or rubber experience essential. Give full particulars of training, experience, draft status, and salary desired.
Box 23–T–9, Ind. & Eng. Chem., Easton, Pa.

SALES ENGINEERING executive. Location Northeast-Central. Man capable of supervising the sales, engineering and servicing of corrosion-resisting equipment. Must have a thorough knowledge of chemical plant processes and the application of equipment for handling corrosive liquids. A knowledge of the various corrosion-resisting alloys and their application is also necessary. Please give complete information regarding self and previous experience.
Box 26–TP–9, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST with general training in chemistry preferably in organic and analytical chemistry, for laboratory doing research work in interesting biochemical-organic field. Location Eastern Pennsylvania. Give details, including salary expected and recent photograph.
Box 28–TP–9, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST: Analytical and Research. Excellent opportunity, residential community, Connecticut shore one hour from New ... ord, include small photo and salary required.
Box 30–TP–9, Ind. & Eng. Chem., Easton, Pa.

SOAP LABORATORY in Middle West requires services of a graduate chemist, man with deferred draft status, or woman. Control and investigational work. Include all pertinent data regarding experience and personal history in reply. State salary required and submit small, recent photo.
Box 39–T–9, Ind. & Eng. Chem., Easton, Pa.

MIDWESTERN CHEMICAL company has excellent opportunity for woman chemist to serve as technical secretary and librarian. Give full information and salary expected in first letter.
Box 40–TP–9, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST for research in well equipped laboratory of Agricultural Experiment Station. Work on fats and oils, proteins, carbohydrates. Emphasis on natural products. Some organic synthesis. Young chemist with Ph.D. or equivalent desired. Salary about $2600. Excellent opportunity for publications. Location, northwestern.
Box 43–T–9, Ind. & Eng. Chem., Easton, Pa.

CHEMIST WANTED for work in chemical laboratory of large Oklahoma refinery. Give complete details, including education, citizenship, experience, salary desired. Send photograph.
Box 45–T–9, Ind. & Eng. Chem., Easton, Pa.

FELLOWSHIP-TITANIUM chemistry research available September 15 to October 5. Applicant with M.S. or equivalent in Chemical Engineering well trained in physics and physical chemistry. Submit complete data first letter including photograph, draft status, experience, and certified transcript of record including grades and references to Arthur W. Hixson, Executive Officer, Department of Chemical Engineering, Columbia University, New York City. $2000.00 per annum leading to doctorate.
Box 48–TP–9, Ind. & Eng. Chem., Easton, Pa.

COLLEGE TEACHER wanted to handle General and Organic Chemistry for the Duration. Experience necessary. Ph.D. desirable. State minimum acceptable salary and air mail full details to Phil Fehlandt, Chemistry Department, College of Pugetsound, Tacoma, Washington.
Box 51–T–9, Ind. & Eng. Chem., Easton, Pa.

PHARMACEUTICAL CHEMIST in established, well equipped midwest laboratory. Must be able to direct development of profitable ethical medicinals to point of commercial manufacture. Would help if he has contacts in institutions to ease clinical trials. An excellent permanent place for man who fits. Write completely of technical education, field of experience and draft status.
Box 55–TP–9, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMISTS. Graduates or commercial analysts for work in plant materials and control laboratories of Electrical Manufacturer. Familiarity with analysis and testing of rubber, metals, varnishes, asphalts, papers and textiles desirable but not essential. Male or female. Give full particulars including draft status. Locations: East, Mid-west, Pacific Coast.
Box 56–TP–9, Ind. & Eng. Chem., Easton, Pa.

(Continued on page 1214)

Address communications to the box number indicated and Mail to Easton, Penna.

The American Chemical Society has no information concerning the position advertised, or in regard to those seeking employment.

(Situations Open Continued)

DEVELOPMENT of MATERIAL specifications and methods. Graduate chemist or chemical engineer who has had experience in writing material specifications and developing methods of test desired by Electrical Manufacturer. Location: East in vicinity of New York City. Give full particulars including draft status.
Box 57-TP-9, Ind. & Eng. Chem., Easton, Pa.

METALLURGIST—experienced in research and development of magnesium alloys, capable of conducting independent research and having some experience in production methods of light alloys. Give details of education, experience, publications, references. State age, salary desired. Send small photograph (not returnable).
Box 64-TP-9, Ind. & Eng. Chem., Easton, Pa.

POSITION AVAILABLE with established company in South for graduate chemist preferably with some experience in petroleum products. Applicant must be capable, for position will lead to research. Salary will advance as value to company increases.
Box 65-TP-9, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER with experience in chemical plant design, mechanical engineering, product design, and with a thorough knowledge of rubber and plastic technology, to work for plant in Middle West. Must be draft exempt and not employed at your highest skill in any other war plant.
Box 81-TP-9, Ind. & Eng. Chem., Easton, Pa.

CHEMIST to take charge of Analytical laboratory in Pennsylvania. Plant engaged in essential war work preferably a Ph.D. with industrial organic analytical experience. Give full details including photo and salary desired.
Box 82-TP-9, Ind. & Eng. Chem., Easton, Pa.

CHIEF CHEMIST

Position as chief chemist open to man with mature experience in the formulation and manufacture of phenolic laminating, impregnating and molding resins. Plant location in large industrial area in Middle West where opportunities in this field are unlimited. Quick availability important because of volume of War work. Only a qualified man with highest reference will be considered. State full details in reply addressed to

Box 83-TP-9, Ind. & Eng. Chem., Easton, Pa.

INSTRUCTOR WANTED immediately for inorganic, organic, analytical first courses at Erie Junior College, University of Pittsburgh $150 to $200 per month. Submit official transcript of college record and have department head send letter of recommendation direct to Department of Chemistry, University of Pittsburgh, Pittsburgh, Pa. M.S. degree required.
Box 84-T-9, Ind. & Eng. Chem., Easton, Pa.

SITUATIONS WANTED
(A.C.S. MEMBERS)

SPECIAL LIBRARIES ASSOCIATION will recommend trained chemical and technical men and women librarians at no cost to employer or member. Competent persons are now available. Write to the Executive Office, 31 East Tenth Street, New York, New York, for additional information.

FOOD CHEMIST with over twenty years' wide experience in the Food Industry, in direction, research, process development, quality control, and factory problems. Desires a responsible position.
Box 69-N-8, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST, B.Sc., M.Sc., several years' industrial experience with oils, soaps, waxes, polishes. Desires industrial research or teaching position offering opportunity for research. Masters in physical chemistry. Trained in micro-techniques, physical methods and new analytical procedures. Married, age 27, prefer Northeastern area.
Box 25-T-8, Ind. & Eng. Chem., Easton, Pa.

MEDICAL CHEMIST, PH.D., Broad experience in technical and scientific research on food products, biologicals and pharmaceuticals. Ten years with medical and hospital supply firm. Research, development and business knowledge. New York State or East preferred. References. Available Sept. 1. Class 3-A.
Box 40-T-8, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, B.Ch., and Biochemist, Ph.D., 1942 from large midwestern university. Desire academic or industrial position. Special training in Colloid chemistry. Experience with nitrocellulose and enzymes. Six publications. Age 25, Single. Available immediately.
Box 41-T-8, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER (Ch.E.), young man, three years' laboratory and plant experience, sixteen years' industrial sales. Loyal, enthusiastic, industrious. Can translate technical data understandingly to the layman. Effective speaker, writer, organizer. Authority chemical defense. Available immediately. Desires position to serve Nation more effectively.
Box 71-T-8, Ind. & Eng. Chem., Easton, Pa.

DIRECTOR, RESEARCH or laboratory. Executive ability to direct staff and to apply original work and processes, on products inorganic, organic, biological, etc., to ethical pharmaceuticals, Drugs and Allied Lines. Pharm.D. extensive training and long experience. Wishes director position or assistant to technical executive.
Box 102-T-8, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. 12 years' academic and industrial experience in synthesis, hydrocarbons (Diolefins and derivatives) polymers and resins, publications, patents, languages. Employed, draft status 3-B. Desires responsible research position.
Box 23-T-8, Ind. & Eng. Chem., Easton, Pa.

INDUSTRIAL POSITION, preferably with small eastern or southern firm, wanted by Ph.D., physical chemistry 1940, with two years' research experience. Married, twenty-eight years old, draft classification 2-B. Sigma Xi. Protestant American. Now employed, available one month's notice.
Box 18-N-9, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. 14 years' experience various fields. Organic, pharmaceutical, cosmetic bio-chemistry. Analysis, Research, Development, Production control. Three languages. Imaginative, inventive, adaptable worker. Married with child. Age 39. Immediately available. Desires position. Location anywhere.
Box 29-N-9, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, M.A. Columbia, 1941; physical and organic. Recently resigned from non-essential research position. Age 21. Excellent scholastic background and record. One year's experience. Alert, intelligent, practical, versatile. Highest references. Research preferred but will consider other. Available immediately anywhere in U. S.
Box 39-N-9, Ind. & Eng. Chem., Easton, Pa.

ORGANIC-INORGANIC Chemist. M.A. leading Mid-Western University. Six years' industrial research experience including organic and inorganic polymers. Knowledge of properties, reactions and uses of compounds of 91 elements beside carbon. Patents. Articulate, adaptable, independent, willing worker with insatiable curiosity. Aged 29, married. Employed but seeking research position with greater responsibilities.
Box 45-N-9, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST. August Ph.D.; minors, Physical and Chemical Engineering. Excellent scholastic record, publications, experienced teaching and fulltime research in isolation, identification and synthesis of organic acids and nitrogen heterocycles. Age, 28; dependents. Now available for teaching or research preferably in Southwest.
Box 49-N-9, Ind. & Eng. Chem., Easton, Pa.

INDUSTRIAL CHEMIST, with business and executive experience. University graduate, twenty years' excellent record in research, development, sales and service with State, Federal institution and corporation. Publications, patents, sales literature. Desires active employment. References from all employers. Listed in American Men of Science. Draft 3-B.
Box 59-N-9, Ind. & Eng. Chem., Easton, Pa.

COLLEGE TEACHING, PH.D. 1937. Analytical or inorganic preferred. Experience also in physical, electrochemistry, and photochemistry. Desire teaching and research position. Publication. honorary societies. Ten years' teaching experience. Employed. Age 37, family.
Box 12-T-9, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST, M.S. 1940, with work in organic synthesis. Industrial experience in analytical development, supervision and training of analysts. Employed at present, desires position with executive future, preferably in South or Southwest.
Box 13-T-9, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, B.S. and grad. credits, four years' experience in organic compounds, synthetic rubber, resins and plastics, thoroughly familiar with pilot plant operation. Seeks position in development or production. Available short notice, anywhere.
Box 15-T-9, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST, B.S., white, single, Gentile. Eighteen years' analytical, research, supervisory experience; fuels, air pollution, yeast technology; bibliographic and editorial studies. References. Employed. Prefers bibliographic or supervisory work. $2400.
Box 20-T-9, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST—M.A., Phi Beta Kappa, age 25 years, single. Five years' supervisory experience and development and production of organic chemicals and pharmaceuticals. Patents pending. Adaptable; can handle men. Seek research, pilot plant or production position in war industry. Excellent references. Available on reasonable notice.
Box 21-T-9, Ind. & Eng. Chem., Easton, Pa.

INDUSTRIAL CHEMIST in responsible position with specialties manufacturer wants job with direct bearing on war effort and post-war prospects. American, 37, married, two children. Sixteen years' achievement in production control, analysis, development, package improvement, plant operation, chiefly in utilization of materials including plastics, glass, metals, rubber. Like trouble-shooting, development, technical service work. East Coast location.
Box 25-T-9, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST—Experienced in plant biochemistry and pharmaceutical chemistry. Six years' research isolation, identification, analysis plant compounds. Experience in microanalysis, and organic synthesis. Ph.D. 1935. Major organic; minors, physical chemistry, bacteriology. Fifteen publications. Employed. Desires permanent position with chance for advancement. Age 33, married, two children, 3-A, Protestant.
Box 29-T-9, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, Ph.D., industrial organic chemist, 25 years' industrial and research experience, process developments, production problems, among others rayon, cellulose and derivatives. Patents, publications, new projects, languages, business knowledge. Married, one child. Available on short notice.
Box 31-T-9, Ind. & Eng. Chem., Easton, Pa.

INDUSTRIAL CHEMIST seeks position of responsibility in chemical production directly concerned with war effort. Location immaterial. Now employed in East. Five years' industrial experience in plant control and operation chiefly in field of distillation. Experienced in handling labor. B.S. degree in organic chemistry from large middle western university. 3-A draft classification. Protestant.
Box 35-T-9, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST: B.S. 1935. 4 years' public service, 2 years' industrial experience in foods and allied products, supervision of analytical control laboratory. Desire investigational work on development and revision of methods. Age 29, married. Western or Northern states preferred, but will consider other locations. References. Now employed, but available on short notice.
Box 36-T-9, Ind. & Eng. Chem., Easton, Pa.

ARE YOU looking for a chief chemist? Have had twenty-five years' experience in analysis and research work on metals, ores, coal, oils and waters. Last fifteen years in full charge of commercial analytical laboratory. Would consider desirable opening as chief chemist or research on analytical methods.
Box 42-T-9, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, Ph.D., age 45, married, expert in synthetic resins with 20 years' experience in research, development and production. Excellent chemical background. Desires responsible position in research or development work in progressive company.
Box 44-T-9, Ind. & Eng. Chem., Easton, Pa.

INDUSTRIAL CHEMIST, Ph.D., 14 years' varied experience in research and plant. Inorganic, medicinals, pigments, metal salts, metallurgical. Patents in welding and soldering. Age 39, family, draft classification 3-A. Experience as market analyst and translator. Four languages. Metropolitan New York and New Jersey.
Box 46-T-9, Ind. & Eng. Chem., Easton, Pa.

TEACHER, PH.D. Well qualified in Organic and General Chemistry. Twenty-five years' experience in University of recognised standing. Employed at present. Desire to make change.
Box 49-T-9, Ind. & Eng. Chem., Easton, Pa.

(Continued on page 1215)

(Situations Wanted Continued)

ORGANIC CHEMIST, 23. Three years' industrial development experience with resins, adhesives, and gasket materials. Capable, efficient, publications, patent applications. Desire research or development position with opportunity. Prefer West or Southwest, consider others. Presently employed. New England area. Married, 2-B draft.
Box 50–T–9, Ind. & Eng. Chem., Easton, Pa.

SPECIAL PRODUCTS research and development chemist. Twelve years' experience in development and production of automotive, aeronautical, and household special products, including lubricating oils and petroleum specialties. Capable of directing development and production of products in these and allied fields. Now employed but would like to relocate, preferably in Dallas area. Age 39.
Box 52–T–9, Ind. & Eng. Chem., Easton, Pa.

PACIFIC COAST position desired by chemical engineer, 11 years' experience engineering and process work in organic chemicals, petroleum refining and equipment application design. Draft exempt, 33 years old, 3 dependents.
Box 58–T–9, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST, Ph.D., with excellent record of original accomplishment in research requiring application of physical-chemistry to enzymes, other systems of biological interest. Over twenty publications. Experience includes seven years of teaching, fellowships abroad, work in physico-chemical, biochemical, and biological laboratories. Prefer university position, or one requiring assumption of responsibility, exercise of initiative. Available at short notice. Family.
Box 59–T–9, Ind. & Eng. Chem., Easton, Pa.

MANUFACTURING & PRODUCTION chemist executive, formulator, analytical, engineering & medical training, 15 years' experience, organic, pharmaceutical, oils, etc. Has own established business but must change to defense

CHEMIST: 6 years' experience in analysis, production and development of essential oils and flavors. Six months' experience in iron analysis. Employed at present but desire change. Draft deferred.
Box 61–T–9, Ind. & Eng. Chem., Easton, Pa.

SYNTHETIC ORGANIC chemist, Ph.D. August 1942, Columbia. Thesis on the synthesis of substituted acetylenes, olephins, and veratroles. Experienced in biochemical and micro analysis, natural products isolation, synthetic preparations. Phi Lambda Upsilon, Sigma Xi. Available immediately, location immaterial, defense work preferred.
Box 63–T–9, Ind. & Eng. Chem., Easton, Pa.

UNIVERSITY or COLLEGE teaching. Ph.D. 1940. Organic major; mathematics minor. Two years' college teaching experience. Fellowships, assistantships, publications, honors. Present teaching position temporary. Desire post with opportunity for research. Woman.
Box 68–T–9, Ind. & Eng. Chem., Easton, Pa.

ESSENTIAL INDUSTRY employment desired by a physical chemistry major with minors in organic and chemical and metallurgical engineering. Ph.D. course work and research completed but lack languages and preliminary examinations. Single, 30, 2-A. Prefer processing or metallurgy. Employed.
Box 71–T–9, Ind. & Eng. Chem., Easton, Pa.

SYNTHETIC RESIN chemist. Five years' experience in technical research on synthetic coatings and adhesives. Also experienced in photochemistry and textiles. Has shown originality and has obtained practical results. Married, 2 dependents. Age 29. Harvard training. Now employed.
Box 72–T–9, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST—Spectroscopist, M.S. Experienced in inorganic chemical analysis; also in the development of spectrochemical methods. Familiar with physical methods of analysis. Experience in supervising. Training in physical, organic and inorganic chemistry. No routine. Employed, Gentile, married, draft status 3-A.
Box 78–T–9, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, M.S. 1941. Year's synthetic organic research experience. Thorough chemical training at accredited university including year of organic research and micro-analysis. Desires position as research assistant with view toward future business administration. Age 24. Draft status, 4-F. Available shortly.
Box 80–T–9, Ind. & Eng. Chem., Easton, Pa.

SITUATIONS WANTED
(NONMEMBERS)

CHEMICAL ENGINEER—Design and cost estimating of process equipment experience. Experience in heavy chemicals plant layout, research and development. Will be available shortly.
Box 33–N–9, Ind. & Eng. Chem., Easton, Pa.

BACTERIOLOGIST-CHEMIST, B.S. (1932), age 36, married, 3-A, 10 years' industrial experience as bacteriologist and chemist in foods, beverages, wetting agents, detergents, colloids, lithographic preparations, formulation of industrial products; consultant in above fields; author of scientific articles; supervisor of laboratory, can handle men, write reports, etc. Available on short notice. Min. salary $3,000.00.
Box 10–T–9, Ind. & Eng. Chem., Easton, Pa.

PETROLEUM CHEMIST, B.S. in Ch.E. 9 years' research and development experience on lube oils and petroleum specialties. Age 32. Married. Draft 3-A. Presently employed, but available on reasonable notice.
Box 33–T–9, Ind. & Eng. Chem., Easton, Pa.

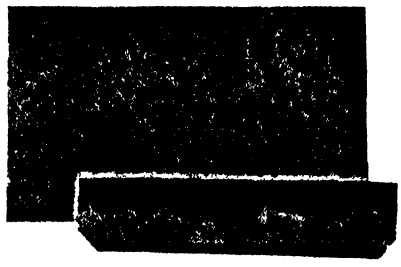
WOMAN CHEMIST, 22, B.S. (1941) in chemistry. Minors in mathematics and physics. One year's analytical experience in large industrial laboratory. New York City or vicinity desired. References. Available immediately.
Box 53–T–9, Ind. & Eng. Chem., Easton, Pa.

PHARMACEUTICAL CHEMIST—Columbia graduate, B.S. 1936, age 27; draft-deferred, total of five years' experience in pharmaceutical and cosmetic fields—four in analytical work and one in research and development.
Box 54–T–9, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST, B.A. 1942, honors in chemistry, desires position organic field. Location immaterial, prefer vicinity university. Knowledge French, German, shorthand, typing, single, Protestant, age 19. Employed but available short notice.
Box 70–T–9, Ind. & Eng. Chem., Easton, Pa.

METALLURGIST, CHEMICAL engineer, age 33. Experience: Inorganic chemical development and production. Mineral dressing research and operation. Location immaterial.
Box 76–T–9, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, first class experience design, installation, development, and operation organic chemical plants. Capable taking complete charge of project from laboratory stage to operating plant. Desire permanent connection with responsibility. Married. One child.
Box 79–T–9, Ind. & Eng. Chem., Easton, Pa.



Industrial Literature

CONTINUED FROM PAGE 1212

mersions alternately from ice cold to hot water. Protective coatings which pass salt water immersion tests are also available.

Nonslippery Flooring

TO PRODUCE nonskid floors, either wet or dry, the Walter Maguire Co., Inc., New York, N. Y., offers Cortland emery aggregate, a mixture of scientifically graded large and small, sharp, hard particles of mineral emery, rating next to diamond in hardness.

For application, the aggregate is mixed with portland cement and water for the floor topping. This surface improves with wear, the floors actually becoming safer with use, because, as the rough emery particles are exposed by wearing away of the cement, their gripping action improves.

Insulating Varnish

Flame-resistant insulating varnishing protects windings of large electrical units

THE Sterling Varnish Co., 140 Ohio River Blvd., Haysville, Penna., has recently developed a new flame-resistant insulating varnish, designated as R-878, which is recommended for class B high-temperature insulation.

This new varnish is mechanically strong and dries all the way through when applied to electrical apparatus. After drying, it will not support combustion, when the flame is removed, neither will it melt nor resoften under operating temperatures.

Safety Cloth

A SAFETY cloth has been developed by the Colloid Equipment Co., Inc., 50 Church St., New York, N. Y., to provide a flexible window for buildings without the use of priority materials, and to be used as protection upon the inside of glass windows to reduce the danger to persons or property. Ceco safety cloth is a 10-mesh cotton with a tough, transparent plastic film.

New Drop-Forging Plant

AN associate company, the Kropp Forge Aviation Co., has been formed by the Kropp Forge Co. of Chicago.

A new plant in the course of construction involves a modern high-speed drop-forging manufacturing plant almost equal in size to the present plant.

The production tonnage of the new plant will be approximately four times the company's existing drop-forging production, but through the broad use of labor-serving equipment the manpower requirements of the new addition will be only two and one-half times that of existing operations.

All heating and heat-treating operations will be under complete laboratory control. A modern laboratory for making complete chemical and metallurgical de-

MISCELLANEOUS

BUSINESS OPPORTUNITIES • FOR SALE • WANTED • ETC.

Five cents a word, minimum charge $2.00; display available at $7.50 per inch; in advance. No discounts or allowances

MICRO-ELEMENTARY ANALYSES: C, H, N, S, P, Halogens, Methoxyl, Mol. wt., etc., U.S.P. and other official tests, Purity tests, Microinorganic assays, Spot tests, Micro-distillations, Toxicological investigations, and typical micro-chemical research work. Dr. Carl Tiedcke, 366 Fifth Avenue, New York, N. Y.

WANTED: Refractometer, new or used, send full description, price, etc.
Box 61-NP-9, Ind. & Eng. Chem., Easton, Pa.

WILL PURCHASE for cash or on royalty basis formulas for useful commercial compositions for use in paper, rubber coatings, adhesives, metal treatments, textiles, ceramics, tobacco, foods, fireproofing, waterproofing, insecticides, plastics, detergents, polishes, leather, soap, grease, inks, materials of construction, resins, emulsions plating, warfare, and other miscellaneous uses. It is not necessary that product have a very large market or be patented. Your reply will be held in strict confidence and we reserve the right to return any offering without obligation.
Box 32-T-9, Ind. & Eng. Chem., Easton, Pa.

WANTED JOURNAL of the American Chemical Society 1900 to 1940; Industrial & Engineering Chemistry volumes 1 to 32; Analytical Edition volumes 1 to 12; Chemical Abstracts first and Third Decennial Indexes; London Chemical Society Journal 1900 to 1941. State condition of journal and lowest price for immediate disposal.
N. Klein, 113 Fourth Ave., N. Y.

WANTED 2 Kilos Caesium Carbonate, 50 Kilos Boron Trichloride, 5 Kilos Uranium Metal, 10 pounds Boron Amorphous, 5 Kilos Histidine Hydrochloride, 500 grams Histamine, 100 grams Naphthoresorcinol, one Kilo Rhamnose, 20 lbs l. Asparagine, 25 pounds Xylose.
Box 66-T-9, Ind. & Eng. Chem., Easton, Pa.

WANTED—WANTED—WANTED—Your idle or surplus Laboratory equipment. More and more inquiries are coming in from direct war plants. Government departments. Research laboratories for practically all types of laboratory apparatus. All are trying to save time which new equipment requires. Sell us now while liberal government price regulations are in effect. Write or wire us your offerings for immediate purchase. We are in urgent need of microscopes, refractometers, polarimeters, microscopic cameras, metallurgical testing equipment, precision meters, Weston, Leeds & Northrup, Centrifuges, Hydraulic Presses, Ovens, Agate Mortars, Spectrographic Equipment, Wide Field Microscopes, Measuring Microscopes, Vacuum Ovens, Scott Testing Machines, Suter and others for all fabrics, rubber, paper, etc. Analytical balances, Torsion scales, chainomatics and hundreds of other items too numerous to mention. Contents of entire laboratories or plants will receive our immediate attention. Air-mail for immediate results. The Laboratory Exchange, 24 East 21st St., New York City.

FOR SALE: Cacodylic Acid and Sodium Cacodylate. These chemicals are of excellent quality and can be supplied in steady amounts.
Box 11-T-9, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Journal Chemical Society-London complete from 1874-1942, with Collective Indexes 1841-1922, containing Transactions, Abstracts & British Chemical Abstracts. Fine set, new condition uniformly labeled throughout, bound black buckram mostly new bindings, $525.00. Annual Reports Progr. of Chemistry Vol. 1—Date (1904-1941) cl. $40.00. Journal Soc. Chemical Industry—Vol. 1-59 (1882-1940) bound uniform condition with Collective Indexes $240.00.
Box 19-T-9, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: International Critical Tables. Complete with index. In excellent condition. Price $50.00 plus transportation cost. Oscar T. Quimby, 3129 Penrose Place, Cincinnati, Ohio.

FOR SALE: Ullman Encyclopedie der Technischen Chemie. First Edition Friedlander Fortschritte der Teerfarbrikationen 1—10 Ostwald Laherbuch der Chemie Moissan Traite de Chemie Minerale. Will sell at a reasonable cash offer.
Box 34-T-9, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Journal American Chemical Society, ten year set 1931-40; also Industrial Engineering Chemistry, ten year set 1931-40 with analytical edition. Price $27.50 each set, complete, unbound, some covers soiled. Cash with order. Willis A. Boughton, 12 Oxford Street, Cambridge, Mass.

FOR SALE: Comprehensive chemical dictionary manuscript, longhand, on 5 × 3 index cards; about 120 thousand terms. Steel cases. Correspondence invited from bona fide possible purchasers.
Box 38 T-9, Ind. & Eng. Chem., Easton, Pa.

AMERICAN CHEMICAL Society Publications. Complete set of all Journals since 1917. Mostly unbound and in perfect condition. Will sell as lot or complete file of any one Journal. Also ASTM Proceedings.
Box 41-T-9, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Biochemical Journal vols. 23 to 27. 31 to 34. Berichte der Deutschen Chemischen Gesellschaft years 1888 to 1920, 1935 1937. 1938. Bound. Industrial & Engineering Chemistry complete set up to 1939. Journal American Chemical Society years 1914 to 1941 bound. Pharmaceutish Weekblad, Amsterdam, 1903 to 1912 bound Transactions American Institute Chemical Engineers volumes 3 to 1940. Zeitschrift analytische Chemie vols. 16 to 54. 1877-1915 with General Registers.
Box 62-T-9, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: 5 Kilos Sparteine Sulphate, 100 pounds Sodium and Iron Cacodylate, Cacodylic Acid, 5 pounds each Barium and Strontium Metals, 200 pounds Orpiment, 100 pounds Greenland Cryolite, 100 pounds Chalcopyrite.
Box 69-T-9, Ind. & Eng. Chem., Easton, Pa.

FOR SALE—We are serving American chemistry as we have for the past ten years with fine, used, fully guaranteed laboratory equipment. Send us your lists for immediate quotations. We are constantly receiving new shipments and purchases. We may also locate or furnish those hard to get instruments or equipment which is holding you up. We are at your service at all times though we are very busy. Write or wire us your needs, no matter what they are. The Laboratory Exchange, 24 East 21st Street, New York City.

FOR SALE: Check this list of laboratory apparatus which we have available for immediate delivery. Leits New Inclined Binocular Model Microscope, B & L and Spencer Microscopes of all types are available. Spencer Model 810 Rotary Microtomes. B & L and Leits sliding microtomes. Scott 0-25 and 0-50 motor driven Tensile Tester with Recorder. Suter 0-12 lbs and 0-32 oz Table Model Tensile Tester, Mullen 0-600 lbs Hydraulic Hand Model Tester (3) Mullen Paper Testers, hand model 4 jar Porcelain Pebble Mill Motor driven. Bramhall & Deane #2 Autoclave. American Double Wall Autoclave 14 × 24. McMichael Viscosimeter. Stormer Viscosimeter. Hanovia Ultra Violet Quarts Lamp. International Clinical and type C Centrifuge Schmidt & Haensch Double Wedge Saccharimeters for tubes to 400 mm Zeiss Sugar Refractometer. B & L Dipping Refractometer Mechanical Stages. Dark field and Abbe Condensers. Other Microscopic accessories. Unused Pulp balances. 150 gr capacity 1 mg sensitivity in fine Mahogany Glass Case with Drawer. Laboratory Hydraulic Presses 6 × 6 self contained Hydraulic Pump. Gauge to 10 ton capacity. Electric Platten and Moulds for rubber, powder metallurgy and plastics are available. Agate Mortar Grinder E & A. Gaertner Spectrometer, small Drying Ovens and Incubators, etc. Write us your needs for immediate quotations. The Laboratory Exchange, 24 East 21st Street, New York City.

BERYLLIUM COPPER alloy for sale. 1773 pounds in form of ingots and miscellaneous scrap. 1.8 to 5.6 per cent beryllium; 0.08 to 0.7 per cent iron. General Preference Order M-160 applies.
Box 77-T-9, Ind. & Eng. Chem., Easton, Pa.

terminations and photomicrograph studies of test bars is nearing the point of completion.

The latest types of inspection equipment will be employed for making surface determinations, including a new luminous Magnaflux department.

Synthetic Wax

IN REPLACING rubber as a cloth backing in the manufacture of raincoats, life belts, etc., polyvinyl butyral has been used with considerable success. However, its surface tack has to be eliminated without adversely affecting the other properties. It is reported that Acrawax C, a synthetic wax manufactured by the Glyco Products Co., Inc., 230 King St., Brooklyn, N. Y., when added to the polyvinyl butyral in amounts as low as 1 per cent effectively eliminates this surface tack.

THE Sykes Advertising Agency has moved to larger quarters at 505 Empire Bldg., Liberty Avenue and Stanwix Street, Pittsburgh, Penna., as Army having asked for its previous office space.

Bethlehem Foundry & Machine Co. Earns Additional Honors

THE Bethlehem Foundry & Machine Co., Bethlehem, Penna., has been honored with the new Army-Navy production award recently announced. The new award is for "especially meritorious production of war materials" for both Army and Navy and is the highest honor to be presented. It is symbolized by a swallow-tailed flag with a large letter "E" in the center surrounded by a yellow wreath of oak and laurel leaves, mounted on a blue and red vertically divided background. The word "Army" appears on the red and the word "Navy" on the blue background. The flag has a white border. In February the company was awarded the Navy "E." This was later superseded by the All-Navy "E" burgee.

Brass Shine

WITH the unprecedented boom in brass buttons, brass fabricators have discovered a new and easier way to produce the shine for which these articles are noted.

Ferric sulfate has been found to do an exceptionally good job of removing ugly black smut and red cuprous oxide scale from the surface of the brass, according to Monsanto Chemical Co., Everett, Mass., which developed the process for commercial production of this chemical.

Ferric sulfate is used for the same purpose in the manufacture of brass cartridge cases. Since the making of a cartridge case consists of a series of drawing and annealing operations, it is essential that all scale and stain be removed before each draw or there is likelihood of fouling or breakage of the drawing dies.

Magnetic Separators

SEVERAL new designs in magnetic separators have been designed by the Stearns Magnetic Mfg. Co., Milwaukee, Wis.

One of these new laboratory units is the Stearns Style D size 0 separator, which features a steel inductively magnetized revolving take-off ring employed to carry the magnetic material beyond the conveyor belt to final delivery.

THE Michigan Alkali Co. has removed its general sales offices to Wyandotte, Mich.

New Processes for Old Ones in Wartime[1]

ARTHUR W. HIXSON

Department of Chemical Engineering, Columbia University, New York, N. Y.

IN MODERN all-out global warfare, when the Nation's life is in great peril and the very foundations of civilization are crumbling, the country must use all of its energy and all of its possessions to support two great armies—a combat army and a production army. Industry must largely lay aside its normal peacetime activities and use its facilities for the mass production of highly specialized and efficient instruments of destruction and material for the support of the combat armies. In conversion to wartime service industry must meet new product specifications and output demands that tax existing manufacturing facilities beyond their limits. Normal supplies of raw materials are shut off or drastically limited. New raw materials must be used. Old processes must be adapted to their use or abandoned. New processes must be developed to supplement the old, and new plants must be designed and built to operate them. Many of the traditional processes of peacetime industry have been or are being pulled up by the roots or have had new processes grafted on the old roots. Many plants operating old processes have been shut down and will never open again unless entirely new uses can be found for them. The production army front is just as fluid as the combat army front After every engagement there is a new demand for a new product or for a modification of the old. This is true of the whole gamut of war supplies. Industry must meet these changing demands promptly.

Since many of the products and the processes of manufacture are essentially chemical in nature, the problem of maintaining a fluid production army front has caused an increasingly heavy demand for well-trained chemical engineers. The great demand is for men who are well trained not only in the fundamental sciences and principles of chemical engineering but also in the principles of research and experimental techniques. The government laboratories, Army, Navy, industries, research foundations and institutes call repeatedly and insistently for chemical engineers, with clear vision and bold imagination, who can conceive and develop new processes to meet the wartime demand. Such are the drastic changes which the chemical industries are undergoing and the new demands upon the chemical engineering profession.

How long the industrial dislocation will continue, what additional changes will take place, and what the ultimate result will be no one knows. We do know, however, that we are in the midst of the most profound world-wide, social, political, industrial, and general economic upheaval in the history of civilization. Lesser upheavals in the past have sharply changed the direction of future developments. That this one will do likewise there is little doubt.

What effect will this change have on the course of development of the chemical engineering industries and on the chemical engineering profession in the future? The longer the war continues the more complete the dislocation will be. What kind of training will the chemical engineer of the future need to cope with the new requirements? On what phases of his training will there need to be a shift in emphasis? How will this chemical engineering curriculum have to be changed to meet the new emphasis? What new requirements will there be for the teaching profession in chemical engineering education? There are signs and omens in the dark clouds of this cataclysmic storm, and straws are drifting with accompanying winds. What future developments do the omens portend, and what direction do the straws indicate they will take?

Courses of Development in Manufacturing

When the war is ended, will there be a sudden transition back to the old normal conditions? I think not. The reconversion to normal industry will be slow at first. Time will be needed to determine what course new industrial developments must take. There is likely to be much unemployment among professional men as well as laborers during this period of adjustment, with attendant social disturbances. The new normal will be very different from the old normal.

Many manufacturing processes which had a stable existence in the old order will not be supported by the new economics. They will have to be greatly altered or scrapped. Competent authorities are convinced that the automobile industry has passed its peak. It is believed that some of the largest producers in the industry will not re-enter it. Many of the industries which depended largely on the automobile industry will have to point their activities in new directions. The rubber industry will be very different in the future. Profound changes will have to be made in the petroleum industry if it expects to maintain its dollars and cents position in the American industry of the future. It will undoubtedly become more of a chemical industry than it has been.

The rapid development of aerial transport of freight, as well as passengers, will have a profound effect on all human institutions and relationships as well as on industry. The social, scientific, economic, and political implications of this development are boundless. The relationships between great central power developments and industry will be different.

Aluminum in America will not be made largely from imported bauxites that have to be beneficiated in one part of the country and shipped to remote power sites for conversion to the metal which then has to be reshipped great distances for use. It will be made from domestic high-grade clays located near power sites.

Manufacture of chlorine will not be tied to large power developments and to the coproduction of caustic soda as at present. It will be produced in simple small units from salt and sulfur without the use

[1] Presented before the Society for the Promotion of Engineering Education at Columbia University, June 26, 1942.

of large amounts of power in the localities where the products are needed, with the elimination of transportation costs.

Manufacture of titanium pigments will not depend upon the transportation of ilmenite from Travaucore, in India, but will be produced from domestic titaniferous magnetites with the simultaneous production of magnetite of sufficient purity for use in the manufacture of steel. This notable achievement will be in full swing in 30 days. This may bring about an important change in the geography of our domestic iron and steel production as well as in the titanium pigments industry.

Research well under way at this time will undoubtedly result in the development of new power sources and in new methods of using the resultant energy. Such a development may well sharply alter the whole course of civilization. Other work may result in discoveries that will nullify or limit the use of the present-day types of explosives in warfare. That is not an idle dream.

The sudden shut-off of foreign sources of supply of strategic metals of which we have limited or no domestic reserves is bringing about a new alloy metallurgy involving the use of trace elements and their compounds and new methods of assembly of alloy components into finished products with unusual, useful properties. Introduction into process metallurgy of a new separation technique involving the use of cheap organic solvents with high selective specificity will make profitable the working of low-grade mineral deposits for the production of aluminum, vanadium, tungsten, molybdenum, chromium, uranium, perhaps radium and many of the common metals.

Development of new materials of construction for chemical process machinery is at this moment bringing into industry the practical use of processes heretofore considered impossible. Use of these materials for the construction of heat transfer apparatus, reaction vessels, evaporators, stills, filters, etc., for handling extremely corrosive substances in wide temperature ranges is opening many new fields for chemical process development. These are only a few of the new courses of development in the manufacturing side of industry that could be enumerated.

Trends toward Socialization

On the other side of industry great changes are taking place in the relationship between capital, labor, the public, government, and the professions. Whether we like it or not, the trend is toward more socialization than in the past. Considerable progress in this direction has already been made in the public utility industries, in the field of medicine, public housing and private home construction, and in agriculture. The tax-supported agricultural agent and farm consultant in every county is well known.

That such socialization may extend to the chemical engineering profession is more than a possibility. Several large cities which are industrial centers are now considering the proposal to set up tax-supported consulting engineering departments in the municipal government framework. Recent decisions of the superior courts definitely limiting the value of patent protection is a straw in the wind of socialization.

All of these changes combined will result in a new economic framework on which the chemical and other engineering industries of the future will depend and in which the chemical engineering profession will have to work and serve.

The methods of sales and distribution of manufactured products will be different. New elements will enter into cost determination, and new methods will be prescribed for cost accounting and company reports. The Government will more than likely prescribe many new techniques for the whole field of business management and administration. These may be very complicated in the chemical engineering industries.

There will undoubtedly be a greater trend toward decentralization of industries in the form of smaller manufacturing units. I believe that individual initiative and private enterprise will be encouraged and that the economic hazards of starting and operating small business enterprises will be largely removed by new stabilizing agencies of semigovernmental nature, such as industrial loan corporations similar to the present Home Owners Loan Corporation and the Agricultural Loan Corporation. Obsolescence in all branches of the industry, particularly in the processing branch, will probably run at a much higher rate than in the past. The rapidly recurring costs of replacement may have to be handled by obsolescence insurance agencies subsidized by the Government.

There will be many changes in the American ways of living. New structural materials and new methods for their assembly in small units will bring in new and different types of housing. The chemical engineer will have a greater part in this than in the past. The general introduction of the small family-size helicopter plane with a small automobile as an accessory for shopping purposes may have a wide effect in industry.

The Chemical Engineer in the New Era

The omens in the skies and the straws in the wind seem to indicate that the industrial norm of the future will be very different from the old one. That the new era will require chemical engineers to have new knowledge and new abilities is certain. New processes for old ones in wartime? Yes, but of as great and perhaps more importance to him will be his ability to originate, develop, and operate new processes for old ones in the future under the new fluid normal conditions. He will have to be a man of much broader training than the chemical engineer of the past. He will have to have a more thorough training in the fundamental sciences and in the principles of chemical and allied engineering than in the past and will have to know more about their practical applications. Much greater emphasis will have to be placed on training in the principles of research and experimental techniques, for he will be called on more and more for creative research and development work.

If he is to achieve a high professional development in this field, he will have to know much more than in the past about equipment design, plant design, process control and plant operation, industrial economics, business management, plant administration, sales engineering, public engineering and public relations, labor relations, corporation law, and finance. As a foundation for all of this, if he is to be a leader in his profession or even make a reasonable success, his professional training must have as a foundation a good liberal education in cultural and humanistic subjects. There will be much less chance for success than in the past for the handbook type of chemical engineer whose training consisted of standardized, formalized, and stereotyped instruction in the various subjects of the curriculum which has characterized much of engineering training. The use of dead textbooks and stereotyped instructional methods by incompetent or lazy-minded teachers will not produce chemical engineers who can cope with the future. Instruction in any subject which does not imbue the student with the spirit of research and teach him its methods and the methods and practice of creative thinking is a waste of time and money.

A.

Inspiring teachers—of course we must have them. After an experience of more than 30 years of teaching, research, and an extensive consulting practice in the field of chemical engineering, it is my considered judgment that no teacher can long be inspiring or have any considerable constructive influence in chemical engineering education, or in any kind of engineering education for that matter, who does not have a research program on which he continuously works and publishes. I frequently hear men complain that they do not do research because their teaching load is too heavy. That, in my opinion, in most cases is the excuse of a lazy man or of one whose research initiative is dead. Such a man, in my opinion, has no place on the staff of a modern and dynamic chemical engineering department which hopes to train efficient chemical engineers for the future.

Have I interpreted the signs and omens correctly? You must be the judge. New processes for old ones for wartime and the new peacetime? Yes, and chemical engineers with new visions, new capabilities, new human understandings, and new determinations to lift their profession to new heights of achievements in a democratic society of free people.

Acheson Medal Presentation

THE Edward Goodrich Acheson Medal and $1,000 prize were presented by The Electrochemical Society to Charles Frederick Burgess at the Hotel Statler, Detroit, Mich., on October 8.

Record Year for Cadmium in 1941

PRODUCTION of primary cadmium metal and compounds in 1941 increased 14 per cent over 1940, and established a new record, according to the Bureau of Mines, United States Department of the Interior. Producers' shipments of primary cadmium metal and compounds were 10 per cent larger in 1941 than in 1940. Production and producers' shipments of secondary cadmium (metal and compounds) increased 56 and 55 per cent, respectively, in 1941 compared with 1940.

Consumption of cadmium reached 8,063,000 pounds in 1941, a 31 per cent increase over 1940. About 95 per cent of the cadmium was consumed in electroplating, bearing alloys, and pigments.

George S. Gardner, for the past 10 years a partner in the firm of Brewer & Gardner, consulting chemists, is now associated with the American Chemical Paint Co., Ambler, Penna.

Danger

CURRENT rumors endanger our chemical manpower. Large numbers of chemists and chemical engineers up to 45 years of age have erroneously concluded that their professional services are not to be utilized or retained and that they might as well resign and enlist. Many have already done this. This tendency must be stopped or there will result a more serious loss of technical manpower than that due to the mistaken action of some Local Boards, employers, and technical men who have not understood the seriousness of the situation and the intent of Selective Service as laid down in official occupational directives.

It should be emphasized that there have been no changes in the policy or directives of the Selective Service System on the deferment of chemists and chemical engineers since Occupational Bulletin No. 10 (June 18, 1942) reprinted in full in CHEMICAL AND ENGINEERING NEWS for July 10, 1942. The suggestions for handling deferment, appeal, and the like published in CHEMICAL AND ENGINEERING NEWS for September 10, 1942, still hold. The only point to be added is that *each* deferment should be handled on its own merits at the time and without prejudice because of earlier deferments.

The SOCIETY is prepared to furnish, on request, one set of the following documents:

(*a*) Procedure in requesting deferment for chemists and chemical engineers in war industry and other essential activity.
(*b*) Excerpts from Selective Service Regulations referring to final appeal after refusal by local and state appeal boards.
(*c*) Planographed copy of Occupational Bulletin No. 10.

Any number of extra sets furnished for 3 cents (in stamp) each.

The following occupational bulletins are also important for reference in specific instances. They all list chemists and chemical engineers as being in "critical occupations" to which local boards should give careful consideration.

Occupational Bulletin 15, "Petroleum, Natural Gas and Natural Gasoline Activity". Includes petroleum refining and the production of tar, pitch, coal gas, and coke.

Occupational Bulletin 16, "Smelting, Refining and Rolling of Metals Activity".

Occupational Bulletin 18, "Agricultural Activity". Includes most forms of agricultural production and processing.

Occupational Bulletin 20, "Food Processing".

Occupational Bulletin 21, "Transportation Service Activity". Section 4. Railroad Transportation Service.

The SOCIETY has no copies of these bulletins for distribution, but they are supposed to be on file with the local boards. Any chemist or technical engineer directly interested will probably be furnished a single copy on written request to the Selective Service System, 21st and C Streets, N. W., Washington, D. C.

CHARLES L. PARSONS, *Secretary*

AMERICAN CHEMICAL SOCIETY

WASHINGTON, D. C.

Data Published on Selective Service

BECAUSE of the wide interest in this subject and the need for obtaining trained men for our Production Army, we give below references to information we have published on occupational deferements, including those of men in training, and the need for technically trained persons. Future developments will be brought to the attention of our readers.

Herbert E. Smith has been elected president of the United States Rubber Co., chairman of the executive committee, and a member of the finance committee. Mr. Smith has been with the company 29 years and since 1929 has been vice president and a director of the company.

Problems in the Industrial Utilization of Tobacco[1]

M. J. COPLEY, R. K. ESKEW, AND J. J. WILLAMAN

Eastern Regional Research Laboratory, Bureau of Agricultural Chemistry and Engineering, United States Department of Agriculture, Philadelphia, Penna.

SINCE a surplus of certain types of tobacco has developed in recent years, the Eastern Regional Research Laboratory of the United States Department of Agriculture has undertaken a program of research to find more extended industrial uses for tobacco. The program at present is directed principally toward the wider utilization of nicotine, because nicotine is already a commercial product and is one of the most unique constituents now known in this plant. Other constituents, however, show promise as industrial materials and are being investigated.

Nicotine has been an important product for many years. It is derived from tobacco factory by-products, such as stems, scraps, and other wastes and, to a lesser extent, from low-grade leaf of the fire-cured types. About a million pounds of the alkaloid have been recovered annually in this country. Until recently practically all of the nicotine was used in insecticides. Within the past year a considerable demand for it has developed for conversion into nicotinic acid. The main objectives at present, therefore, are more economical recovery of nicotine from tobacco, development of new and more efficient nicotine insecticides, and improvement in the oxidation of nicotine to nicotinic acid.

The principal methods which have been suggested for the recovery of nicotine are steam distillation, water extraction, and organic solvent extraction. Steam distillation is the method largely used in this country, although solvent methods appear to be employed in other countries. Aqueous extracts are often used as such without further isolation of the nicotine and usually near the site of extraction, since their low nicotine concentration prohibits commercial shipment. Steam distillation is cumbersome in that the concentration of nicotine vapor carried by the steam is around 4 per cent at best and, where a batch process is used, the average nicotine content of the distillate is usually less than 1 per cent. This necessitates the handling of a very large volume of distillate for each unit of nicotine. Vacuum distillation of tobacco has been tried with some success. The material is treated with lime and a minimum amount of water to liberate the free alkaloid. The mixture is then subjected to distillation in a vacuum of less than 50 mm. Water comes over first, carrying less than 1 per cent of nicotine. When practically all of the water is removed and the temperature of the material is raised above the boiling point of nicotine at this pressure, nicotine with a relatively small content of water distills over. The resulting distillate, containing 80 per cent or more nicotine, could be purified readily and converted either to the pure alkaloid or to the 40 per cent nicotine sulfate of commerce. To the present this has been done only in a small way using inefficient equipment. The principle, however, seems to be sound, and equipment in which the industrial feasibility of the process can be determined is under construction.

Nonaqueous solvent extraction of nicotine may have possibilities of development. Unfortunately, there are considerable amounts of nonnicotine materials in tobacco which are soluble in the ordinary solvents. It is possible, however, that among the great variety of solvents available, some may be found which have a marked preference for nicotine and could meet other requirements, such as recoverability, cost, and freedom from hazards.

The case for aqueous extraction is further complicated by the still greater quantity of constituents soluble in water. An inexpensive and feasible precipitating agent which will remove the nicotine with a minimum of impurities may be found, however. The nicotine would then be recovered from the precipitate.

In the attempt to find new and more advantageous forms of nicotine for insecticides, several promising lines of work have opened up. What is believed to be a wholly new series of double salts or complexes containing nicotine has been developed. These salts consist of two basic and one acidic radical. An example is copper-nicotine-picrate. Over 40 different salts have so far been prepared involving copper, cobalt, cadmium, zinc, iron, nickel, picrate, benzoate, thiocyanate, cyanide, salicylate, and *o*-benzoyl benzoate. These salts are of constant composition, have high nicotine contents, are extremely insoluble in water, and are prepared readily as impalpable powders without grinding. Their insecticidal value is being tested. Those containing copper may have combined insecticidal and fungicidal value.

Rubber dust, either hard or soft, will absorb about 10 per cent of nicotine and still remain a dust. Above this concentration the mixture becomes gummy, and finally the rubber and nicotine become fluid. These dusts liberate nicotine rather slowly. They should, therefore, be effective insecticides over a period of several days, in contrast to dusts containing lime, where the nicotine is vaporized in a matter of hours. Similar combinations have been found between finely ground plastics of various sorts and nicotine, as well as other volatile insecticides such as ethylene dichloride. Again, it has been found possible to impregnate fine fibers, such as medullary wood fibers, with a dye and then form the nicotine salt of that dye in the fibers. These fibers adhere tenaciously to foliage and fruit.

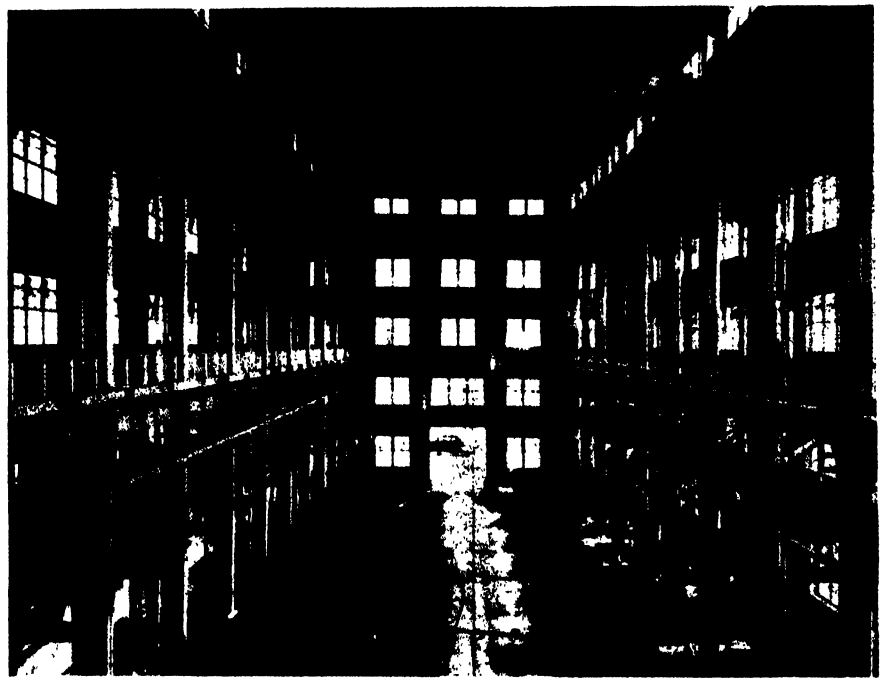
On January 29, 1941, the Committee on Food and Nutrition of the National Research Council announced that wheat flour would be enriched by the addition of thiamin, nicotinic acid, and iron. This initiated an intensive search for adequate sources of nicotinic acid. In 1940 about 10,000 pounds of this acid had been manufactured for the treatment of pellagra. In addition, it is estimated that upwards of 200,000 pounds will be needed for flour fortification in 1942. Since nicotine has been the best known material for producing nicotinic acid, an unprecedented demand was created for this alkaloid. Quinoline and β-picoline are also possible raw materials but at that time, at least, were not available commercially. Therefore a race developed among these three starting materials. The Eastern Regional Research Laboratory started work immediately to improve the oxidation of nicotine to nicotinic acid.

Since a chemical source of oxygen such as nitric acid is costly for carrying on this reaction, air oxidation was attempted. Vapor-phase catalytic oxidation is being intensively studied. Some success has resulted, but it is premature to discuss the results in detail. Sulfuric acid oxidation in the presence of a catalyst works rather well, but here a chemical source of oxygen is again involved. It would be hazardous to predict from what source the nicotinic acid of the future will be obtained, but we feel that nicotine is still a logical source.

War in the Pacific may impose a still further demand on nicotine because of restricted importations of pyrethrum and

[1] Presented before the Division of Agricultural and Food Chemistry at the 103rd meeting of the AMERICAN CHEMICAL SOCIETY, Memphis, Tenn., April 20 to 23, 1942.

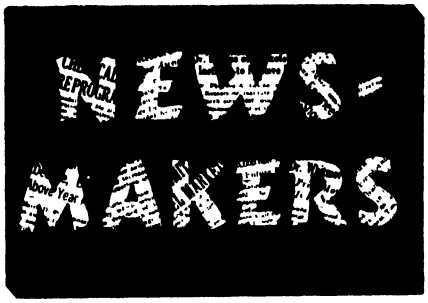
A field of tobacco in Connecticut



derris for insecticide purposes. Since Africa may be able to supply these materials in sufficient quantity and nicotine can replace them for only certain purposes, it is difficult to predict just what the situation in this regard will be in the near future. The best estimate, however, seems to be that there will be a shortage of something like 300,000 pounds of nicotine this year, from at least three causes—its use in nicotinic acid manufacture, its use to replace derris and pyrethrum, and its increased agricultural use for greater food production. Attempts to make up this deficit are along three lines. First is the development of more effective means of using nicotine as an insecticide. Possibly some of the new compounds mentioned above will help; possibly activators or synergistic materials will be found. Second, a considerable poundage of low-grade leaf tobacco of certain types will be diverted from the ordinary leaf channels to nicotine manufacture. Such diversion has occurred during recent years, and it may be expanded during the present year. A third possible source of additional nicotine might be the growing of *Nicotiana rustica*, a species of tobacco which is not used for smoking in this country and contains about twice as much nicotine as ordinary tobacco. Rustica has been grown experimentally for a great many years in various parts of the country and constitutes a potential source of an appreciable amount of nicotine.

Other phases of tobacco chemistry are also being investigated at the Eastern Regional Research Laboratory. An attempt is being made to develop chemical standards for the grading of tobacco. Different grades are well established in the trade, and they are purchased for particular effects in blending for various tobacco products. A scientific basis, however, for defining these grades and explaining their particular qualities has never been established. Certain of the constituents of tobacco are known to exert a favorable influence on the value of the leaf, and others markedly detract from its worth. Some of these, however, have never been identified, and for others known to be present no satisfactory methods of quantitative estimation are available. This project involves making a careful inventory of the constituents of tobacco, means for determining these constituents quantitatively, and application of this information to the grading of tobacco. This is naturally a long-time undertaking, and as yet it is too early to report results. It may be stated that definite progress has been made in the isolation and identification of certain of these constituents, particularly those that contribute to the aroma of the leaf.

As a result of these analyses, it is possible that some constituents of tobacco which may have industrial uses will come to light. It is known that tobacco contains appreciable quantities of citric and malic acids. In fact, earlier attempts have been made to recover these, and this laboratory is now studying methods for their recovery. Tobacco also contains unique essential oils, of some types in appreciable quantities. Pectin and the enzyme, pectase, are known to occur at least in the stems. A considerable quantity of resins, possibly suitable for coatings and plastics, is also present. The alkaloids, nornicotine and anabasine, occur with nicotine in certain types. Some attempts have been made to convert the residual fiber from nicotine recovery into fiber boards.



Tobacco, like any other crop, contains a variety of constituents, and every reasonable attempt will be made to evaluate the commercial possibilities of these constituents.

An attempt is being made to keep the research program on tobacco in tune with changing conditions. When this program was first started, the viewpoint was almost

Interior view of the pilot-plant wing of the Eastern Regional Research Laboratory. Findings of the chemical laboratories will be tested on a semiworks production basis in this wing. It is 65 feet wide, 258 feet in length, and has an overhead clearance of 45 feet in the center. Galleries 12 feet wide run the entire length of both sides.

wholly that of finding more extensive uses for a surplus commodity. It was felt that more extended uses for nicotine, for example, would consume more of the lower grades of tobacco and maintain a better price for the other grades. The change in world conditions, however, has now altered this picture. Instead of wondering how more nicotine could be used, we are now wondering where sufficient nicotine can be obtained.

Harold R. Alley, is now associated with Tested Papers of America, Inc., as technical director. The company maintains a sales office and a modern paper testing laboratory in the Carbon and Carbide Building, 230 North Michigan Ave., Chicago, Ill. Mr. Alley was formerly associated with the Testing Department, Commonwealth Edison Co., Chicago.

George J. Bair, formerly an industrial fellow at Mellon Institute, in charge of Garco Products, Inc., has joined the research and development staff of the Corning Glass Works, Corning, N. Y., to assist in the war effort.

Francis Boyer has been elected a member of the board of directors of the Pennsylvania Salt Manufacturing Co., to fill the vacancy resulting from the death of **Samuel D. Warriner** on April 3. Mr. Boyer is executive vice president and director of the Smith, Kline & French Laboratories.

Robert L. Brown, formerly du Pont fellow in chemistry at The Ohio State University, has been employed as research chemist in the Pioneering Research Section, Rayon Technical Division, E. I. du Pont de Nemours & Co., Inc., Buffalo, N. Y.

Charles C. Chamberlain has been named general sales manager of Jenkins Bros., Bridgeport, Conn. Mr. Chamberlain has been publicity manager of Jenkins Bros. since 1940.

Harold F. Cleveland, Springfield, Mass., has been elected national commander of the Chemical Warfare Service Veterans Association.

L. Keith Coad is now a research chemist with the Research Laboratories Division of the General Motors Corp., Detroit, Mich. Mr. Coad has finished his graduate work at the University of Minnesota, and will receive the Ph.D. degree in December.

Howard I. Cole, formerly an expert of the League of Nations, has been commissioned a major in the Chemical Warfare Service with station in the Office of the Chief of Chemical Warfare Service, Washington, D. C. The Leonard Wood Memorial has granted him a leave of absence from his position as director of Chemical Research for the duration.

A. Laurence Curl has been transferred from the Plants Products Section, Agricultural Chemical Research Division, Bureau of Agricultural Chemistry and Engineering, U. S. Department of Agriculture, Washington, D. C., to the Citrus Products Station of the Division in Winter Haven, Fla.

Charles B. DeWitt, formally employed at the pilot plant of Kalunite, Inc., Salt Lake City, Utah, has been transferred to the aluminum reduction plant of Olin Corp., Tacoma, Wash.

Richard B. Ellis is now connected with the Corning Glass Works as a member of the Research and Development Department. At the end of July he left the Research Department of Joseph E. Seagram & Sons, Inc., where he was supervisor of the Analytical Division.

Since the middle of March **W. B. Esselen, Jr.,** has been spending half time in Washington as a consultant in the Packaging Section of the Office of Agricultural War Relations. He is also serving on the Technical Sub-Committee of the Glass Container Industry Advisory Committee of the War Production Board.

Recent additions to the staff of Foster D. Snell, Inc., Brooklyn, N. Y., include **Norman Fine, Alvin Gruder, Anne Sullivan,** and **Herbert Terry.**

Adolph R. Jensen, who received the Ph. D. degree in analytical chemistry at the University of Illinois in August, has accepted a position as assistant research chemist in fuels and lubricants at the Aircraft Engine Research Laboratory, National Advisory Committee for Aeronautics, Cleveland Airport, Cleveland, Ohio.

Z. H. Mischka has been named advertising manager of the American-Marietta Co., Chicago, Ill., succeeding **Marvin E. Smith,** who has entered the service.

Herbert D. Schmidt, formerly New England representative of the American Hard Rubber Co., has become affiliated with the Sales Department of the United States Stoneware Co., with headquarters in New York.

Recent additions to the staff of the Armour Research Foundation, Chicago, Ill., include **Joseph Robert Spraul,** physical chemist, formerly of the research department of the American Can Co.; **Anton Novy,** ceramist, formerly junior metallurgist with the Fansteel Metallurgical Co.; and **Howard T. Francis,** physical chemist, recent graduate of Pennsylvania State College.

Charles A. Thompson, of the Pittsburgh office of Robins Conveying Belt Co., Passaic, N. J., has become a Lieutenant in the United States Navy. A graduate of Carnegie Institute of Technology, Lieutenant Thompson had considerable engineering experience before joining the Robins sales staff.

William E. Vogt has been elected secretary of the Electro Metallurgical Sales Corp., a unit of Union Carbide and Carbon Corp., with headquarters at 30 East 42nd St., New York. Mr. Vogt has been connected with Union Carbide for more than 30 years.

William E. Vogt

James A. Wilson has been promoted to the position of assistant plant manager of the Trenton, Mich., plant of the Monsanto Chemical Co.

Thomas R. Wood, University of Illinois, and **Edward M. Scott,** University of Minnesota, have been appointed postdoctorate fellows in biochemistry in the University of Pittsburgh.

Harry L. Yale, on leave of absence from Shell Development Co., Emeryville, Calif., in order to carry out special research for the National Defense Research Committee, has returned to his former position with that company.

Reclaims and Reclaiming[1]

PAUL M. ELLIOTT

U. S. Rubber Co., Naugatuck, Conn.

Steps in reclaiming are pictured on pages 1252 and 1253.

IN CONSIDERING a process or a product it is usually entertaining and frequently profitable to look into its background. A knowledge of the way a process or product has developed aids in understanding its shortcomings and appreciating its perfections. A consideration, therefore, of the background of present-day reclaiming seems in order.

Prior to the time of Goodyear, rubber was used in the uncured state. Scrap and imperfect goods could be treated with solvent and the rubber recovered as a solution, then be used to make new goods. With Goodyear's discovery of vulcanization the situation was changed. Goodyear termed his product "metallic rubber". This was because heat which ordinarily seriously affected the properties of rubber goods had relatively small effect upon goods produced by his process. Goodyear's cured rubber was by the standards of his day relatively metal-like in resistance to ordinary temperature changes. It was likewise found to be resistant to solvents and could not be milled. As a result, unusable scrap began to accumulate and with rubber at over a dollar a pound the problem was serious. Many men tried their ideas, but almost the first to patent a process for reuse of the scrap was Goodyear himself. In 1853 in England and 1855 in the United States he received patents for the use of mill ground scrap which he called "Crumb". The process worked best with fiber-free scrap and really gave only a cheap filler. Even today many tons of scrap are prepared for reuse each year by simple grinding such as Goodyear proposed.

The next steps forward were taken in 1858 by Hiram Hall and Francis Baschnagel of the Beverly Rubber Works in Massachusetts. In January, Hall patented a process for softening scrap rubber by boiling with water. The softened rubber was then milled with tar. Baschnagel improved the process by using pressure to get temperatures up to 600° F. Here are the basic features of today's heater or devulcanizer process. In later patents that same year Hall proposed treating scrap rubber with various solutions including dilute sulfuric acid, and in 1863 the Hayward Brothers also used dilute sulfuric acid, but either concentrations or heating times were wrong for another 20 years were to pass before the "acid process" as we know it today was evolved.

The next development to last was that of E. H. Clapp who in 1868–70 opened a plant in Boston to reclaim shoes. The shoes were cut and torn apart by hand to separate as much rubber as possible from the cloth. The remaining cloth scrap was then ground and, the novelty, subjected to an air blast to blow out as much as possible of the fine fiber. The rubber was then steamed and milled with oil and sold under the name of "Shoddy". The product was indeed a shoddy material, and the name stuck. Clapp's winnowing has been "rediscovered" many times since his day and still finds use in a variety of applications.

In 1881 Colonel Chapman Mitchell secured his first patent on the "acid process". In spite of the earlier work of Hall and the Haywards, Mitchell so clarified and rounded out the process that he is quite generally credited with its discovery. He boiled the stock for a few hours with 20 per cent acid, washed it well, dried it, mixed it with oils, heated it at 300° F. to restore plasticity, and milled it to blend and smooth the product. In the 80's, Mitchell started the Philadelphia Rubber Works, the first concern organized solely for reclaiming. All reclaiming prior to that time was done by rubber manufacturers in conjunction with the production of rubber shoes or other goods.

The next and one of the most important steps in reclaim development started in the plant of the Boston Woven Hose and Rubber Co. The tale is told of two bright young chemists, fresh from college, who, working together in the laboratories of this company, asked themselves why the rubber stoppers in sodium hydroxide bottles became so soft and whether this observation could be used to improve reclaiming. They disagreed as to the answer and soon split.

Arthur Marks went to Akron with the Diamond Rubber Co., and in 1899 patented his process for treating ground scrap in a jacketed pressure vessel with 3 per cent caustic soda for 24 hours at 125 pounds steam pressure. The process simultaneously removed fiber and plasticized the rubber. It did away with the messy corrosion of the acid process and soon gained widespread favor. It made Marks a fortune and gained for him general credit for discovering the "alkali process" of reclaiming.

Little reference is made in literature to the other chemist, R. B. Price. It is evident, however, that he continued working on his interpretation of the action of sodium hydroxide in the softening of cured rubber. In 1904 Price received a patent for his interpretation of the action of caustic in reclaiming rubber. His idea was to treat ground scrap with caustic of such concentration that the boiling point at atmospheric pressure would be over 232° F., the melting point of sulfur. He used an open vessel at first but later used a closed spherical vessel heated by direct injection of steam into the charge. To exploit his process he organized the Rubber Regenerating Co. which was incorporated in Illinois in 1906 and again in Indiana in 1908. This company later became affiliated with the United States Rubber Co., and what is now known as the Reclaiming Plant of the Naugatuck Chemical Co. was called the Rubber Regenerating Co.

The heater process developed by Hall and Bachanagel still produces about 10 per cent of the total reclaim made in the country. Another 3 per cent is made by the acid process of Mitchell, while by far the largest portion, some 80 per cent of the total, is prepared by the Mark's alkali process. The other 7 per cent of present reclaim production is made by simple grinding and by other miscellaneous processes.

In the early days the reclaiming business was largely the recovery of the rubber portion of old shoes. Even as late as 1905, of a total world consumption of 62,000 tons of crude rubber, some 30,000 tons went into shoes. In this same year bicycle and automobile tires consumed only 12,000 tons. About 1910, however, the picture began to change. The automobile gained in popularity at a tremendous rate, and so larger and larger proportions of tires began to appear in the scrap piles. In 1937 the world used about 1,000,000 tons of crude rubber, and of this total about three-fourths, or some 750,000 tons, went into tires, while shoes consumed only 60,000 tons, about twice the figure for 1905. It is evident, then, that by far the most important item of scrap today is the automobile tire, and in considering present-day reclaiming we discuss almost entirely the production of reclaim from tires. The reclaimers' problem is not a simple one. There are many types of tires and even more types of scrap from other sources.

Reclaim Production

Since many of the properties of reclaim are controlled by the reclaim manufacturer through his choice of process, the

[1] Abstract of paper presented at Yale University, April 1942.

rubber chemist should know how rubber is reclaimed. An understanding of the process will also indicate why production capacity cannot be expanded at a moment's notice.

First there is the problem of scrap. Adequate supplies must be maintained for proper blending and to give stability of costs. The result is huge stacks of old tires and other types of scrap. The tires come loose, but most other scrap is bagged or baled. Special equipment is needed for handling the bales which average 1,200 pounds in weight, and may weigh as much as a ton. Tires are handled largely by hand, but power equipment and conveyors have been devised to minimize handling.

For treating scrap containing fiber, the digester process is generally used. Perhaps the easiest way to follow this process is to follow the path taken by a tire through the Reclaiming Plant. From the storage yards the tires are taken by truck to the bottom of a conveyor on which they go to a storage room. This room serves the dual purpose of acting as a reservoir of scrap for night operations and, during the winter, of permitting much of the ice in the tires to melt. From the storage room the tires are taken by hand truck to the Cracker Department, where they are first cut radially by a device called an alligator shear. The cut tires are conveyed to a bank of debeaders where they are fed manually to a machine which smoothly and rapidly cuts the beads from the tires.

The beads contain many lengths of steel wire imbedded in hard rubber, fabric, and soft rubber in such a way that in ordinary times it is not economical to reclaim the rubber present. In the present situation every effort is being made to reclaim the rubber in tire beads as well as in all other scraps. The cut and debeaded tires are conveyed from the debeading machine to a powerful chopping machine which, by a system of whirling knives, reduces even the largest tire to chunks which will flow easily by gravity to the cracking mills. The cracking mills are large corrugated roll friction mills which crush and grind the chunks of tires to fine bits. From the crackers the finely ground stock falls into bucket elevators which convey it back to the upper floors and feed it to gyratory screens. The screens return coarse material to the crackers for regrinding, and pass fine material through screens of desired mesh to a magnetic separator where all scrap iron is removed. The cleaned stock which still contains brass, aluminum, and some clinging iron is blown to storage bins preparatory to further treatment.

For the removal of fabric and plasticizing of the rubber, the ground scrap together with swelling agents, binding agents, liquid caustic, and water is charged into a vessel termed a digester. Modern digesters are horizontal, jacketed, cylindrical, steel vessels of up to 4,300 gallons capacity, equipped with powerful agitators. In the digester the fabric in the tire is destroyed, the rubber is reverted by the heat, and the oils and binding agents penetrate the rubber particles quite uniformly. Heating cycles vary from 5 to 50 hours at 150 to 200 pounds' steam pressure. At the end of the heating period the valve in the bottom of the digester is opened, permitting internal pressure to blow the entire contents of the digester into a blow-down tank, connected through heat exchangers to the atmosphere.

From the blow-down tank the scrap slurry is carried by screw conveyors to vibratory washing screens. As the stock passes across the screen, jets of hot water wash out completely the soaps, sodiocellulose, and other soluble or emulsified materials. The clean softened rubber drops into a mechanical squeezer where it is pressed to effect the removal of a large per cent of its water content. Screw conveyors carry the still wet stock (it has a moisture content of about 50 per cent at this point) to a continuous drier of a special design. Stock coming from the drier has a residual moisture content of not over 5 per cent and is ready for final blending and mechanical finishing operations of the mill room. It is taken by conveyor to storage bins preparatory to milling operations.

Some fiber-containing stock and much of the fiber-free stock is treated by a somewhat different process, known as the heater or devulcanizing process. The ground scrap is mixed with oils, binders, and some liquid caustic in an internal mixer and then either put in small pans or in a large specially designed boat which can be pushed on rails into the heating vessel. This vessel is cylindrical and has a quick closing door capable of withstanding the steam pressures used in the process. The steam is blown into the vessel and comes into direct contact with the rubber. Steam pressures from 125 to 250 pounds per square inch are now commonly used in the heater process. The heat cycle varies from 5 to 20 or more hours depending on the type of scrap, the pressure of the steam, etc. Any cellulose present in this scrap is so weakened by the heat that it can be blended into the rubber, and the rubber itself is softened and plasticized. Contact with steam has, of course, added moisture to this stock. So, after removal from the heater, the material is broken apart and dried in a continuous drier. It is now ready for the milling operation.

In the mill room massive machines blend together and mechanically complete the plasticization of the intermediates partially softened by the digesting or devulcanizing process outlined above. Selected proportions of various intermediates are mixed with each other and desired quantities of pigments, fillers, or compounding ingredients in Banbury mixers or on open mills. The blended stock is then taken to sheeting mills which squeeze and rub the particles into a more or less continuous sheet some 0.007 to 0.01 inch thick.

From the sheeting mills the stock is fed into a strainer which is a modification of the tubing machine. The rubber is forced by worm feed through screens which are from 15 to 40 mesh depending upon the stock, and all aluminum, brass, copper, residual iron, and unsoftened rubber particles are strained out. The strained stock is conveyed to refining mills. The refining mill is a sturdily built two-roll friction mill. The rolls are ground with a slight crown so that when the mill is tightened the pressure will be slightly greater in the center of the rolls than toward the edges. The difference in pressure in the bite of the rolls brings about a special refining action whereby less completely plasticized particles are forced to the edges of the roll so that they may be separated and reworked or retreated to give a more uniform finished product.

The main mass of reclaim comes from a refining mill as a continuous sheet 0.003 to 0.005 inch thick. The refined stock is put through the finishing mills which are again designed with crown rolls. Finished reclaim comes from these mills as a smooth almost silky sheet 0.002 to 0.003 of an inch thick and is wound on a drum until a sheet from 0.5 to 1 inch thick is built up. The resultant slab of reclaim rubber is removed from the drum by skilled operators, cooled, dusted with talc, and stacked on skids ready for the final inspection and testing. All reclaim is made to rigid specifications and must pass from 12 to 20 tests before being okayed for shipment.

The reclaim manufacturer can vary the process in many ways and so may control the property of the product to give many special characteristics to the finished reclaim. Among the controllable factors may be listed the type of scrap, fineness of cracking, kind and amount of chemicals and oils used in the digester, time and temperature of the heating operation, extent of washing, blending of intermediates, fillers, and modifiers in the Banbury or on the mixing mills, quality of the straining, and nicety of refining and finishing. There is also the possibility of blending digested intermediates with those produced by the devulcanizer and acid processes. Since each process may contribute to the product certain special properties, a wide range of grades and qualities of reclaimed rubber is obtainable. It must also be apparent that, because of the equipment required, the production of reclaim cannot be expanded very much without extensive outlay in new machines.

Compounding

Of great importance is the problem of compounding. Obviously it is not within the scope of this paper to go very deeply into compounding problems, but certain general principles can be considered profitably.

Basically reclaimed rubber is like crude

rubber. It cures with sulfur, requires accelerators for rapid curing, is protected by antioxidants, and reacts as expected to loadings of reinforcing or inert fillers. One should always keep in mind, however, that reclaimed rubber possesses all these characteristics to a different degree than does crude rubber. To illustrate this, let us consider the steps that a compounder might take to convert an existing formula based on crude to one containing a desired proportion of reclaim. There are, of course, many ways to accomplish this. The method outlined is one which is relatively simple and quite generally satisfactory. The steps are as follows:

1. He should select a reclaim that is economically and physically suited to the proposed use. This choice involves many factors considered more fully below.
2. On a rubber hydrocarbon basis he should replace as much as desired of the crude in his formula by the chosen reclaim. That is to say, one should not expect to replace 30 parts of crude in a formula by 30 parts of a reclaim containing only 60 per cent rubber hydrocarbon but should use 50 parts of the reclaim. It is usually satisfactory to consider crude as 100 per cent rubber hydrocarbon, although we know it is not. The rubber content of the reclaim is generally furnished by the reclaim manufacturers. In the past there has been some disagreement as to how "rubber content" should be determined. It is calculated by difference, i. e., the other constituents of the mixture are determined and the unaccounted for portion is considered to be rubber. At present the practice is becoming more uniform and correction is applied for the carbon black and cellulose in the reclaim as well as for extractibles, moisture, combined sulfur, and ash.
3. Since reclaimed rubber is nearly always faster curing than crude, the acceleration of the compound should be reduced or modified to take advantage of this feature.
4. Adjustment should be made for the fillers, reinforcing agents, and zinc oxide available in the reclaim used. Carbon black or clay in the reclaim will contribute towards hardness and abrasion resistance in the cured product. Inert filler which is in the reclaim will in general function much like the same filler added to the mix. If zinc oxide is present in the reclaim in large amounts, it is available not only for the curing of the reclaim but also to a certain extent for curing of new rubber added to the mix. It is to be noted, however, that a certain amount of new zinc is generally necessary to give stocks which age well. To avail himself of the compounding ingredients present in the reclaim, the compounder should substitute the reclaim for the crude on the hydrocarbon basis and then progressively reduce the loading or zinc content of his formula to give him the desired properties in the finished product.
5. Reclaimed rubber may materially alter the processing properties of the compound. This change in properties should be studied for it has in very many cases, particularly with calendered or extruded goods, been found worth while in processing to add some reclaim to the mix.

Choice of Reclaim

The problem of the selection of the best reclaim for the job is always important and is especially so today when it is desired to get the most value from reclaim. The properties of reclaims vary over wide limits and various types may overlap in characteristics.

On the basis of the type of scrap going into the reclaim the following generalizations can be made:

Auto tube reclaims are likely to be "nervy" in processing but will give "rubbery" cured stocks with good tensile.

Whole tire reclaims are flat processing, that is, they show relatively little shrinkage or distortion after calendering or extruding operations. They give stiffer cured stocks showing good aging and abrasion resistance with moderate tensile.

Carcass reclaims are flatter than tube reclaims and give "rubbery" cured stocks with moderate tensile and aging characteristics.

Tread reclaims give excellent resistance to abrasion and good aging with, of course, relatively hard, stiff cured stocks.

Shoe reclaim is very flat and calenders well but generally has a high specific gravity and low rubber content with correspondingly low tensile.

Superimposed on the above characteristics will be those conferred by the reclaiming process. For the most part it is not important whether a reclaim has been devulcanized or digested since proper variations of either process can be made to yield nearly all classes of reclaim. But both processes can be run by alkaline or acid procedures and this change does materially alter the character of the reclaim. To generalize again:

Alkali reclaims tend to be "nervy" and fast curing. They give snappy high-tensile cured stocks. The finished reclaim is usually alkaline.

Acid reclaims are flatter and slower curing. They give less trouble in scorching and are widely used in tubed and calendered goods. They are likely to give lower tensiles. The finished reclaim is generally neutral.

In any class of reclaim we can make the additional statement that high gravity stocks, particularly those which have been built up by the reclaimer through addition of filler, will be flatter and smoother than a similarly well-refined stock of lower gravity.

With all of these variations and their combinations it must be apparent that the specifications of available reclaims should be carefully examined before a choice is made for a specific use. The large reclaim manufacturers all make a relatively complete line of reclaims and have types which they recommend for certain applications. The recommendations will help in making selections, and in special cases the manufacturers will doubtless be glad to aid in making the choice of reclaim.

Present Practice

At present many are wondering how high a proportion of reclaim can be used in various articles. For a number of years the consumption of reclaim has ranged between 25 per cent and 35 per cent of the weight of crude used, and the maximum ratio of use was 50 per cent in 1928. This is, of course, the over-all figure for the industry and includes products made entirely from reclaim and others made entirely from crude. The demand now is for higher and higher reclaim content in many lines, and many products must be made 100 per cent from reclaim. No one can say dogmatically just how high we can go in reclaim content and how little rubber can be used in a given application. Things are being done today which were considered impossible or highly improbable only a few months ago. For example, consider the all-reclaim inner tube. A few months ago it was the general opinion of manufacturers that it would not be feasible to produce such an article. The difficulties of tubing were believed to be such as to preclude its manufacture. However, now it is reported that such a tube has actually been in production.

Also there is the problem of the all-reclaim tire. Production of a tire 100 per cent from reclaim involves many problems in building. In the past there has been no call for such a tire, and therefore these problems have not been studied and worked out completely. It is generally considered economically unsound to build a tire from all-reclaim provided new rubber is available. In recent weeks much publicity has been given to the production of all-reclaim tires, and it seems highly probable that such tires will be made for nonmilitary use. The actual service that would be obtained by a consumer in using an all-reclaim tire would depend on many factors such as the time of year, the speed with which he drives, how fast he accelerates, how he applies the brakes, and the general care that he gives both his car and the tires. In giving figures for the miles that can be obtained from the all-reclaim tire we must know under what conditions the tire was used if we are to compare with the mileage that would be obtained with a first line, all new rubber tire.

Many of the new products being made today may not possess the properties called for by specifications set some time in the past. There are indications, however, that in actual service, which is the only true test, many of these new high-reclaim or all-reclaim products will be acceptable.

Conclusion

The capacity of the reclaim industry is quoted at 350,000 tons per year. This is based on certain assumptions—first, that certain types of reclaims will be produced; second, that the proportions of these reclaims will bear certain ratios to each other so that the complete usage of all available equipment will be ensured; and finally, we are assuming that the scrap needed to produce this reclaim will be available.

Buffalo Echoes

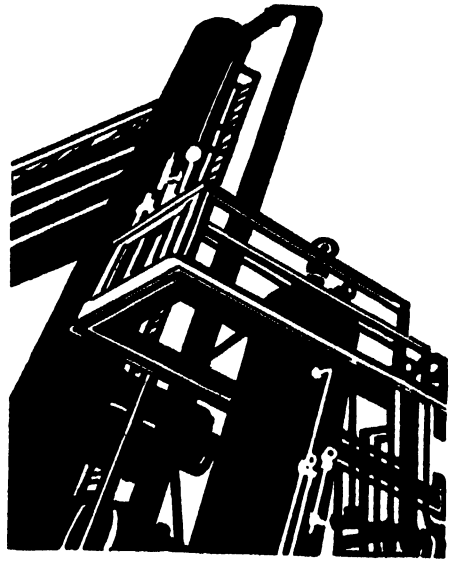
Biological Chemistry

Of the 300 members of the Division of Biological Chemistry about 70 were present at the Buffalo meeting. The joint session with the Division of Agricultural and Food Chemistry on vitamins and nutrition (all day Tuesday) as usual was very well attended. The highlight of the meeting was the Garvan Medal address by Florence B. Seibert, of the Phipps Institute, Philadelphia, on the chemistry of tuberculosis.

The meetings of the Division were well attended and 46 papers were presented.

A Joint Symposium with the Divisions of Agricultural and Food Chemistry and Biological Chemistry on the Correlation of Biological and Chemical Methods of Vitamin Assay is under consideration for the Indianapolis meeting.

E. Brand, *Secretary*



Industrial and Engineering Chemistry

The attendance at division sessions was larger than for any meeting in the past several years. The General Session on Monday afternoon had an average attendance of about 150. A variety of subjects was discussed, including new methods of calculation for countercurrent leaching, industrial preparation of sulfamide, a device for the measurement of detergency, solvent extraction, aging of whisky, and fundamental data on binary liquid mixtures and their industrial utilization. Considerable interest was shown by the press and other quarters in a method for obtaining vanadium concentrates from phosphoric acid mixtures, a process reported to offer a possible method of alleviation for present shortages of this material.

The Symposium on Research Management on Tuesday morning attracted a record attendance, necessitating the opening of additional rooms to accommodate the approximately 300 people who wanted to attend. Dr. Work began the symposium with his definitive paper, "What is Research?" "The Direction of Research" was next handled by Dr. Mees, who discussed the various ways of administering a research laboratory and the attendant costs for these different methods. The paper was stimulating in its entirety and provoked active discussion. Control of "Research Accounting" was presented by Messrs. Sheehan and Curtis, who showed how it was possible quantitatively to define the costs of research and to control the direction of research through an accurate knowledge of expenses. Many of those who rose to discuss the paper were not in agreement with the rigid system advocated, maintaining that research should be controlled by its results and not by its cost. The importance of patents to research organizations was ably treated by Dr. Hamilton and Mr. Deitch, who explained the vital role that protection of inventions plays in the administration of a research laboratory. The pitfalls into which faulty legislation may lead the patent system were brought out in the discussion; this topic will be more completely covered in the final paper.

Dr. Hass described the graduate fellowship system practiced at Purdue and showed the benefits which can arise from cooperative industrial research as carried out at an educational institution. Numerous contacts with technical men of sponsoring companies prove of value to the research fellow and are a real factor in the successful conclusion of the problems assigned. The new chemical industry founded upon Purdue nitroparaffin research serves as an example of the value of such a system. The reduction of facts to numerical values is the first requirement for scientific knowledge of any subject, and Mr. Ayres in his paper, "The Evaluation of Research", reduced the costs of the various steps necessary for the commercial utilization of new processes to relative numerical values. Adequate research is shown to be one of the most profitable of investments owing to the financial savings occasioned by adequate research and development work prior to the commercialization of a process.

The Seventh Unit Process Symposium, with R. Norris Shreve presiding, drew an average attendance of well over 200 on Tuesday afternoon, necessitating the opening of an additional room to accommodate the overflow. First on the program was a paper by H. B. Hass and Carl Bordenca of Purdue. This address discussed the ways in which the chlorinolysis (defined as high-temperature, high-pressure chlorination) of paraffin hydrocarbons could be applied as a means of converting any paraffin or partially chlorinated paraffin into carbon tetrachloride or similar compounds. Although chlorine is now an extremely scarce commodity, it will undoubtedly be plentiful and cheap after the war, when such reactions may well be of commercial significance. The art of synthesizing trialkylated phenols from cresols and a refinery butane-butene fraction was next described by the writer in a paper showing how laboratory reactions are translated to the small-scale pilot plant stage and eventually to the status of commercial chemical manufacturing processes. Continuous methods for alkylating the cresols to di-*tert*-butyl cresols by the use of a bubble-cap type of reactor were described, as well as continuous means for fractionating the alkylated derivatives. Dr. Othmer and his associates presented a series of papers on utilization of such waste products as bagasse and lignocellulose by destructive distillation and on methods of purification of products so derived. "The Partial Pyrolysis of Wood" was discussed by Merritt and White of the University of Michigan.

The symposium was continued on Wednesday morning with additional papers on unit processes, dealing with such subjects as the preparation of strontium carbonate from strontium sulfate and the oxidation and sulfonation of aniline and of members of the naphthalene series. The symposium was concluded with a paper by Pardee and Dodge on "The Catalytic Vapor Phase Alkylation of Benzene with Ethylene", a method advanced for the preparation of the now-strategic war chemical, ethylbenzene. Discussion was particularly active on this latter paper, which attracted considerable comment in petroleum and chemical news periodicals.

The division luncheon was well attended, and those who were fortunate enough to be present heard an inspiring address by Dr. Crossley, of Calco Chemical, "The Dye Industries". He gave a stirring exposition of the opportunities open to the chemical industry for bettering man's lot in this world.

The Ninth Annual Chemical Engineering Symposium, "The Application of Kinetics to Design and Operation of Chemical Engineering Equipment", will be held December 28 and 29 in the Palmer House, Chicago. The fundamentals of reaction kinetics will be outlined by experts from leading universities, but the industrial applications of reaction kinetics will be emphasized by papers from industrial organizations. The symposium is under the joint sponsorship of the University of Wisconsin and the Illinois Institute of Technology. O. A. Hougen, of the University of Wisconsin, will serve as chairman.

Plans for the Indianapolis meeting are still tentative, but an effort is being made to organize a Symposium on The Manufacture and Use of Solvents well in advance.

Whitney Weinrich, *Secretary*

Conference of the Committee on Examinations and Tests Division of Chemical Education, A. C. S.

Buffalo, N. Y., September 5 to 7, 1942

Following the plan adopted at the conference held at the University of Chicago last year, the members of the Division of Chemical Education who volunteered to participate in the construction of new tests and new forms of established examinations met in general sessions to discuss the work of the committee as a whole and in smaller groups to develop tests along lines of their immediate interests. During the first session a report on the 1942 Testing Program was given by Alexander Calandra, of Brooklyn College. This report will appear in full in an early number of the *Journal of Chemical Education*. Theodore A. Ashford, of the University of Chicago, presented a critical item analysis of the 1942 Form. (The subject of his talk, in amplified form, was presented as a paper before one of the sessions of the division at the Buffalo meeting. A booklet containing subdivisions of the 1942 Form, giving sample items and specific directions for the construction of such items, was circulated, thus inviting the cooperation of a large number of teachers in the construction of tests. Copies of this booklet will be sent to those who wish to participate. Inquiries should be addressed to Dr. Ashford directly.) The objectives to be realized in the testing program were stated and the test evaluated in the light of these aims. The 1942 Form was found to be weak only in a few minor details, and it appeared in general to be a satisfactory measuring instrument for the purposes for which it was designed. For reasons of economy of money and effort, it was deemed advisable to recommend the use of the 1942 Form in the 1943 Testing Program.

The committee has made available tests in only three fields—general chemistry, qualitative analysis, and organic chemistry. Requests have been received for tests in quantitative analysis and physical chemistry. It was decided to undertake a revision of the test in qualitative analysis and organic chemistry and to initiate the preparation of the two new tests needed. The result will be a battery of standardized examinations covering the major fields of the elementary chemistry curriculum. This work was started by small groups at the conference, and it is hoped that the tests, at least in preliminary form, may be available during the coming academic year.

In place of a revision of the General Chemistry Test, it was decided to experiment with the construction of a small number of short unit tests to cover phases of the work in the elementary course. These tests would not only measure achievement but would also make it possible to diagnose the difficulties the student experiences when studying the material and thus enable the teacher to reteach those topics which were found to have been inadequately mastered. These diagnostic tests are to cover unit topics such as Hydrogen-Oxygen-Water, Solids-Liquids-Gases and the Kinetic Molecular Theory, and Atomic Structure and the Periodic Table. Work on two units was started at the conference.

Another project started was the construction of a 50-minute examination on laboratory technique. A small committee is compiling test items which will attempt to measure attitudes and information which a student could learn only by laboratory experience. It is hoped that an experimental form of this enlarged version of the Laboratory Section may be available before Christmas.

The cooperation of many teachers is needed for the successful completion of this ambitious program and volunteers are invited to participate. Requests for further information should be sent to the Chairman of the Committee, Otto M. Smith, Oklahoma A. & M. College, Stillwater, Okla.

The committee is comprised of the following members: Theodore A. Ashford, University of Chicago; Alexander Calandra, Brooklyn College; J. S. Coles, Middlebury College; Ed. F. Degering, Purdue University; Laurence S. Foster, Brown University; B. Clifford Hendricks, University of Nebraska; Frank D. Martin, Purdue University; Earl W. Phelan, Georgia State Woman's College; Rufus D. Reed, New Jersey State Teachers' College; Otto M. Smith, Oklahoma A. & M. College (Chairman).

L. S. Foster
Secretary, Pro-tem.

Buffalo Employment Clearing House

The Employment Clearing House conducted as part of the national meeting of the American Chemical Society in Buffalo, September 7 to 11, 1942, was significant in that, for the first time, the employers' representatives outnumbered the applicants. The number of interviews scheduled, 1793, was the largest in the history of this enterprise.

Of the 327 chemists and chemical engineers registered as candidates for employment, only 23 were unemployed at the time of the meeting. Of this small group, 6 are aliens and only 7 are known to have left their previous positions prior to August 1. A total of 233 (71 per cent) were already employed but were looking for opportunities to render increased service in the war effort or for personal advancement. The balance, 71, were students (B.S., M.S., or Ph.D.) whose degrees will be awarded between November 1942 and June 1943.

The 327 candidates averaged about 5.5 interviews each. The 19 women registrants were interviewed 188 times, an average of almost 10 each. Thirteen naturalized U. S. citizens averaged 2.3 and 26 aliens 2 interviews each. Fifty-nine persons were interviewed by 11 or more employers; one person was scheduled for 45 appointments.

Fifty-two per cent of the registrants (171) had received the degree of Ph.D. or equivalent. As usual, organic chemists predominated, constituting one third of the registrants. The number of those with a bachelor's degree and no subsequent university work or experience was unusually low (6.7 per cent). Only 12 analytical chemists were registered and all were interviewed. Only 20 persons above draft age were candidates for new employment.

The records were inspected by 445 employers' representatives. Of these, 352 were connected with industrial concerns, 67 represented educational institutions, and 26 were recruiting for governmental agencies. The latter included the War Production Board, the National Defense Research Committee, the Chemical Warfare Service, Army Medical School, Naval Research Laboratory, an arsenal, six ordnance plants, Tariff Commission, National Bureau of Standards, Food and Drug Administration, Bureau of Agricultural Chemistry and Engineering, Bureau of Mines, Forest Products Laboratory, Tennessee Valley Authority, and three state agencies. The Civil Service Commission maintained an information desk. Its attendant, sent from Washington, interviewed interested persons throughout the week. Most of the employers were seeking trained men to operate the many new plants that are supplying important materials to the combat army. Approximately 50 per cent of them could find the records of no one qualified for the vacancies to be filled.

It is not yet known how many positions the 445 employers were attempting to fill, how many offers were made, or how many of the 327 registrants made new connections. This information is now being sought.

Thomas Matchett, president of the Robins Conveying Belt Co., Passaic, N. J., has been appointed to the Conveyor and Mechanical Power Transmission Industry Advisory Committee of the War Production Board. **R. W. Eichenberger, E. C. Salzman**, and **J. F. Meissner** have been elected vice presidents of the company.

E. W. Ritter, assistant to the president of the Corning Glass Works, has been called to Washington, D. C., for work in connection with the Signal Corps.

POTOMAC POSTSCRIPTS

Technical Group to Assist WPB

DONALD M. NELSON has announced the appointment of a committee of engineers and scientists to determine the manner in which the projected Office of Technical Development should be set up within the War Production Board, and to define the scope, functions, and method of operations which the office should have.

Decision to establish such an office was made earlier, following a report by a previous committee recommending that the War Production Board set up a strong scientific and technical organization to make sure that the Nation's technical ability and resources were utilized to the full in the war production program.

Chairman of the new committee is Webster N. Jones, director of the College of Engineering, Carnegie Institute of Technology at Pittsburgh. Other members are: Lawrence W. Bass, director of research, New England Industrial Research Foundation, Boston; Oliver E. Buckley, president, Bell Telephone Laboratories, New York; Colonel Clarence E. Davies, Ordnance Department, U. S. Army, Washington; Ray P. Dinsmore, manager, Development Department, The Goodyear Tire and Rubber Co., Akron, Ohio; Admiral J. A. Furer, U. S. Navy, Washington; Jerome C. Hunsaker, head of the Departments of Mechanical and Aeronautical Engineering, Massachusetts Institute of Technology, Cambridge, Mass.; H. W. Graham, director of Metallurgy and Research, Jones and Laughlin Steel Corp., Pittsburgh; and S. D. Kirkpatrick, editor, *Chemical and Metallurgical Engineering*, New York.

WPB Industry Advisory Committees

AMONG the Industry Advisory Committees formed by the War Production Board, the following are connected with the chemical industry:

ABRASIVE INDUSTRY, Arthur Batts, Carborundum Co.; J. H. Byers, president, Abrasive Products Co.; R. R. Cole, Phosphate Division, Monsanto Chemical Co.; A. T. Dalton, Chicago Wheel & Manufacturing Co.; E. B. Gallaher, Clover Manufacturing Co.; W. A. Harty, Exolon Co.; C. N. Jeppson, Norton Co.; H. D. Williams, Washington Mills Abrasive Co.; J. Kuzmick, Manhattan Rubber Mfg. Div. of Raybestos Manhattan, Inc.; S. B. Leishman, Gardner Machine Co.; T. J. McIntyre, Macklin Co.; W. L. McKnight, Minnesota Mining & Mfg. Co.; J. W. McLean, Abrasive Co.; A. V. Parker, General Abrasive Co.; and P. R. Shuttleworth, Allison Co.

CARBON BLACK MANUFACTURERS INDUSTRY, E. H. Bucy, government presiding officer. Reid L. Carr, Columbian Carbon Co.; Thomas D. Cabot, Godfrey L. Cabot, Inc.; R. H. Eagles, J. M. Huber, Inc.; L. C. Herkness, Charles Eneu Johnson Co.; Robert I. Wishnick, Continental Carbon Co.; C. E. Kayser, National Gas Products Association; Oscar Nelson, United Carbon Co.; T. P. Walker, Thermatomic Carbon Co.; and H. M. Wilgus, General Atlas Carbon Division.

COBALT INDUSTRY, E. F. Hatch, government presiding officer. C. D. Clawson, Ferro Enamel Corp.; O. J. Hall, Harshaw Chemical Co.; C. T. Hill, Pyrites Co., Inc.; E. M. Hommell, O. Hommell Co.; J. Leroy, African Metals Corp.; Robert Louden, McGean Chemical Co.; George F. Martin, Hilton-Davis Chemical Co.; Lee Shepherd, Shepherd Chemical Co.; and W. F. Wenning, Ceramic Color and Chemical Co.

COPPER, LEAD AND ZINC PRODUCERS INDUSTRY TRANSPORTATION INDUSTRY, George C. Heikes, government presiding officer. A. J. Bien, American Metal Co., Ltd.; J. W. Brown, E. I. du Pont de Nemours & Co.; C. A. Butler, Anaconda Copper Mining Co.; C. C. Lewis, American Smelting & Refining Co.; Walter G. Patton, St. Joseph Lead Co.; A. C. Schweitzer, U. S. Steel Corp.; H. A. Gray, Eagle Picher Mining Co.; James W. Lee, Phelps Dodge Copper Corp.; N. S. Worrell, American Zinc Lead & Smelting Co.; R. E. Taylor, Kennecott Copper Corp.; and Omar O. Victor, U. S. Smelting, Refining & Mining Co.

COAL-TAR DISTILLING INDUSTRY, Edward Casey, government presiding officer. E. W. Clark, Allied Chemical & Dye Corp.; J. N. Forker, Koppers Co.; P. C. Reilly, Sr., Reilly Tar & Chemical Corp.; J. V. Freeman, U. S. Steel Corp.; T. H. Hall, Jr., Public Service Corp. of New Jersey; and Charles R. Faben, Hennison-Wright Corp.

FLUORSPAR MINING INDUSTRY, M. H. Billings, government presiding officer. Ralph B. Derr, Aluminum Company of America; W. N. Smith, Mahoning Mining Co.; K. A. Johnston, U. S. Coal & Coke Co.; J. M. Blayney, Rosiclare Lead & Fluorspar Mining Co.; R. H. Dickson, General Chemical Co.; E. D. Timberlake, Peerless Oil & Gas Co.; F. G. Fabian, Hillside Fluor Spar Mines; Robert N. Frazer, Kentucky Fluor Spar Co.; Miles Haman, Crystal Fluorspar Co.; L. F. Hearne, Eagle Fluor Spar Co.; B. E. Clement, Davenport Mine; and Dr. J. L. Gillson, E. I. du Pont de Nemours & Co.

FROZEN FRUIT AND VEGETABLE INDUSTRY, R. P. Juhnichen, government presiding officer. Ralph O. Dulany, John H. Dulany & Son; M. T. Fannaly, M. T. Fannaly, Inc.; F. J. Becker, Gresham Berry Growers; Edwin T. Gibson, Frosted Foods Sales Corp.; R. M. Hagen, California Consumers Corp.; B. C. Olney, Snider Packing Corp.; A. J. Rogers, Cherry Growers, Inc.; Courtney Seabrook, Deerfield Packing Corp.; J. M. Seaman, Rozeman Canning Co.; R. T. Shannon, R. D. Bodle Co.; T. R. Skinner, Westfield Planters Co-op. Fruit Products, Inc.; and E. E. Huddleson, Santa Cruz Packing Co.

INDUSTRIAL ALCOHOL PRODUCERS, Walter G. Whitman, government presiding officer. James McLaughlin, Carbide & Carbon Chemicals Corp.; Lewis H. Marks, Publicker Commercial Alcohol Co.; Glenn Haskell, U. S. Industrial Chemicals, Inc.; Owsley Brown, Brown-Forman Distilling Co.; Julian P. Van-Winkle, Stitzel Weller Distillery; I. Strouse, Baltimore Pure Dye Distilling Co.; H. F. Willkie, Jos. E. Seagram & Sons, Inc.; W. H. Venneman, Frankfort Distilleries, Inc.; J. B. Cella, Roma Wine Co., Inc.; and Carl J. Kiefer, Schenley Distillers Corp.

MEDICAL AND SURGICAL RUBBER GOODS, C. S. Reynolds, government presiding officer. J. Stone Carlson, Davidson Rubber Co.; Karl Herbruck, Wilson Rubber Co.; Ernest I. Kilcup, Davol Rubber Co.; F. Thatcher Lane, Seamless Rubber Co.; R. L. Limbert, Lee Tire & Rubber Co.; W. B. McIntosh, Pyramid Rubber Co.; W. S. Richardson, B. F. Goodrich Co.; Julius Schmid, Jr., Julius Schmid, Inc.; E. Ward Stearns, Parker, Stearns & Co.; and Ray A. Whidden, Bauer & Black.

PAINT, VARNISH AND LACQUER INDUSTRY, E. H. Bucy, government presiding officer. Walter M. Clark, Muralo Co., Inc.; O. J. S. de Brun, Egyptian Lacquer Mfg. Co.; W. D. Gilman, Gilman Paint & Varnish Co.; Franklin J. Lane, Boston Varnish Co.; W. I. Longworth, Lilly Varnish Co.; Paul R. Croll, Pittsburgh Plate Glass Co.; E. M. Flaherty, E. I. du Pont de Nemours & Co., Robert F. Jaegle, Jaegle Paint and Varnish Co.; M. J. Merkin, M. J. Merkin Paint Co., Inc.; Oakley Paint Co.; Edward H. McIver, Leland-Moore Paint and Oil Co.; McMurtry Manufacturing Co.; H. S. Margetts, W. P. Fuller and Co.; Frank Sulzberger, Enterprise Paint Co.; and A. W. Steudel, Sherwin Williams Co.

POTASH PRODUCERS INDUSTRY, T. E. Milliman, government presiding officer. Morace M. Albright, United States Potash Co.; Cecil B. Baker, American Potash & Chemical Corp.; J. B. Grant, Potash Co. of America; and James P. Margeson, Jr., International Minerals & Chemical Corp.

PULPWOOD INDUSTRY, David Graham, government presiding officer. William T. Brust, Hammermill Paper Co.; R. L. Caldwell, Rhinelander Paper Co.; William D. Comings, West Virginia Pulp & Paper Co.; A. G. Curtiss, Gaylord Container Corp.; William Hilton, Great Northern Paper Co.; Stanton W. Mead, Consolidated Water Power & Paper Co.; James B. Nash, Nekoosa-Edwards Paper Co.; K. A. Swenning, Brown Co.; Walter DeLong, Puget Sound Pulp & Timber Co.; D. S. Denman, Crown Zellerbach Corp.; Thomas Farwell, Ryegate Paper Co.; C. E. Wilds, The Brown Paper Mill Co., Inc.; Irving T. Rau, St. Helens Pulp & Paper Co.; C. E. Smith, The Champion Paper & Fibre Co.; and A. H. Stier, Container Corp. of America.

REFRACTORY MAGNESITE INDUSTRY, R. B. Ladoo, government presiding officer. Max Seaton, Westvaco Chlorine Products Corp.; T. W. Shook, Basic Refractories, Inc.; P. N. Laws, West India Sales, Ltd.; John L. Giles, Michigan Chemical Corp.; H. S. Robertson, Northwest Magnesite Co.; S. M. Shallcross, Warner Co.; and J. D. Baker, Jr., Standard Lime & Stone Co.

SOYBEAN CRUSHERS INDUSTRY, T. L. Daniels, government presiding officer. D. J. Bunnell, Central Soya Co.; H. E. Carpenter, Berea Milling Co.; J. B. De Haven, Allied Mills, Inc.; Roger Drackett, The Drackett Co.; W. A Eastman, Archer-Daniels-Midland Co.; W. E. Flumerfelt, Soy Bean Processing Co.; George Stewart, Swift & Co.; E. D. Funk, Jr., Funk Brothers Seed Co.; E.

F. Johnson, Ralston Purina Co.; H. Kellogg, Jr., Spencer Kellogg & Sons; S. D. Ormsey, Oswego Products Co.; E. K. Scheiter, A. E. Staley Mfg. Co.; H. R. Schults, Standard Soy Bean Mills; and P. E. Sprague, Glidden Co.

Toiletries and Cosmetics Industry Transportation, Robert Blair, government presiding officer. Michael Harris, Max Factor, Inc.; Stuart E. Kaiser, The Andrew Jergens Co.; Howard S. Lyon, Comfort Mfg. Co.; Abe Plough, Plough, Inc.; S. V. Rettino, Bristol-Myers Co.; Horace Rosner, Coty, Inc.; Carl von Rohr, Burma-Vita Co.; and O. D. Wheaton, Wildroot Co., Inc.

Vinyl Resins Producers Industry, Frank H. Carman, government presiding officer. H. S. Bunn, Carbide & Carbon Chemicals Corp.; L. F. Loutrel, Shawinigan Products Corp.; John C. Brooks, Monsanto Chemical Co.; A. E. Pitcher, E. I. du Pont de Nemours & Co., Inc.; J. R. Hoover, The B. F. Goodrich Co.; Bradley Dewey, Dewey & Almy Chemical Co., Inc.; W. C. Goggin, The Dow Chemical Co.; and Henry B. Townsend, General Latex and Chemical Corp.

WPB Activities

Aromatic Petroleum Solvents. Complete allocation of aromatic petroleum solvents other than benzol and toluol, starting October 1, has been ordered in an amendment to Order M-150. Until September 30, deliveries of aromatic petroleum solvents were limited to preference ratings of A-2 or higher. Allocation control will not apply to users requiring 60 gallons or less a month. Applicants for allocation must apply on Form PD-600 by the 10th day of the month preceding the month for which allocation is requested, and suppliers must report their proposed deliveries by the 15th of each month, using Form PD-601.

Caffeine and Theobromine. Conservation Order M-222 places caffeine and theobromine, two important medicinal drugs, under complete allocation control beginning October 1. This control is established because supplies of cocoa beans, coffee, coffee scrapings, tea waste, and maté, the raw materials from which the drugs are made, have been reduced by the present shipping situation. The order is expected to reduce the amounts of caffeine which can be made available for beverage production. It is used chiefly in "cola" beverages. Extent of the curtailment will depend on the supply of raw materials imported into this country and on the military and civilian medicinal needs for both drugs.

Theobromine, which is used exclusively as a medicinal stimulant, can be processed to produce caffeine. Caffeine, which is used extensively in beverage production as well as in medicinal preparations, can also be produced directly from the coffee scrapings, cocoa beans, etc. The conservation order, therefore, restricts the manufacture of caffeine through methylation of theobromine, and prohibits the use and delivery of either theobromine or caffeine except on the specific authorization of the Director General for Operations.

The order affects all importers, producers, refiners and primary distributors but does not affect wholesale and retail druggists, who, by definition in the order, use the drugs only for medicinal purposes. Standard dosage forms (tablets, capsules, etc.) are not covered by the order, which also exempts from the restrictions use or delivery of two pounds or less of either drug in any one month. The drugs will be allocated by the WPB Health Supplies Branch, based on proposed delivery schedules and requests for authorization received each month.

Coconut Oil, Babassu Oil, Palm Kernel Oil and Other High Lauric Acid Oils. Freezing of an additional 25 per cent of inventory stocks of coconut, babassu and palm kernel oils of all persons who have 240,000 pounds or more on hand has been ordered by the Director General for Operations. Twenty-five per cent of all future imports of these oils, or of materials containing them, is also ordered frozen in Supplementary Order M-60-a, thereby adding to the Nation's stockpile of high lauric acid oils. Order M-60, issued March 20, 1942, froze 25 per cent of inventories exceeding 30,000 pounds and applied to all high lauric acid oils. The additional freeze applies only to large inventory stocks and does not include any but the three principal sources of high lauric acid oils. The various end use restrictions of M-60 continue in effect and M-60-a provides only for the additional freezing.

Copper Chemicals. Order M-227 places copper chemicals under allocation control in order to conserve copper scrap. Farmers, however, are permitted to obtain these materials for soil treatment, insecticides, and fungicides without filing PD-600 forms. The allocation of these chemicals, including copper sulfate, carbonate, chloride, oxide, nitrate, and cyanide, takes effect October 1. Small order deliveries may be made by certification from the purchaser to his supplier. Limits on these small deliveries are 450 pounds of copper sulfate or 25 pounds of the other chemicals in any one month. The standard chemical forms, PD-600 and PD-601 must be used by those seeking allocation and by suppliers making deliveries for reports to the War Production Board.

Corundum. The order controlling allocation and use of corundum, M-89, has been issued in amended form by the Director General for Operations to include control over use of corundum in the hands of consumers, and to write into the definition of material covered by the order corundum ores and corundum superfine flour. The amended order provides for new reporting procedures for suppliers and consumers of corundum, and for consumers' applications for authorization to receive corundum. Two new forms, PD-294 and PD-294A, are to be used in complying with the amended order's reporting provisions, in addition to Form PD-293 which was used under the old order. The original order put corundum under complete allocation and use control. The new amendment does not fundamentally alter this control, as its prime purpose is to clarify certain points in the original order.

Cryolite has been put under complete allocation and use control by General Preference Order M-198. Natural and synthetic cryolite may not be delivered, received, or used after October 1, 1942, except by specific authorization of WPB. The sole exception is the receipt and use of cryolite as an insecticide. Requests for authorization to receive or use cryolite are to be made to WPB on Form PD-592. Requests for authorization by producers to deliver cryolite to be used as an insecticide are to be made to WPB by letter. Initial requests to use or receive cryolite are to be accompanied by inventory and consumption Form PD-632.

Cyanamid. To provide adequate supplies for military needs of several important cyanamid derivatives not covered by General Preference Order M-165, the Director General for Operations has issued Amendment 1, expanding the definition of materials covered by the order to include cyanides, melamine, guanidine, and dicyandiamide. These cyanamid derivatives used in nonferrous mining, in explosives, in some instances do not contain cyanamid, but are made from it.

Dichloroethyl Ether. General Preference Order M-226 places dichloroethyl ether under complete allocation and use control and provides that no person may deliver, accept delivery of, or use dichloroethyl ether without specific authorization by the Director General for operations. No exception is made for small quantities. Specific instructions are included in the order for the use of the standard WPB chemical forms, PD-600 and PD-601, by persons desiring to deliver, receive, or use this chemical.

Fats and Oils. Limitations on uses of fats and oils to permit building a reserve supply have been ordered by the Director General for Operations. This action, a revision of Order M-71, establishes new controls over fats and oils, but does not include cocoa butter, butter, wool greases, essential oils, mineral oil, vitamin-bearing oils, and some others. The order is made retroactive to September 1 of this year in that the first period is from September 1 to December 31, 1942. After December 31, the order is applicable to regular calendar quarters. A blanket exemption is granted

to all manufacturers using less than 6,000 pounds of fats and oils in a quarter. None of the restrictions apply to Lend-Lease orders, nor to military purchases of edible products. Inventory restrictions on finished products heretofore in effect are continued. There are no restrictions on inventories of raw materials.

Fertilizers. Nationwide conservation of chemical fertilizers, to save nitrogen for vital war manufacture is provided for in Order M-231, which makes the following prohibitions:

1. Fertilizer containing chemical nitrogen cannot be used on grains sown in the fall of 1942 to be harvested as grain. If the grain is used as pasture or cover crop, the restriction does not apply.
2. Chemical nitrogen fertilizer cannot be used on golf courses, cemeteries, lawns, roadsides, and noncommercial planting of trees, shrubs, and flowers.
3. Delivery and use on crops of any mixed chemical fertilizer within a state not on the list of approved grades for that state as listed in Schedule A of the order is prohibited.
4. Delivery of any fertilizer containing chemical nitrogen prior to November 15, 1942, except for use during 1942 is prohibited.
5. Delivery of any chemical fertilizer in bags of less than 100 pounds is stopped, but provision is made to allow delivery of bags of not less than 80 pounds in a manufacturer's stocks.
6. Delivery of any superphosphate which carries less than 18 per cent available phosphoric acid is prohibited.

Amendment 1, however, permits unlimited use of nitrogen-bearing fertilizer by the Army, Navy, or Coast Guard on new planting of grass on airports or airfields.

Fish Oil. No restrictive orders on the use of fish oil will be necessary, the Fats and Oils section, WPB, announced today, since the catch of fish used in production of fish oil is currently about equal to last year's. The fishing season is now under way and, contrary to earlier expectations largely because of lack of boats, the catch apparently will come close to equaling that of last year. If the present production rate continues there will be a normal supply for all regular users. Speculation about a possible restrictive order on certain types of users, it was explained, has caused some buyers to shy away from the market. As producers do not have more than temporary storage it is imperative that the oil move to consumers' plants as rapidly as possible.

Glycerol. Procedure for glycerol users and producers to file reports and requests for allocations with WPB is changed by Amendment 1 to General Preference Order M-58, announced by the Director General for Operations. The new procedures are to conform to the WPB policy of allocating in advance only shipments of 10,000 pounds or over, and of filling orders from 50 to 10,000 pounds pursuant to directive. The same forms, PD-361, PD-362, and PD-363, are to be used under the new procedure as have been used in the past.

Incendiary Units. The Chemical Warfare Service of the United States Army has been designated as the only agency to authorize the sale and delivery of incendiary units for demonstration purposes. Order L-115, issued on May 7, stipulated that sale and delivery of incendiary units could be made only on the written authorization of the United States Army or the United States Navy. Since the Chemical Warfare Service has been designated by both the War Department and the Navy Department to issue such authorizations, this change (Amendment 1) in wording was made to clarify procedure under the order.

Maintenance, Repair, and Operating Supplies. Chemical producers, by Amendment 3 to Preference Rating Order P-89, are granted new higher preference ratings to enable them to obtain maintenance, repair, and operating supplies. P-89 was issued originally to provide chemical producers with preference ratings high enough to ensure their getting immediate delivery of supplies to avoid or repair breakdowns. The order has been amended several times to increase the ratings assigned as supplies became more difficult to get.

Amendment 3 raises to A-1-a the rating assigned to the industry for obtaining all metals appearing on List 1 of Form PD-25A for the fourth quarter. A similar rating is assigned to fabricated parts and equipment having a unit cost of $250 or less. All other materials needed for maintenance, repair, and operating purposes are assigned an A-1-c.

To repair plant breakdowns and avoid threatened curtailment of production in emergencies, the amendment provides for the assignment of ratings higher than A-1-a upon application, by letter or telegram to WPB, stating all pertinent data.

None of these ratings may be applied to the purchase of metal containers or container materials without specific authorization by WPB. Further conditions of use of these ratings are: Form PD-315 must be filed with WPB; the producer must have a serial number assigned by WPB; the material sought must not be available with a lower rating than assigned by this order; and the materials so bought must not be replaceable by substitutions.

The ratings assigned by this amendment are extendible in accordance with the terms of Priorities Regulation 3.

The formula for calculating permissible inventories under the order is revised to eliminate containers as a factor in computing ratios of allowable supplies on hand.

Naphthenates. Since new war demands have made existing controls over naphthenates insufficient, Order M-142 has been amended to bring them under complete allocation October 1 and to continue allocation control of naphthenic acid. The order also is changed to provide for the use of the standard chemical forms, PD-600 and PD-601, for the allocation of both naphthenates and naphthenic acid. Forms PD-438 and 439, previously used for allocation of naphthenic acid, will be discontinued.

Natural Resins. Restrictions on road-marking paints are revised to allow use of up to one pound of Batu gum, or up to two pounds of Congo Copal gum, or both, per gallon of paint by Amendment 1 to Conservation Order M-56. The original order as amended June 5, 1942 permitted only $1/2$ pound of Batu gum per gallon of paint to be used. Stocks on hand of these two natural resins have remained substantial because of cessation of manufacture of products formerly requiring protective coatings containing them.

Phosphorus, widely used in war production, has been placed under complete allocation control beginning October 1, the Director General for Operations has announced. The action was taken in Order M-230. Allocations must be applied for on Form PD-600, and suppliers are required to report monthly on Form PD-601. Persons seeking 1,000 pounds or less of phosphorus in any one month may obtain delivery by certificate to their suppliers and need not file PD-600.

Research Laboratories, Supplies and Equipment. The Director General for Operations has issued Amendment 2 to Preference Rating Order P-43 restating Amendment 1, which raised from A-2 to A-1-a the rating which certain specifically approved research laboratories could use to obtain reagent chemicals and other materials. In the case of reagent chemicals, the rating can be used by the approved laboratories for both research and educational purposes. In the case of other materials, the rating can be used only for research, and not for educational purposes. The status of the use of materials other than reagent chemicals for educational purposes was left unclear by the omission of certain words from Amendment No. 1.

The Safety and Technical Equipment Branch stated that Order P-43 requires laboratories and suppliers who use the rating to file monthly reports on Form PD-93 on or before the 20th day of each month. Prompt filing of such reports is necessary for continued operation under the order. Communications and reports should be addressed to the Branch, Room 4068, Railroad Retirement Building, Washington, D. C.

Silica Gel. General Preference Order M-219, places silica gel under complete allocation and use control on October 1,

1942. Silica gel, a dehydrated silicic acid, is used principally as a drying agent to remove moisture and to prevent corrosion in shipment and storage and is needed for shipping a wide variety of war materials. Present supply is falling behind demand and in 1943 demand is expected to be several times maximum supply. To guarantee that all available silica gel is directed into the most essential military purposes, today's order provides that no person may deliver or accept delivery of silica gel except by specific authorization by WPB, and that no silica gel may be used except for the specific purposes authorized. Persons desiring to obtain silica gel may apply to WPB on Form PD-600, and persons seeking authorization to deliver, on Form PD-601.

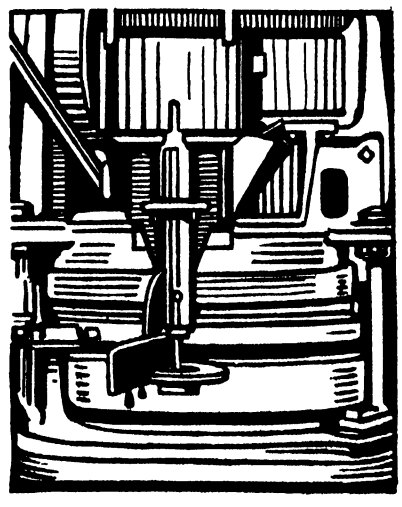
Silicate of Soda. Users of silicate of soda are permitted to build stocks without restriction by Amendment 6 to General Inventory Order M-161. Silicate of soda, which is in relatively plentiful supply, is expected to enter its heavy shipping season in October and November. To remove undue burden on transportation facilities at that time, inventory restrictions are removed to permit users to build stocks at their plants, rather than have supplies accumulate in the hands of producers.

Soluble Nitrocellulose. Two changes in the soluble nitrocellulose order M-196 remove from the restrictions of the order nitrocellulose suitable for dynamite manufacture, since this grade is not suitable for other uses and no need exists for allocating it, and take undissolved film scrap out of allocation control. The amended order gives the Director General for Operations authority to issue directions for the delivery and use of undissolved film scrap, but permits its free circulation where such directions are not issued.

Steel Shipping Drums. The use of new or second-hand steel shipping drums for packing approximately 200 food, chemical, and petroleum products after 60 days from September 14, 1942, has been prohibited in Limitation Order L-197. Effective immediately, the order also prohibits the packing of any product on an additional list of approximately 35 items in a new or used drum manufactured, purchased, or delivered after September 14. This provision does not prohibit the packing of a product on the second list in drums now owned by the packer. The order forbids the use by any person of new or used drums for packing products which he has not packed in drums prior to the issuance of today's order.

Officials of the Containers Branch said that the order is expected to conserve approximately 100,000 tons of steel annually, and release thousands of drums for essential purposes. Most products barred from the use of steel drums are expected to be shifted to tight cooperage (barrels) and in some cases to fiber containers and glass containers.

Among the products which may not be packed in steel drums after the 60-day period are paints, colors, shellac, crude oil, petrolatum, and many chemicals. Among products which cannot be packed in steel drums after September 14, if the drums are not already owned by the packer, are asphalt, floor wax, animal, fish, and vegetable oils, turpentine, liquefied silicate of soda, and printing inks.



Tar Coatings. Use of tar coatings on cast-iron soil pipe has been prohibited by WPB in an action taken in an amendment to schedule 4, as amended, to Limitation Order L-42. The restriction is expected to result in considerable savings of tar and conservation of transportation facilities. Last year approximately 65 per cent of all cast-iron soil pipe was coated with tar. Consumption for this purpose was about 640,000 gallons. In addition to this savings, it is estimated that 150 tank cars and boxcars required for transportation of the tar will be made available for other purposes.

Tin Survey. The Compliance Branch of the WPB has initiated a survey of the operations of the principal manufacturing users of tin, to determine their degree of compliance with WPB orders issued to conserve this material for essential war uses. The 280-odd firms whose operations are being checked use approximately 90 per cent of all tin consumed in this country.

Attorney-examiners of the Federal Trade Commission have been designated as representatives of WPB to conduct the field work of the survey.

Wage-Hour and Public Contracts Divisions Consolidated

SECRETARY of Labor Perkins has ordered a consolidation of the Wage and Hour and the Public Contracts Divisions of the Department of Labor. The greater efficiency and the avoidance of duplicate effort brought about by the consolidation will make it possible for the two divisions to carry out unimpaired their responsibilities under the Fair Labor Standards Act and the Public Contracts Act despite a cut of nearly $400,000 in the combined budget of the divisions, the Secretary said.

It will also bring about a consistent policy of enforcement and interpretation of the two laws, wholesale coordination of enforcement, and avoidance of any duplication of inspection by having one inspector cover for both acts.

L. Metcalfe Walling, who became administrator of the Public Contracts Division when it was established in 1937 and administrator of the Wage and Hour Division last March, will head the combined agency.

Candy and Chocolate Equipment

THE Food Conversion Section, War Production Board, Washington, D. C., has prepared a list of available equipment in candy and chocolate plants that could be used in the manufacture or processing of certain chemicals. The equipment is located in various parts of the country, and the WPB will be glad to assist in making necessary contacts to bring this idle machinery into production.

Drugs and Cosmetics Section

PERSONNEL of the new Drugs and Cosmetics Section of the Chemicals Branch of WPB as announced by E. W. Reid, chief, follows:

Section chief, F. J. Stock, formerly deputy chief of the Health Supplies Branch until its transfer to Chemicals; deputy chief, C. A. Willard, former chief of the Cosmetics Branch; consultants, Floyd Thayer, A. B. Pacini, John Williams, and Dan Dahle. Unit chiefs are: Biologicals and Medical Chemicals Unit, J. T. Batson; Botanicals and Imports Unit, T. F. Currens; Vitamins and Agar Unit, Mark Merrell; Cosmetics Unit, Robert Blair.

The Drugs and Cosmetics Section of the Chemicals Branch has taken over the functions previously performed by the Drugs and Pharmaceuticals Section of the Health Supplies Branch, and by the Toiletries and Cosmetics Branch of WPB.

New appointments at the Illinois Institute of Technology include: **Howard T. Francis**, physical chemist, metallurgical division, formerly assistant to the supervisor of chemistry, engineering defense training program at Penn State College; **Anton Novy**, ceramics staff, metallurgical division, formerly with the Fansteel Metallurgical Co.; **E. B. Penrod**, research engineer, experimental engineering division, formerly professor of physics at Hillsdale College; and **Joseph R. Spraul**, member of the chemical engineering staff, formerly associated with the American Can Co.

Fifth WPB Report Shows Increasing Scarcity of Materials

A CONTINUED increase in the momentum of the Nation's all-out war effort is reflected in the fifth provisional report on relative scarcity of certain materials, prepared by the Conservation and Substitution Branch of the Conservation Division. Materials are listed in three groups, ranked on the availability of existing supplies. "There is always the possibility of a quick change in the status of an item," said Harvey A. Anderson, chief of the branch. "For this reason the grouping indicates merely the current availability of material within broadly defined categories."

Civilian industry is or has been denied the use of items in Group I and must accordingly use substitutes. All steel and zinc are now placed in this group, as well as many grades of lumber. Scrap materials, such as iron and steel and rubber scrap, fall in this "insufficient for essential needs" category. Silver retains its position in Group II, for the metal is commercially scarce although large stocks exist. The items in Group III are largely the mass products of coal mines, oil fields, quarries, forests, and fields, with few metals or chemicals included. These items should be our first source of substitute materials. Here transportation difficulties, resulting in an unequal distribution of the material, in some instances confuse the situation.

Group I. The available supply of these materials is inadequate for war and essential civilian uses and in many cases for war purposes alone

METALS

- Alloy iron
- Aluminum*
- Aluminum pigments
- Brass*
- Bronze*
- Cadmium
- Chromium
- Cobalt
- Copper*
- Iridium
- Lithium
- Magnesium*
- Molybdenum*

- Teak
- Tung oil*

* Most critical.

Group II. Materials that are essential to the war industries but the supplies of which are not so limited as those in Group I

When considering the use of an item in Group II as a substitute for an item in Group I, the relative quantity available should be considered. When replacing large tonnage with smaller tonnage items (for example, copper with silver), the supply of the smaller item will be soon exhausted.

METALS

- Antimony
- Beryllium-copper
- Bismuth
- Calcium
- Calcium-silicon
- Columbium
- Ferrosilicon
- Ferrotitanium
- Iron
  - Gray cast
  - Malleable
  - Pig
- Mercury
- Platinum
- Ruthenium
- Silicomanganese
- Silicon and alloys
- Silver
- Spiegeleisen
- Zirconium and alloys

CHEMICALS

- Acetic acid
- Acetic anhydride
- Acetone
- Alcohols
  - Amyl
  - Ethyl
  - Methyl
- Butyl acetates
- Chlorates and perchlorates
- Chlorinated hydrocarbon solvents and waxes
- Chlorine
- Chromium chemicals
- Citric acid
- Lactic acid and lactates
- Maleic acid and anhydride
- Manganese chloride, anhydrous
- Molybdenum chemicals
- Nickel chemicals
- Phosphorus

Sweden's Production of Oilseed Increases

SWEDEN'S 1942 production of oilseeds is estimated at 21,000 metric tons compared with 8,500 tons for 1941, according to the Department of Commerce.

It is anticipated that 7,500 tons of oil and 13,000 tons of oilcake will be produced from the current crop compared with 2,700 tons of oil and 5,500 tons of oil cake last year.

Plantings of oilseeds increased from 20,009 acres in 1941 to 46,980 acres in 1942. Government guarantee of good prices and retention of experts to assist growers have been instrumental in increasing oilseed production.

India's Oilseed Crop Shows Slight Decrease

THE final official forecast of the 1941–42 oilseed crop of India places the yield slightly below the previous season, according to trade reports reaching the Department of Commerce.

Production of mustard and rapeseed is estimated at 1,109,000 long tons compared with 1,103,000 tons last year; linseed production at 361,000 compared with 434,000 tons.

Acrylic acid and acrylates
Alkyd resins
Aluminum chemicals

Group III. Materials that are available in significant quantities as substitutes for scarcer materials, and materials that are available in large amounts unless restrictions are imposed by labor, manufacturing, or transportation difficulties

METALS

Ferroboron
Ferromanganese
Gold
Indium
Lead
Osmium
Palladium
Sodium

CHEMICALS

Aluminum sulfate
Barium carbonate
Borax and boric acid
Camphor
Caustic soda
Chromic acid for plating
Hydrochloric acid
Nicotine sulfate
Soda ash
Sodium silicates
Sodium silicofluoride
Sodium sulfide

MISCELLANEOUS PRODUCTS

Asbestos (short-fiber)
Asphalt
Bauxite, low-grade
Bentonite
Brick
Carbon black (except I)
Casein
Cement (portland)
Ceramics
Charcoal
Clay (common)
Coal and coke
Coal-tar pitch
Concrete, plain
Cornstalks
Cotton, raw (to 1 1/8 in.)
Diatomite
Emery
Feldspar
Felt, hair
Fiberboard
Flint
Gilsonite
Glass
Gypsum and products
Hair, cattle, calf, and goat
Ilmenite
Lead pigments
Lignin
  Extender for plastics
  Linoleum paste
Lime
Lithopone
Lumber and millwork
  Low common grades
  Soft and hard woods
  All grades gums
Mica, except block
Mineral wool
Oils
  Cottonseed
  Peanut
  Soybean
  Sunflower seed
Paper
Paperboard
Petroleum products
  Crude oil
  Gasoline, except aviation
  Lubrication oil
Plywood (unrestricted binder)
Pottery
Rosin and derivatives except ester gum
Salt
Silica sand
Soybeans, protein
Starch, domestic
Stone
  Granite
  Limestone
  Marble
  Slate
  Soapstone
Straw
Sulfur
Tile
Titanium pigments
Tripoli
Turpentine
Vermiculite
Wallboard
Wood products
  Sawdust
  Wood fiber
  Wood flour
  Wood pulp
Zinc oxide (Am. process)

Supplementary list. Materials (not all in Group III) on which the Inventory Restrictions of Priorities Regulation No. 1 have been released

Andalusite, domestic
Ball clay
Bentonite
Borax
Boric acid
Caustic soda
Coal and coke
Diatomaceous earth
Dumortierite, domestic
Feldspar
Ilmenite
Kaolin
Kyanite, domestic
Phosphate rock
Pinite
Potter's flint
Pyrophyllite
Salt
Sillimanite, domestic
Soapstone
Soda ash
Spodumene
Stoneware clay
Sulfur
Talc, except steatite
Titanium oxide
Waste paper
Wood and pulp

Production of Alcohol in Syria Decreases

ALCOHOL was formerly manufactured in Syria from molasses imported from Czechoslovakia, according to the Department of Commerce. With the cutting off of imports from that country, manufacturers began to use seeds and grains obtainable locally. The higher cost of these materials resulted in a considerable increase in the price of alcohol, which rose to about $2.75 per gallon at the end of last year. This caused a decreased demand and output for 1941 dropped to 130 tons, about 50 per cent of the normal annual production.

Samuel C. Harris, director of sales, Electrochemicals Department, E. I. du Pont de Nemours & Co., Inc., Wilmington, Del., completed 25 years of service on September 15. He was honored at a luncheon given by his associates at the du Pont Hotel.

Samuel C. Harris

Philip A. Macy has resigned from the Robeson Process Co. to accept a position as research chemist with the Waterbury Paper Box Co., Waterbury, Conn. He has recently applied for a patent for a new paper cap to take the place of metal on glass bottles.

E. A. Metcalf has been made manager of the Neodesha, Kans., refinery of the Standard Oil Co. of Indiana. **Harold R. Snow**, formerly manager of the Neodesha plant, has accepted a position as assistant general superintendent of the Pan American Refining Co.'s refinery at Texas City, Tex. **H. G. Schnetzler**, chief chemist, will succeed Mr. Metcalf as superintendent at Neodesha, continuing his duties as chief chemist.

George W. Morey has taken leave of absence from the Geophysical Laboratory, Carnegie Institution of Washington, to become general manager of the Parkersburg, W. Va., Division of the Corning Glass Works.

Flash of Genius[1]

JOSEPH N. NIELSEN

THE impression is gained from reading various articles relating to the U. S. Supreme Court's decision in Cuno Engineering *vs.* Automatic Device Corp., that the Court has set up a newly defined standard whereby an invention can be evaluated; but a reading of the decision does not support this view. A crystallization of opinion along the lines thus publicly expressed may, however, work harm in the future prosecution of patent applications and the litigation of patents.

To illustrate the effect of the criterion laid down by the Supreme Court, these articles point to the Edison patents and those of corporation research departments as ones which would not have been granted under the rule, since they are based on patient research with no guiding "flash of genius". This does not follow, because the argument confuses two independent sources of new and useful contributions which the statutes recognize as entitling a person to a patent; one of these is invention and the other is discovery. The Supreme Court case only relates to the first, while research work lies in the realm of discovery.

There is a fundamental distinction between invention and discovery. For an invention there is required a concept or mental image of the invention as a preliminary to (sometimes simultaneous with) a reduction to practice; as expressed in patent law, this concept must be substantially complete, that is, sufficient if communicated to another to enable its embodiment in practical form without the further exercise of invention. In a discovery, however, the concept factor is not necessarily present; an illustration is Edison's phonograph which he did not know he had discovered until he accidentally heard the reproduction. Most inventions are in the nature of improvements in which the mental concept is to a greater or less degree dependent on the knowledge of the art or previous contributions made by others; and likewise most discoveries are in the nature of improvement discoveries which have their origin in the continuations of research along paths which have been marked by others. But even so there is the condition present in inventions that the bridging from the problem to its solution (or a recognition of the existence of a problem) involves a mental act of a character which for the lack of a better term may be called an inspiration; in a discovery the element of surprise lies in the realization of a new and unexpected property or result inherent in the discovery. The existence of an invention may be said to be in general determined by a condition precedent to its completion while a discovery may be said to depend on a condition subsequent.

That which has been herein termed an inspiration can just as well be called a "flash of genius" as the Supreme Court has denominated it. In common patent parlance it is usually called the unobvious, and the Supreme Court terminology says nothing more than this. To insist, as these various articles seem to do, that the Supreme Court test of a "flash of genius" necessitates an order of invention to be found only in few revolutionary inventions and excludes discoveries goes far beyond the facts upon which the decision rests.

The facts as stated by the Court are in effect that the Mead device there in issue consisted of a thermostatic control, which in itself was old, applied to a removable heating unit whereby the circuit was opened when the heating coil reached the predetermined temperature and thus relieving the operator of manually holding the plug. In the Court's opinion the use of the thermostat to break a circuit was analogous to or the same in character as the use of such a device in electric heaters, toasters, or irons; and while ingenuity was required to effect the adaptation it was no more than to be expected from a mechanic skilled in the art. Whether the judgment is right or wrong may be questioned. But it seems evident that the Court did no more than what the Examiners of the Patent Office do every day in their rejections when they hold that a substitution or modification does not involve invention; instead of using the office language the Court denominated the invention as one lacking in "the flash of genius".

The facts of the case are of more than passing interest in that they point to a remedy for one of the besetting sins of patent practice and that is the "use" patent. To illustrate, the Cottrell patents on precipitation were followed by hundreds of patents covering uses of the invention in specific fields where the problem of separating dust and fumes was present; in this way a meritorious invention can be so hedged about that the real inventor is denied the return which the patent statutes are supposed to provide. A corrective for this appears in the reasoning of the decision which in the particular case involved held the cigar-lighter, toaster, and flat iron to be in the same class; this is in line with the "proximate function" principle of classification that Mr. Sewall tried so hard to embody in the Patent Office classification and which official opposition largely nullified. The proximate function common to the three devices mentioned is the heating by electrical means of some object separable therefrom; the differences are dictated by the use or art to which each one relates and consist only in shaping and proportioning the elements of the devices to the object with the bread-holding means added in the case of the toaster, and interposing the smoothing surface in the case of the iron. This principle of proximate function has to my mind a peculiar appropriateness to "use" patents, i. e. adaptations of known practices to specific arts.

An analogous principle applicable to discoveries is the doctrine of "reasonable expectation" explained by Dr. Ely in his paper on "Chemical Inventions and Discoveries" before the Patent Office Society. Instead of following this doctrine, the stock reasoning for supporting the grant of patents on discoveries is reliance upon the inability to foretell what a research will produce; while the established rule may be pertinent in many cases, other improvement discoveries are nothing more than applications of known variants and the results are to be expected rather than the contrary.

As with principles generally, their statement is relatively easy; it is their application to specific cases that is difficult because in the final analysis it reduces to personal opinion. The ones here indicated do, however, have a place in patent practice; and with a recognition of the spirit behind them rather than the letter in which they are expressed, they should offer guidance in the consideration of inventions and discoveries as indicative of the presence as well as of the lack of patentability.

The foregoing considerations indicate to me that the Supreme Court decision is not deserving of the criticisms leveled against it, and the facts of the case do not warrant the inferences that any new measure of patentability has been instituted.

I FOUND much of interest in Mr. Poole's letter but I shall only make a brief comment on the question he raises concerning the alleged "erroneous impression" created by the writer's previous discussion. The impression in question was to the effect that the future of industrial research appears to be endangered because most patents based thereon will probably be invalidated by the courts, if the "flash of genius" patentability test is applied.

The law of course is what the judges, not necessarily what counsel or writers, say it is. However, this is not the place to analyze all of the pertinent cases reported since the "flash of genius" case was published. It is also noted that the U. S. Supreme Court has not again had occasion to pass directly on the question. Nevertheless, one decision may be singled out for special note because of its particular pertinence and because of the high standing of the court which rendered it. Reference is made to *Picard* vs. *United Aircraft*

[1] Reprinted from *J. Patent Office Soc.*, 24, 371 (1942).

Corp., 53 U. S. P. Q. 564, C. C. A. 2, (1942). It is doubted whether anyone who reads this decision carefully can believe that the foregoing impression is erroneous.

THOMAS CIFELLI, JR.

3 CLARENDON PL.
BLOOMFIELD, N. J.
July 27, 1942

Editor, Chemical and Engineering News:

EVER since the appearance of Mr. Cifelli's article[1], people interested in chemical industry and research have been expressing deep concern stemming from what this observer believes is an erroneous impression created by that contribution.

Initially, I, too, was much concerned by Mr. Cifelli's article, and immediately set about securing a copy of the reference in question. I found my interpretation thereof to be at distinct variance with Mr. Cifelli's. Furthermore, I have conferred with eminent patent counsel and have found that such authorities consider the "Flash of Genius Decision" to be strictly free from "new law" and to constitute no more than a conscientious attempt to be consistent with statute and precedent.

It is not the courts but Mr. Cifelli who would write new law. In all this fuss and feathers there has been no recognition whatsoever of the basic principle that invention may not be accomplished by mere exercise of the skill of the art.

To be sure, just when we pass to a point more lofty than can be encompassed by "mere skill" is perforce a matter of opinion. Moreover, I personally feel that to devise the cigaret lighter of the "Flash of Genius Decision" would require more than ordinary skill and that the flash of genius—if we choose to use such phraseology—did occur; but we must not forget that judges usually are skilled only in law, not in the scientific arts. No one, not even the greatest judges, can be expected to possess infallibility or even good judgment in subjects about which they know little. In case any one cares to argue that point, I am quite prepared to cite obviously worse decisions including instances when the boot was on the other foot and "inventions" were validated although no more than mere skill was required for their accomplishment—and precious little skill at that.

When we complain about the philosophy of decisions like this one, which bids fair to become a *cause celebre*, we are away off on a tangent. I agree that it was probably a poor decision but I am just as deeply of the opinion that it was good law, and am still more deeply convinced that attacking the "Flash of Genius" from the viewpoint of law will accomplish nothing toward the real problem's solution. For one thing it is looking for an answer to a doubtfully existent problem, while ignoring a very real and clearly discernible problem.

[1] *Chem. Eng. News*, 20, 523 (April 25, 1942).

This writer, probably in common with many others, has seen intricate technical disputes adjudicated by eminent jurists, who did not know the difference between a mole and a molecule, a cylinder and a piston, or heat and temperature; and under such circumstances it is inconceivable that judgment by men of the highest intelligence and integrity can fail to work frequent and grave injustice.

I imagine that in the hands of our non-scientific jurists about the right number of patents have been and will continue to be sustained—we get sort of an "average" justice in our decisions by having enough invalid patents sustained to offset the number of valid patents which are thrown out. We have something similar to choosing by lot from our country's population which one of us would receive the Priestly Medal and which one would hang for murder. Obviously, if a great advance had been made in chemistry and a murder had been committed, such a system would mete out the right amount of reward and punishment.

The question is: Just what should we scientific people do about jurisprudence which fails to make use of pertinent facts?

If we, operators and research men, yell any old way about the "Flash of Genius Decision", we might possibly stir up enough fuss to get a bill introduced which would in effect declare all patents valid. But more likely—and I believe preferably—than such a bill being passed, one would be enacted which would really give us something to yell about. We cannot expect that under a system of free enterprise people are going to stand for being sued, enjoined, and mulcted for doing the same thing that Grandpa would have done if there had been any point in doing it in Grandpa's time.

Continuing to be a bit dogmatic, there is only one logical solution to the question of how to have valid patents validated and invalid patents voided—viz., have both jurists and scientists judge the evidence. With due respect to our most able judges, they are no better qualified in the legal aspects of science than are our best scientists. In general, the legal problems relating to patents are no more profound than are the scientific aspects, regardless of how many lawyers unskilled in science hold opinions to the contrary.

The idea that the present practice of introducing expert testimony provides the jurist with a sufficient grasp of the scientific facts at issue is a myth. Why the court cannot safely depend on such sources of information is a long story and is, moreover, probably known to most of those who have had much to do with litigation of chemical patents. Briefly, expert testimony is very far indeed from being unbiased, and an impressive qualification carries more weight than does scientific fact. Many years of observation have led the writer to suspect that at least 50 per cent of all suits would have been decided differently if the litigants had swapped witnesses. Further, the instance is rare wherein a judge actually comes to comprehend the scientific facts involved in a case of moderate scientific complexity. The job is too great for any one kind of expert.

A proposal for Law ever to share the bench with Science would doubtless be abhorrent to legalists; but to a progressive jurist any resort which is conducive to more perfect application of the law should be no less than acceptable. In fact, we should be able to work out a scheme whereby competent and unbiased scientific opinion could be assured, short of formally cloaking it with judicial powers. What is important is assurance that such opinion will enter into patent decisions, and will be competent, and unbiased. This in turn means that it be surrounded by the same freedom from economic pressure and political exigency which has proved uniquely conducive to a thoroughly judicial attitude. The scientific, as well as the legal, minds which contemplate the evidence should be those of men appointed for life and compensated on a scale comparable to that of our federal judges. Whether their decision shall be legally binding, or whether their functions shall be advisory only, is not a vital question, but unless such opinion shall decide all scientific aspects of patent disputes it is the writer's firm conviction that we shall have not only more decisions as debatable as "The Flash of Genius Decision", but continue to have many which are grossly unfair.

There is far less improvement to be enjoyed by altering patent law—either of statute or precedent—than by setting up a judicial procedure designed to meet those conditions which are peculiar to patent litigation. Since such cases typically include profound questions, both legal and scientific, and it is a practical impossibility to find the best scientific minds and the best legal minds combined as a single intellect, there is but one apparent answer. Judgment must be the joint responsibility of jurist and scientist.

J. W. POOLE, *Manager*

Howard D. Grant has been elected president and **Stevens H. Hammond** executive vice president of the Whiting Corp., Harvey, Ill.

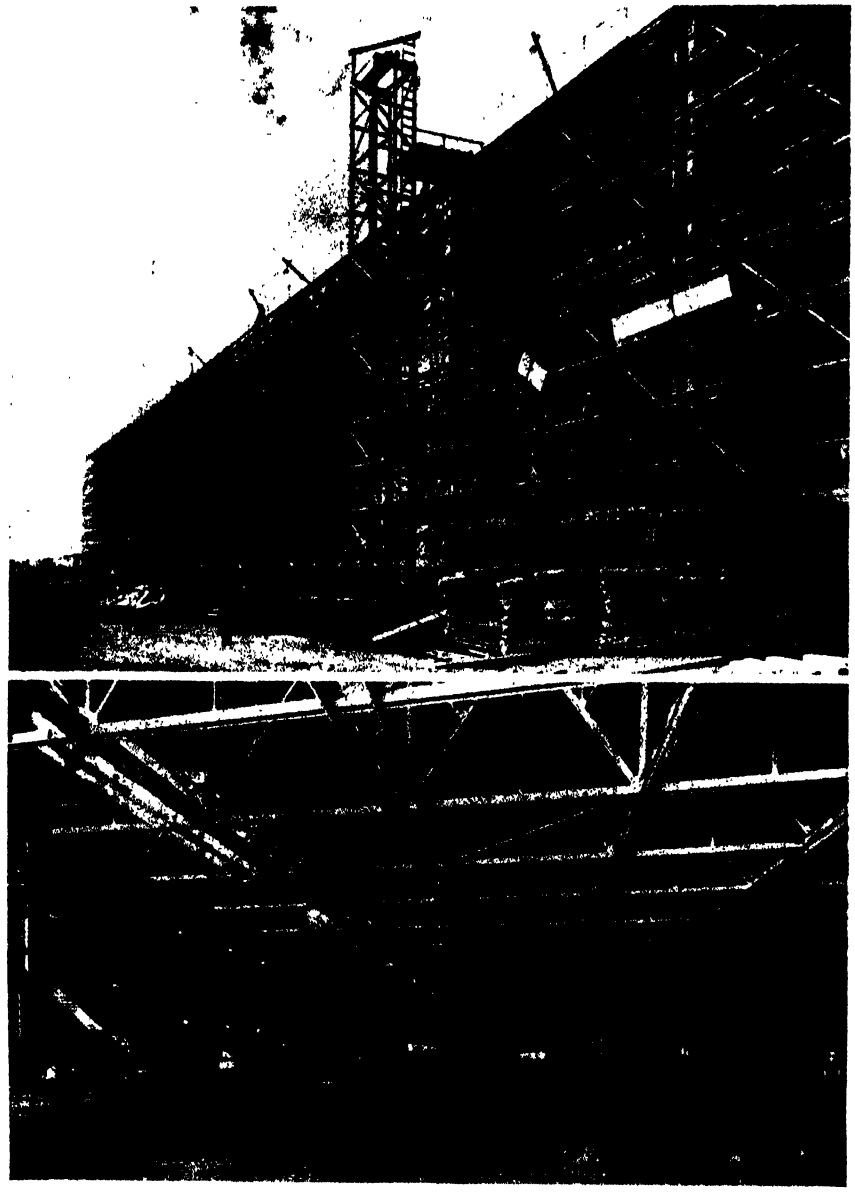
Morris Kaplan, who has been assistant to the chief, Division of Laboratories, Bureau of Customs, Treasury Department, for several years, has become chief chemist of the customs laboratory in Baltimore, Md. **E. F. Kenney** is succeeding Mr. Kaplan in Washington. **Joseph O. Broussard** of the Honolulu customs laboratory is being transferred to the Baltimore laboratory.

New-Construction Possibilities for Chemical Plants

A NEW and revolutionary technique in plant construction which may hold distinct advantages for chemical processing units has been developed in a joint effort by the Truscon Steel Co., Owens-Corning Fiberglas Corp., and The Austin Co. The new building method, called "Ferroglas construction", has been successfully used in two huge new plants erected and completed late last year in the Southwest. Features of this construction, which uses practically only Fiberglas and steel, are excellent insulating properties, low sound reflectivity, high light reflectivity, and, important to the chemical field, little condensation of vapor.

The construction is simple, lends itself to speedy construction, and is uniform, although side-wall and roof techniques are somewhat different. Thus the wall, completely constructed from one outside scaffolding, is built up from the inside with expanded metal mesh, a Fiberglas mat, a 4-inch blanket of Fiberglas, a metal channel, a vapor seal of cold asphalt primer and vapor-resistant paper, a 1-inch Fiberglas insulation board, and on the outside of the building a metal facing panel.

To facilitate construction and to save time, the side-wall channel is filled at the job site with the Fiberglas insulating blanket (secured in position by an asphalt adhesive), the retaining mat, and metal mesh. The complete, filled C-channels, which are made of 22-gage steel, 30 inches wide and 3 inches deep, are then hoisted into position and secured to the connecting plates by metal screws. Thus the only work done from the scaffolding is the application of the remainder of the wall—the asphalt and paper seal to the back of the channel, the rigid 1-inch Fiberglas board, and the outside ribbed metal siding. These exterior facing panels, 30 inches wide and ribbed 10 inches on centers, are fabricated from 18-gage steel and are designed to resist a 30-pound wind load. The ribs, $2^1/_4$ inches wide and $1^{19}/_{32}$ inches deep, form an air space with the rigid insulation board; this space acts as a flue, carrying a current of air which dries any moisture that may condense at these points.



Roofs of Ferroglas construction are built up in layers similar to the sidewall; the chief difference is that there are no prefabricated sections such as the filled channel hoisted into place for the side wall. Expanded metal guards are fastened to the runner channels by clips, and above the expanded metal is placed a colorless, light-reflecting, Fiberglas retaining mat which prevents passage of dust but does not materially reduce the sound absorption qualities of the 3-inch blanket of 1.5-pound-density Fiberglas laid directly on it. These three materials constitute the ceiling of the factory. The roof proper is made of metal roof deck welded to the purlins and having on its upper side a continuous vapor seal which is mopped on. Over this vapor seal a $^{13}/_{16}$-inch thickness of 6-pound-density Fiberglas roof insulation board is laid; finally, a built-up waterproofing, consisting of four layers of roofing paper held in place with melted pitch, is applied over that.

Expansion and contraction in the roof are provided for by means of specially designed expansion joints spaced at intervals of 400 feet. As in the case with the expansion in the side walls, allowance for $2^3/_4$-inch movement is made, yet insulating qualities are not impaired.

Originally this construction was designed to meet the specifications of the Government for various physical efficiencies and for an easily built factory.

The Ferroglas construction averages, for a 6-inch wall, a weight of about 10 pounds per square foot. It has an overall coefficient of heat transfer of 0.07 B. t. u., has low heat capacity, absorbs about 75 per cent of the noise striking its surface, and has excellent light reflection. The roof construction is about 11 pounds per square foot and has a heat transfer of 0.06 B. t. u. The other properties are similar to those of the side wall. Light reflection is of great value for the windowless-type blackout plant such as the two plane factories constructed by this method.

Specifications and actual performance of the construction are shown in Table I.

One of the two new plants in the Southwest which are the first examples of Ferroglas construction. The main building of each is longer than the combined length of the world's four largest ocean liners. More than 19,400,000 board feet of Fiberglas materials are employed in the two plants for sound absorption and heat insulation.

Table I. Specifications and Performance

	Designers' Requirements	Actual Performance
Walls		
Thickness, inches	8	6
Weight, pounds/sq. ft.	20	10
Heat transfer coefficient, B.t.u.	0.14	0.07
Heat capacity	Low	Low
Sound absorption, %	60	75
Light reflection (natural finish)	Greatest possible	Good
Condensation and vapor control, %	100	Excellent
Fire resistance, %	100	Excellent
Bomb and incendiary protection	Shatterproof	Shatterproof
Maintenance	Least possible	Low
Roofs[a]		
Thickness, inches	...	5
Weight, pounds/sq. ft.	...	11
Heat transfer coefficient, B. t. u.	0.125	0.06
Heat capacity	...	Very low

[a] Other characteristics are the same as for walls.

New Alcohol Process Dedicated to Public Use

IN LINE with the Baruch report that newly developed apparatus is available for increasing the production of war alcohol without use of critical materials, Schenley Distillers Corp., New York, N. Y., is preparing applications for a patent on such apparatus, with the patent dedicated to public use. The method developed by Schenley engineers does not use critical materials, and is said to save time and expense in converting beverage distilleries to war alcohol production.

The company in August offered to other concerns in the distilling industry detailed information about construction methods used in putting the first packed column into operation. Work on new packed columns is being rushed at the company's six remaining low-proof spirits plants, so that all production facilities may be devoted to war work.

Who Makes It?

SOURCES of supply for the following are wanted by the National Registry of Rare Chemicals, Armour Research Foundation, 35 West 33rd St., Chicago, Ill.: 1,8-dihydroanthraquinone, calcium sulfaguayacolate, ergotamine tartrate, 2,3,5-trichlorophenoxy acetic acid, 2,3,5-triiodophenoxy acetic acid, 2,4-diiodophenoxyacetic acid, 2,4-dichlorobenzoic acid, 2,3,5-trichlorobenzoic acid, 2-chloro, 3-nitrobenzoic acid, 2,3-dichlorobenzoic acid.

Carl M. Anderson has been appointed executive assistant to the president of Merck & Co., Inc., Rahway, N. J.

WIDE WORLD PHOTOS

Women Chemists Heed War Call

Donna Price, one of the outstanding women chemists at the Hercules Powder Co., Wilmington, Del., tests rosin size for oxygen stability in this oxidation train process.

Metallurgy Training for Women

THE first war-training course in metallurgy, established exclusively for women, opened September 21 at the Illinois Institute of Technology, Chicago, Ill. Since March the institute has trained several hundred women in ordnance inspection, industrial drafting, and industrial chemistry.

Mineral Industries Building, West Virginia University, Dedicated

THE Mineral Industries Building, West Virginia University, will be dedicated at Morgantown, W. Va., on October 16 and 17. In addition to the dedication ceremonies and inspection of the new building, sectional meetings have been planned, covering chemical, metallurgical, and ceramic engineering, geology, and mines and mining, as well as the annual meeting of the Allegheny Section of the S. P. E. E.

Contributions of Chemical Research

A BRIDGE of ships spanning the Atlantic, spaced only a trifle over one mile apart, would be required to bring to America just five of the many vital war products which the chemical industry has developed synthetically since 1917.

The five products are nitrates for explosives production and other uses; rubber for a mechanized army and necessary civilian transportation; dyestuffs for uniforms, various types of military equipment, and civilian clothing; fibers for parachutes, powder bags, and essential industrial uses; and camphor, used medicinally and in the manufacture of many chemical products essential to the war.

To bring these things to America in the quantities either required this year, or actually imported before the chemical equivalent was in production, would require 2,682 sizable cargo ships.

Contract Distribution Branch of WPB Is Discontinued

THE War Production Board has announced discontinuance of its Contract Distribution Branch in Washington, the functions of which will be taken over by the Smaller War Plants Division of WPB and the Smaller War Plants Corporation. The latter organization was set up by Congress for the purpose of bringing more smaller manufacturing plants into the production of war materials and essential civilian goods. This was the motive for setting up the original Contract Distribution Division under OPM, and since these objectives are now assigned to the Smaller War Plants Corporation, the continuance of the CDB would constitute duplicating functions and overlapping of effort. Two units of the Contract Distribution Branch in Washington—the Facilities Records Unit and the Critical Tools Service—are being temporarily continued under the jurisdiction of the Facilities Utilization Division.

Awards in Chemistry at Montana State College

RECOGNITION of good work in undergraduate chemistry at Montana State College took definite form with the establishment of two annual awards, one first made 12 years ago and the other more recently. The older award is sponsored by the Alpha Omicron Chapter of Alpha Chi Sigma and is presented by inscribing the student's name on a bronze plaque located in the main stairway of the chemistry building. The Cyril Evans Award, established in 1940, is a year's membership in the AMERICAN CHEMICAL SOCIETY and is awarded to a student of chemistry, industrial chemistry, or chemical engineering who after nearly two and one half years of study is considered most worthy by faculty and senior students. The Alpha Omicron Chapter Award (known locally as the Alpha Chi Sigma Award) is made to the student of the above majors of study who has earned the highest grade in his freshman year.

The students and graduates listed have been honored by the Alpha Omicron Chapter Award.

The Alpha Omicron Chapter of Alpha Chi Sigma was founded in 1924 largely through the efforts of Oden E. Sheppard, present head of the Department of Chemistry. The charter group included Wm. M. Cobleigh, dean of the Engineering Division for the past 13 years and now acting president of the college; also Herman J. Almquist of vitamin K fame and others who have won prominence. Eight of the charter members took their PhD.'s in chemistry.

The Cyril Evans Award recognizes a more sustained effort in chemistry and its related fields. Although the first requisite for this award is high scholarship, the student must qualify in other respects as well.

Cyril Evans was graduated from Montana State College in 1931 and obtained his M.S. degree in 1934 while assisting in the chemical laboratory of the Montana Agricultural Experiment Station. He obtained his doctorate degree in biochemistry at the University of Minnesota in 1938 and subsequently carried on protein plastic research at Armour Institute. He is now a member of the U. S. Regional Laboratory at Peoria, Ill. Dr. Evans sponsors his award because he feels that membership in the AMERICAN CHEMICAL SOCIETY produces a broader appreciation of chemistry and of human affairs. Those who have received this award are Lester Hogan, who graduated from Montana State College in 1942, and Arthur Fry, a senior in chemistry at Montana State College this year.

All the recipients of the Alpha Omicron Chapter Award graduated with honors from Montana State College and have also been honored by membership in the Scholastic Honor Society of Phi Kappa Phi.

STUDENT OR GRADUATE	YEAR	PRESENT CONNECTION
CHEMISTRY DEPARTMENT		
Edwin N. Lassettre	1930	Ohio State University, assistant professor
Cornelius Giacchetti	1932	Training stopped because of ill health
Robert Tichenor	1936	Harvard University, Ph.D. candidate (Rhodes scholar)
Richard Gluyas	1940	Montana State College, student
R. Bernal Johnson	1941	Montana State College, student
DEPARTMENT OF CHEMICAL ENGINEERING		
Earl Walters	1933	Northern Pacific Railway, water inspector
John R. Bowers, Jr.	1934	McGill University, demonstrator in wood chemistry
Edwin R. Hahn	1935	U. S. Rubber Co., research
William Alexander	1937	Rayonnier, Inc., research
Elbert C. Herrick	1938	Princeton University, Monsanto Chemical Engineering Fellowship
Roland Gumprecht	1939	Chemical Warfare, Second Lieutenant

D. L. Immel has been appointed assistant plant superintendent, Copperweld Steel Co., Warren, Ohio.

Herbert A. Swenson has been granted military furlough from the U. S. Geological Survey, where he has been employed as chemist since 1938, and has been called to extended active duty as first lieutenant in the Chemical Warfare Service.

American Chemical Society Officers, Committees, and Student Affiliate Chapters

Officers

THE list of officers of the SOCIETY appears in CHEMICAL AND ENGINEERING NEWS three times a year, usually February 10, May 10, and October 10.

National Officers and Directors

PRESIDENT. Harry N. Holmes, Severance Chemical Laboratory, Oberlin College, Oberlin, Ohio.

PRESIDENT-ELECT. Per K. Frolich, Standard Oil Development Co., Box 243, Elizabeth, N. J.

SECRETARY AND BUSINESS MANAGER. Charles L. Parsons, AMERICAN CHEMICAL SOCIETY BUILDING, 1155 16th St., N. W., Washington, D. C. *Assistant Manager*, Alden H. Emery.

TREASURER. Robert T. Baldwin, 50 East 41st St., New York, N. Y.

DIRECTORS. *Ex Officio*, the President, the President-Elect, the most recent Past President (William Lloyd Evans), the Secretary, and the Treasurer. *Regional*, L. H. Adams, R. E. Swain (1940–42); Roger Adams, R. E. Wilson (1941–43); Arthur J. Hill, E. R. Weidlein (1942 44). *At-Large*, Thomas Midgley, Jr. (1939–42); E. K. Bolton (1940–43); Willard H. Dow (1941 44); Charles A. Thomas (1942–45).

COUNSEL. Elisha Hanson.

Editors

JOURNAL OF THE AMERICAN CHEMICAL SOCIETY. Arthur B. Lamb, Chemical Laboratories, Harvard University, 12 Oxford St., Cambridge, Mass.

CHEMICAL ABSTRACTS. E. J. Crane, Ohio State University, Columbus, Ohio. *Assistant Editor*, Elmer Hockett.

INDUSTRIAL AND ENGINEERING CHEMISTRY and CHEMICAL AND ENGINEERING NEWS. H. E. Howe, 1155 16th St., N. W., Washington, D. C. *Assistant to Editor*, N. A. Parkinson.

PUBLICATION MANAGER. Harvey F. Mack, 20th and Northampton Streets, Easton, Penna.

NEWS SERVICE. *Director*, H. E. Howe, 1155 16th St., N. W., Washington, D. C. *Managing Editor*, James T. Grady, 609 Journalism Bldg., Columbia University, New York, N. Y.

MONOGRAPHS. H. E. Howe, 1155 16th St., N. W., Washington, D. C.

CHEMICAL REVIEWS. W. Albert Noyes, Jr., Department of Chemistry, University of Rochester, River Campus, Rochester, N. Y. *Assistant Editor*, Louise Kelley. Published by Williams & Wilkins Co., Baltimore, Md.

JOURNAL OF PHYSICAL CHEMISTRY. Samuel C. Lind, School of Chemistry, University of Minnesota, Minneapolis, Minn. *Assistant Editor*, Louise Kelley. Published by Williams & Wilkins Co., Baltimore, Md.

Members of Council

EX OFFICIO. *National Officers. Directors. Editors* of the *Journal of the American Chemical Society*, *Chemical Abstracts*, and *Industrial and Engineering Chemistry*. *Past Presidents*, Roger Adams, L. H. Baekeland, W. D. Bancroft, Edward Bartow, M. T. Bogert, Wm. Lloyd Evans, Moses Gomberg, C. A. Kraus, Arthur B. Lamb, Irving Langmuir, S. C. Lind, William McPherson, L. V. Redman, E. R. Weidlein, F. C. Whitmore, W. R. Whitney. *Chairmen of Divisions and Councilors of Local Sections* (listed under Divisional and Local Section Officers).

Councilors-at-Large. Edward Mack, Jr., C. E. K. Mees, W. Albert Noyes, Jr., H. C. Urey (1940–42); Wm. Mansfield Clark, H. B. Hass, J. H. Hildebrand, G. E. F. Lundell (1941–43); George D. Beal, Gustav Egloff, Henry Gilman, Carl S. Marvel (1942–44).

Divisional Officers

AGRICULTURAL AND FOOD. *Chairman*, Ellery H. Harvey; *Secretary*, Roger H. Lueck, Research Department, American Can Co., Maywood, Ill.

ANALYTICAL AND MICRO. *Chairman*, Harvey C. Diehl; *Secretary*, Francis W. Power, S. J., Fordham University, New York, N. Y.

BIOLOGICAL. *Chairman*, H. A. Shonle; *Secretary*, Erwin Brand, Department of Biochemistry, College of Physicians and Surgeons, Columbia University, 630 West 168th St., New York, N. Y.

CELLULOSE. *Chairman*, H. M. Spurlin; *Secretary*, Charles R. Fordyce, 275 Maplewood Drive, Rochester, N. Y.

CHEMICAL EDUCATION. *Chairman*, Arnold J. Currier; *Secretary*, Paul H. Fall, Hiram College, Hiram, Ohio.

COLLOID. *Chairman*, W. O. Milligan; *Secretary*, G. E. Cunningham, Staynew Filter Corp., 11 Centre Park, Rochester, N. Y.

FERTILIZER. *Chairman*, H. B. Sioms; *Secretary*, Charles A. Butt, International Minerals and Chemical Corp., Box 69, East Point, Ga.

GAS AND FUEL. *Chairman*, Orin W. Rees; *Secretary*, G. Robert Yohe, State Geological Survey, Urbana, Ill.

HISTORY OF CHEMISTRY. *Chairman*, Harrison Hale; *Secretary*, Ralph E. Oesper, Department of Chemistry, University of Cincinnati, Cincinnati, Ohio.

INDUSTRIAL AND ENGINEERING CHEMISTRY. *Chairman*, R. Norris Shreve; *Secretary*, Whitney Weinrich, Gulf Research & Development Co., Box 2038, Pittsburgh, Penna.

MEDICINAL CHEMISTRY. *Chairman*, John H. Speer; *Secretary*, Maurice L. Moore, Medical Research Division, Sharp & Dohme, Glenolden, Penna.

ORGANIC. *Chairman*, Louis F. Fieser; *Secretary*, Arthur C. Cope, Department of Chemistry, Columbia University, New York, N. Y.

PAINT, VARNISH, AND PLASTICS. *Chairman*, W. W. Bauer; *Secretary*, Adolf C. Elm, New Jersey Zinc Co., Box 263, Palmerton, Penna.

PETROLEUM. *Chairman*, C. L. Brown; *Secretary*, Lawrence M. Henderson, Pure Oil Co., Laboratory, Box 266, Winnetka, Ill.

PHYSICAL AND INORGANIC. *Chairman*, R. E. Gibson; *Secretary*, Thomas F. Young, Department of Chemistry, University of Chicago, Chicago, Ill.

RUBBER. *Chairman*, John T. Blake; *Secretary*, Howard I. Cramer, Sharples Chemicals, Inc., 23rd & Westmoreland Sts., Philadelphia, Penna.

SUGAR CHEMISTRY AND TECHNOLOGY. *Chairman*, George H. Coleman; *Secretary*, E. Whitman Rice, National Sugar Refining Co., 129 Front St., New York, N. Y.

WATER, SEWAGE, AND SANITATION. *Chairman*, Louis F. Warrick; *Secretary*, H. Gladys Swope, North Shore Sanitary District, Dahringer Road, Waukegan, Ill.

Local Section Officers

AKRON. *Chairman*, Arthur W. Sloan; *Secretary*, Victor E. Wellman, The B. F. Goodrich Co., Akron, Ohio; *Councilors*, W. I. Burt, E. G. Haas, M. M. Harrison, C. K. Novotny.

ALABAMA. *Chairman*, George D. Palmer; *Secretary*, Harold E. Wilcox, 7837 Fifth Ave., South, Birmingham, Ala.; *Councilors*, S. S. Heide, J. T. Vann.

AMES. *Chairman*, Harvey C. Diehl; *Secretary*, Wm. J. Shannon, 78 Chemistry Bldg., Iowa State College, Ames, Iowa; *Councilors*, N. A. Clark, L. A. Underkofler.

BATON ROUGE. *Chairman*, Arthur G. Keller; *Secretary*, Sumner B. Sweetser, 2960 Hyacinth Ave., Baton Rouge, La.; *Councilor*, A. R. Choppin.

BINGHAMTON. *Chairman*, Keith Famulener; *Secretary*, Frank J. Kaszuba, 100 Gilmore Ave., R. D. 3, Binghamton, N. Y.; *Councilor*, Maurice Dorfman.

CALIFORNIA. *Chairman*, Paul F. Bovard; *Secretary*, Sterling L. Redman, Redman Scientific Co., 585 Howard St., San Francisco, Calif.; *Councilors*, Ross Cummings, T. C. Daniels, Dosier Finley, C. R. Noller, William Hirschkind, L. B. Howard, Merle Randall, L. V. Steck, Frank Wills.

CENTRAL PENNSYLVANIA. *Chairman*, Arthur Rose; *Secretary*, N. B. Guerrant, Department of Biochemistry, Pennsylvania State College, State College, Penna.; *Councilors*, R. A. Dutcher, C. C. Wright.

CENTRAL TEXAS. *Chairman*, W. A. Cunningham; *Secretary*, Maxwell A. Pollack, Chemistry Department, The University of Texas, Austin, Tex.; *Councilors*, H. R. Henze, H. L. Lochte.

CHICAGO. *Chairman*, Roy C. Newton; *Secretary*, George M. Schmeing, 505 North Michigan Ave., Chicago, Ill.; *Councilors*, Howard Adler, E. B. Carter, Victor Conquest, J. J. Doheny, Jr., W. V. Evans, B. B. Freud, Arthur Guillaudeu, L. M. Henderson, W. F. Henderson, C. D. Hurd, W. C. Johnson, L.

E. May, J. C. Morrell, R. C. Newton, H. E. Robinson, M. C. Rogers, B. E. Schaar, H. I. Schlesinger, E. H. Volwiler, R. E. Zinn.

CINCINNATI. *Chairman*, Wilmer C. Gangloff; *Secretary*, Daniel J. Kooyman, Chemical Division, Procter & Gamble Co., Ivorydale, Ohio; *Councilors*, R. F. Brown, D. J. Kooyman, R. E. Oesper, C. C. Ruchhoft.

CLEVELAND. *Chairman*, Eric A. Arnold; *Secretary*, M. R. Hatfield, Research Laboratory, National Carbon Co., Box 6087, Cleveland, Ohio; *Councilors*, E. A. Arnold, H. S. Booth, G. H. McIntyre, L. E. Steiner, J. C. Weaver.

COLORADO. *Chairman*, H. B. Van Valkenburgh; *Secretary*, Robert W. Virtue, University of Denver, Denver, Colo.; *Councilors*, W. W. Howe, S. A. Powell.

COLUMBUS. *Chairman*, Alfred B. Garrett; *Secretary*, Melvin S. Newman, Department of Chemistry, The Ohio State University, Columbus, Ohio; *Councilors*, C. E. Boord, W. A. Manuel, M. L. Wolfrom.

CONNECTICUT VALLEY. *Chairman*, Samuel E. Q. Ashley; *Secretary*, Harold S. Schwenk, University of Connecticut, Storrs, Conn.; *Councilors*, R. D. Dunlop, G. A. Hill, M. L. Sherrill.

CORNELL. *Chairman*, Albert W. Laubengayer; *Secretary*, William T. Miller, Jr., Department of Chemistry, Cornell University, Ithaca, N. Y.; *Councilor*, John R. Johnson.

DALLAS–FORT WORTH. *Chairman*, Manuel H. Gorin; *Secretary*, J. M. Hersh, Magnolia Petroleum Co., 1920 McKinney Ave., Dallas, Tex.; *Councilors*, W. H. Clark, J. L. Whitman.

DAYTON. *Chairman*, John D. Coleman; *Secretary*, Fred T. Marshall, Monsanto Chemical Co., Dayton, Ohio; *Councilors*, M. E. Haas, A. M. Patterson.

DELAWARE. *Chairman*, J. Harrel Shipp; *Secretary*, Frank K. Signaigo, Experiment Station, E. I. du Pont de Nemours & Co., Inc., Wilmington, Del; *Councilors*, R. F. Conaway, H. R. Dittmar, R. M. Goepp, Jr., E. O. Kraemer, G. G. Lahr, Emil Ott, Wm. E. Shaefer, H. W. Starkweather.

DETROIT. *Chairman*, Ralph D. Hummel, *Secretary*, Frances W. Lamb, 17140 Third Ave., Detroit, Mich.; *Councilors*, G. Calingaert, J. J. Jasper, Helen I. Miner, A. Rautenberg, L. A. Sweet, T. H. Vaughn.

EAST TENNESSEE. *Chairman*, Robert R. Ralston; *Secretary*, Eric Winters, Department of Agronomy, University of Tennessee, Knoxville, Tenn.; *Councilor*, J. H. Wood.

EASTERN NEW YORK. *Chairman*, Francis J. Norton; *Secretary*, Egbert K. Bacon, Chemical Laboratory, Union College, Schenectady, N. Y.; *Councilors*, H. M. Faigenbaum, Arthur Knudson, A. L. Marshall.

ERIE. *Chairman*, John C. Tongren; *Secretary*, James V. Blake, Pennsylvania Electric Co., Front Street Station, Erie, Pa.; *Councilor*, Sister Doloretta Thorn.

FLORIDA. *Chairman*, Isabel McKinnell; *Secretary*, Rowland B. French, Agricultural Experiment Station, University of Florida, Gainesville, Fla.; *Councilors*, J. P. Bain, A. T. Cole.

GEORGIA. *Chairman*, John J. McManus; *Secretary*, R. A. Day, Jr., Chemistry Building, Emory University, Emory University, Ga.; *Councilors*, J. S. Guy, H. M. Waddle.

HAWAIIAN. *Chairman*, O. C. McBride; *Secretary*, J. H. Payne, Pacific Guano & Fertiliser Co., P. O. Box 48, Honolulu, T. H.; *Councilor*, Martha Potgieter.

ILLINOIS-IOWA. *Chairman*, Charles L. Guettel; *Acting Secretary*, Charles L. Guettel, 2012 Fourth St., Moline, Ill.; *Councilor*, J. F. Goggin.

INDIANA. *Chairman*, John A. Leighty; *Secretary*, Kenneth W. Wantland, 6036 Haverford Ave., Indianapolis, Ind.; *Councilors*, William Higburg, E. H. Niles, J. L. Riebsomer, E. H. Stuart.

IOWA. *Chairman*, L. C. Raiford; *Secretary*, Joseph I. Routh, Chemistry Building, State University of Iowa, Iowa City, Iowa; *Councilor*, Wm. G. Eversole.

KALAMAZOO. *Chairman*, George R. Laure; *Secretary*, Hal B. Coats, 1017 Grant St., Kalamazoo, Mich.; *Councilor*, L. F. Smith.

KANAWHA VALLEY. *Chairman*, G. Vincent Scofield; *Secretary*, Alfred W. Downes, 506 Highland Ave., South Charleston, W. Va.; *Councilors*, H. L. Cox, Whitfield Price, W. E. Vail.

KANSAS CITY. *Chairman*, Leonard V. Sorg; *Secretary*, Clarence W. Sondern, George A. Breon & Co., Inc., Box 769, Kansas City, Mo.; *Councilors*, J. A. Austin, R. Q. Brewster.

KANSAS STATE COLLEGE. *Chairman*, A. C. Andrews; *Secretary*, Alfred T. Perkins, Kansas State College, Manhattan, Kans.; *Councilor*, H. H. King.

LEHIGH VALLEY. *Chairman*, Thomas H. Haslehurst; *Secretary*, Edward D. Amstutz, Department of Chemistry, Lehigh University, Bethlehem, Penna.; *Councilors*, E. A. Engle, H. A. Neville, C. D. Pratt.

LEXINGTON. *Chairman*, Martin E. Weeks; *Secretary*, Simon H. Wender, Department of Chemistry, University of Kentucky, Lexington, Ky.; *Councilor*, W. A. Hensley.

LOUISIANA. *Chairman*, A. W. Chapman; *Secretary*, Worden Waring, Department of Chemistry, College of Arts and Sciences, Tulane University, New Orleans, La.; *Councilors*, H. A. Levey, H. P. Newton.

LOUISVILLE. *Chairman*, G. L. Corley; *Secretary*, Gordon C. Williams, Speed Scientific School, University of Louisville, Louisville, Ky.; *Councilors*, R. C. Ernst, A. W. Homberger.

MAINE. *Chairman*, Samuel E. Kamerling; *Secretary pro-tem*, Wm. C. Root, 80 Federal St., Brunswick, Maine; *Councilor*, F. T. Martin.

MARYLAND. *Chairman*, Paul H. Emmett; *Secretary*, Channing W. Wilson, 4122 Westview Road, Baltimore, Md.; *Councilors*, A. H. Corwin, W. H. Hartung, Duncan MacRae, S. B. Schofield.

MEMPHIS. *Chairman*, Linwood N. Rogers; *Secretary*, E. E. Hembree, Pulp Plant, Buckeye Cotton Oil Co., Memphis, Tenn.; *Councilor*, J. R. Meadow.

MICHIGAN STATE COLLEGE. *Chairman*, Erwin J. Benne; *Secretary*, Clifford W. Duncan, 618 Butterfield Drive, East Lansing, Mich.; *Councilor*, D. T. Ewing.

MID-HUDSON. *Chairman*, Frank H. Bruner; *Secretary*, Fred C. Toettcher, Texas Co., Beacon, N. Y.; *Councilor*, Dorman McBurney.

MIDLAND. *Chairman*, John J. Grebe; *Secretary*, H. A. Stearns, Route 2, Midland, Mich.; *Councilors*, E. C. Britton, W. R. Veazey.

MILWAUKEE. *Chairman*, Howard L. Gerhart; *Secretary*, Charles W. Marshall, 2487 Oakland Ave., Milwaukee, Wis.; *Councilors*, N. A. Thomas, H. H. Tucker.

MINNESOTA. *Chairman*, Harold P. Klug; *Secretary*, Edward J. Meehan, Chemistry Department, University of Minnesota, Minneapolis, Minn.; *Councilors*, G. O. Burr, C. G. Ferrari, W. M. Lauer, R. E. Montonna.

MONTANA. *Chairman*, John F. Suchy; *Secretary*, Ray Woodriff, Chemistry Department, Montana State College, Boseman, Mont.; *Councilor*, O. E. Sheppard.

NASHVILLE. *Chairman*, W. P. Fishel; *Secretary*, Hanor A. Webb, Department of Chemistry, George Peabody College for Teachers, Nashville, Tenn.; *Councilor*, W. C. Sumpter.

NEBRASKA. *Chairman*, Carl E. Georgi; *Secretary*, Norman H. Cromwell, Department of Chemistry and Chemical Engineering, University of Nebraska, Lincoln, Nebr.; *Councilor*, E. R. Washburn.

NEW HAVEN. *Chairman*, Herbert S. Harned; *Secretary*, Harding Bliss, Sterling Chemistry Laboratory, Yale University, New Haven, Conn.; *Councilors*, Clinton Doede, C. C. Furnas.

NEW YORK. *Chairman*, Charles N. Frey; *Secretary*, Cornelia T. Snell, 66 Park Ave., New York, N. Y.; *Councilors*, M. Irene Bailey, H. H. Baker, Jr., R. A. Baker, J. J. Beaver, A. T. Burtsell, C. R. Dawson, M. E. Dros, E. J. Durham, Vincent du Vigneaud, R. C. Elderfield, A. S. Elsenbast, S. F. Gaffin, P. P. Gray, H. W. Hermance, H. A. Horan, W. R. Johnston, D. H. Killeffer, S. D. Kirkpatrick, F. S. Low, S. P. Miller, W. F. O'Connor, Donald Price, W. M. Ralph, E. W. Rice, F. D. Snell, W. M. Sperry, A. H. Tenney, L. A. Wooten.

NORTH CAROLINA. *Acting Chairman*, Sherman E. Smith; *Secretary*, Marcus E. Hobbs, Duke University, Durham, N. C.; *Councilors*, R. W. Bost, P. M. Gross.

NORTH JERSEY. *Chairman*, Calvin S. Fuller; *Secretary*, Reginald G. Sloane, 19 Pingry Place, Elizabeth, N. J.; *Councilors*, C. R. Addinall, E. R. Allen, J. B. Austin, J. A. Bradley, A. E. Brooks, F. E. Carruth, Thomas Cifelli, Jr., M. L. Crossley, H. F. Jordan, R. H. Kienle, R. T. Major, R. J. Moore, S. O. Morgan, E. B. Peck, R. D. Reed, William Rieman, III, H. F. Wakefield, R. E. Waterman.

NORTHEAST TENNESSEE. *Chairman*, Chester H. Penning; *Secretary*, Joseph H. Brant, Research and Development Division, Tennessee Eastman Corp., Kingsport, Tenn.; *Councilor*, J. R. Caldwell.

NORTHEAST WISCONSIN. *Chairman*, J. O. Frank; *Secretary*, John W. Green, The Institute of Paper Chemistry, Appleton, Wis.; *Councilor*, H. F. Lewis.

NORTHEASTERN. *Chairman*, Frederick S. Bacon; *Secretary*, Alberto F. Thompson, Jr., Eastman Chemical Laboratory Massachusetts Institute of Technology, Cambridge, Mass.; *Councilors*, G. R. Alden, C. M. Alter, A. A. Blanchard, R. D. Eddy, G. J. Esselen, J. J. Healy, Jr., F. C. Howard, H. A. Iddles, Grinnell Jones, A. A. Morton, Deborah Russell, Florence C. Sargent.

NORTHERN WEST VIRGINIA. *Chairman*, A. J. W. Headlee; *Secretary*, P. Lloyd MacLachlan, Department of Biochemistry, Medical School, West Virginia University, Morgantown, W. Va.; *Councilor*, I. J. Duncan.

NORTHWESTERN UTAH. *Chairman*, John R. Lewis; *Secretary*, G. Victor Beard, Chemistry Department, University of Utah, Salt Lake City, Utah; *Councilor*, Walter D. Bonner.

OKLAHOMA. *Chairman*, Harold M. Smith; *Secretary*, Leonard F. Sheerar, Department of Chemical Engineering, Oklahoma A. & M. College, Stillwater, Okla.; *Councilors*, B. C. Frichot, J. P. Jones, B. W. Logue.

OMAHA. *Chairman*, Wm. K. Noyce; *Secretary*, R. R. Briggs, Nebraska Power Co., Omaha, Nebr.; *Councilor*, C. L. Kenny.

OREGON. *Chairman*, Glenn C. Ware; *Acting Secretary*, Charles S. Pease, 2120 Harrison St., Corvallis, Ore.; *Councilors*, B. E. Christensen, C. S. Pease.

PANHANDLE PLAINS. *Chairman*, W. M. Deaton; *Secretary*, E. M. Frost, Jr., 815 Fairmont St., Amarillo, Tex.; *Councilor*, R. G. Atkinson.

PENNSYLVANIA–NEW YORK WESTERN BORDER. *Chairman*, Russell E. Palmateer; *Secretary*, Everett J. Schneider, 236 West 4th St., Emporium, Penna.; *Councilor*, Ralph W. Hufferd.

PEORIA. *Chairman*, Gerald C. Baker; *Secretary*, L. Gerber, 601 Linn St., Peoria, Ill.; *Councilor*, Wm. B. Baker, R. D. Coghill.

PHILADELPHIA. *Chairman*, Harry A. Alsentzer; *Secretary*, Lyle L. Jenne, 825 City Hall Annex, Philadelphia, Penna.; *Councilors*, W. G. Batt, J. L. Crenshaw, E. L. Haenisch, J. W. E. Harrisson, J. B. Hill, L. C. Hurd, H. S. Lukens, W. B. Meldrum, Arthur Osol, H. C. Porter, P. E. Rollhaus, Wm. Stericker, L. D. Stratton, F. T. Tyson.

PITTSBURGH. *Chairman*, J. C. Warner; *Secretary*, Ralph W. Bridges, Aluminum Research Laboratories, Box 772, New Kensington, Penna.; *Councilors*, F. W. Adams, L. H. Almy, H. V. Churchill, L. H. Cretcher, J. D. Edwards, C. G. King, J. N. Roche, E. K. Wallace, W. P. Yant.

PRINCETON. *Chairman*, Hubert N. Alyea; *Secretary*, John F. Lane, Frick Chemical Laboratory, Princeton University, Princeton, N. J.; *Councilor*, H. S. Taylor.

PUGET SOUND. *Chairman*, W. L. Beuschlein; *Secretary*, Victorian Siverts, Department of Chemistry, University of Washington, Seattle, Wash.; *Councilors*, A. L. Kniseley, R. J. Robinson.

PURDUE. *Chairman*, Earl T. McBee; *Secretary*, Fred J. Allen, Chemistry Department, Purdue University, West Lafayette, Ind.; *Councilor*, Thomas DeVries.

RHODE ISLAND. *Chairman*, Dana Burks; *Secretary*, Leallyn B. Clapp, Department of Chemistry, Brown University, Providence, R. I.; *Councilors*, P. C. Cross, J. P. Howe.

ROCHESTER. *Chairman*, Charles F. H. Allen; *Secretary*, Ernest R. Taylor, Building 14, Kodak Park, Rochester, N. Y.; *Councilors*, F. R. Baxter, E. K. Carver, C. R. Fordyce, R. W. Helmcamp, D. K. Tressler.

SACRAMENTO. *Chairman*, C. E. Larson; *Secretary*, L. M. Lampert, State Office Building No. 1, Sacramento, Calif.; *Councilor*, F. W. Bunyan.

ST. JOSEPH VALLEY. *Chairman*, Columba Curran, C. S. C.; *Secretary*, F. L. Benton, Department of Chemistry, University of Notre Dame, Notre Dame, Ind.; *Councilor*, H. B. Froning.

ST. LOUIS. *Chairman*, Fredrich Olsen; *Secretary*, Henry A. Carlton, Mallinckrodt Chemical Works, 3600 North Second St., St. Louis, Mo.; *Councilors*, H. L. Dahm, P. A. Krueger, LeRoy McMaster, R. B. Semple, L. J. Wood.

SAN DIEGO. *Chairman*, Paul B. Donovan; *Secretary*, Viola Sommermeyer, 301 Medico Dental Bldg., San Diego, Calif.; *Councilor*, D. E. Clark.

SIOUX VALLEY. *Chairman*, Guy G. Frary; *Secretary*, Ernest Griswold, Department of Chemistry, University of South Dakota, Vermillion, S. Dak.; *Councilor*, L. S. Guss.

SOUTH CAROLINA. *Chairman*, Maston T. Carlisle; *Secretary*, Willard A. Whitesell, 307 Southwood Drive, Columbia, S. C.; *Councilor*, J. E. Mills.

SOUTH JERSEY. *Chairman*, Clifford E. Carr; *Secretary*, Arlie A. O'Kelly, 78 North American St., Woodbury, N. J.; *Councilors*, H. G. Berger, W. S. Calcott, J. M. Tinker.

SOUTHEAST KANSAS. *Chairman*, Max E. Colson; *Secretary*, O. W. Chapman, Chemistry Department, Kansas State Teachers College, Pittsburg, Kans.; *Councilor*, J. H. Davidson.

SOUTHEAST TENNESSEE. *Chairman*, Emerson P. Poste; *Secretary*, William O. Swan, University of Chattanooga, Chattanooga, Tenn.; *Councilor*, I. W. Grote.

SOUTHEASTERN PENNSYLVANIA. *Chairman*, J. B. Zinn; *Secretary*, H. A. Reehling, Revonah Spinning Mills, Hanover, Penna.; *Councilor*, R. W. Higgins.

SOUTHEASTERN TEXAS. *Chairman*, M. C. Van Gundy; *Secretary*, E. P. Doremus, Jr., Research Laboratory, Shell Refinery, Deer Park, Tex.; *Councilors*, I. S. Cliff, A. J. Hartsook, R. H. Price.

SOUTHERN CALIFORNIA. *Chairman*, Willard E. Baier; *Secretary*, Harry V. Welch, Western Precipitation Co., 1016 West 9th St., Los Angeles, Calif.; *Councilors*, G. A. Alles, L. R. Brantley, W. A. Bush, H. N. McCoy, L. C. Pauling, J. B. Ramsey, R. W. Truesdail.

SYRACUSE. *Chairman*, Frank Porter; *Secretary*, Joseph L. Neal, Jr., Department of Chemistry, Syracuse University, Syracuse, N. Y.; *Councilors*, A. L. Elder, P. A. Keene.

TEXAS A. & M. *Chairman*, J. D. Lindsay; *Secretary*, G. S. Fraps, College Station, Tex.; *Councilor*, H. H. Garretson.

TOLEDO. *Chairman*, Harold F. Stose; *Secretary*, John J. Thornton, 3827 Alameda Drive, Toledo, Ohio; *Councilor*, J. H. Toulouse.

UNIVERSITY OF ILLINOIS. *Chairman*, George L. Clark; *Secretary*, Herbert A. Laitinen, Department of Chemistry, University of Illinois, Urbana, Ill.; *Councilors*, L. F. Audrieth, R. E. Greenfield, G. F. Smith.

UNIVERSITY OF MICHIGAN. *Chairman*, L. O. Case; *Secretary*, Lawrence O. Brockway, Department of Chemistry, University of Michigan, Ann Arbor, Mich.; *Councilor*, H. H. Willard.

UNIVERSITY OF MISSOURI. *Chairman*, Luther R. Richardson; *Secretary*, Herbert E. Ungnade, School of Chemistry, University of Missouri, Columbia, Mo.; *Councilor*, H. E. French.

VIRGINIA. *Chairman*, H. R. Hanmer; *Secretary*, E. S. Harlow, The American Tobacco Co., Box 4178, Richmond, Va.; *Councilors*, W. C. Jones, S. S. Negus, John H. Yoe.

VIRGINIA BLUE RIDGE. *Chairman*, John D. Schumacher; *Secretary*, Nan V. Thornton, Randolph Macon Women's College, Lynchburg, Va.; *Councilor*, J. W. Watson.

WASHINGTON. *Chairman*, Norman Bekkedahl; *Secretary*, Edgar R. Smith, National Bureau of Standards, Washington, D. C.; *Councilors*, W. D. Collins, N. L. Drake, H. L. J. Haller, R. M. Hann, J. H. Hibben, F. O. Rice, F. D. Rossini, M. X. Sullivan, E. Wichers.

WASHINGTON-IDAHO BORDER. *Chairman*, E. V. White; *Acting Secretary*, E. V. White, Wood Products Laboratory, University of Idaho, Moscow, Idaho; *Councilor*, R. W. Gelbach.

WESTERN CONNECTICUT. *Chairman*, Wm. H. Cope; *Secretary*, Wm. Cabler Moore, 42 Chesterfield Road. Shippan Point, Stamford, Conn.; *Councilors*, H. L. Fisher, F. P. Lasseter, Lois W. Woodford.

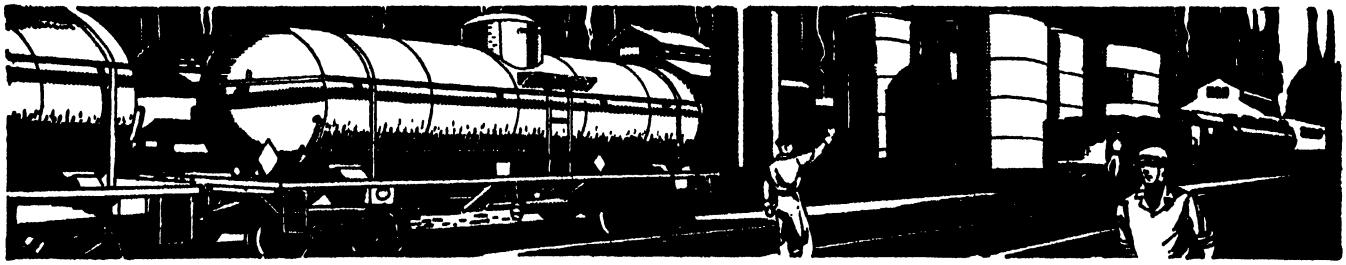
WESTERN MARYLAND. *Chairman*, John L. Baggett; *Secretary*, Dustin Y. Miller, 418 Avirett Ave., Cumberland, Md.; *Councilor*, G. W. Seymour.

WESTERN NEW YORK. *Chairman*, Nelson Allen; *Secretary*, Edward F. Wesp, E. I. du Pont de Nemours & Co., Inc., Station B, Buffalo, N. Y.; *Councilors*, W. K. Eglof, W. L. Hyden, C. J. Kinsie, H. W. Post, C. H. Rasch, M. C. Taylor.

WESTERN VERMONT. *Chairman*, E. B. Womack; *Secretary*, Constance L. Brown, Williams Science Hall, University of Vermont, Burlington, Vt.; *Councilor*, H. C. Hamilton.

WICHITA. *Chairman*, Leonard C. Kreider; *Secretary*, L. A. Enberg, East Plant No. 2, Carey Salt Co., Hutchinson, Kans.; *Councilor*, R. E. Puckett.

WILSON DAM. *Chairman*, John W. Lefforge; *Secretary*, Ernest O. Huffman, P. O. Box 1641, Wilson Dam, Ala.; *Councilor*, J. W. H. Aldred.



WISCONSIN. *Chairman*, Michael W. Klein; *Secretary*, Alfred L. Wilds, Department of Chemistry, University of Wisconsin, Madison, Wis.; *Councilors*, Homer Adkins, N. F. Hall.

WOOSTER (OHIO). *Chairman*, Charles H. Hunt; *Secretary*, John W. Chittum, 722 North Bever St., Wooster, Ohio; *Councilor*, Roy I. Grady.

Committees

(April 1942 to April 1943)

Members of the SOCIETY should note that these committees are *their* committees. Some of these committees deal with very general and all-important problems.

They desire to serve as clearinghouses and are anxious to have suggestions and thoughts from individual members. Send your suggestions to the chairman of the committee. There is no committee so able or representative that it cannot profit by the individual ideas of the membership.

Advisory to the Bureau of Mines and National Bureau of Standards on Nonferrous Metals. *A. C. S. Representative on the Committee:* Wm. B. Price, Scoville Mfg. Co., Waterbury, Conn.

Analysis of Commercial Fats and Oils (established 1926). *Chairman*, V. C. Mehlenbacher, 112 South La Grange Road, La Grange, Ill.; J. Fitelson, W. D. Hutchins, M. L. Laing, C. P. Long, K. S. Markley, J. E. Maroney, L. B. Parsons, W. J. Reese, H. A. Schuette, M. L. Sheely, S. O. Sorensen, L. M. Tolman, H. P. Trevithick, F. C. Woekel.

Analytical Reagents (established 1917). *Chairman*, Edward Wichers, 113 West Woodbine St., Chevy Chase, Md.; A. Q. Butler, W. D. Collins, P. H. Messinger, R. A. Osborn, Joseph Rosin, John F. Ross.

Annual Report on Atomic Weights (established 1897). G. P. Baxter, Coolidge Memorial Laboratory, Cambridge, Mass.

Award Committees:

American Chemical Society Award in Pure Chemistry (established 1931). Canvassing Committee for Award Nominations: *Chairman, Term expires April 30, 1943:* George Scatchard. *Term expires April 30, 1944:* Ralph L. Shriner. *Term expires April 30, 1945:* Joel H. Hildebrand.

Borden Co. Award in Chemistry of Milk (established 1938). Canvassing Committee for Award Nominations: *Chairman, Term expires April 30, 1943:* R. C. Newton. *Term expires April 30, 1944:* R. Adams Dutcher. *Term expires April 30, 1945:* George E. Holm.

Eli Lilly and Company Award in Biological Chemistry (established 1934). Canvassing Committee for Award Nominations: *Chairman, Term expires April 30, 1943:* M. L. Crossley. *Term expires April 30, 1944:* Lyndon F. Small. *Term expires April 30, 1945:* C. A. Elvehjem.

Chemical Service to Medicine (established 1939). (Committee reports to the Directors.) *Chairman*, Vincent du Vigneaud, Cornell University Medical School, 1300 York Ave., New York, N. Y.; H. T. Clarke, W. G. Karr, V. C. Myers, A. E. Osterberg, D. D. Van Slyke.

Cooperation with Chemical Warfare Service (established 1920). *Chairman*, H. E. Howe, 1155 16th St., N. W., Washington, D. C. *Research:* Roger Adams, Per K. Frolich, C. A. Kraus, A. B. Lamb, W. A. Noyes, Jr., E. R. Weidlein, F. C. Whitmore. *Development:* Bradley Dewey, W. K. Lewis, G. A. Richter, C. M. A. Stine, L. T. Sutherland. *Production:* G. O. Curme, Jr., W. H. Dow, L. C. Jones, M. C. Whitaker. *Physiological:* Wm. Mansfield Clark, Paul D. Lamson, E. K. Marshall, Jr., D. D. Van Slyke, Vincent du Vigneaud.

Cooperation with National Defense Research Committee (established 1940). (Committee reports to the Directors.) *Chairman*, Roger Adams, Chemistry Laboratory, University of Illinois, Urbana, Ill.; Harry N. Holmes, Thomas Midgley, Jr. *Ex Officio;* J. B. Conant, W. K. Lewis, Charles L. Parsons, E. R. Weidlein, R. E. Wilson.

Council Policy (established 1923). *Ex Officio: Chairman*, Harry N. Holmes, Severance Chemical Laboratory, Oberlin College, Oberlin, Ohio; Robert T. Baldwin, E. J. Crane, Wm. Lloyd Evans, Per K. Frolich, H. E. Howe, A. B. Lamb, Thomas Midgley, Jr., Charles L. Parsons. *Term expires December 1942:* Erle M. Billings. *Term expires December 1943:* G. J. Esselen. *Term expires December 1944:* Walter A. Schmidt.

Economic Status (established 1941). *Chairman*, Lawrence W. Bass, New England Industrial Research Foundation, Inc., 137 Newbury St., Boston, Mass.; George Calingaert, Walter A. Schmidt, Walter G. Whitman, F. C. Whitmore.

Exchange (established 1907). *Chairman*, E. J. Crane, *Chemical Abstracts*, Ohio State University, Columbus, Ohio; H. E. Howe, A. B. Lamb.

Hazardous Chemicals and Explosives, to cooperate with National Fire Protection Association Committee on the same subject (established 1923). *Chairman*, George W. Jones, U. S. Bureau of Mines, Pittsburgh, Penna.; F. F. Chapman, A. H. Nuckolls.

Industrial Alcohol (established 1921). *Chairman*, Martin H. Ittner, Colgate-Palmolive-Peet Co., Jersey City, N. J.; R. F. Bacon, J. H. Beal, J. G. Davidson, W. H. Dow, E. H. Killheffer, R. H. McKee, H. W. Rhodehamel

Licensing Inquiry (established 1939). *Chairman*, Frederic W. Willard, 12 Hawthorn Place, Summit, N. J.; Arthur Guillaudeu, H. S. Lukens, Foster D. Snell.

Membership (established 1876). *Chairman*, W. D. Collins, U. S. Geological Survey, Washington, D. C.; H. E. Howe, Charles L. Parsons.

National Research Council Representatives from A. C. S. on Division of Chemistry and Chemical Technology. *Terms expire July 1, 1943:* G. J. Esselen, Paul M. Gross. *Terms expire July 1, 1944:* L. W. Bass, H. M. Chadwell; *Terms expire July 1, 1945:* Paul D. Bartlett, Per K. Frolich.

Nomenclature, Spelling, and Pronunciation (established 1894). *Chairman*, E. J. Crane, *Chemical Abstracts*, Ohio State University, Columbus, Ohio; Board of Editors of the *Journal of the American Chemical Society;* Editor of *Industrial and Engineering Chemistry;* L. T. Capell, A. M. Patterson, Janet D. Scott.

Paper (established 1908). *Chairman*, Byron L. Wehmhoff, 6506 Brennon Lane, Chevy Chase, Md.; B. W. Scribner, H. J. Skinner.

Patent and Related Legislation (established 1899). *Chairman*, Walter A. Schmidt, 1016 West Ninth St., Los Angeles, Calif.; Robert T. Baldwin, F. E. Barrows, F. G. Breyer, Bruce K. Brown, Henry Howard, Nelson Littell, J. C. Morrell, Elmer Stewart, O. W. Storey, E. H. Volwiler.

Professional Training of Chemists (established 1936). *Chairman*, W. Albert Noyes, Jr., Department of Chemistry, University of Rochester, River Campus, Rochester, N. Y. *Secretary* (member *ex officio*), Erle M. Billings, 343 State St., Rochester, N. Y. *Term expires April 30, 1943:* W. G. Young. *Term expires April 30, 1944:* Harry B. Weiser. *Term expires April 30, 1945:* W. Albert Noyes, Jr. *Term expires April 30, 1946:* S. C. Lind.

Retired Chemists. Committee to Consider Utilizing Their Services in the Present Emergency (established 1942). *Chairman*, J. Sam Guy, 1192 Ponce de Leon Ave., N. E., Atlanta, Ga.; Wm. Lloyd Evans, B. S. Hopkins, S. R. Brinkley, S. C. Lind, E. Emmet Reid, H. H. Willard.

Soap and Soap Products (established 1935). *Chairman*, F. W. Smither, National Bureau of Standards, Washington, D. C.; R. E. Divine, J. E. Doherty, C. P. Long, E. B. Millard, M. L Sheely, H. P. Trevithick.

Standard Apparatus (established 1917). *Chairman*, W. D. Collins, U. S. Geological Survey, Washington, D. C.; J. V. Freeman, R. A. Osborn, Lyon Southworth, Edward Wichers, H. H. Willard.

Standard Methods for the Examination of Water and Sewage, to Cooperate with the Committee of the American Public Health Association (established 1920). *Chairman*, Arthur M. Buswell, University of Illinois, Urbana, Ill.; W. D. Collins, F. W. Mohlman, F. G. Straub.

Standardization of Biological Stains (established 1924). *A. C. S. Representative on the Commission:* John T. Scanlan, Eastern Regional Research Laboratory, U. S. Department of Agriculture, Chestnut Hill, Philadelphia, Penna.

Standardized Methods for Vitamin Research (established 1921). *Chairman*, Edward A. Doisy, 1402 South Grand Ave., St. Louis, Mo.; A. D. Emmett, C. G. King, E. V. McCollum, E. M. Nelson.

Study Problem of the Teaching of Chemistry in High Schools (established 1941). *Chairman*, B. S. Hopkins, Chemistry Laboratory, University of Illinois, Urbana, Ill.; H. N. Alyea, D. M. Kumro, M. V. McGill, A. W. Scott.

Supervision of Chemical Engineering Catalog (established 1915). W. R. Veasey, Dow Chemical Co., Midland, Mich.

Supervisory on Standard Methods of Analysis (established 1910). *Chairman*, H. H. Willard, 208 Chemistry Bldg., University of Michigan, Ann Arbor, Mich.; B. L. Clarke, I. M. Kolthoff, G. E. F. Lundell, W. W. Skinner.

Women's Service (established 1927). *Chairman*, May L. Whitsitt, Department of Chemistry, Southern Methodist University, Dallas, Tex.; Mildred Adams, H. Marjorie Crawford, Rachel H. Edgar, Mildred W. Grafflin, Gertrude Vermillion.

A. C. S. New Members Elected September 1 to October 1, 1942

Total Membership as of October 1, 31,602

Akron Section. Bernhard N. Larsen, Leora E. Straka.

Alabama Section. Roberts Bouson, James J. Dwyer[1], William Tillman Haynes, Jr.

California Section. Vernon E. Haury, Milton Kahn[1], Philip Mitton, Oliver Tire & Rubber Co.

Central Pennsylvania Section. Robert I. Dixon[1], Joseph Kalina[1].

Chicago Section. Robert A. Diehm, John P. Edwards[1], John Ralph Ferraro[1], John E. Flanagan[1], Arden R. Johnson, Richard W. KixMiller[1], Thaddeus J. Kowalski[1], Charles Lowe[1], Aaron Miller, Edward J. Shaeffer, Sidney L. Simon.

Cleveland Section. Eric de Reville Falcao, Richard R. Holmes[1], Walter M. Iliff[1], Joseph H. Schneider.

Columbus Section. Howard W. Kruse, L. P. Larson, G. Frederick Smith Chemical Co.

Connecticut Valley Section. Franklin H. Branin, Jr.[1], Harry Pearlman, Alfred G. Rossow, L. Blaine Tewksbury, Jr.

Cornell Section. Milton L. Scott.

Dayton Section. Robert C. Treue.

Delaware Section. Stanley G. Ford.

Detroit Section. Deno Laganis[1], Albert John Sargent, Jr.[1], Robert J. Thorn.

Eastern New York Section. Royal A. Cutler, Jr.[1], Theodore A. Jacob[1].

Indiana Section. Herbert F. Smith.

Kanawha Valley Section. Ben W. Kiff, Andrew T. Walter[1].

Lehigh Valley Section. Michael Bebel[1].

Louisiana Section. Jacob S. Guepet, Charles M. McKay.

Maine Section. Nathan Glover[1].

Maryland Section. Erwin M. Raabe[1], Harry Gordon Steinman.

Michigan State College Section. Heber R. Baldwin, Robert W. Besch[1], Benjamin Hartley Pringle.

Midland Section. Wesley Dean Schroeder.

Milwaukee Section. Fred C. Kraats.

New Haven Section. Doris R. Seeger[1].

New York Section. John R. Abrams, Thomas F. Callahan, Robert T. Florence, Leon Hammer[1], Rev. Alvin A. Hufnagel[1], Martin S. Kulpinski[1], Frank W. Miller, Jr.[1], Mimosa Pfalts, Morton L. Reich[1], Robert G. Seaman, Eugenia P. Tenney[1], I. Louis Wolk, Ernest G. Wollish, Lois M. Zucker.

North Jersey Section. John G. Augenstein, Francis P. Baldwin[1], Edward W. Harvey, Roland A. Morck, Daniel T. Piwowar, M. L. Rushmore, Ernest Solomon, Warren B. Warden, Herbert A. Wells.

Northeastern Section. Richard Bersohn[1], Edward O. Densler, Sidney W. Factor[1], Carl F. Floe, George C. Harris, G. Haugaard, William Jay, III[1].

Oklahoma Section. Harold G. Owen.

Peoria Section. Rexel Scholfield.

Philadelphia Section. Daniel F. Dickel[1], Austin A. Dodge, G. Harvey Saunders[1], Waclaw Szukiewicz, Philip B. Taft, Donald B. Thornton[1].

Pittsburgh Section. G. Leslie Armstrong[1], Carl E. Carlson, James Cooperman, Rufus N. Palmer, Peter V. Paulus, Robert S. Sikora[1], Maurice H. Whitlock[1].

Puget Sound Section. Oscar Fitzalan Orr, Jr.[1]

Purdue Section. Willard S. Breon, Elwyn D. Schall.

Rhode Island Section. Ross E. Van Dyke[1].

Rochester Section. Robert F. Brown, Dana Lee French[1], Alvin D. Keene[1], Leonard R. Sainsbury.

St. Joseph Valley Section. Earl T. Anderson, Joe D. Miller, Robert C. Poock.

St. Louis Section. Robert E. Broholm[1], L. Lynn Nickel, William C. Teach[1].

South Jersey Section. Albert H. Klein, Lewis H. Wilson[1].

Southern California Section. H. D. Chapman, Marcellus T. Flaxman, Oscar Grisat[1], Jack S. Hicks[1], Frank J. Ross, Thomas C. Van Osdall[1].

Syracuse Section. Frank Lawatsch[1], Hutton W. Theller[1], H. Kent Vanderhoef[1].

Toledo Section. R. P. Meyer.

University of Illinois Section. John D. Garber[1], Sol Wexler[1].

University of Missouri Section. Martin B. Williamson[1].

Washington Section. George H. Berryman, Jane C. Ebbs, Elden D. Haller, Paul L. Kingsley, Harold D. Levene.

Western Connecticut Section. Henry James Rand[1].

Western Maryland Section. Albert M. Kaiser.

Western New York Section. Mary H. Aldridge[1], Norman L. Anderson, George J. Antlfinger[1], George C. Aronstamm, John A. Baumann, Robert H. Beeman[1], Leslie E. Chamberlain, John W. Churchill, Clarence E. Coleman, Robert M. Coleman, Robert Kent Gatley, John W. Healy[1], Walter Klabunde, Doris Ann Lyman[1], James E. Mensching, Wayne F. Nelson[1], Ralph B. Payne, Thomas P. Reville, John J. Ronayne, Jr.[1], Raymond A. Russell[1], Arthur E. Weber, Richard G. Werth[1], Robert A. Willihnganz, Robert J. Wineman[1], Emerson L. Wittbecker, John A. Woodard[1], R. Woodell[1].

Wichita Section. W. A. Hartman[1].

No Section. Robert L. Bennett, H. Edward Cable, Montroy J. Cohen[1], Harry E. Crawford[1], Mary Ann Davis[1], Gordon P. Dillon, Edmund Langley Hirst, R. E. Hurst, S. L. Nevins, Richmond J. Roberts, Warnock Work[1].

[1] Junior member.

NECROLOGY

Hector R. Carveth

HECTOR R. CARVETH, internationally known electrochemist, died on September 17 in Niagara Falls, N. Y., as a result of injuries suffered when a cement tank exploded while being tested at the winery of Chateau Gay, Ltd., of which he was president.

Dr. Carveth was born in Fort Hope, Ontario, January 23, 1873, and studied at Toronto University and Cornell University. He was an instructor in chemistry at Cornell from 1900 to 1905, and then became associated with E. G. Acheson, of the Acheson Graphite Co. In 1906 he became works manager of the Niagara Electro-Chemical Co., a subsidiary of Roessler & Hasslacher. During World War I he was in charge of all technical operations of R. & H., with the title of vice president, and in 1928 he became president of the company. He retired in 1932, a year after the company had been absorbed by du Pont, and since that time had devoted himself to private chemical research in the development of sodium. He held many patents on sodium and sodium derivatives.

Dr. Carveth was a member of the AMERICAN CHEMICAL SOCIETY, the Electrochemical Society, The Chemists Club, and the Society of Chemical Industry.

Carl Nelson Hand

CARL NELSON HAND, chemical engineer and retired plant manager of the Rubber Service department of Monsanto Chemical Co., died September 18 at Charleston, W. Va. He was 50 years old.

Mr. Hand, with E. J. Smail, Jr., and C. O. North, founded the Rubber Service Laboratories at Akron, Ohio, in 1922 and was president and general manager until 1929 when Rubber Service became a part of Monsanto Chemical Co. He continued as manager of the Rubber Service department plant at Nitro, W. Va., until his retirement in 1938. Since then he has been engaged in private research work.

Mr. Hand was a graduate of Hobart college and held a chemical engineering degree from the Massachusetts Institute of Technology. Prior to founding Rubber Service Laboratories he was a development engineer for the Goodyear Tire & Rubber Co. For some years he was a member of the AMERICAN CHEMICAL SOCIETY, which he joined in 1927.

Leonard V. Rohner

LEONARD V. ROHNER, research chemist for the Solvay Process Co., Syracuse, N. Y., died July 29 after a short illness.

Mr. Rohner was graduated in chemical engineering from Syracuse University in 1923, and since that time had been in the employ of the Allied Chemical and Dye Corp. in various technical capacities. He had been a member of the AMERICAN CHEMICAL SOCIETY since 1936, and also belonged to Alpha Chi Sigma.

Edward W. P. Smith

EDWARD W. P. SMITH, 56-year-old consulting engineer for The Lincoln Electric Co. and a nationally known authority on arc welding, died suddenly September 19.

A veteran of more than 20 years' service with The Lincoln Electric Co., Mr. Smith had traveled extensively in the last year in the interests of the war production program. Visiting many war industry centers, he had been conducting welding courses and giving lectures on the latest techniques in welding. He gave advice to many war concerns utilizing welding in the construction of war equipment.

Mr. Smith was born in Cleveland and was graduated from Colorado College, Colorado Springs, Colo., with a degree in electric engineering. Before joining Lincoln Electric as a tester he had worked in the electrical inspection department of the City of Cleveland and for the Westinghouse Electric and Manufacturing Co. in Pittsburgh.

He gave special courses at the Lincoln plant each month on designing for welding. He developed several original methods of demonstrating the stresses in metals and was to have been chairman of a number of technical sessions at the convention of the American Welding Society in Cleveland the week of October 12.

Mr. Smith was widely known as a technical writer and contributed many articles to the trade and technical press.

Harry V. Wallace

HARRY V. WALLACE, vice president and director of sales of the Kimble Glass Co., died September 15, at the age of 48.

After experience in the sales field with the Socony-Vacuum Co. and the Owens-Illinois Glass Co., Mr. Wallace joined the Kimble Glass Co., in 1931, as Chicago branch manager. In 1939 he was transferred to Vineland, N. J., and on June 7, 1939, became vice president and director of sales.

Otto Wilson

OTTO WILSON, free-lance research writer, died September 12 in Washington, D. C., at the age of 57.

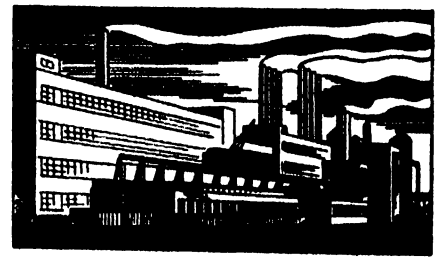
Mr. Wilson was born in New Bethel, Ind., and was educated at Butler College and Indiana University. During World War I he was a captain in the Chemical Warfare Service. He was a frequent contributor to CHEMICAL AND ENGINEERING NEWS and *Industrial and Engineering Chemistry*.

WE ANNOUNCE with regret the death of the following A. C. S. members:

Paul L. Aultman, technical superintendent, Sun Rubber Co., Akron, Ohio. Member since 1937.

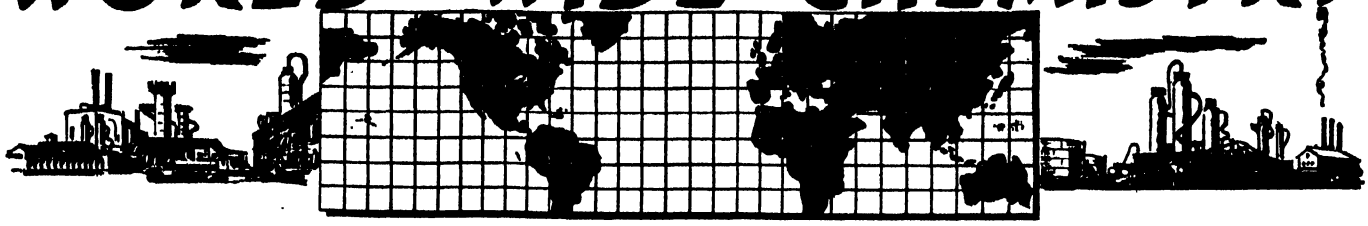
Gustavus R. Glenn, Jr., manager, survey and engineering department, Johnson & Higgins, New York, N. Y. Member since 1934.

Charles S. Roy, Cuffley, Herts, England. Member since 1912.



Neal D. Ryan, vice president, Purity Drug Co., Inc., New York, N. Y. Member since 1935.

F. M. Stanton, physician, Columbus, Ohio. Member since 1940.



Donald P. Swisher, Chemical Warfare Service, U. S. Army, Butler, Penna. Member since 1929.

WORLD-WIDE CHEMISTRY

GREAT BRITAIN

The concentration process is progressing in the chemical industries. Soap manufacturers whose business has been severely curtailed by rationing now must have an official license. Paint makers have been informed of further restrictions in raw materials. A survey of drug stocks has been undertaken by the Ministry of Supply to establish the requirements of imported drugs. Labor set free in chemical industries affected by control and concentration orders, however, is placed immediately in other chemical factories unless needed for more urgent tasks elsewhere.

Tar Distillers Tackle Problems

The Association of Tar Distillers has been concerned about the increasingly difficult labor problem. The possibility of employing women is being considered, based on the experience of a number of distillers; it has been approved by the government and the trade unions. The Committee on Building Materials Standardisation in the Ministry of Works and Planning has issued recommendations for the replacement of imported asphalt and bitumen. Mastic asphalt for roofing is to be replaced by built-up tar felts; in damp-proofing, by cement rendering or tar and pitch membrane; on static water tanks, by a layer of tar felt; and for acid-resisting flooring, by acid-resisting vitreous tiles in acid-resisting cement. Instead of tar macadam for road construction, water-bound macadam (possibly with a tar surface dressing) or concrete (either uncarpeted or tarred for camouflage) are suggested. Cold bitumen emulsion as used for damp-proofing wall surfaces, coating static water tanks, blinding concrete roofs, and fixing wood block flooring is replaced by fluxed coal-tar pitch. Bitumen-protected metal for roofing and structures is replaced by black iron dipped in hot pitch.

EDITOR'S NOTE. Those interested in further details should address the correspondent whose name and address appear for each country, and enclose sufficient International coupons to prepay the reply. United States stamps should not be sent.

Vitamin C Preservation In Rose Hips Is Studied

Rose hips collected last autumn in Hertfordshire had the largest vitamin C content, report Ovaltine Research Laboratories, when collected in the middle of November—namely, 400 mg. per 100 grams. During the previous weeks the vitamin C value was slightly lower, and by early December it had declined to two thirds of the maximum. Moreover, the vitamin C content declines as soon as the hips are collected, and drying is not satisfactory. When the rose hips are dried *in vacuo* (for 8 hours at 50° C.) or minced before drying, 10 per cent of the vitamin C is lost. Loss during manufacture can be avoided by heat treatment as soon as possible after collection to destroy the oxidizing enzymes, followed by preparation *in vacuo* of an extract stabilized by mixing with a high concentration of sugar and storing at a low temperature. There is a gradual loss of vitamin C in the interval between preparation and use. This may amount to as much as 50 per cent in the case of rose hip sirup kept until spring. It can be retarded, though not entirely prevented, by storing the sirup in nitrogen-filled containers.

Export License Required for CS_2

Carbon disulfide has been added to the list of chemical products for which export licenses are required to all destinations. Shipping difficulties and growing demands on the part of British manufacturers on war work have compelled the authorities to scrutinize more closely applications for export licenses. New restrictions have been placed on shipments to South Africa and other African countries.

Sewage Sludge Tested as Fertilizer Material

The Agricultural Research Council has undertaken experiments on the use of sewage sludge in agriculture, either alone or mixed with other waste products. Between 500,000 and 1,000,000 tons are available annually, but large differences are found in the sludge from different towns. Therefore its widespread use cannot be recommended before the results of the trials are known.

Study of Silicosis Leads to New Abrasives

Every effort has been made in the pottery industry to discourage the use of siliceous abrasives because of the danger of silicosis. A leading firm has successfully substituted harmless abrasives for sand in cleaning "browned-biscuit" ware. Although the new material is much more expensive, it has been found to be technically efficient. In polishing operations, promising results have been obtained with crushed fused alumina instead of siliceous abrasives.

Restrictions Extended to Substitute Motor Fuels

Restrictions on the use of motor fuel and Diesel oil have been extended to include all kinds of substitute fuels such as coal, steam, electricity, propane, and producer gas. The Ministry of War Transport will have to be convinced of the essential nature of the work performed before vehicles are licensed for the use of any of these fuels. Some alternative fuels, such as propane and butane, are in such great demand for essential purposes that no licenses for their further use in road transport will be given even to firms using them now. Meanwhile, Shell-Mex and B. P. Ltd. state that ample supplies of "Propagas" which can be substituted for acetylene in aluminum welding, annealing, lead burning, metal spraying, etc., are available. The ministry has placed two orders for 5,000 plants each for producer gas apparatus.

Artificial Silk Used for Utility Textiles

The bulk of British textile production now consists of so-called utility materials—i. e., fabrics which have been made to government specification at fixed prices and profit margins with special consideration to savings in material and labor. A

wide variety of fabrics is produced from a limited number of rayon yarns, and this rationalization has contributed to the cheapness of artificial silk materials. Considerable use is made of staple fiber, and viscose and acetate are used in mixtures as well as viscose fiber alone. Most of the staple fiber fabrics are subjected to the crease-resisting process; as a result, chemical manufacturers are receiving many inquiries from textile firms which were not formerly interested in chemicals for finishing textile fabrics. The rationing system has increased interest in materials which help to prolong the life of clothes, and the chemical industry has benefited from the demand for antifelting, crease-resisting, and waterproofing materials.

G. ABRAHAMSON
150 HALFWAY ST.
SIDCUP, KENT
ENGLAND
August 15, 1942

Until the beginning of 1941, cement produced in Brazil was sufficient to meet local requirements and importation was confined to a very limited quantity constituted mainly of special qualities of cement. Because of the increased expansion of building construction, not only private but also governmental, the production of cement in Brazil proved insufficient for the development of building activities. Several studies were carried out in various parts of the country to ascertain the possibility of installing new plants. Besides those referred to in previous letters, a new company is being formed having in mind the installation of a cement manufacturing plant at Paraiso, in the neighborhood of Campos, in the State of Rio de Janeiro. It is reported that the machinery will be bought in the United States and shipped during the current year, thus enabling the factory to start production by the middle of 1943. The new factory will have a capacity of about 800 metric tons per day, the initial production being estimated at 700 metric tons. The plant, besides burning fuel oil, will be adapted to burn Brazilian coal, obtained from the State of Paraná.

Export Regulations Have Been Issued

The Export and Import Department of the Bank of Brazil announced that export licenses are required for export from Brazil of machinery; vehicles; chemical and pharmaceutical products; surgical, electrical, optical, and photographic material; agricultural machinery; and tools in general.

Decree 9618, issued by the Federal Government, approved the specifications and classification control of export of new potatoes and citrus essential oils.

The National Council for Foreign Trade recently fixed minimum prices for export of rock crystals (quartz) for weights up to 10 kg. Crystals weighing more than this will be valued by the National Department of Mineral Production.

The Federal Government has granted a special license for the shipment to a firm in Philadelphia of 2,000 metric tons of zirconium ore from the Poços de Caldas region in the State of Minaes Geraes.

Marahuita Shale Deposit Is Studied

Because of the decrease in imported coal, the Brazilian Government is again studying the use of marahuita for production of city gas. "Marahuita" is the name given by Orville Derby to the shale obtained from the region of Marahú, in the State of Baía. The deposits of shale were recently estimated at about 450,000 metric tons of moist rock, discovered in the middle of the last century. Several tests were carried out in Europe and the United States and two industrial enterprises began using Marahú shale as raw material for oil production. Analyses performed at the Instituto Nacional de Tecnologia showed the following composition: moisture, 2.7 to 46.6 per cent; volatile matter, 30.0 to 75.7 per cent; fixed carbon, 6.4 to 31.5 per cent; ash, 7.7 to 42.5 per cent; and sulfur, 0.2 to 1.4 per cent. The samples analyzed showed a great variety in percentage composition, due to the fact that different kinds of marahuita were tested. Although several attempts were also made on a small scale for commercial exploitation of the Marahú shale, none showed a continuous operation because of the high costs of the oil products obtained. Large-scale experiments are being carried out in collaboration with the gas company in Rio de Janeiro. It was stated that marahuita produces more gas and of a better quality than imported coal. Steps were also taken by the government to obtain, for Rio de Janeiro City, a daily output of 200 metric tons of fuel from the deposits of Marahú; the Minister of Transport and Public Works had recommended the rationing of gas consumption in the city. According to the press, consumers are to be rationed on the basis of their average consumption less 20 per cent. Brazilian coal and marahuita are to be used in place of imported coal as far as possible.

Paper Industry in Brazil Is Active

The consumption of paper of all qualities in Brazil during the last 3 months amounted to the following: 1939, 171,735 metric tons; 1940, 170,619 metric tons; and 1941, 190,176 metric tons. During the same period imports were very irregular, decreasing from 52,612 metric tons in 1939 to 49,711 in 1940, and increasing to 61,405 in 1941. However, local production showed a steady and regular increase, amounting to 119,123 metric tons in 1939, 120,908 in 1940, and 128,771 in 1941. In the local production of paper not only imported but locally manufactured cellulose pulp was used. Imports of cellulose pulp amounted to the following: 1939, 84,480 metric tons; 1940, 63,708 metric tons; and 1941, 79,926 metric tons.

There are in Brazil 38 paper factories, 16 of which are located in the State of São Paulo, 6 in the Federal District, 5 in the State of Rio Grande do Sul, 4 in the State of Minas Geraes, 2 each in the States of Rio de Janeiro and Paraná, and one each in the States of Santa Catarina, Baía, and Pernambuco. The factories in the State of São Paulo produced during 1941 about 52 per cent of the total Brazilian production, the Federal District about 13 per cent, the State of Rio de Janeiro about 13 per cent, the State of Minas Geraes about 7 per cent, the States of Pernambuco and Paraná about 5 per cent each, the State of Rio Grande do Sul 3 per cent, the State of Santa Catarina about 2 per cent, and the State of Baía a little less than 1 per cent. Six factories produced during 1941 more than 6,000 metric tons of all kinds of paper.

The Klabin concern controls two factories, one in the State of São Paulo, the largest in all Brazil, and the other in the Federal District; the two factories produced together more than 15 per cent of the total Brazilian production. Five factories were responsible for more than 40 per cent of the total Brazilian production: Companhia Fabricadora de Papel in São Paulo the Companhia Fabrica de Papel de Petropolis in the State of Rio de Janeiro, Companhia de Melhoramentos de São Paulo in São Paulo, the Companhia Agricola Industrial Cicero Prado in São Paulo, and the Companhia Industria de Papel e Cartonagem in the Federal District. Of the total Brazilian production in 1941, amounting to 128,771 metric tons, 64,702 metric tons were wrapping paper, 29,539 metric tons printing paper, 26,554 metric tons writing paper, and the balance cartons, blotting paper, carbon paper, drawing paper, etc. Of the 61,404 metric tons of imported paper, 45,885 tons were newsprint, and 6,379 metric tons of scraps of paper for industrial and advertising purposes. Glazed paper and tissue paper, as well as paper for packing fruits, were imported in substantial quantities.

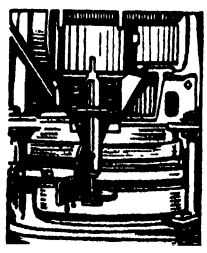
In order to meet local demand the Federal Government is granting several concessions for the establishment of pulp plants destined to supply paper factories. Of the plants under construction or starting production, the most important is undoubtedly the pulp plant now being built by Klabin concern in the State of Paraná which will produce very shortly 100 tons of wood pulp, 60 tons of chemically

bleached cellulose, and 40 tons of unbleached cellulose per day. The plant will furnish 160 tons daily of newsprint.

Compulsory Use of Brazilian Fibers Required

Considering that Brazil produces enough fibers to permit their use mixed with imported material, the National Economic Defense Committee approved a resolution by which the compulsory use of Brazilian fibers was increased from 10 to 25 per cent in mixture with jute or other imported material. This increase beginning July 1 will be controlled by the delegates of the committee in the weaving and spinning plants. The prices for the blended fibers will be also adjusted, taking into consideration the increase in the percentage of national fibers.

Exports of Mineral Products Improved



According to the *Bulletin of the Federal Council of Foreign Trade*, Brazilian exports of mineral products during the first 4 months of the current year showed an increase in value over the same period of 1941 of about 55 per cent. Rock crystal was the principal export product, the total value of shipments amounting to 53.1 per cent of the total value of exports of minerals, compared to about 12 per cent during the same period of 1941.

Metallic ores come second, having risen from 31,079 contos de réis in the first 4 months of 1941 to 38,807 contos de réis in the same period of 1942. Manganese and rutile ores are responsible for this increase in value. However, metallic ores represented 25 per cent of export value in 1941 against only 20 per cent in 1942.

The value of exports of precious and semiprecious stones fell in January–April 1942 as compared with the same period of 1941, owing to a marked decrease in exports of diamonds and aquamarines. Similarly, iron and steel products showed a considerable decrease in exports during 1942. Exports of mica showed a slight increase, while exports of coal increased from only 487 contos de réis in the first 4 months of 1941 to 2,181 contos de réis in the same period of 1942.

C. E. Nabuco de Araujo, Jr.

Caixa Postal 970
Rio de Janeiro
August 24, 1942

Germany

Expansion of various chemical enterprises in the eastern provinces of Germany is typical of the trend towards the east, which is a notable feature of present industrial development. Among the industries trying to move eastward are cement works, of which there is a surplus in western Germany and the Low Countries, whereas plants in the east can scarcely meet demands. Transport of bulky commodities from western to eastern Germany is difficult, and at least one cement plant is therefore to be transferred bodily to the east and re-erected.

Synthetic Rubber Is Utilized in Transportation

The various types of synthetic rubber produced in Germany are being used for numerous purposes in connection with transportation. Perbunan gives excellent service for spring suspension and is said to be superior to steel in some respects. On street cars experiments have been carried out with Buna-suspended wheel sets and Perbunan suspension springs between bogie and chassis. There is a possibility that use will be made of synthetic rubber for motor bedding and electric switches. Soft Buna has been employed for torsion suspension in the form of elastic coupling and for torsion vibration absorbers for Diesel engines where these parts are subject to considerable strain. Buna coatings, either alone or mixed with polyvinyl chloride type resins, have been utilized for various parts of vehicles. It is claimed that these coatings permit the use of ordinary iron for parts which otherwise would have to be made of expensive heat- and corrosion-resisting metals. The railway company has introduced Perbunan in place of leather for air-tightening steering valves and brake cylinders.

Paint Materials Subjected to Control

Paint manufacturers have been instructed to reduce the number of paints produced in 1941 by half. Special shades and kinds will no longer be made. It is hoped that the reduction in the number of paints made will help to offset the effect of further withdrawals of labor.

The manufacture of lacquer has been hampered by the shortage of imported materials, but it is claimed that years ago 70 per cent of all raw materials were synthetic, and that this proportion has increased since. Lacquer production is now concentrated in about 300 factories, as compared with 900 at the beginning of the war. In future, lacquer manufacturers are to be given greater freedom in the choice of raw materials.

The shortage of vegetable drying oils has stimulated research into mineral oil substitutes. It is claimed that large quantities of drying oils can be produced from high-molecular carbon substances with high hydrogen contents, such as paraffin wax, ozocerite, ceresin, crude vaseline, and crude lubricating oils rich in hydrogen, by treating them with metal or boron halides in the presence of acid halides. One hundred parts of a product obtained by repeated cracking of paraffin wax at 500° C., for instance, are dissolved in 30 parts of ethylene chloride; 30 parts of aluminum chloride are added and 15–20 parts of phosgene are allowed to penetrate the mixture at 50–60° C. for several hours. The aluminum chloride is then dissolved in dilute hydrochloric acid, the aqueous solution is removed, and the solvent separated by distillation from the reaction product. This process yields 90 parts of a drying oil with an iodine value of 115. Cracking gases also supply a raw material for the process, and ethylene chloride can be replaced by carbon tetrachloride. Aluminum, zinc, iron, and titanium chlorides are the metal halides mostly used; boron fluoride can also be employed. Iodine values between 100 and 160 are obtainable. The drying oils thus produced are used either alone or in admixture with vegetable oils. The drying time can be shortened by use of the oxides, acetates, or borates of lead, manganese, and cobalt.

Corrosion-Resisting Materials Developed

Chilled castings of 65–70 per cent ferrosilicon have been used in the I. G. Farbenindustrie works at Höchst (Main) as a corrosion-resisting material, especially in large boilers up to 6 cubic meters in volume. They withstand all acids except fluoric but do not protect against strong alkalies. Pressure resistance is 4000 kg. per sq. cm., tensile strength is between 60 and 100 kg. per sq. cm., expansion at rising temperatures is half that of steel, and the modulus of elasticity is five times that of steel. Ferrosilicon plates welded to steel are soldered with tin-free solders, and joints are protected with a new acid-resisting putty. This treatment is claimed to be equivalent to enamel in many respects and superior to it, in that it can be applied to large vessels, possesses greater mechanical strength and heat conductivity, and can be easily repaired. No serious complaints were reported in operation during more than two years.

Less than 6 ounces of chromium per square meter are said to be required to confer corrosion resistance on pipes and other metal surfaces by the so-called BDC-Inkrom process, which is being used on a large scale. The steels employed as base do not contain any other alloy metals but are specially selected for the process. Volatile chromium compounds

are made to react with the surface of the article to be protected at about 1000° C., either directly, in a salt melt, or by means of ceramic products in which they are stored. The chromium content of the protected steel decreases inwardly at a regular rate, from 35 per cent on the surface. Corrosion resistance is normally complete down to $^1/_{32}$ inch and is reported to be equivalent to that of a high-chromium steel.

Methane Motor Fuel Extracted from Gas

The Berlin Gasworks Company expects to produce methane from city gas for use as a motor fuel. A plant supplying 300 cubic meters of methane to a filling station would use about 2,500 cubic meters of city gas with a methane content of 20 per cent, of which more than half would be extracted. The remaining 220 cubic meters would still have a methane content of 9 per cent and a calorific value of 8,600 kg.-cal., and could be used to regulate the calorific value of the gas sold by the company, for which water gas or generator gas is now employed.

Seed Potatoes Treated with Gas

A 20–100 per cent increase in the yield of potatoes can be obtained, according to reports of the German Botanical Society, by treating seed potatoes with gas or ethylene. The tubers of plants grown from seed potatoes which had been exposed for 24 hours to atmospheres containing 7.5, 15, or 30 per cent of gas at 18° C. were more numerous, larger, and richer in vitamin C. Care in selecting the amount of gas seems necessary. It is claimed that this process is cheaper than the application of hormones.

Products are Recovered from Carbonization Plants

Lurgi Company and I. G. Farbenindustrie have jointly developed a method for extracting phenol from waste liquors of hydrogenation and low-temperature carbonization plants, the Phenosolvan process; it is said to be profitable with as low a phenol content as 3–4 grams per liter. The price of the recovered phenol is sufficient to meet the cost of the Phenosolvan used, but further treatment of the waste liquor is required for the extraction of volatile fatty acids and other substances before it can be released into rivers. Phenosolvan is a mixture of aliphatic esters with optimum extractible properties. After use it can be largely recovered by distillation with steam, so that the consumption of Phenosolvan is less than 200 grams per cubic meter of water treated.

Gas is obtained as a by-product in the hydrogenation, Fischer-Tropsch, and low-temperature carbonization plants, but in the early days the gas was used mostly for furnaces, tar stills, etc. One low-temperature carbonization plant using lignite, however, subjects the surplus gas to special treatment and sells the resulting product to a gasworks.

A synopsis of industrial advances in Palestine during the past 20 years was given by M. A. Novomeysky, managing director of Palestine Potash Ltd., before the recently organized Palestine Industrial Council at its first meeting held in Jerusalem the middle of February 1942.

Industrial Council Has Been Organized

With the establishment of a special Labor Department by the mandate government, the organization of an industrial council seemed desirable. This council, like the Federation of British Industries and similar organizations, among other things will regulate relations between industry and its employees, discourage and settle labor differences, cooperate in labor legislation, promote industrial hygiene, which is still neglected in Palestine, and direct the vocational development of the workers and the rising generation. The members of the executive committee are: M. G. Pallak, Portland Cement Co., Haifa, A. M. Ruthenberg, Palestine Electric Corp., Haifa, M. A. Novomeysky, Palestine Potash, Jerusalem, and Julius Simon, Palestine Economic Corp., Jerusalem. The new organization is expected to maintain friendly relations with the Manufacturers' Association of Palestine and also to arrange for occasional joint conferences.

Manufacturers' Association Sponsors Industrial Exhibit

The Manufacturers' Association, with an adequate modern office building in Tel Aviv and local sections in Haifa and Jerusalem, has as its president Arie Shenkar, of the Lodzia textile factory in Tel Aviv, and embraces numerous small and medium-sized factories, but not the above-mentioned large factories, the largest in the country, although they are in sympathy with it. In recent years the association, in collaboration with the Pro-Palestine Products Committee and the Foreign Trade Institute, has been busily engaged with the exportation of Palestinian goods to neighboring countries. The association also took part in the Palestine Government Industrial Exhibition sponsored by the mandate government in Cairo last year. The exhibit was designed to bring before the Middle East Command the products Palestine can supply for army purposes, to show Egyptian importers and merchants the goods Palestine manufactures, and to promote relations between the industries of Palestine and Egypt. It occupied 11 rooms in a skyscraper in Cairo's business center, where the offices of Imperial Chemical Industries in Egypt are also located. Over 300 Palestinian firms were represented, and a good detailed catalog of over 200 pages gave information concerning more than 10,000 objects on display. An exhibit well worth seeing was in the room devoted to the products of the Dead Sea and a model of the potash plant there. The Palestine Indicator Factory, Jerusalem, had on display indicator test papers, a hemometer, soda tablets, war-gas test papers, and the like.

War Gives Great Impetus to Industry

The Egyptian industry because of its raw materials, chiefly cotton and sugar, moves in an entirely different course from that of Palestinian industry (for example, mention is scarcely made of a pharmaceutical industry in Egypt) and thus the industries of the two countries are not in competition. Egypt's industry has experienced healthy development during recent years. At the close of 1940 it employed about 1,200,000 people, in comparison with about 40,000 in small Palestine, and the invested capital amounted to 130,000,000 pounds. Prior to the war Palestine's industry suffered greatly as a result of importation from highly developed industrial countries and of dumping, particularly from Japan. The war has brought a great upswing to the industry, as a result of orders for war supplies and stoppage of imports, without extending it until now to full utilization of production capacity. The High Commissioner, Sir Harold MacMichael, in his New Year radio message correctly said that few countries produce such a relatively large number of scientists and experienced technicians as Palestine.

Palestine Actively Engages in Search for Raw Materials

A conference recently held in Jerusalem for Middle East representatives of the United Kingdom Commercial Corporation was convinced of Palestine's ability to supply many needs of Turkey, Syria, Iraq, and Egypt. Moreover, the government has set up various war committees, which among other things are busy with the importation of raw materials, in which the country is known to be poor. Re-

cently more attention has turned to the question of raw materials in the country, and as a result the counterwaste movement is making good progress here.

Orange Industry Suffers from the War

The orange industry, the principal export industry of Palestine, has suffered greatly as a result of the war, because the chief purchasing countries have been cut off. Although the orange harvest for 1941–42 amounted to about 6,000,000 cases in comparison with 15,000,000 before the war, at most only a third of the production was consumed in Palestine by the military authorities and in the neighbor countries. The home industry requires about 750,000 cases of oranges for the manufacture of alcohol, acetic acid, citric acid, pectin, acetone, salt, concentrates, marmalade, jam, sirup, ethereal oils, and certain medicinal preparations. The skins are utilized for feeding purposes.

New Factories Are Established

Among new factories may be mentioned: Carbidan, the first carbide plant, in Ramat Gran; Malton Chemical Works Ltd., producer of lactates and lactose, also in Ramat Gran; Jordan Chemical Works, manufacturers of modern solvents, in Tel Aviv; Palacid Ltd., producer of nitric acid and pure sulfuric acid, in Haifa Bay; Vita, in Tel Aviv, producers of ether, anesthesia ether, and mineral and medicinal waters; Taassiyah Chemith, Tel Aviv, manufacturer of sulfite, liquid ammonia, and insecticides; and Topas-Werke, producer of pectin, citrus alcohol, and lemon oil. Since the World War I about 1,800 factories have been established by private capital. Industrial production now reaches a value around 14,000,000 pounds in comparison with 9,500,000,000 pounds before the present war. E. Schmorak, director of the Industry and Commerce Department of the Jewish agency in Jerusalem, demands for Palestinian industry in the postwar period a protective tariff and abolition of the "open-door" policy (paragraph 18 of the Mandate); promotion of expertation; and the establishment of a credit institute to provide capital for a china industry, for long-time loans, and to attract capital from abroad. In any event Palestine needs a well-planned industrial policy, which heretofore has been lacking.

Chemical Prices Listed

Highest prices are noted mainly in certain foods. Wide fluctuations prevail in the chemical market, and this condition made welcome an announcement of prices by the Imperial Chemical Industries (Levant) Ltd., Jaffa-Tel Aviv, the middle of February, as follows:

Chemical	Package	Retail Selling Price per Package, Pounds
Caustic soda, 76 to 77%	340 kg., drum	10,400
Soda ash, light solid	100 kg., bag	2,000
Sodium bicarbonate, technical	50 kg., bag	1,450
Ammonium bicarbonate	5 kg., tin	430
Bleaching powder, 39%	150 kg., drum	4,650
Sodium silicate, 59.4%	45 gal., drum	10,120
Sodium sulfide	232 kg., drum	14,200
Lithopone, 30%	100 lb., paper bag	2,150
Sulfuric acid, 98% H_2SO_4	1000 kg.[a]	45,500
Ammonia, anhydrous[b]	153 lb., cylinder	17,350

[a] In customer's containers in Haifa.
[b] Wholesale only.

Olive Oil Produced by Primitive Method

According to figures given by the government statistician olive oil production for the season 1940–41 was 10,535 tons and came from 605 presses, of which 75 per cent was still operated by animal power with an average yield of 10 tons per press, whereas the rest, motor-driven, averaged 40 tons each.

Feedingstuffs Are Studied

In connection with efforts to improve the profitableness of cattle raising in Palestine as much as possible by rational feeding, A. Bondi and co-workers in the Agricultural Research Station at Rehovot have conducted extensive investigations on feedingstuffs by means of digestion experiments. The composition and feed value of 40 feedstuffs (green plants, hay, and concentrates) were determined[1]. Palestinian feeds often show a lower content of dry matter than the same feedstuffs in northern countries[2]. The digestibility of the dry fodder from domestic plants is as good as, and in certain cases even better than, that from plants in northern climates. The total content of digestible nutrients (T. N. D.) is thus frequently higher than in other regions, if it be reckoned on the basis of dry weight, whereas it is lower on the basis of green weight. Present obstacles in the way of importing vitamin A concentrates, known to be particularly valuable in poultry feed, prompted an investigation by Bondi and Uri[3] to determine the carotene content of about 40 domestic plants at different stages of growth and to establish the quantity of each plant that would be necessary to supply the vitamin A requirements of the hens. In the same experiment station, experiments were also conducted on ensiling carbohydrate-rich feeds[4]. These experiments were carried to a successful conclusion without difficulty. Protein-rich feed plants make good ensilage, provided they are mixed with citrus by-products. The preserving effect of citrus fruits is attributable to their high contents of acid and sugar. The losses that occur in hay curing under conditions that prevail in Palestine are usually considered insignificant and under some circumstance may even be completely eliminated[5].

Translation by W. L. Hill

New Chemical Industries Established in Australia

Local production is now supplying some of Australia's chemical needs, according to government sources originating in Australia. Iron ammonium citrate (green), used for medicinal purposes and for sensitizing blueprint paper for munition and engineering drawings, is now being made in South Australia. That state is also producing anhydrous basic subacetate of lead (Horne's dry lead), formerly imported from Germany. This product is used by the Queensland sugar industry.

The manufacture of industrial plastics is another new industry recently established in South Australia.

New Dyestuffs Factory Is to Be Built in Spain

A projected new dyestuffs factory, authorized to be built at Barcelona, Spain, by the S. A. Fabricación de Anilinas y Productos Químicos, is expected to be in production by the end of the year. It is anticipated that exports of finished products will pay for imported raw materials.

Local efforts to produce 12,000 tons of superphosphate annually under auspices of the Palestine Government are reported Orders sufficient to provide for immediate requirements until full production is attained have been announced.

Spanish Chemical Situation Reported

THE National Syndicate of Chemical Industries has recently issued a report from Spain, reviewing the Spanish chemical situation in 1941. It was a year of considerable difficulties and the industry had to deal with shortages of raw materials and fuel and with the obstacles to foreign trade caused by the war.

The fertilizer shortage, which was very acute in 1940, was relieved last year. Imports of nitrogenous fertilizers increased from 65,000 tons to 110,000 in 1941. Imports of Chilean nitrate remained at about the same level; 50,000 tons were imported in 1941. Ammonium sulfate imports showed a large increase, from 11,000 tons in 1940 to 35,000 in 1941, with 12,000 tons coming from the United States. About 10,000 tons of synthetic sodium nitrate were imported from France.

The import of 485,000 tons of Moroccan phosphate considerably improved the phosphatic fertilizer situation over 1940, when only 250,000 tons were imported. Larger imports of phosphate made possible the manufacture of about 1,000,000 tons of superphosphate, an amount sufficient for domestic needs.

Wax from Sugar Cane Investigated

TO RELIEVE the present acute shortage of wax in South Africa, consideration has been given to manufacturing it from sugar cane, according to the British press. Experiments are being conducted to find a practical method of extracting the wax from filter cake, which, it is said, contains a relatively high proportion of sugar cane wax.

The production of glycerol from molasses has already started on an industrial scale.

New Chemicals Made in South Africa

MANY new products are being made by South African chemical companies, reports the Department of Commerce and Industries in a recent communication from South Africa. A group important to the leather industry includes chrome salts, sodium sulfide, lactic acid, and sulfonated oil.

Other new products are chlorine and aluminum sulfate for water purification, casein glues, nitrocellulose finishes, and ceresine disks for food packing.

FORMATION of a new German company, which it is believed plans to exploit German rights in various Scandinavian patents in the cellulose industry, is reported from abroad. The company will "purchase and develop" such processes, it is stated.

Caustic Soda to Be Produced in Brazil

REPORTS have reached this country that a British mission is investigating the possibility of establishing large-scale caustic soda production in Brazil, that country's imports in 1941 having included 35,000 metric tons of caustic soda, and 21,000 tons of soda ash, with a total value of $3,450,000.

Other Brazilian imports are given as lead arsenate, white zinc sulfide, potassium chlorate, potassium chromate, copper sulfate, sodium cyanide, tannic acid, and formic acid.

Swedish Metal Imports Decline

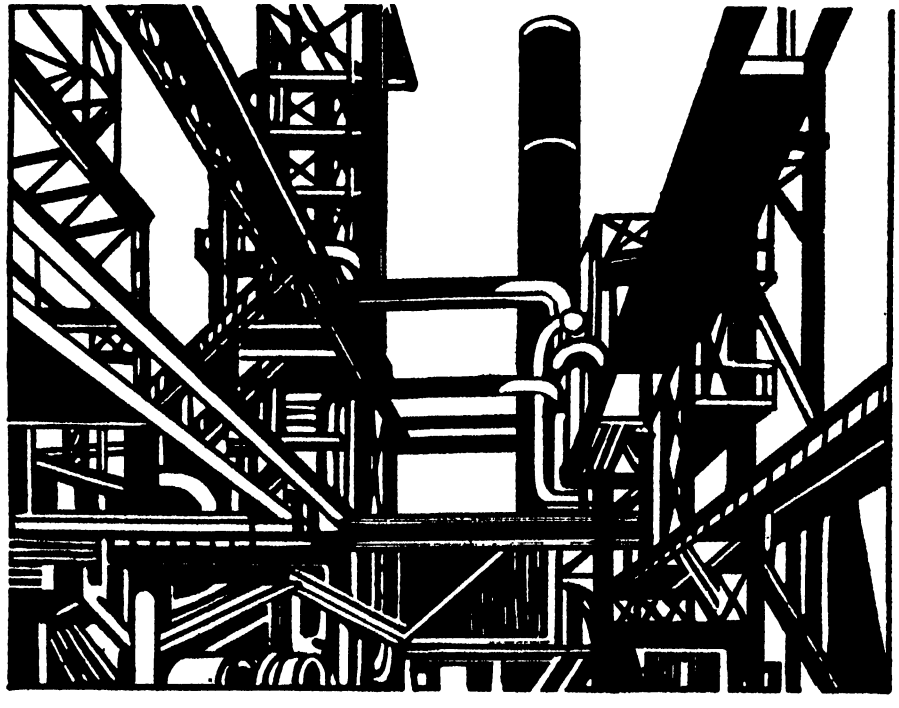
SWEDISH imports of metals and minerals were valued at 93,100,000 crowns in the period January to April 1942, compared to 116,500,000 crowns in the same period of 1941, while exports of the same commodities in the first four months of 1942 amounted to 105,300,000 crowns, compared to 1941 exports for the same period, amounting to 146,000,000 crowns.

German Pharmaceutical Situation Becomes Serious

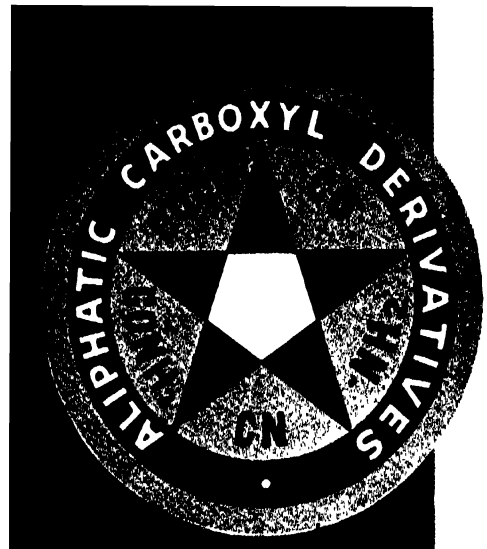
THE pharmaceutical situation as reported in the German press is becoming more serious. Aspirin and narcotics formerly bought freely from pharmacists are obtainable only on submission of an order signed by a medical practitioner. The number of brands and types of packages of medicinals have been drastically reduced and supplies to the Balkans and Scandinavian countries curtailed.

CANADIAN zinc deposits, discovered near the Labrador border and believed to be of considerable importance, are reported through official sources from that country. A zinc refinery is said to be under consideration, aided by a government subsidy. The short open season, three months, and lack of transportation are cited as obstacles.

PLANS for manufacture of its own supply of carbon bisulfide by the Borregard Cellulose Works are reported from Norway, the company's capital having been increased from 10,000,000 to 12,000,000 kroner for the purpose.



EXPERIMENTAL use of cement sheets and certain chemicals in a composition for roofing material in low-cost housing in Rhodesia is reported from that country in Africa.



ITALIANS are experimenting with copper recovery from vine leaves sprayed with copper sulfate, reporting that 5 pounds of copper per acre have been recovered. The method consists of burning the leaves and extracting the copper from the ashes.

IRELAND is reported to be ready to export optical glass sand, commercial production from the top of Muckish Mountain being said to be profitable.

THE Swedish A-B Bofors chemical company has added a number of new products to its output since the war, including nitrobenzole, acetanilide, chloramine, and toluene sulfonic acids. It plans to produce analine oil and salt, but does not project dyestuffs manufacture.

THE Swedish Government has established the A-B Skogsindustier to supervise state-owned saw mills, cellulose factories, and distillation plants, including important units at Karlsborg and Pitea.

CHEMICALS FOR THE WORLD OF THE FUTURE...

Available Today!

The Armour Chemical Division Offers These High Molecular Weight Carboxyl Derivatives in Carload Quantities . . . for Your Work in Planning "The Shape of Things to Come"

The World to Come is being shaped today in America's research laboratories. A world of new materials, new processes . . . that will be built in part from your own work in chemical synthesis.

That is why the groups of "CD" chemicals now being produced by the Armour Chemical Division are so vitally important to every research director.

Investigate the possibilities of Armour Chemical Division's "CD" AMINES . . . NITRILES . . . AMIDES . . . KETONES in your research now. Full information will be sent you on your request.

AMINES. Organic ammonia . . . hydrocarbon alkali . . . eleven different primary amines . . . almost unlimited possibilities for secondary and tertiary amines and quaternary ammonium compounds . . . molecular weights from 101 to 773 . . . with only one amine grouping . . . boiling from 133° C. to more than 350° C. at atmospheric pressure . . . melting points from 19° C. to 65° C.

NITRILES. Alkyl Cyanides . . . liquids and solids . . . non-toxic . . . stable . . . eleven different members of the series . . . unusual solvent characteristics . . . boiling from 165° C. to 357° C. . . . molecular weights from –97 to 265 . . . melting points from 79° C. to 41° C.

SYMMETRICAL ALIPHATIC KETONES. Really high in molecular weight, ranging from 170 to 507 . . . melting from 14° C. to 87.7° C. . . . boiling from 226° C. to more than 350° C. at 760 mm. . . . Eleven different members of the symmetrical series . . . an almost unlimited number of unsymmetrical and mixed members of the series . . . ranging from fairly soluble to very insoluble in usual organic solvents.

AMIDES. Eleven different primary members of the series . . . containing 6 to 18 carbon atoms with only one amide group and that always in the 1-position . . . large numbers of substituted amides possible . . . melting points from 101° C. to 160° C. . . . molecular weights from 115 to 704 . . . almost insoluble in usual organic solvents at room temperatures . . . miscible in all proportions with most of them at elevated temperatures.

Current productions are from materials of domestic origin. We are limited to five members of each series, except in cases of high-ranking, priority-rated orders.

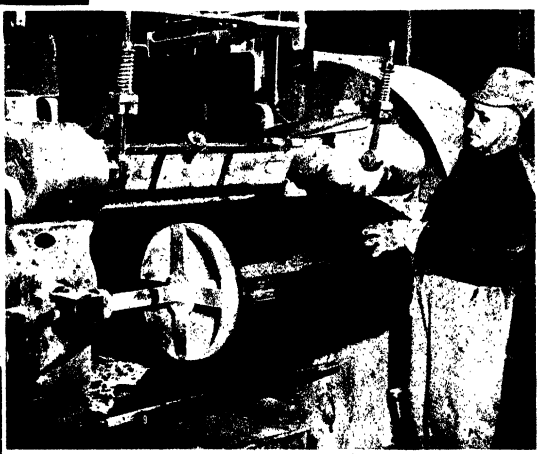
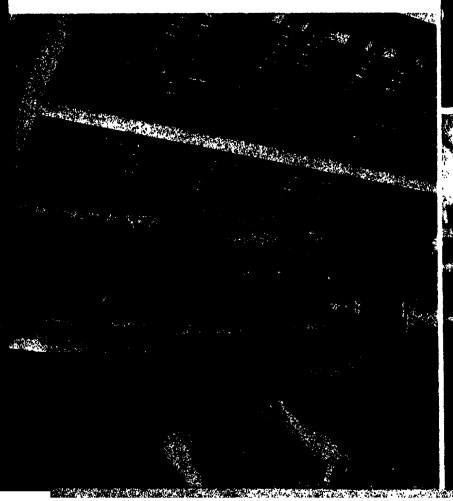
THE CHEMICAL NEWS PARADE



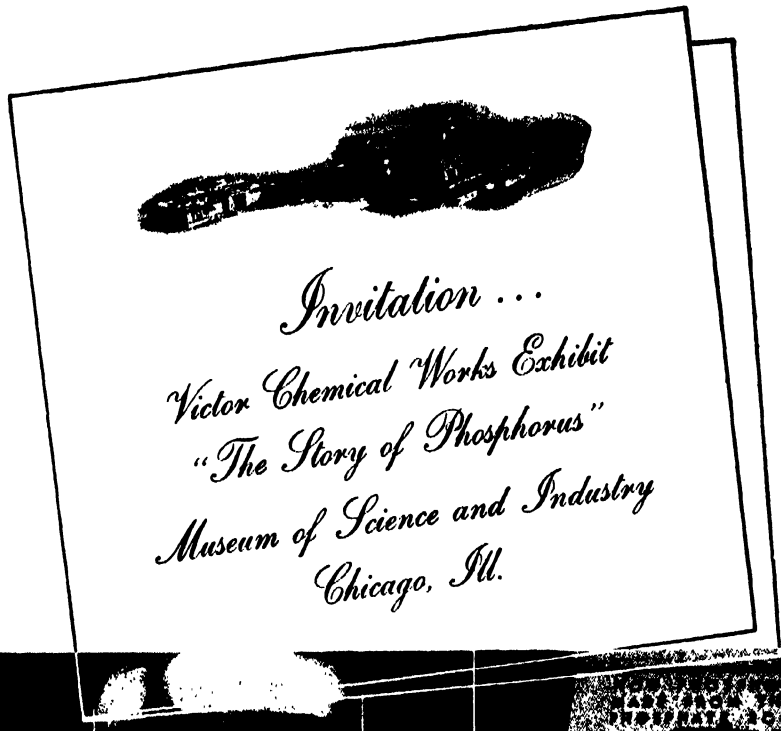
See "Reclaims and Reclaiming", page 1223

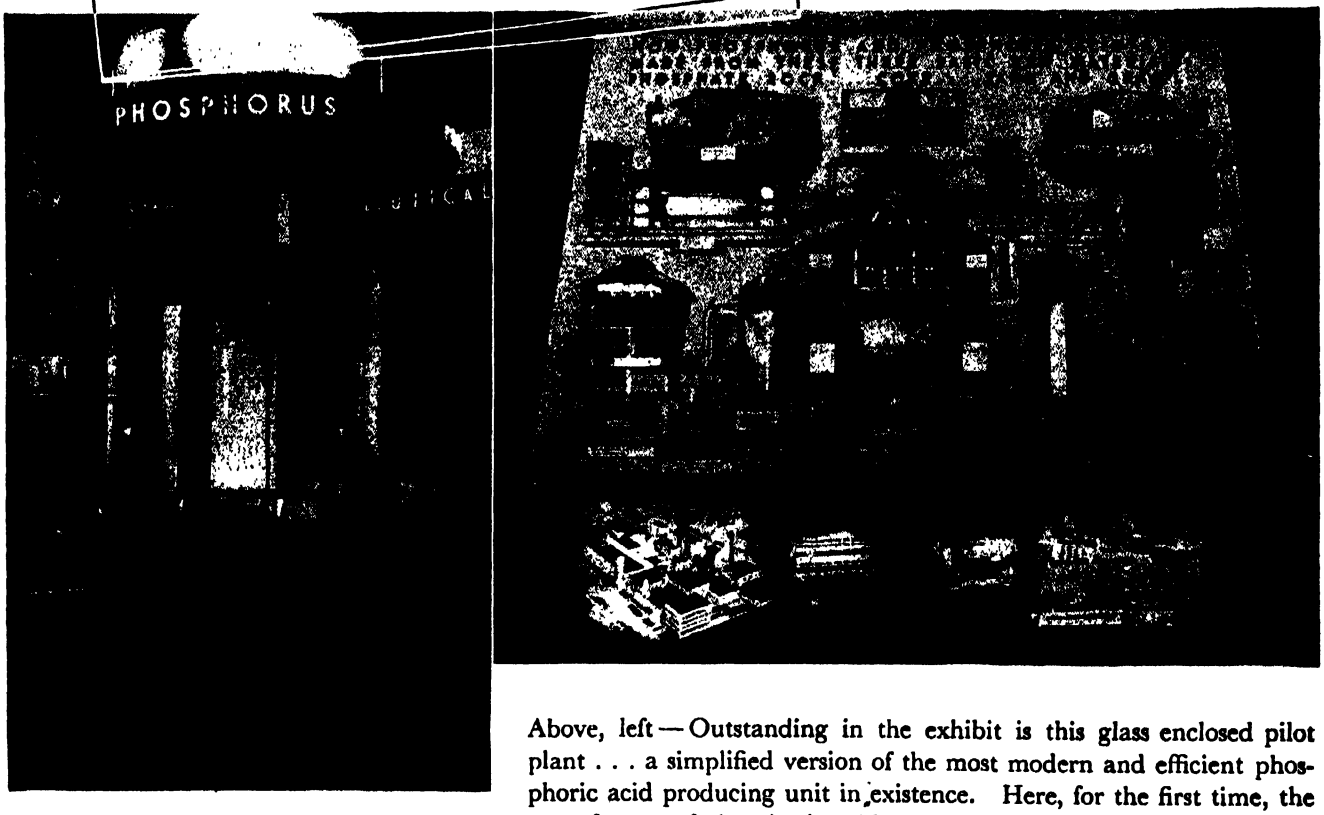
UNITED STATES RUBBER CO. PHOTOS



(1) Truckload of used tires is shown being dumped at a Connecticut reclaim plant of the United States Rubber Co. The tires will be carried into the plant on the conveyor shown at left. (2) Before rubber can be ground up for reclaiming metal bead must be removed from the used tires. Worker is running a tire through rotating knives to remove the steel wires formerly thrown away but now reclaimed. (3) Tires are fed into the machine by toothed feeder roll in the center. The mechanic is adjusting the knives which revolve on drum at high speed. The chopper, one of the largest of its kind, is wide enough to take any passenger-sized tire. (4) Tires are pulled over to the shearing blade and after cutting are then pushed onto the conveyor belt for delivery to the debeaders. (5) The electromagnet shown here removes particles of metal from the rubber ground up in the reclaim process.

(6) Devulcanizers perform an important step in the reclaiming process of old rubber. (7) Conveyer in center delivers digested, washed stock to the feed hopper of the continuous dryer. Above the conveyer are shown flights which deliver the stock to the dryer. (8) Reclaimed rubber stock comes out of an automatic dryer after being chopped up, devulcanized, and washed to remove the dissolved fabric and chemicals. From here it goes to mixing mills where it is plasticized. (9) The operator pictured here is performing the final operation—cutting from the drum of the refining mill a slab of finished stock for delivery to the shipping room. (10) Old galoshes and garden hose shown in the form of finished slabs of reclaimed rubber are taken by a worker from the conveyer line, after being dusted with talc to prevent their sticking together, and piled for storage or shipment.





You are cordially invited to inspect the recently completed Victor Exhibit in Chicago's famous Museum of Science and Industry. It tells the story of phosphorus . . . and the important role played by phosphorus compounds in serving mankind . . . through a miniature pilot plant in actual operation, colorful translites, and ingenious working models that operate at the push of a button. Two of the many displays of interest to layman and technical expert alike are illustrated below.

Above, left — Outstanding in the exhibit is this glass enclosed pilot plant . . . a simplified version of the most modern and efficient phosphoric acid producing unit in existence. Here, for the first time, the manufacture of phosphoric acid can actually be seen . . . an operation heretofore concealed within the confines of brick and steel.

Above — In this animated production diorama . . . complete with miniature steam shovels in simulated action, model furnace, condenser, burner, hydrator, precipitator, storage tank, tank cars, etc. . . . is told the story of phosphorus from raw phosphate rock to ultimate conversion into a host of phosphatic compounds.

National Chemical Show to Aid WPB Salvage Campaign

WITH the Industrial Salvage Section, Conservation Division of the War Production Board participating, the National Chemical Exposition set for November 24 to 29 at the Sherman Hotel in Chicago definitely will be a contribution to the war effort.

Arrangements have been concluded by the Industrial Salvage Section with the Chicago Section of the AMERICAN CHEMI-

CAL SOCIETY, sponsor of the show, for adequate space for an educational exhibit which will stress the campaign to salvage approximately 100,000 pounds of essential chemicals.

Exhibit space has been assigned to more than 100 firms in the chemical and allied industries including manufacturers of equipment, precision instruments, materials, and products. A feature exhibit will be a gallery of micrographs contributed by 40 laboratories which are using the electronic microscope. Another contribution designed to be of aid to the war effort will be a special exhibit of "alternates and substitutes".

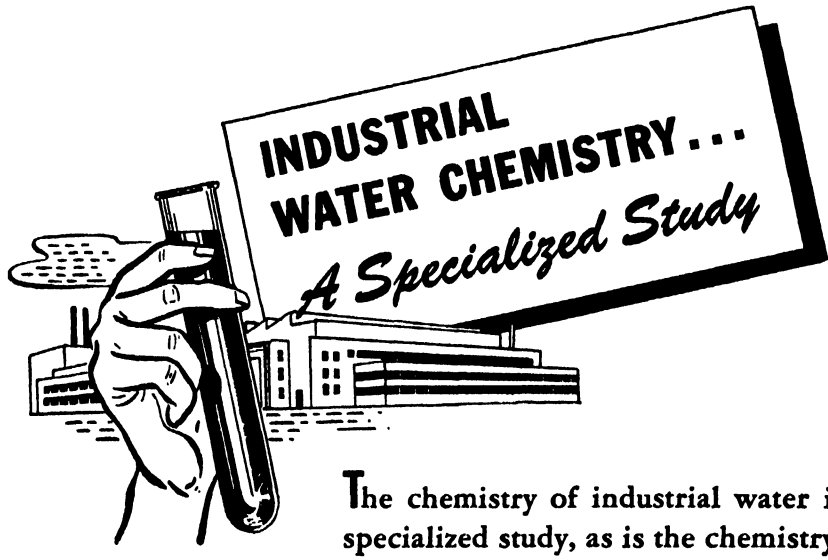
Leaders in the chemical industry, educators, and other authorities will appear on the conference program which will extend through the period of the exposition. The conference will be in the nature of a forum. The general subject of applied chemistry and chemical research, with particular emphasis on fields related to the war effort, will be featured.

Industrial Research Institute Meeting

THE Industrial Research Institute held the largest meeting in its history in Buffalo, N. Y., on September 4 and 5, with headquarters at the Hotel Statler. Seventy-five industrial executives and research directors, representing member companies, and their guests participated in round-table discussions of current research management problems.

Patent trends and pending legislation were reviewed by H. S. Demaree, The Hoover Co., at the opening session, following which E. R. Schaeffer, War Production Board, outlined the production requirements plan and its effect on research laboratories. The mass spectrometer as a new research tool was described by Harold Washburn.

The principal speaker at the Saturday morning round-table session was C. E. K Mees, Eastman Kodak Co., who outlined his philosophy of the direction of research. A project was initiated that will have as its purpose the development of a monograph on the organization of industrial research laboratories, based on member experience.



New Brunswick Group Meetings

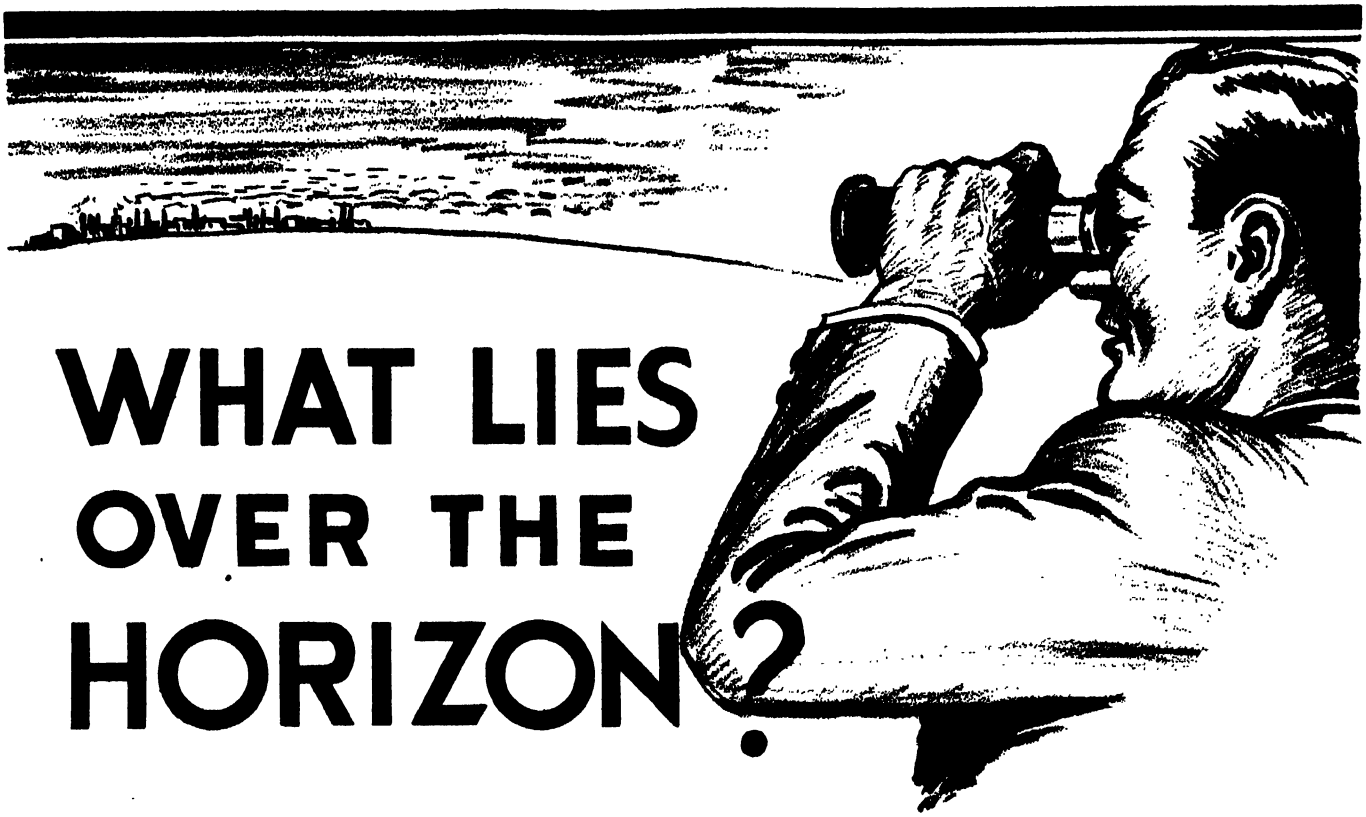
ONE solution of the problem of transportation to meetings has been offered by the North Jersey Section which has authorized the holding of four group meetings during this year at New Brunswick. This recognizes that over 300 members reside in Middlesex and Somerset counties at the southern end of the section's area. Chairman C. S. Fuller has appointed the following committee to act for the section in holding these meetings: C. A. Amick, L. L. Johnson, W. A. Lott, E. B. Middleton, William Rieman, III, and H. L. Davis, chairman.

The first meeting of the group is to be held Wednesday, October 21, 1942, at 8:00 P. M. in the Rutgers University Chemistry Lecture Room. M. L. Crossley, research director of American Cyanamid Co., will speak on, "The Chemistry of Infectious Diseases". The fundamental attack which Dr. Crossley and his associates are making on the vital problems involved will make this meeting of unusual interest.

Power Exposition Transferred to Other Quarters

THE 15th Exposition of Power and Mechanical Engineering, scheduled to be held in Grand Central Palace, November 30 to December 5, will be transferred to Madison Square Garden, and held November 30 to December 4. The change is due to the fact that the U. S. Army has taken over the four exposition floors of the palace to be used as an induction center for the duration.

The chemistry of industrial water is a specialized study, as is the chemistry of rubber, plastics, petroleum or foods. And today, with industry operating at unprecedented production levels, the proper conditioning of water is a matter of the greatest importance.



W. H. & L. D. BETZ is an organization of water specialists—chemical engineers and chemists qualified by long experience in the conditioning of any water for any use . . . boiler feed water, cooling, process and municipal water, waste and sewage disposal. Here is one organization ready to work with you on all phases of water conditioning.

WHAT LIES OVER THE HORIZON?

NO ONE has an exact picture of what is in the future for our country. We all know, though, that those who are looking forward now, are those who in our post war economy, will be prepared to help our nation affect the transition that is to be.

Furfural

is now an essential war chemical, and it is unlikely that any large, new, non-essential uses will be allowed for the duration. War Production Board General Preference Order M-224, however, makes specific allowance for purchasing sufficient quantities of Furfural to carry on research. Join now with those who are insuring a place for themselves in the post war period.

The Furans

FURFURAL
FURFURYL ALCOHOL
TETRAHYDROFURFURYL ALCOHOL
HYDROFURAMIDE

TYPICAL PROPERTIES

Boiling point	157–167° C. (99%)
Freezing point	—37°C.
Flash point (open cup)	56°C.
Refractive index (20/D)	1.5261
Specific gravity (20/20)	1.159

Inquire about Furfural. Learn about its use in tremendous quantities as a solvent and resin reactant. Learn also about the myriad of other uses of this versatile aldehyde.

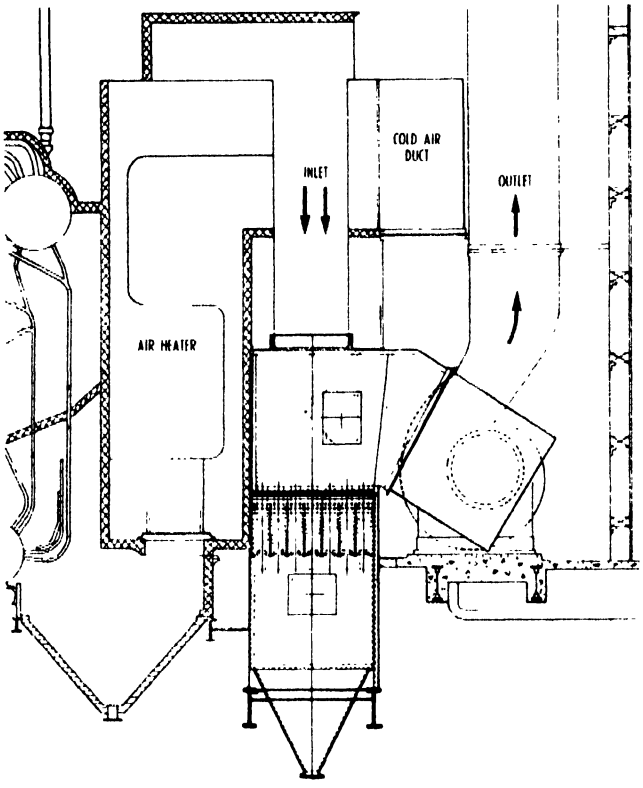
The Recovery of Vapors. *Clark Shove Robinson.* 273 pages. Reinhold Publishing Corp., 330 W. 42nd St., New York, N. Y., 1942. Price, $4.75.

THIS is a revised edition of a book entitled "The Recovery of Volatile Solvents", published by the same author in 1922, and presents the basic theory and the fundamental practices involved in the recovery of industrial solvents and vapors. Classical elementary principles of chemical engineering and underlying basic theory as related to adsorption, scrubbing, condensation, compression, and cooling are reviewed and illustrated by numerous examples. Various processes of recovery, descriptions of apparatus commonly used, and certain of the factors important in the design of equipment are discussed briefly.

The text contains much of the original edition without revision. The only completely new chapter, in addition to the "Introduction", is the one on "Commercial Activated Carbon Systems". As acknowledged in the preface, excessive space has been devoted to many of the older methods for recovering solvents which have since been rendered obsolete. The author's justification for this is that "a description of the early art helps to explain present practice".

This book cannot be considered a reference book or treatise on the subject of solvent recovery and hence has little value for the expert in the field. Its merit lies rather in affording the beginner in the field a basic course of study for grasping the fundamental theory of the various processes of solvent recovery.

A. B. JAPS



Ultraviolet in Science and Industry. *Hanovia Chemical and Manufacturing Co.* 24 pages. Alpine Press, Inc., Newark, N. J., 1942. Price, 50 cents.

THIS booklet describes in a very brief manner a number of applications of ultraviolet light in science and in industry, principally those resulting from the production of fluorescence in different substances. After a brief historical introduction there is an equally brief discussion of the effects of ultraviolet radiation in the promotion of fluorescence and chemical action, in the enhancement of the potency of vitamins, and in bactericidal action.

Various lamps and lamp units manufactured by the Hanovia company are described including the hydrogen discharge lamp and the mercury arc lamps. Some specific uses of the quartz mercury arc lamp in the analysis of substances by examining the fluorescent light produced are described and the techniques employed are given. Other applications of ultraviolet light in museum and libraries, for crime detection, in various industries, and in physical, chemical, and biochemical research are mentioned briefly. Among those more completely

The MULTICLONE is *Versatile*

Because of its patented vane construction, Multiclone Collectors permit a variety of gas inlet and outlet designs to meet practically all space requirements. The Multiclone can be provided with *side* inlet and *side* outlet—or with *side* inlet and *top* outlet, or where necessary with *top* inlet and *side* outlet. This versatility is of great importance especially where space is a major consideration in either old or new plants or where additions are necessary.

EVERY DRAINAGE CHANNEL

TAPERED

Every Plate has that EXTRA CAPACITY

THE faster the flow of filtrate down the drainage member, the more quickly room is made for additional filtrate coming through the cloth. Anything, therefore, which aids in the flow helps to increase the capacity of the filter.

F-M FREEFLOW Filter Plates, with their tapered drainage members, certainly help. There's no tendency for filtrate to back up because the channel can handle all that flows in. It is like a river with its ever-deepening bed. Flow from tributary streams is taken in stride.

F-M FREEFLOW Filter Plates are made to fit all standard filter presses. Construction is of different woods and of Bakelite. In writing for further details, tell us fully about your problem so that we can make intelligent recommendations.

FILTER MEDIA CORPORATION

10-FM-1

Beyond the Flyleaf

CONTINUED FROM PAGE 1258

described are the identification of various fats and oils in foods and as adulterants in foods. The detection of other types of adulterants is likewise mentioned. The discovery of stains, blood spots, poisons, substitute dyes and paints in works of art and in clothing or in body cavities is discussed. The advantage in the use of fluorescence in the study of details of fossils is pointed out. Brief accounts are given of various techniques in the use of ultraviolet light and some accessory equipment is listed.

The style is semi-technical and in parts reads very much like a catalog or descriptive bulletin issued by a manufacturer. It can be read with profit by nontechnical persons.

A number of errors appear, a few typographical, and, more to be regretted, some errors in usage. On page 4 appears a statement, "current is applied", which does violence to the sensibilities of a physicist. A similar statement appears on page 5 in "wattage consumed". On page 4 the text reads, "the quartz mercury arc primary spectrum is not continuous but is a strong band spectrum consisting of a series of lines". The term "band spectrum" has a very definite meaning in physics and applies to the spectra of diatomic or multiatomic molecules and not to a spectrum like that of the quarts mercury arc which is called by physicists a line spectrum in counter-distinction to a band spectrum.

The chief value of the booklet lies in its listing and brief description of the uses of ultraviolet radiation in science and industry. More extensive works must be consulted for details.

O. S. DUFFENDACK

Metallurgy of Copper. *Joseph Newton* and *Curtis L. Wilson.* 518 pages. John Wiley & Sons, Inc., 440 Fourth Ave., New York, N. Y., 1942. Price, $6.00.

IT HAS been 18 years since either a new edition or a new textbook has appeared on copper metallurgy. This book is in the main a compilation of the American literature during the past 15 years. However, the authors have done well in combining the theoretical description of the various processes used in the smelting and refining of copper with examples of modern practice so that the book gives an easily readable and well-connected description of the metallurgy of copper of today. In doing this the authors have drawn heavily on the "Copper Volume" Volume 106 (1933) of the American Institute of Mining and Metallurgical Engineers, there being no less than 130 references to that volume. Since most of the references are within the last 10 years, the book is free from antiquated and historical processes, but as a result many familiar names and processes are missing.

In addition to the metallurgy of copper about one quarter of the book is a compilation of the properties and uses of copper and the economics of the copper industry, both in this country and abroad. Consequently the book gives a comprehensive view of the copper industry as a whole which will be of value not only to students but also to those interested in the copper industry.

The authors have been unfortunate in selecting an old table of the electrode potential of the metals, and the noble metals are given as negative to hydrogen, whereas the modern concept of electrochemistry considers these metals as positive to hydrogen. It is confusing, particularly to students, to have these signs vary in the different textbooks.

S. SKOWRONSKI

What is the

MOST IMPORTANT PROPERTY

of Glass for Laboratory Use?

GLASS HAS MANY PROPERTIES. Each is important. And each can readily be enhanced in glass formulae.

Success in the manufacture of any laboratory glass does not rest upon a particular property but rather upon how successfully that property is combined with all the other properties.

In 1915 Corning Research developed Pyrex brand Chemical Glass No. 774. It was then—and still is—the only *balanced* chemical glass. In it, the essential properties of chemical stability, mechanical strength and heat resistance were scientifically combined. No one property was enhanced at the expense of another. All were *balanced* for all-around laboratory use.

But Corning Research did not stop there. The need for special glasses for special uses was recognized. Throughout the years that followed, Corning scientists have developed over 25,000 different formulae.

Typical of such, is Corning brand Alkali-Resistant Glass No. 728 which is also suitable for Boron determinations.

"Vycor" brand 96% Silica Glass No. 790 is a further example, specially developed for high temperature reactions, rapid chemical analyses or exceptionally accurate work, with a linear coefficient of expansion of .0000008 per °C.

Each of these glasses—and the many more developed through Corning Research—emphasizes Corning's ability to produce glass to meet any laboratory requirement.

When careful analysis is made of any comparative test data—when the true importance of any property is evaluated—only Pyrex brand Laboratory Ware, fabricated from *the* balanced glass, can truly be called the all-around ware for all-around laboratory use.

When you buy laboratory ware, economize. Benefit from Balance. Standardize on Pyrex brand Laboratory Ware. Pyrex brand Ware and other laboratory glassware, fabricated from special glasses developed by Corning Research, are available from your laboratory supply dealer.

"PYREX" and "VYCOR" are registered trade-marks and indicate manufacture by

CORNING GLASS WORKS • CORNING, N. Y.

Magnesium Plant Begins Production

THE world's largest magnesium plant, Basic Magnesium, Inc., is the latest of five important magnesium plants to begin production in recent weeks. The others are the Dow Chemical Co. plant in Texas, the Ford Motor Company plant in Michigan, the Permanente Metals Corp. plant, in California and the New England Lime Co.'s Connecticut plant. All five plants were financed and are owned by the Government through the Defense Plant Corporation. The total cost approximates $175,000,000.

All the new plants were completed in record time, ranging from ten months for the huge Basic Magnesium plant to four months for the ferro-silicon plants. Three more ferro-silicon plants are nearing completion and will commence operations later this year. Four additional electrolytic plants are under construction. Completion of the program will place the United States far in the lead of all other countries as a magnesium producer. Only small quantities were produced in this country before the war, with Germany as the world's leader.

—SECOND EDITION—
Thoroughly Revised and Enlarged

CHEMICAL REFINING *of* PETROLEUM

The Action of Various Refining Agents and Chemicals on Petroleum Products

by VLADIMIR A. KALICHEVSKY

Research and Development Laboratories, Socony-Vacuum Corpn.; Author of "Modern Methods of Refining Lubricating Oils"

and BERT ALLEN STAGNER, Ph.D.

Consulting and Research Chemist; Member, American Institute of Chemical Engineers; Formerly: Supervisor Chemical Research, Union Oil Company of California; Research Fellow, Mellon Institute of Industrial Research

The rapid development of petroleum technology has necessitated a revision of the original volume published in 1933. The newest practice in regard to treatment with sulfuric acid, tetraethyl lead, octane rating, etc., is described in detail. The present emphasis on all phases of this vitally important subject makes this book a particularly timely one, especially since the petroleum problem today is rather one of refining capacity than of crude production. For this reason technical improvements are of the utmost importance for the pressing problems of national defense.

—CHAPTERS—

Preface. Composition of Petroleum; Treatment with Sulfuric Acid; Sulfuric Acid Sludge and Hydrogen Sulfide; Recovery and Manufacture of Sulfuric Acid; Treatment with Alkaline Reagents; Sweetening Operations, Elimination of Elemental Sulfur, and Reduction of Total Sulfur in Light Distillates; Refining by Adsorption; Refining with Solvents; Detonation and Antidetonants; Inhibitors of Atmospheric Oxidation of Petroleum Products. Antioxygens; Gums and Cracked Petroleum Products; Deterioration of Lubricating and Similar Oils. Addition Agents; Supplementary List of United States Patents on Petroleum Refining; Appendix; Special Tables; Patent, Author, and Subject Indexes.

New Arc Welding Handbook Discusses Design and Practice

A MANUAL of arms for welders in shops, shipyards, airplane factories, ordnance plants and arsenals, The Lincoln Electric Co.'s seventh edition of Procedure Handbook of Arc Welding Design and Practice, explains various methods and techniques used in welding, with a view to speeding up welding design and engineering and making it easier for the thousands of men in training to learn the essentials of welding in the shortest possible time.

This 1308-page handbook, containing 1810 illustrations, gives new and significant information on welding symbols, new allowable stresses, preheating for welding, stress relieving, procedures, speeds, and costs, "Fleet-Fillet" technique, general metallurgical characteristics of metals and alloys, weldability of aluminum alloys, tubular construction, and appearance and styling of welded design.

Copies of the book may be secured from The Lincoln Electric Co., Cleveland, Ohio, for $1.50 postpaid.

Accident Rates in the Chemical Industry

THE National Safety Council, Chicago, Ill., has just issued its annual statistical report on accidents in the chemical industry. This is a 16-page planographed booklet, available at 20 cents a copy. It shows the high lights of 1941 experience, experience in various types of plants, and comparisons with other industries, and includes tables of injury rates of individual industrial units.

New Edition of Welding Handbook

TO ANSWER the metal industries' demand for general up-to-date information in concise form on welding, the American Welding Society has published a second edition of its Welding Handbook.

The primary purpose of this volume is to give engineers an authoritative reference book on the technical phases of welding. The material has been arranged, however, in logical sequence with enough explanatory matter so that it may be used as a textbook in engineering schools and as a reference book in trade schools. Subjects covered include, first, the physics and metallurgy of welding and the weldability of steels; second, the welding and allied processes; third, the materials used; fourth, training, inspection and safety; fifth, design considerations and testing of welding; and sixth, the applications of welding. Outstanding authorities were chosen to prepare the respective chapters.

Copies of the handbook may be secured from the American Welding Society, 33 West 39th St., New York, N. Y., by members for $5.00. The price for nonmembers is $6.00.

Accidents in Industry

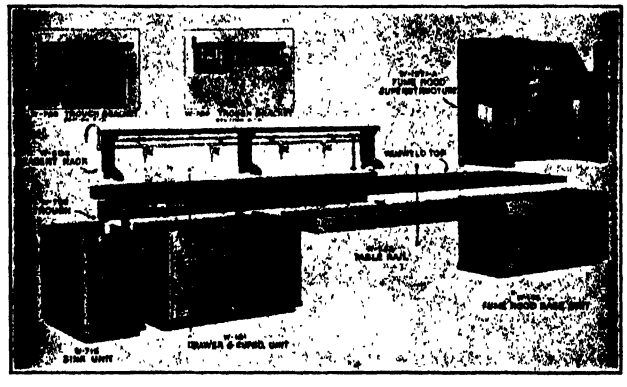
MANY industrial workers literally fell down on the job in 1941—and their falls cost a lot of money as well as time and pain. The 1942 edition of Accident Facts, the National Safety Council's statistical yearbook, shows that falls of one kind or another accounted for 23 per cent of all compensation paid for accident cases in industry last year.

"Handling objects" resulted in a larger number of accident cases than falls—24 per cent of the total, against 18 per cent for falls—but "handling objects" accidents were less severe and drew only 15 per cent of all compensation paid.

Falls and operations involving the handling of objects of one kind or another, combined, caused 42 per cent of all compensated occupational accidents and drew 38 per cent of all compensation paid. Machinery, vehicles, falling objects, hand tools, and actions of "stepping on or striking against" each contributed smaller numbers of accidents and drew smaller fractions of the total compensation bill.

Barnstead Water Stills
ARE EASY TO KEEP
IN GOOD CONDITION

★ ★ ★



In the case of Barnstead Electric or Gas-Operated Water Stills, make sure enough water is in the evaporator before starting. And for all Barnstead Stills, make sure they are regularly cleaned. Barnstead makes this easy for you. The extra-duty steam heated stills for distilling hard water—the stills that need cleaning more regularly—have convenient openings for getting at the heating coil and still's interior.

With reasonable care Barnstead Stills last a long, long time. Some, over 20 years old, are producing water as pure as the day the still was first used.

Hercules Resin-Design Scores Again

PENTALYN M

Gains 100% High-Priority Uses

Hercules announced Pentalyn* M a month ago. Already the entire current production of this new resin is sold for high-priority uses. This instant acceptance is merely one more example of the importance of the Hercules principle of *resin-design.*

Pentalyn was specifically designed to produce acceptable varnishes from straight linseed oil. Its outstanding features are:

Tough through-dry—more complete than has been heretofore possible—after overnight air-drying.

Rapid top-dry—the same outstanding speed as is developed by the familiar Pentalyn G resin—is fully retained.

Faster cooking—allowing you to start with less viscous oils without exceeding normal kettling times, or materially shortening the cook when using heavier bodied linseed oils.

Pale colors—permitting the production of either clears or pale tints without sacrifice of any other advantages.

If you are currently working on high-priority applications, you should immediately familiarize yourself with the possibilities inherent in Pentalyn M-linseed varnishes.

From all present indications, this is one of the major resins of the future. Further information, on Pentalyn M or any other Hercules resin, is readily available. Write today.

Specify Florite Desiccant

For Efficient Dehydration of GASES and LIQUIDS

FLORITE, the new granular drying agent, is now being used successfully for dehydrating natural gas, propane, gasoline, air, nitrogen, carbon dioxide and other gases and liquids where high drying efficiency is required.
It selectively adsorbs 4 to 20% of its weight in water, depending upon the particular application, and is regenerated by heating to 300–350°F. FLORITE is hard, stable, non-corrosive, non-poisonous, and is available in a variety of particle size classifications.

Industrial Chemistry as an Occupation

STUDENTS, teachers, parents, and others interested in industrial chemistry will find helpful information in a six-page leaflet on "Industrial Chemistry as an Occupation", published by Occupational Index, Inc., at New York University. In quantities the price is five dollars a hundred. Single copies are 25 cents, cash with order.

This is one of a series of 67 such leaflets describing opportunities in 67 different occupations. Each covers the nature of the work, abilities and training required, income, and miscellaneous advantages and disadvantages.

Plastic Manufacture Discussed for Layman

A NONTECHNICAL discussion of the manufacture of plastics from raw materials to finished products has recently been issued by Durez Plastics & Chemicals, Inc., Walck Road, North Tonawanda, N. Y. This 8-page booklet illustrates and describes the manufacturing process, compression molding, and uses of phenolic plastics and resins in a very easy-to-read style. It contains a brief review of recent books and suggests sources for comprehensive study of the subject.

Specification and Description of Color

THE American War Standard Specification and Description of Color, Z44-1942, has been issued by the American Standards Association, 29 West 39th St., New York, N. Y., and is available at 25 cents a copy. This was approved June 17, 1942.

Molten Salt Baths

MOLTEN SALT BATHS" is the title of a new 72-page illustrated manual published by the Electrochemicals Department of E. I. du Pont de Nemours & Co., Inc.

Case hardening of ferrous metals in baths containing sodium cyanide, use of simple cyanide baths as reheat media for high carbon and oil hardening alloy steels and for carbonized work, and nitriding of high-speed steel and other high alloy tool steels in molten cyanide baths are described. The du Pont accelerated salt bath for efficient production of mixed carbon-nitrogen cases on plain carbon and on alloy carburizing steels and the du Pont carburizing salt for production of deep cases at usual carburizing temperatures also are covered in the manual.

Information is given on salts for heat treatment of steel and other metals and for heat coloring of finished and polished steel parts, as well as on salt bath equipment, cyanide disposal, modern analytical methods, safety in operation, first aid, and medical aid.

Copies of the manual will be sent by the Electrochemicals Department of the du Pont company, Wilmington, Del., to executives and engineers who request it on business letterheads.

Acetic Acid

THE Vinegar Cruet Goes to War" is a nontechnical article on acetic acid included in the August 6 issue of *Domestic Commerce* to attract the attention of nonchemical businessmen to one phase of the far flung activities of the chemical industry. Written by W. S. Gaylord, Chemicals Staff, U. S. Bureau of Foreign and Domestic Commerce, the article appears in Vol. 30, No. 6, of *Domestic Commerce*, which is issued weekly by the U. S. Department of Commerce and may be obtained at 5 cents a copy.

Surface Temperatures READ DIRECTLY. QUICKLY. ACCURATELY with the "Alnor" Pyrocon!

Here's a portable, easy-to-read pyrometer that you can use on both flat and shaped surfaces, whether they are stationary or in motion . . . It's sturdy, has a shock-absorbing movement and factory-calibrated accuracy . . . Ten different types of thermocouples adapt it to practically any surface temperature application in plant, laboratory or shop. *Write for Bulletin 3511!*

Illinois Testing Laboratories Inc.
420 N. LaSalle St. Chicago, Ill.

OK'd by the Best!

Sure we're bragging, but—when companies like duPont, Socony-Vacuum, Shell Oil and Warner Quinlan use our tachometer we've got a right to be proud. Portable—less than 2 lbs. in weight, Jones Hand Tachometers are ideal for speed and rating checks on revolving platens, generators, turbines and motors of all types.

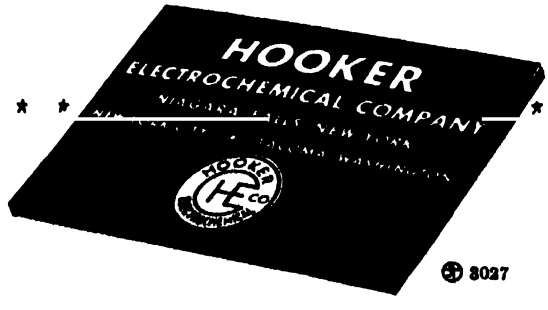
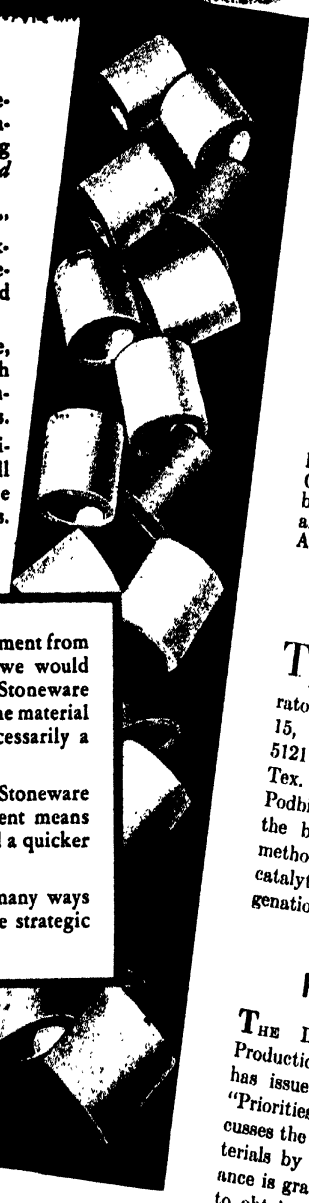
PENNANT-WINNING COOPERATION



—helped bring this award to

HOOKER

To be awarded the Joint Army-Navy "E" Flag for "high achievement" in the production of war materials is something to make *any* company feel proud. We at Hooker are no exceptions.



Yet the cooperation of others was essential in winning this flag for our Niagara Falls plant. Our customers have given us splendid support. Our suppliers have been invaluable. We are deeply appreciative of the honor paid us by the Army and Navy authorities. We acknowledge that, in awarding us the "E", they have recognized the all-important contribution of chemistry to the war effort.

Chemicals are swords for war and ploughshares for peace. We are happy to play our part in the never-ceasing search for new ways to help America in this war and beyond.

8027

"U. S." RASCHIG RINGS

"U. S." white porcelain or chemical stoneware raschig rings are outstanding in the fundamental qualities required of a good raschig ring: *mechanical strength, chemical purity, and uniformity.*

Vitrified at temperatures of 2500 deg. F., "U.S." raschig rings cannot soften or crumble. Their extremely low co-efficient of thermal expansion prevents chipping, cracking, or spalling under rapid heating or cooling.

Our non-absorbent, zero-porosity, iron-free, white porcelain bodies permit easy and thorough flush cleaning, eliminating the danger of contamination or discoloration of following solutions.

They are unreservedly guaranteed, as is chemical stoneware, to be inert to the action of all acids, solvents, and corrosive solutions, with the exception of hydrofluoric acid and hot alkalies.

Write for Bulletin No. 54 on Modern Tower Packing

As a manufacturer of corrosion-resistant equipment from natural rubber, synthetics, alloys and ceramics, we would like to point out that "U.S." Standard Chemical Stoneware is made 100% from non-critical materials, and is one material of construction for which priorities are not necessarily a pre-requisite to obtain.

The substitution of "U.S." Standard Chemical Stoneware for synthetic, metal and rubber process equipment means more planes . . . more tanks . . . more guns . . . and a quicker victory.

Our engineers will be glad to explain the many ways in which versatile chemical stoneware can release strategic materials for the more vital needs of war.

Army-Navy E Awards

RECENT presentations of the Army-Navy Production Award, the Army-Navy E, have been made to the Leeds & Northrop Co., Philadelphia, Penna., which received the burgee from Admiral Henry A. Wiley, U. S. Navy, retired, on September 5; to the H. K. Porter Co., Pittsburgh, Penna., which received the award on August 27 from Colonel J. S. Seybold; to Handy & Harman, New York, N. Y., which received the award August 15 from Lieut. Commander R. W. Rose; to the Foster Wheeler Corp., New York, N. Y., which received its second award at Danville, N. Y., on August 17, the presentation being made by Rear Admiral Clark H. Woodward; and to the Goodyear Tire & Rubber Co., Akron, Ohio, on September 15, by Major General William N. Porter, Chemical Warfare Service.

On September 18 the Army-Navy E was presented to E. R. Squibb & Sons, in recognition of efforts to supply critical drugs, biologicals, and other essentials. Rear Admiral Harold W. Smith made the presentation. Buffalo Pumps, Inc., received the award from Rear Admiral Wat T. Cluverius. On September 1 the Victor Chemical Works, Mt. Pleasant, Tenn., was given the award for excellence in production of war equipment, Brigadier General Haig Shekerjian of Edgewood Arsenal delivering the principal address. The Struthers Wells Corp. received the Army-Navy E on September 9 from Lieutenant Colonel A. F. Witte of the Cleveland Ordnance District to the Chain Belt Co., Milwaukee, Wis., on September 19, by Captain D. D. Dupre, U. S. Navy, and Lieut. Colonel D. J. Martin, U. S. Army.

Fractionation Clinic

THE Podbielniak Fractionation Clinic has been established as a special laboratory (September 1 to about November 15, 1942) at the Petreco Tretolite Co., 5121 South Wayside Drive, Houston, Tex. Its purpose is to assist users of Podbielniak fractionation apparatus in the best application of apparatus and methods to effective control of alkylation, catalytic cracking, isomerization, dehydrogenation, and similar processes.

Priorities and Industry

THE Division of Information, War Production Board, Washington, D. C., has issued an 84-page booklet entitled "Priorities and Industry". This discusses the over-all pattern, control of materials by priorities, how priority assistance is granted, and what you should do to obtain priorities assistance. The appendexes give a list of regional directors and district managers, with addresses, WPB regulation on delegations of authority, text and summaries of priorities regulations, and directive for wartime construction.

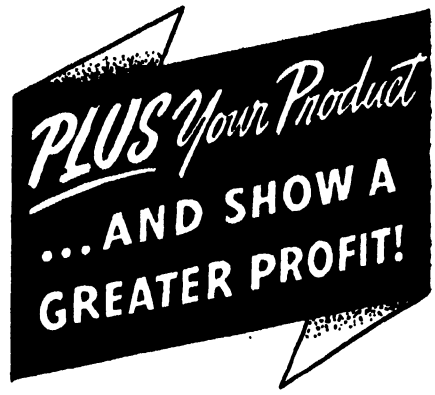
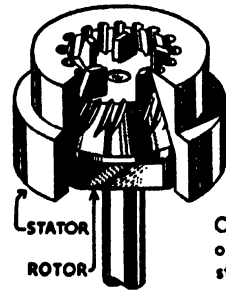
Student Subsidy and Allocation

In the face of a rapidly growing national shortage of engineering personnel, Dean Thorndike Saville of New York University College of Engineering, has called for the prompt establishment of a government-sponsored program which would select, finance, and allocate those high school graduates who show promise in engineering.



In a report to Chancellor Harry Woodburn Chase, Dean Saville said that high school graduates with obvious aptitudes for engineering study were presently caught in a welter of confusing information, and that many were lost to the profession in complete disregard for well-defined national needs.



He pointed to the conflicts now affecting students between Selective Service principles and directives; the recruiting practices of the military services; the policy of the Air Corps, Signal Corps, and Army Enlisted Reserves; the "V" programs of the Navy and the requirements of the R. O. T. C. He said:

There is the vaguest and most unsatisfactory coordination among them and none at all with the equally important needs of industry and the government technical services connected with war activities.

Obviously, we should regularize coordinate, and compromise. No activity essential to the war effort can obtain, for some time, all of the engineering talent which it needs. Some 50,000 additional engineering personnel will be needed within a year. The engineering colleges will graduate between 18,000 and 20,000. And yet high school students lacking means for a college education, and others enticed by the high wages of the war employment offices, and the civil service, are lost to professional training in complete disregard of the national need for engineers.

Therefore, in engineering, as in other necessary professions in which shortages exist, there should be a government-sponsored program which will select, finance, and allocate high school students with the proper aptitudes. This allocation may even be effected by induction into a special students training corps for assignment to engineering colleges. Upon completion of approved curricula, which may be of varying lengths of time to meet specific needs, or when their records indicate an inability to complete their

Original design of rotor and stator in

EPPENBACH COLLOIDAL MILL assures more efficient triple action.

AMAZING RESULTS have been achieved with the Eppenbach Colloidal Mills. Products, as wide apart as emulsions, serums, lipsticks, rubber compounds, have acquired new, improved qualities, because the Eppenbach is so far ahead in its triple action.

It's more powerful, the mixing turbines break liquids more violently. Clearances can be so finely adjusted, they seem practically closed. The teeth in the rotor and stator shear the materials mechanically—then the smooth surfaces hydraulically shear to any required particle size.

Perfect control is assured. No air is sucked in. Micrometric adjustments are made without stopping. Water jackets provide right temperatures. Rotor is only moving part—and it's conically shaped to take up wear. Self-cleaning, simple, rugged. *Write us.*

EPPENBACH INC.

PROCESSING EQUIPMENT FOR OVER 29 YEARS

[illegible] Boulevard Long Island City N Y

course successfully, they should be allocated on a quota system to work for which they are best fitted from the standpoint of the national need existing at that time. All agencies, whether they be civilian or military, which are connected with important war work, should be considered in the final allocation of trained technical personnel.

I feel that it is essential to invoke promptly some form of public subsidy if the nation is to have an adequate supply of properly trained and motivated engineering graduates. A policy of government selection, finance, and allocation should be based upon the expectation of a long war, and should be adopted after agreement between engineering colleges' administrators, and officials charged with the training of technical personnel for war purposes.

The mechanism for all of this will be hard to devise, will be productive of fundamental changes in the present recruitment of students, and will pose serious post-war problems of readjustment. But the mechanism can be reasonably simple; it is desperately needed, and the efforts of students and faculty will be amazingly enhanced to the prodigious benefit of morale and effective national service.

It seems that the national needs in engineering education are at present about as follows:

(*a*) Many more well-selected high school graduates tested for engineering ability and aptitude and assigned to engineering colleges.

(*b*) A determination of the number of different kinds of engineering graduates estimated as needed in 1943, 1944, 1945 and for each year until the end of the war.

(*c*) A quota of freshmen assigned each year to each engineering college. This should be determined in part by the capacity of the college, and in part by its special facilities. Some colleges should be required to concentrate on large numbers in fields in which they are superior, and abandon other fields for the duration.

(*d*) The college authorities should determine the financial needs of the students. They are experienced in this. Subvention should be furnished to the degree necessary from public funds. As an alternative all students might be paid while in college. This might be accomplished by induction into a special students training corps, or perhaps less desirably by induction into the armed services and assignment to college training.

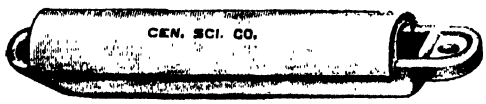
(*e*) Upon completion of an approved college curriculum, students should be assigned to technical work in the armed services, the civilian technical agencies of government, or to war industry according to the amount of training they have had, their physical condition, and the national needs existing at that time.

(*f*) Upon failure in college from any cause, assignment would be similarly made.

(*g*) Accredited institutions should participate without reference to particularities of curricula or variations in length of term.

It is my feeling that defective as it doubtless is from lack of consideration of all the items to be taken into account, some such program would go far toward solving the present uncertainties in training objectives on the one hand, and on the other hand would assist materially in a long-range plan for producing the right kind of engineers in more adequate numbers for the all-round job of winning the war.

Plastic War Production Association Formed



A POOL of plastics companies in the New York area, known as the Plastic War Production Association, has been formed with headquarters at 122 East 42nd St., New York, N. Y. The association will pool the engineering, research, and manufacturing facilities of its members for the benefit of government branches placing war contracts, and will endeavor to develop new applications of plastics to conserve vital metals.

Leitz Seized by Alien Property Custodian

AMONG the concerns, the capital stock of which has recently been seized by the Alien Property Custodian, is E. Leitz Inc., New York, N. Y., dealer in photographic equipment, and optical and scientific instruments.

BARE FACTS!

These combustion boats are less expensive and better

Made from an improved ceramic mixture, Leco combustion boats are the best boats it is possible to make. The ceramic used is extremely dense, highly refractory, and will withstand temperatures up to 2700 deg. F.

No. 26278-D Combustion Boat (Leco #6) is unexcelled for volumetric or gravimetric determinations. It is made deep for repeated samples and thin for quick heating. It may be used with or without alundum until full and without bulging, and it will take a two-gram sample at one heating. Dimensions: 3-7/8 × 1/2 × 1/4"—**$35.00** per 1000 ($4.50 per 100). **No. 26279-B Covers** for above are **$27.00** per 1000 ($3.50 per 100).

No. 26278-C Combustion Boat (Leco #5) is made larger for those who prefer to use a larger sample and is an excellent substitute for the nickel barge. Dimensions: 4 × 3/4 × 5/16"—**$10.00** per 100. **No. 26279-C Covers** for above are **$10.00** per 100.

Transportation of Explosives

THE Interstate Commerce Commission, Washington, D. C., has issued a mimeographed leaflet, No. 3666, covering proposed changes in regulations for transportation of explosives and other dangerous articles.

PRODUCTION of from 3 to 4 tons weekly of carbide is reported for a factory recently constructed in Eire, where annual consumption is given as approximately 700 tons. Increased output at the new plant will supply about a third of such requirements, it is thought.

NORWAY is developing her own tar products to take the place of former imports. The output of carbolic acid is increasing, and crude pyridine is being manufactured. Road tar is also being made in larger quantities, a report from that country states, and pitch and distilled tar have been used in making roofing materials.

CANADA has continued reduced duties of 5 per cent ad valorem on imports into Canada from non-Empire sources of casein, other than rennet casein, for use in Canadian manufactures, the Department of Commerce has been advised.

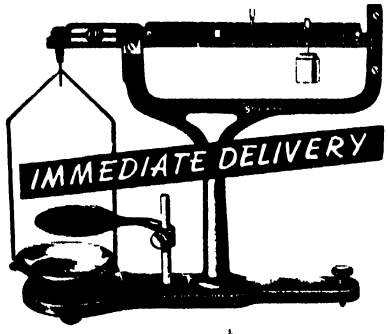
Lend-Lease Produces Giant Orange Squeeze

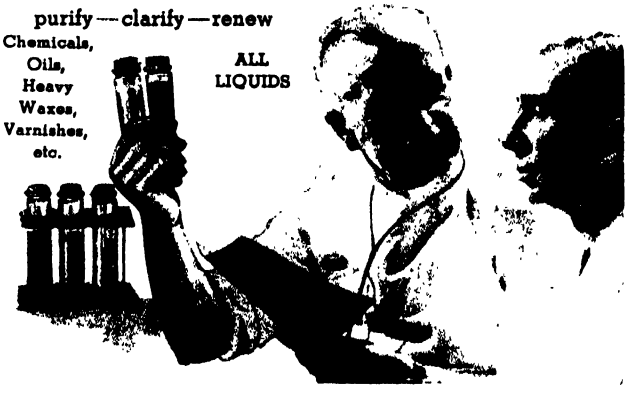


Orange juice prepared for Lend-Lease shipments to United States troops abroad and to Allied Nations is concentrated and pasteurized at 170° F. and then sealed into gallon cans. This filling and sealing equipment boasts a capacity of 500 cans per hour.

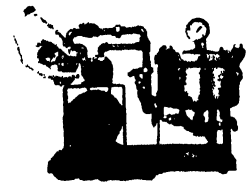
for FAST, ACCURATE WEIGHING

SCHAAR Triple Beam BALANCE

211 GRAM CAPACITY
Without the Use of Separate Weights
10 MG. SENSITIVITY



Here is a low-priced balance which will be found most useful wherever fast, accurate weighing is required. With its sensitivity of 10 milligrams and its capacity of 211 grams—without the use of any loose weights—it has innumerable applications in the analytical or in the educational laboratory. Weighing is greatly speeded up by the ingenious provision for damping: the beam can be stopped by simply pressing the finger against the beam-end, which swings in a slotted recess.



No. 577 Schaar Triple Beam Balance, 211 Gram Capacity, Finished in Black Enamel..... $20.00

. . . BUILD DURABLE CORROSION-RESISTANT EQUIPMENT with PENCHLOR ACID-PROOF CEMENT

REG. U. S. PAT. OFF.

Quick-setting • Self-hardening

Wartime needs demand time-saving wherever possible in acid-proof construction. Wartime pressure for the utmost in production means that corrosion-resistant construction *must* stand up. Penchlor Acid-Proof Cement meets both these requirements with a record of proved performance.

With Penchlor Acid-Proof Cement you can get brick-lined equipment into service without delay because this tough, long-lasting sodium silicate cement offers these advantages: Quick-setting and self-hardening—easily handled—no heating required—no drying delays—no acid treatment.

Continuous production is possible because Penchlor Acid-Proof Cement has proved itself in years of uninterrupted service. Great strength and minimum porosity reduce repairs to a minimum. The mortar set is permanent. There is less shrinkage with Penchlor Acid-Proof Cement. It is steam and water resistant. It adheres well to a wide variety of construction materials.

Industries Using Penchlor Acid-Proof Cement

Acids	Explosive	Pulp
Alum	Fertilizer	Rayon
Bleaching and Dyeing	Glass	Rubber
Chemical	Lacquer	Smelting
Coke and Gas	Leather	Spark Plugs
Distilling	Metal Pickling	Steel
Electrochemical	Oil	Tanning
Electroplating	Paper and Parchment	Textile

Where conditions require a cement of unusual strength and high resistance to abrasion, consider these Penn Salt *resin* cements: *Asplit*®, for conditions always acid . . . *Causplit*®, for alternate acid and alkaline conditions. These are easy to handle and will withstand a wide range of corrosive conditions up to 350 degrees F.

Despite vulnerability to higher corporate taxes, leading chemical shares continue to enjoy higher market evaluations per dollar of earnings than other leading corporate securities, as indicated by comparison with the Dow-Jones Industrial Averages, according to a report by E. F. Hutton & Co. On the average these shares are selling at 21.0 times estimated 1942 profits on a 50/90 per cent tax basis and 32.4 times on a 50/100 per cent tax basis.

D. M. Musser, formerly with Mellon Institute, is now engaged in research work with the Pacific Mills, New York, N. Y.

Merck Training School

The Merck Training School, sponsored by Merck & Co., Inc., Rahway, N. J., has started classes in subjects essential to the war effort. Among the subjects included are chemistry, chemical equipment, shop mechanics, blueprint reading, power plant engineering, electricity, English, mathematics, and stenography. While all new employees are required to attend safety classes, first aid instruction will be included on a voluntary basis.

In addition to the classroom, a demonstration room has been set up with numerous kinds of chemical equipment, which will be used to acquaint new employees with the various types of machinery used in a modern chemical plant. In addition, an industrial library and reading room have been established in which employees will have access to trade and industrial journals and technical books.

Acid Open Hearth Research Association

The Acid Open Hearth Research Association was formed in Pittsburgh, Penna., September 14, 1942, with the purpose of conducting practical and technical research upon the problems governing the production of steel in the acid open hearth steel furnaces. G. R. Fitterer, Department of Metallurgy, University of Pittsburgh, has been appointed director of research, and J. W. Linhart, research metallurgist. The work will be conducted under the auspices of the University of Pittsburgh with full study of actual furnace heats in the plants of the 19 member companies. Secretary of the new association is Fred C. T. Daniels, 901 Bingham St., Pittsburgh, Penna.

Survey of Manpower Resources

Senator Claude Pepper has introduced a resolution calling for the creation of a special committee of five Senators "to make a full and complete study and investigation in cooperation with the Manpower Commission of the manpower resources of the United States and how such manpower resources should be employed to the best advantage in agriculture, industry, the armed services, and other activities as consistent with the spirit of our institutions and the national emergency best to promote the war and victory for our cause".

FIRE PREVENTION WEEK

THE nation is preparing to defend itself from fire that may be caused by incendiary bombs. Equally vital is the need to prevent the slowdown of war production by fires that may result from sabotage or ordinary causes. And, at this time when we are facing material shortages, replacements in the home and elsewhere must be reduced to a minimum.

The seriousness of the situation has been recognized by every organization concerned with fire safety, and, for the first time, the sponsors of Fire Prevention Week are joined, this year, by the U. S. Office of Civilian Defense, which is charged with civil protection in wartime.

By virtue of the President's proclamation, the U. S. Office of Civilian Defense now calls upon the entire Nation to heed the danger of fire, a danger which threatens our lives, menaces the security of our homes, and waits, ready in an instant, to sabotage our war industries.

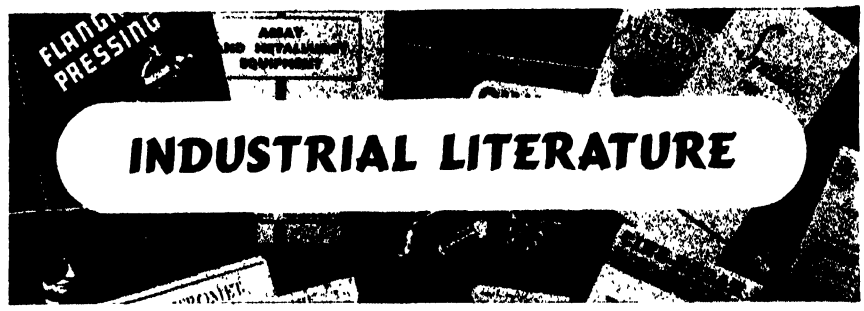
"General Grants"—
THEY'RE TOUGH, FAST AND HARD HITTERS!

Challenged by an aggressive enemy with years of war machine building experience, American engineers, in record time, designed, tested and built the famed "General Grant" tanks. Heavily gunned, tough and fast in the field, these steel monsters can out-fight, out-shoot and outmaneuver anything the Axis powers have yet rolled out.



But it takes water to build tanks—water for the men who work in the plants—for those who produce the steel for those who operate and service them—and for millions of other people in the Service of Supply. Before plants could be built, armies trained and munitions made, there had to be an abundance of water. Upon the old, reliable and capable shoulders of the Layne Organization fell much of the task of producing that water. Layne swung into action and in record time, built deep well water systems by the hundreds, thus making possible unprecedented war and production programs.

Layne's reputation like that of the "General Grant" tanks, has been won on the field of action. Layne wells and pumps are doing an outstanding job—operating day and night, producing millions and millions of gallons of water for almost every phase of America's war effort. For late bulletins, wire or write LAYNE & BOWLER, INC., Memphis, Tenn.

Listed publications should be requested directly from the company concerned. Use business stationery, mention bulletin numbers, and refer to this journal. Publications will be sent free unless otherwise noted.

Automatic Reduced Voltage Starters. This 16-page bulletin gives a description of this new line of starters, a complete discussion of the factors that enter into the selection of such units for squirrel-cage motors and of the company's automatic resistance starters of various types and sizes. *Bulletin CEN.* ALLEN-BRADLEY Co., 1311 South First St., Milwaukee, Wis.

Automatic Time Controls. An 8-page pamphlet on Vernier-Set and Cycle-Progress timers, Series 2800. Applications, construction, types, and operating features, ratings and arrangements are given in detail. Included are combinations of timers and auxiliary equipment. *Pamphlet CEN.* AUTOMATIC TEMPERATURE CONTROL CO., INC., Philadelphia, Penna.

Bakelite Laminating Plastics. This 24-page booklet tells what laminated plastics are and the various types of stock available. It is illustrated with photographs showing the manufacture of laminated materials and their essential uses in the aircraft, chemical process, and other industries. *Booklet CEN.* THE BAKELITE CORP., UNIT OF CARBIDE AND CARBON CORP., 30 East 42nd St., New York, N. Y.

Chemical Feeders. This bulletin describes a new displacement pump type unit in which the operating parts are isolated from the material to be handled. Specifications and construction details are also given. This feeder is either manually or automatically controlled. *Bulletin BLW 25 CEN.* WILSON CHEMICAL FEEDERS, INC., Buffalo, N. Y.

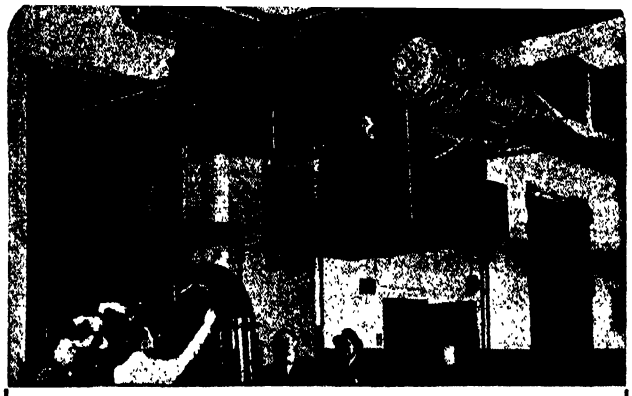
Cleaning Compound. This product, called "Trojan Electro-Purjit" is a fused chemical, claimed to be better than gasoline or naphtha for cleaning machinery. It will not burn and is harmless to hands and clothes. It dissolves rust, grease, and weather corrosion from glass; eliminates acids and alkalis; cleans and disinfects greasy, oily cement, wood, and other type floors. *Bulletin CEN.* TROJAN PRODUCTS AND MFG. CO., 3130 South Wabash Ave., Chicago, Ill.

Coal Crusher and Breakers. This 20-page bulletin describes the development of these units and shows the mechanical principles involved in crushing and breaking coal sizes. Construction features, capacities, dimension charts, line drawings, and photographs complete the bulletin. *Bulletin 342 CEN.* MCNALLY PITTSBURG MFG. CORP., 307 North Michigan Ave., Chicago, Ill.

Contact Making Clock. This bulletin describes a new unit for use where an accurate and dependable impulse timing element is required. It can also be used as an impulse timer for various time-recording instruments. An illustration, with descriptive details and diagrams of the construction features is given. *Bulletin S-3 CEN.* R. W. CRAMER CO., INC., Centerbrook, Conn.

Defibrators. This 15-page catalog gives a detailed, illustrated description of the construction and operation of the Asplund Defibrator. Installations and uses are described, with photographs, as well as products made with the Defibrator. *Catalog 2 CEN.* THE AMERICAN DEFIBRATOR, INC., New York, N. Y.

Fire and War Gas Extinguisher. This extinguisher is recommended as a decontaminator for chlorine, phosgene, and chloracetophenone. It is effective in combating automotive, airplane, industrial, and marine fires. *Bulletin CEN.* O. H. ADAMS CO., Milwaukee, Wis.



Flowmeters. A 56-page edition of a complete flowmeter line catalog describes electric, mechanical, linameter, ring balance, liquid level and weir meters; 2-penelectric flow recorders with ratio indicating pointer, an improved low-pressure electric type meter; and an ultra high-ring balance meter. The catalog is well illustrated and includes a discussion of flow-metering benefits, with complete listings of specifications and ranges. *Catalog CEN.* COCHRANE CORP., 17th St. and Allegheny Avenue, Philadelphia, Penna.

Industrial Instruments. A 48-page catalog describes a full line of instruments for the measuring and control of industrial process conditions. There are 10 sections, with over 200 illustrations, six of which group and describe the instruments, accessories, and supplies appropriate to a particular field of application, while the remaining four cover combination instruments, panels, valves, etc. Thorough cross-indexing plus an ingenious use of color makes this catalog a convenient and useful reference handbook. *Catalog 95-A CEN.* THE FOXBORO CO., Foxboro, Mass.

Malacca Plastic Rubber. A 2-page bulletin describes the properties and uses of Malacca plastic rubber. *Bulletin CEN.* ROBINS CONVEYING BELT CO., Passaic, N. J.

Manual for New Employees. A 72-page pocket-size booklet answers prac-

Something worth looking into!

ARMSTRONG Low Cost, Positive HUMIDIFICATION

What It Will Do for You

1 PREVENT loss of weight, strength or quality of hygroscopic materials.
2 IMPROVE workability of materials.
3 CONTROL drying processes.
4 CONTROL troublesome or dangerous dust and static conditions.
5 PROVIDE healthier working conditions.

ARMSTRONG Steam Type Humidifiers have brought about a new conception of industrial humidification. They are installed and used as simply as unit heaters — connected into existing steam supply lines. They are low in cost — small models capable of handling 40,000 cu. ft. of space or more list for only $100 complete with sensitive Friez humidistat and all accessories.

They give results that end your dry air problems permanently. It may pay you rich dividends to investigate the possibilities for application of Armstrong Humidification in your plant. A request for information does not obligate you.

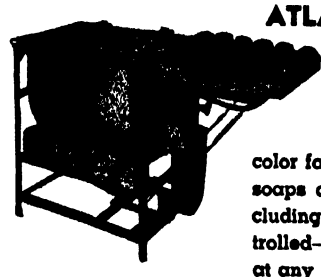
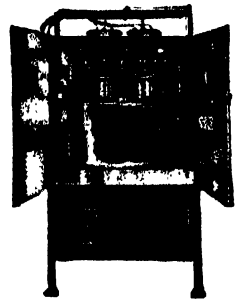
ATLAS-OMETERS

ACCELERATED TESTING EQUIPMENT



- **Predetermine, in laboratory, effects of sun, laundering, and weathering.**
- **Reduce years of actual use to just a few days testing.**
- **Recognized by manufacturers and consumers as the standard accelerated test equipment for more than a quarter-century.**
- **Used in 36 countries . . . all over the world.**
- **Many Federal Specifications call for tests with Atlas-Ometers.**

ATLAS ELECTRIC DEVICES COMPANY
377 W. Superior St., Chicago, Ill.



ATLAS FADE-OMETER

The accepted standard for determining the fastness to light of dyestuff and dyed fabrics — originated and made solely by Atlas, and now used all over the world. Atlas enclosed Violet Carbon Arc represents closest approach to natural sunlight. Temperature automatically controlled.

ATLAS LAUNDER-OMETER

Standard laboratory washing machine of A.A.T.C.C. Tests washing action, textile shrinking, staining, and color fastness to dry cleaning solvents, soaps and detergents. All factors, including washing action, carefully controlled—can be reproduced identically at any time.

ATLAS WEATHER-OMETER

Reproduces faithfully the destructive action of sun, rain, thermal shock with all the attendant phenomena of expansion and contraction. Shows natural weathering effect from any given conditions at any time, any location. Latest model has twin arcs, full automatic with temperature control.

LEARN NEW USES OF ALTERNATES AND SUBSTITUTES

ATTEND THE
1942
NATIONAL
CHEMICAL
EXPOSITION
AND
NATIONAL INDUSTRIAL
CHEMICAL CONFERENCE
★
CHICAGO
SHERMAN HOTEL
NOVEMBER 24-29

Chemistry has gone to war! Research directors, chemists, plant managers, engineers and executives who attend the Exposition, will find a vast store of knowledge available concerning new methods and materials. Men high in their respective fields will impart interesting data vital to both America's war effort and to civilian economy.

INDUSTRIAL MOVIES
A continuous showing will provide a liberal education in chemical processing. Subjects covered will include plastics, rayon, chemical stoneware, glass, bread, coke, white lead, glass insulators, gelatin capsules, steel, aluminum and many others important to the American way of life.

COMMERCIAL EXHIBITS
An imposing list of leaders in every field will display and introduce many new items to the profession. These remarkable exhibits, in themselves, will completely justify attendance.

SCIENTIFIC EXHIBIT
The "Electronic Microscope" will be exhibited by RCA Manufacturing Company. See actual micrographs from this Electronic Microscope.

SPECIAL EXHIBITS
The War Production Board (W.P.B.) exhibit demonstrates reclamation and recovery of vital chemical products.

"Successful alternates and substitutes"—the extensive exhibit prepared by Dr. Harrison E. Howe.

"New Chemicals"—a significant exhibit by W. J. Murphy.

Industrial Literature

CONTINUED FROM PAGE 1274

tically every kind of problem that confronts the new employee. Illustrated with cartoons and with photographs of key executives. *Manual CEN.* MANNING, MAXWELL & MOORE, INC., Bridgeport, Conn.

Pumps for Vacuum and Pressure. This bulletin describes in full the Motoair motor and pump in one integral unit. Installations, illustrations, specifications, and uses of the unit are given. Space saving, positive vacuum or pressure, no pulsation or vibration, positive oil control are some of the features claimed. *Bulletin CEN.* MOTOAIR DIVISION, NEW JERSEY MACHINE CORP., 1505 Willow Ave., Hoboken, N. J.

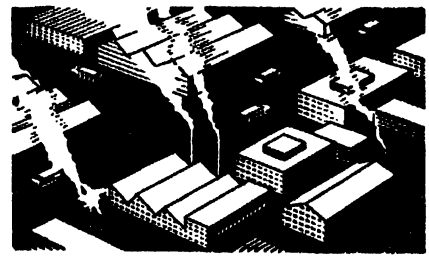
Rubber Guidebook. Designed to present maximum information in easily accessible, indexed, condensed form, this new 30-page booklet lists the applications and properties of many types of products for industrial and aeronautical purposes using natural, synthetic, or reclaimed rubber. Some subjects covered are properties of Ameripol, sponge products, extruded rubber goods, anode process of rubber coverings, hard rubber parts, and rubber cements. Subzero, thickness, and hardness tests in oil and suggested uses for Ameripol compounds are given. *Booklet 2-8981-GA CEN.* B. F. GOODRICH CO., Akron, Ohio.

Sugar Factory Equipment. A complete, 63-page illustrated catalog of equipment for the sugar industry shows the various pieces of equipment and actual installations in factories. Specifications, metals used, and prices are given in detail on various types of chains, sprocket wheels, feeders, transmission machinery, elevators, idlers, conveyors, minglers, shredders, stackers, and other units. *Catalog 766 CEN.* THE JEFFREY MANUFACTURING CO., Columbus, Ohio.

Thermocouple Gage. A 4-page illustrated folder describes the all-metal Type D thermocouple gage. *Folder CEN.* NATIONAL RESEARCH CORP., 100 Brookline Ave., Boston, Mass.

Trucks. This bulletin describes a new 10,000-pound capacity, heavy-duty crane type truck. This mobile crane is adapted to every industry where heavy loads must be lifted. Special features assure safety in operation. The No-Plug travel controller makes careful and correct operation compulsory, and design results in lower dead weight despite heavier construction throughout. *Bulletin 1612 CEN.* THE BAKER INDUSTRIAL TRUCK DIV., BAKER-RAULANG CO., 2168 West 25th St., Cleveland, Ohio.

Variable-Speed Drive. Description of a new variable-speed multiple V-belt-drive called the "Allspeed drive", said to be exceptionally compact, ball-bearing equipped, and so designed that it can be operated in any plane. It can be direct-coupled with a standard motor and the output shaft can be run at motor speed, and is flexible enough so that it can be applied to any type of machine within its power range. *Bulletin CEN.* WORTHINGTON PUMP AND MACHINE CO., Harrison, N. J.



V-Belts. A handbook on the wartime care of all types of V-belts. This book includes the anatomy of the V-belt, the principle of the V-belt drive, and post-mortems on actual damaged belts. How to obtain proper tension, what to do about worn sheaves, what determines the life-expectancy of a V-belt are some of the facts revealed. *Booklet CEN.* TEXROPE DIV., ALLIS-CHALMERS MFG. CO., Milwaukee, Wis.

Vitamin A Meter. An illustrated bulletin on the Lumetron photoelectric meter for this vitamin includes data on principle of operation, calibration, optical, and electrical system. *Bulletin CEN.* PHOTOVOLT CORP., 95 Madison Ave., New York, N. Y.

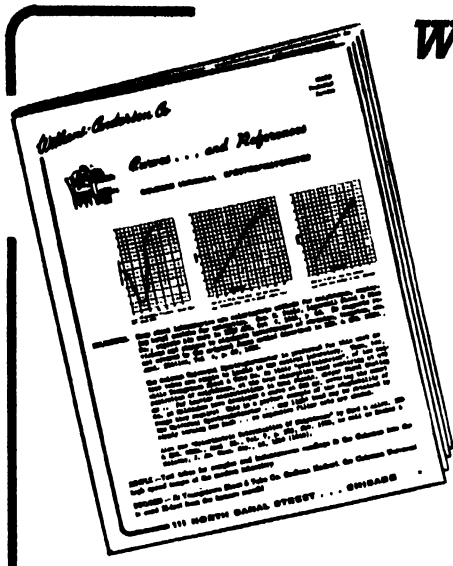
Water Handbook. This publication well deserves the title "handbook". It not only discusses chemical analysis, but the correct interpretation of these analyses. In the first section 25 different methods of water analyses are discussed at length with procedures and calculations. Such water analyses as hardness, alkalinity, phosphate, sulfite, turbidity, oil, calcium, and specific conductance are covered. With but one exception all tests are simple, accurate determinations requiring little or no previous chemical background. The second section of the book is devoted to interpretations of the tests and their applications to plant control. Included here are discussions of such subjects as carbonate and non-carbonate hardness, pH control, steam purity, intercrystalline cracking, corrosion, and many others. Scattered throughout are 16 useful technical graphs and 15 illustrations of different pieces of testing equipment. This handbook will be sent to any interested person upon receipt of 50 cents. *Water Handbook, CEN.* W. H. & L. D. BETZ, Frankford, Philadelphia, Penna.

Water Softeners. This bulletin describes the hot process of water softening. Each unit is taken up carefully, and a flow sheet of the softener is given in detail. Illustrations of the settling and chemical agitating tanks, valves, distributing nozzles, pumps, proportioning meter, and decanting gear are included. *Bulletin W-212-B2 CEN.* WORTHINGTON PUMP AND MACHINERY CORP., Harrison, N. J.

Wire Cloth. A new folder on a complete line of wire and wire cloth, covering major applications, types of metal used, the basic types of weaves, crimp, and special weaves available. Examples of weaves are given full size, reel covers, bolting cloth, and panels are shown in reduction. Complete production services are also described. *Folder CEN.* BUFFALO WIRE WORKS CO., INC., 320 Terrace, Buffalo, N. Y.

Use EASTERN for accurate laboratory work

Precision Temperature Regulators—These famed regulators are offered in two forms; portable for Laboratory and experimental work, and an industrial model for permanent commercial installation. Extremely accurate, they give instant response to small temperature changes.



Variable Speed Stirrers—With ruggedly constructed motors, these stirrers can be used for continuous duty. Their lightness allows convenient operation from ordinary ringstands. Controlled-speed gives accurate duplication in repeated experiments.

For Titrations

• Supplies soft, glareless fluorescent illumination of daylight quality, correct intensity and color characteristics to beakers in which titrations are being carried out.

A *parabolic* reflector directs light against a flat, white, acid resistant vitreous enameled inclined background—eliminating direct illumination and so preventing glare and undesirable illumination intensities.

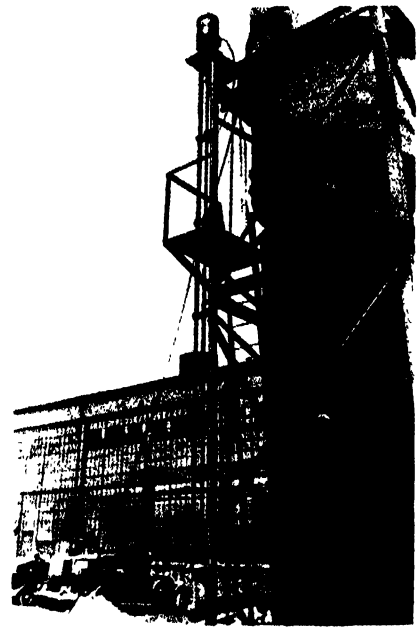
The outer surface of the lamp is finished in a dark blue vitreous enamel. Fitted with snap-switch, connecting cord and plug. Length, 12½ inches; height, 8 inches; depth, 4½ inches.

S-44290 Sargent Fluorescent Titration Lamp. Complete with fluorescent tube, type T-5. For operation from 115 volt 60 cycle circuits $13.00

For Directed Frontal Illumination of Balances

The lamp can be attached to all makes and styles of balances. Mounted at the front of a balance case, the *parabolic* reflector directs all light through the front door over the entire working area of a balance to uniformly illuminate beam, chain scale, pointer index and pans. Objectionable shadows and poorly lighted areas are entirely eliminated.

The lamp is supported by a simple clamp and permits free movement of the sliding balance door. Bulk and weight of the reflector are greatly reduced by making a separate unit of the auxiliary.



Both inside and outside of the reflector are finished in an acid resisting vitreous enamel. Exterior is dark blue.

S-3820 Sargent Fluorescent Balance Lamp. Complete with fluorescent tube, type T-5. For operation from 115 volt 60 cycle circuits $11.50

E. H. SARGENT & CO., 155-165 E. Superior St., Chicago
Michigan Division: 1959 E. Jefferson, Detroit, Mich.

All Outdoors a Well for Pump Test

A VERTICAL pump that required a 25-foot setting, a special unit for a western railroad, used to solve a local water-supply difficulty where water with a heavy sand loading had been causing trouble, presented a problem in testing.

When the pump was completed at the plant of the American Manganese Steel Division, Chicago Heights, Ill., how was it to be tried out? The puzzle was effectively worked out by suspending the unit from one of the company's high dust collector towers as shown in the illustration.

Salvage Campaign

THE salvage campaign at the plants of Merck & Co., Inc., Rahway, N. J., Philadelphia, Penna., and Elkton, Va., has returned 640,292 pounds of scrap iron and 5,199 pounds of scrap rubber, with substantial quantities of copper, aluminum, and brass.

Based on figures issued by the Government, the amount of scrap iron salvaged by Merck & Co. will take care of scrap requirements for 24 anti-aircraft guns, 14 tank guns, 28 machine guns, 16 tanks, 50 aerial bombs, as well as more than 100 hand grenades, aircraft cannon, trucks, and howitzers. The scrap rubber salvage to date would provide material for 3 gun carriages, a 10-ton pontoon bridge, a medium bomber, and some gas masks and boots.

Nonadhesive Films

THE United States Stoneware Co., of Akron, Ohio, has perfected nonadhesive Tygon formulations to provide easily removed temporary protection to highly polished surfaces against rust, corrosion, grease, finger markings, dust, scratches, etc.

Tygon Temprotec, in clear or transparent colored formulations, is applied by brush, dip, spray, or roller coating. It air-dries within a few minutes at normal room temperatures to form a durable, elastic film, unaffected by oil, grease, gasoline, or corrosive atmospheric fumes or condensates.

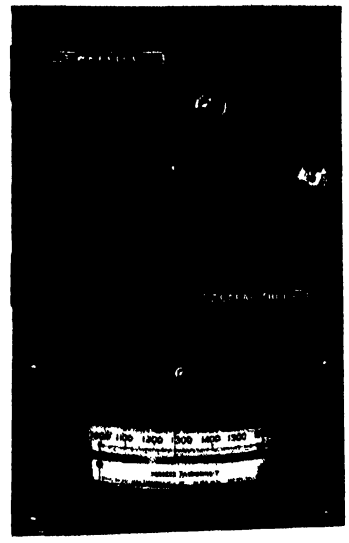
Plastic Hose for Stirrup Pumps

RECENT difficulties of Office of Civilian Defense officials in procuring plastic hose for stirrup pumps provide a graphic illustration of the greatly accelerated pace at which America's research laboratories are working to solve war production problems.

When OCD found in May that rubber hose could not be used for the pumps, plastics producers were asked to find a substitute, and a special formulation of Monsanto Chemical Co.'s Saflex was developed.

At the same time producers of rubberized fabric were searching for a new synthetic rubber for Army raincoats, water bags, life rafts, and collapsible boats and pontoons. To fill this need, Monsanto announced in July the development of a new Saflex formulation that could be vulcanized almost exactly like rubber and had other important advantages over materials previously available. As a result, all production will probably be required for direct Army and Navy use.

Loose Pulley Oiler



FOR use on loose pulleys, idler pulleys, clutches, eccentrics, and similar rotating machine parts, a new wick-type lubricator has been announced by the Oil-Rite Corp., Milwaukee, Wis.

This lubricator consists of a simple glass oil reservoir mounted on a hollow metal stem. This stem is sealed from the oil in the reservoir, except for two small ports at the very top. Inside the stem is a cylindrical felt wick, which extends through the pulley hub to rest directly on the shaft. A compression spring is wrapped around the wick to hold it firmly in position against the shaft. As the pulley rotates, and the lubricator with it, centrifugal force throws the oil against the top of the reservoir, and into the two ports in the stem. These admit oil to the wick, which filters out all dirt and sediment, and conducts the oil directly to the face of the shaft.

Exhauster and Ventilator

A NEW exhauster and ventilator called the "Octopus" is announced by Chelsea Fan & Blower Co., 1206 Grove St., Irvington, N. J. Specially designed for use in ship holds, mines, sewers, tunnels, and welding departments, the unit may be placed or hung in any convenient place between the working area and the open air.

THE Cochrane Corp., Philadelphia, Penna., announces the appointment of the Energy Control Co., as flowmeter representative for eastern Pennsylvania, southern New Jersey, Delaware, and Maryland.

Wheelco is still

FIRST

. . . in pioneering new applications for engineered electronics in temperature control.

The famous Wheelco "Electronic Principle" Control System provides faster, more accurate control than any other type of control and is constantly being applied to more control problems.

In 1941, Wheelco incorporated the instantaneous control action of the "Electronic Principle" and extreme accuracy of temperature measurement into the UNIVERSAL Temperature Controllers, which are the first to provide such plus values as interchangeability of all component parts, interchangeability of scale ranges, ready accessibility of all parts for individual checking and many other features. UNIVERSAL Controllers include Capacitrols, Potentiotrols, Limitrols and Resistance Therm-otrols.

In 1942, Wheelco continues to pioneer new control applications for the "Electronic Principle." *Write for FREE Bulletin No. Z6000.*

1935

"Electronic Principle" Temperature Control (D2)*.
Limitrols (D202)*.
Indicating Pyrometers (D302)*.
"ELECTRONIC PRINCIPLE" TEMPERATURE CONTROL — since proved superior to other types of controllers.

1936

Flame-otrol (L2)*.
Portable Indicating Pyrometers (D602)*.
FLAME-OTROL — only combustion safeguard for all fuels approved by both Underwriters' Laboratories and Factory Mutual Laboratories.

1937

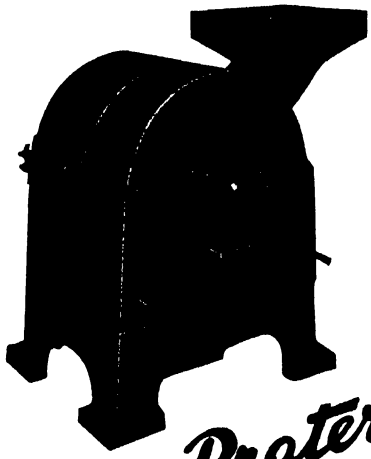
Proportioning Control (D2)*.
Portable Potentiometers (A502)*.
Heat-eyes (S2)*.
Time Delay Relays (S302)*.
PROPORTIONING CONTROL for continuously varying fuel input to maintain constant temperature — applied to "Electronic Principle" Controllers.

1938

Potentio-trols (A2)*.
Program Control (D2)*.
Rheotrols (J302)*.
Flame-eyes (L302)*.
Automatic Ignition Flame-otrols (L2)*.
POTENTIO-TROLS — potentiometric method of temperature measurement combined with "Electronic Principle" Control.

1939

Indicating Therm-otrol (G502)*.
Indicating Thermometers (G303)*.
Recording Thermometers (G403)*.
"ELECTRONIC PRINCIPLE" INDICATING THERMOMETER CONTROLLERS — for low temperature applications.



1940

Recording Therm-otrol (G502)*.
The THERM-OTROL — Recording Control Thermometer. Available in any type of measuring and control system for ranges from —50°F. to +1000°F. or equivalent °C.

Wheelco Instruments Co.
851 W. HARRISON STREET CHICAGO, ILL.
Wheelco—Originator of "Electronic Principle" Temperature Controls.

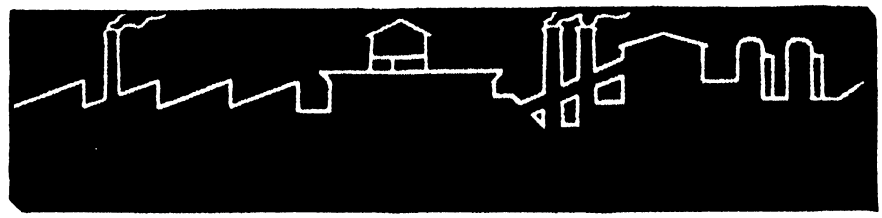
THE GOODS OF WAR AND THE GOODS OF PEACE—

Mean Prater

The process industries are facing terrific demand. Not only must they take on the burden for goods of war — they must also supply materials to replace those ordinarily used for goods of peace. Dependable high production equipment is a necessity.

Many of the newer phases of processing rely on Prater Processing Equipment. In the soya industry, grinding is almost 100% by Prater Mills.

Every Prater Mill is sold on a basis of guaranteed output per horsepower hour and control of quality of grind, and grain size, after analysis of your problem.



Write for any desired information.

PRATER PULVERIZER COMPANY
1825 S. 55th Ave., Chicago, Ill.

Guayule Rubber

MOUNTING demand for guayule rubber resulting from its widened use for compounding with synthetic rubbers has led to doubling the productive capacity of Cia. Hulera de Parras, according to an announcement by the American Cyanamid & Chemical Corp., New York, N. Y., representative of the Mexican company. The increased capacity is being put in with the cooperation of U. S. Government agencies and is expected to be completed early in October.

Present rapid extension of use of guayule is based on the improved properties which it imparts to synthetic rubbers, particularly of the Buna S type. Guayule not only serves as an additive and extender for the synthetic, but also increases adhesiveness.

Production of Commercial Explosives

COMMERCIAL explosives, not used directly in war but extremely vital to the war effort, are being produced this year in quantities approximating an all-time high. It is possible that the United States will use 450,000,000 pounds of dynamite this year, it is announced by E. I. du Pont de Nemours & Co., Inc.

In normal times, the United States uses on the average 1,000,000 pounds of dynamite each day. In addition, some 60,000,000 pounds of black powder are used annually for commercial purposes.

New Timing Device

THE Tandem Timer is a new timing device of the Industrial Timer Corp., 113 Edison Pl., Newark, N. J., for production departments, laboratories, and life testing of electrical apparatus. It is essentially a control unit with two individual and variable plug-in type timing elements. With the timing elements adjusted to their correct respective time intervals, each cycle of operation will follow the other continuously in regular sequence. When the timer dials are once set at the time interval desired, further adjustments are unnecessary until a new sequence is required.

Electric Etcher

THE Ideal Commutator Dresser Co., Sycamore, Ill., has designed a new model etcher to cover an extremely wide range of etching heats. This unit, called the No. 18 machine shop metal etcher, has 14 heats from 115 to 1300 watts. With it, one can etch everything from thin, delicate metal parts to large, smooth castings.

New Fiber Container to Replace Metal

AFTER many months of experimentation, the American Can Co., Maywood, Ill., has developed a revolutionary method for the making of cans with fiber bodies on machines used for the manufacture of metal containers. This new method, which American Can will make available to the entire industry, as soon as it has been thoroughly tried and perfected through actual production, is considered the most important development within the can manufacturing industry in the past decade.

No new machinery is required. The fiber sheets are fed into existing machines geared for manufacturing metal cans and give a reasonable facsimile of the old container. The manufacturer of a product which uses the cans also may use his existing packaging machinery.

Carbon Dioxide Engine for Electrical Fires

THE Alfite carbon dioxide engine is said to be the only 100-pound engine approved by the Underwriters' and Associated Fac-

tory Mutual Laboratories for use on both electrical and oil fires. It is a product of American-La France-Foamite Corp., Elmira, N. Y.

Electronic Crest Voltmeter

A NEW electronic crest voltmeter, announced by the General Electric Co., Schenectady, N. Y., is designed to measure ignition voltages of internal combustion engines; surge voltages caused by corona and surface discharges in the insulation on such electric equipment as motors, generators, and cables; and other repeated-

impulse voltages up to 30,000 volts. The instrument, weighing only 23 pounds, fills the need for a portable crest voltmeter for both laboratory and production testing.

Synthetic to Replace Rubber

A NEW synthetic which is replacing rubber in army raincoats has been announced by the Stanley Chemical Co., East Berlin, Conn.

When the manufacture of automobiles was stopped, the Government had on its hands large quantities of the plastic used in the production of safety glass. It also had the annoying problem of replacing rubber in raincoats, tarpaulins, hospital sheets, pontoons, and scores of other items.

Major Frank M. Steadman, Research and Development Section, Quartermaster Depot, Philadelphia, had an idea that those problems could be made to cancel. He was right.

First from the research laboratories, then from the Stanley plant in carload lots, came a new synthetic formulated from safety glass plastic and named "Haydenite" for Stanley's technical director, E. M. Hayden, claimed to be better than rubber, cheaper than previous waterproof coatings, and easier to apply than other synthetics.

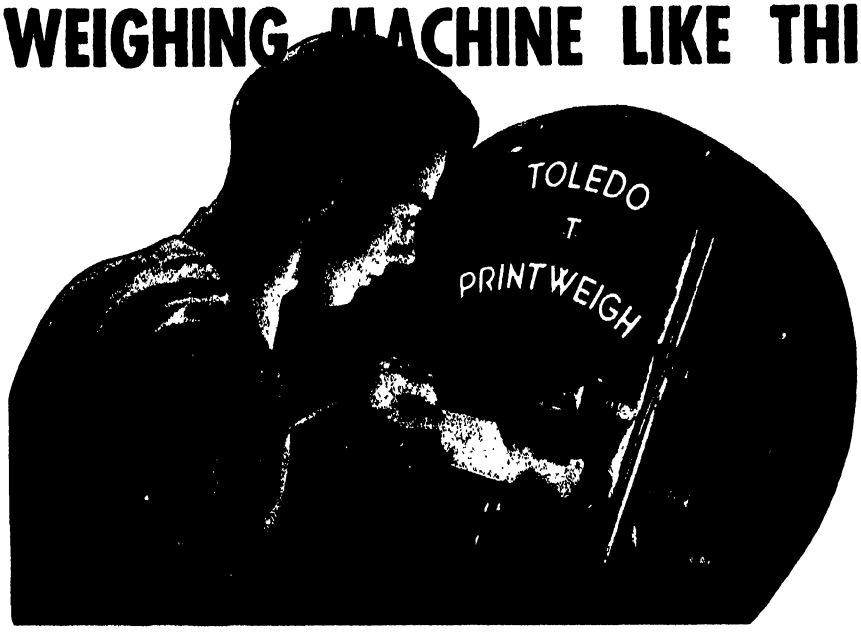
Chamber for Testing Instruments

A CHAMBER for testing instruments under extremes of cold and heat has been developed by American Coils, Inc., Newark, N. J. Its range of operating temperatures extends from −55° to +70° C. It includes apparatus for mechanical refrigerating and electrical heating.

Model RTC-1 consists of a two-stage condensing unit, heat exchanger, liquid subcooler, coil or evaporator, expansion valves, cabinet and forced draft strip heater, along with thermostats and other controls and connections for each. Operation is completely controlled from a front panel board, where the master switch is located along with the off-fan control, light switch, and receptacle switch.

New Circuit Breaker

A NEW high-speed air circuit breaker developed by the General Electric Co., Schenectady, N. Y., minimizes "arc back", a problem engineers have been battling since the first commercial mercury arc rectifier installation. The breaker was described in a paper presented at the summer convention of the American Institute of Electrical Engineers in Chicago by J. W. Seaman of the company's Switchgear Division and L. W. Morton of the Power Rectifier Engineering Department. Application of the new Type AG-1 breaker will lessen the possibility of power interruptions in war plants using direct current for the reduction of vital metal, such as aluminum and magnesium, and for various continuous processes.



Protective Cream

INDUSTRIAL skin disorders which, according to statistics of a major insurance company, comprise two thirds of all occupational diseases, are being brought under closer control by protective creams, according to G. W. Sherin, chemical specialties expert of the du Pont company, Wilming-

Victory thru Efficiency

Burrell High Temp. Furnaces help

BURRELL *High Temp.* FURNACES—War specifications have demonstrated the value of higher temperatures in fast "clean" determinations of carbon and sulfur in iron and steel analyses. Accelerators are not required.

MULTIPLE TUBE FURNACES—The 2-tube "most popular" model doubles capacity, measures 14"x17"x22" long, has a 9" heating chamber, and consumes 1.5 kw at 2500°F. Top temperatures of 2650°F. are easily maintained.

MODERN ACCESSORIES—Tap transformers modernize and simplify heat control. Pyrometers with rare metal thermocouples continuously indicate operating temperatures.

QUICK ELEMENT CHANGE—The non-metallic heating elements (no nickel or chromium) are silicon carbide rods which can be changed conveniently without dismantling the furnace.

CATALOG F-241—See the new box, muffle, tube, and pit type furnaces which provide convenient working chambers for a wide variety of heating operations in laboratories and pilot plants. Special high temperature furnaces are built to order.

CHEMICAL MARKET PRICES

October 2, 1942

Compiled from weekly current price listings in the *Oil, Paint, and Drug Reporter*, with permission of the publisher under its copyright. These prices, unless otherwise specified, are those prevailing in the New York market for technical grades in usual large commercial quantities.

Metal, N. Y.	1 lb.	.0650
Oxide, litharge, bbls., 20-ton lots.	lb.	.0790
Peroxide, powd., tech.	lb.	.23
Red, bbls., 20-ton lots	lb.	.09
Sulfate, bbls.	lb.	.0725
White, basic carb., bbls.	lb.	.0825
Lecithin, edible, drums, c/l.	lb.	.34
Tech., dms., c/l.	lb.	.28
Lime, live, chemical, bulk, wks.	ton	7.00
Lime-sulfur, dry, bags, c/l.	lb.	No prices
Lithopone, ordinary, bbls.	lb	.04½
Magnesite, calcined, dom., bags	ton	84.00
Magnesium carbonate, tech, bags, c/l.	lb.	.06¼
Chloride, drums	ton	32.00
Fluosilicate, cryst., bbls.	lb.	.18
Oxide, light, bbls.	lb.	.26
Manganese chloride, bbls.	lb.	.14*
Dioxide, 85–90%, bbls., c/l., wks.	ton	74.00
Sulfate, anhyd., bbls., wks.	lb.	.11¼
Mannitol, commercial, bbls., wks.	lb.	.35
Menthol, nat., cans	lb.	13.00
Mercury bichloride, cryst., drums, 50 lbs. or more	lb.	2.39
Mercury, flasks, 76 lbs., mines	flask	191.00
Meta-phenylenediamine, kegs	lb.	.65
Meta-toluylenediamine, kegs	lb.	.70
Methanol, synthetic, drums, frt. allowed, c/l.	gal.	.34½
Tanks, frt. allowed	gal.	.28
Methyl acetate, 97–99%, tanks	gal.	.09½
Chloride, cylinders	lb.	.32
Formate, l. c. l., drums	lb.	.89
Hexylketone, drums, tech., wks.	lb.	.60
Salicylate, drums	lb.	.35
Monoamylamine, drums, c/l., wks.	lb.	.61
Monobutylamine, drums, l. c. l., wks.	lb.	.51
Monoethanolamine, drums, wks.	lb.	.24
Naphthalene, crude, dom., 74 deg., bags, c/l., wks.	100 lbs.	2.75
Nickel salt, single, bbls.	lb.	.13
Niter cake, bulk	ton	16.00
Nitrobenzene, drums	lb.	.08
Nitrocellulose, alcohol-sol., bbls., wks.	lb.	.28
Nitromethane, drums, l. c. l., wks.	lb.	.25
Octanol, normal, drums	lb.	.85
Oil, castor, No. 3, tanks	lb.	.12¾
China wood, dms.	lb.	.39
Coconut, crude, tanks	lb.	.0835
Cod, Newf., bbls.	gal.	.90
Corn, crude, tanks, mills	lb.	.12¼*
Cottonseed, cooking, bbls.	lb.	.16¾
Linseed, raw, tanks	lb.	.1260
Menhaden, crude, tanks, f. o. b. Baltimore	gal.	.0880
Neat's-foot, pure, bbls.	lb.	.19¼
Oiticica, bbls.	lb.	.25
Oleo, No. 1, bbls.	lb.	.13¼
Olive oil, denat., bbls.	gal.	3.50
Edible, Calif., drums	gal.	4.00
Palm, Niger, bbls.	lb.	.0825
Peanut, crude, tanks	lb.	.13
Perilla, drums	lb.	.2450
Rapeseed, denatured, c. i. f.	gal.	.1150
Red, bbls.	lb.	.11¾
Soy bean, crude, tanks	lb.	.12¼*
Sperm, 38°, bbls.	lb.	.1301
Whale, bbls., natural, refined	lb.	.1070*
Ortho-dichlorobenzene, drums	lb.	.06
Ortho-nitrochlorobenzene, kegs	lb.	.15
Ortho-nitrotoluene, drums	lb.	.09
Ortho-toluidine, bbls.	lb.	.19
Para dichlorobenzene, drums, c/l.	lb.	.11
Para-formaldehyde, drums	lb.	.23
Paraldehyde, tech., drums	lb.	.12
Para-nitraniline, drums	lb.	.45
Para-nitrochlorobenzene, drums	lb.	.15
Para-nitrotoluene, bbls.	lb.	.30
Para-phenylenediamine, bbls.	lb.	1.25
Para-toluidine, bbls.	lb.	.48
Paris Green, 250-lb. kegs	lb.	.24
Perchlorethylene, drums, c/l, wks.	lb.	.09
Phenol, drums, c/l., wks.	lb.	.12½
Phenolphthalein, yellow, drums, ton lots	lb.	.80
Phenylethyl alcohol, bottles	lb.	2.10
Phloroglucinol, tech., tins, wks.	lb.	15.00
c. p., tins, wks.	lb.	20.00
Phosphorus, red, cases	lb.	.40
Oxychloride, 175-lb. cylinders	lb.	.15
Trichloride, cyl.	lb.	.15
Phthalic anhydride, bbls., c/l.	lb.	.14½
Platinum, metal, solid	os.	36.00
Potash, caustic, solid, drums	lb.	.06¼
Potassium acetate, tech., bbls.	lb.	.28
Bicarbonate, gran., bbls.	lb.	.19
Bichromate, casks, c/l., wks.	lb.	.09½
Bromide, U. S. P., gran., bbls.	lb.	.27
Carbonate, 80–85%, calc., casks.	lb.	.06½
Chlorate, cryst., kegs	lb.	.11*
Chloride, tech., cryst., bgs.	lb.	.08*
Cyanide, drums	lb.	.55
Meta-bisulfite, bbls.	lb.	.18
Muriate, fert., bulk	K_2O unit	.53½
Permanganate, tech., drums	lb.	.19¾
Prussiate, red, bbls.	lb.	.70
Yellow, casks	lb.	.17
Pyridine, denat., drums	gal.	1.71
Pyrocatechin, c. p., drums	lb.	2.15
Quinine, 100-os. cans	os.	.97½
Resorcinol, tech., kegs	lb.	.68
Rochelle salt, powd., bbls.	lb.	.43½
Saccharin, drums	lb.	1.45
Salt cake, bulk, wks.	ton	15.00
Saltpeter, gran., bbls.	100 lbs.	8.20
Silica, amorph., 96%, 325 mesh, bags, c/l., wks.	ton	17.00
Silver nitrate, vials	os.	.26½
Soda, ash, 58%, light, paper bags, contract, wks.	100 lbs.	1.05
Caustic, 76%, solid, drums, contract, wks.	100 lbs.	2.30
Sodium acetate, flake, 60%, bbls.	lb.	.05
Alginate, drums	lb.	.79
Antimoniate, bbls.	lb.	.15
Benzoate, U. S. P., bbls.	lb.	.46
Bicarbonate, U. S. P., powd., bbls., c/l., wks.	100 lbs.	1.85
Bichromate, c/l., wks.	lb.	.07½
Bisulfite, bbls.	100 lbs.	3.00
Bromide, U. S. P., bbls.	lb.	.27
Chlorate, cryst., bags	lb.	.06¼
Chloride, bags	ton	15.70
Cyanide, 96–98%, dom., drums	lb.	.14
Fluoride, white, 90%, bbls., c/l., frt. alld.	lb.	.08
Metallic, untrimmed bricks, drums, f. o. b. Niagara Falls	lb.	.15½
Metasilicate, gran., bbls.	100 lbs.	2.50
Naphthionate, bbls.	lb.	.50
Nitrate, crude, bulk, works	ton	27.00
Nitrite, bbls.	lb.	.06¾
Perborate, bbls.	lb.	.14¼
Phosphate, disodium, cryst., bags, c/l., wks.	100 lbs.	2.55
Phosphate, trisodium, bags, c/l., wks.	100 lbs.	2.70
Picramate, kegs	lb.	.65
Prussiate, yellow, bbls.	lb.	.11
Silicate, drums, c/l., 40°	100 lbs.	.80
Silicofluoride, dom., bbls.	lb.	.09
Stannate, drums	lb.	.33½
Sulfate, anhyd., bags	100 lbs.	1.70
Sulfide, cryst., bbls.	100 lbs.	2.40
Solid, 60%	100 lbs.	3.15
Sulfocyanide, c. p., bbls.	lb.	.55
Thiosulfate, reg., cryst., bgs.	100 lbs.	2.25
Tungstate, tech., kegs	lb.	No prices
Strontium carbonate, tech., bbls.	lb.	.25*
Nitrate, bbls.	lb.	.07¼
Sulfur, bulk, mines	ton	16.00
Chloride, drums	lb.	.03
Dioxide, commercial, cyl., wks.	lb.	.07
Tetrachloroethane, 50-gal. drums	lb.	.08
Thiocarbanilid, bbls.	lb.	.24
Tin, Straits	lb.	.52
Crystals, bbls.	lb.	.39
Oxide, bbls.	lb.	.55
Tetrachloride, anhydrous, drums, bbls.	lb.	No price
Titanium dioxide, bags	lb.	.14¾
Toluene, tanks	gal.	.28
Triamylamine, drums, c/l., wks.	lb.	.98
Triamylborate, drums, l. c. l., wks.	lb.	.33
Tributylamine, drums, c/l., wks.	lb.	.78
Trichloroethylene, drums, wks, frt. allowed	lb.	.08
Tricresyl phosphate, tech., drums	lb.	.25
Triethanolamine, drums, c/l., wks.	lb.	.19
Triphenyl phosphate, barrels	lb.	.31
Tungsten, tech., powder	lb.	2.60
Urea, dom., 46 + % N., bags, f. o. b. wks. or seaboard	ton	80.00
Vanillin, 25-lb. tins	lb.	2.35
Whiting, comm., dry-grd., bags, c/l., wks.	ton	18.00
Xylene, 10°, tanks	gal.	.30
Xylidine, drums	lb.	.35
Zinc ammonium chloride, bbls.	lb.	.0565
Chloride, tech., fused, drums	lb.	.05
Dust, bbls., c/l.	lb.	.1035
Metal slabs, at N. Y.	lb.	.0865
Oxide, Amer., bags	lb.	.0725
Stearate, tech., bbls.	lb.	.30
Sulfate, cryst., bgs., c/l., wks.	100 lbs.	3.60

* Nominal.

EMPLOYMENT INFORMATION

RATES to be paid in advance. Standard setting 5c a word, minimum charge $2.00 each; include 8 words for box address. Exceptions see ⟶ Display, $10.00 per column inch. 2 inches maximum, larger units at regular display unit rates. No discounts or allowances.
SEND advertisements with remittance to INDUSTRIAL AND ENGINEERING CHEMISTRY, 332 West 42nd St., New York, N. Y., to reach there not later than 10:00 A.M. on the 5th and 20th, closing dates for editions of CHEMICAL and ENGINEERING NEWS of the 25th and 10th, respectively. Insertions made in order of receipt provided necessary remittances are complete. EMPLOYERS are requested to mention in their announcements the section of the country in which the open position is located to ensure replies only from those who are geographically available.
In printing these advertisements the SOCIETY assumes no obligations as to qualifications of prospective employees or responsibility of employers.

UNEMPLOYED members of the AMERICAN CHEMICAL SOCIETY seeking employment for themselves are allowed in one calendar year 3 announcements free (one per issue) set in standard style and limited to 50 words each, including 8-word box address, and 3 additional standard announcements at 50% of regular rate. Further announcements and excess words at full rate.

EMPLOYED members of the AMERICAN CHEMICAL SOCIETY seeking new positions are permitted 3 standard announcements during the calendar year at 50% of the regular rate—include 8 words for box address.

EMPLOYERS seeking chemists and chemical engineers are permitted 3 standard announcements, not to exceed 50 words each including box address and not more than one per issue, during the calendar year without charge, provided they agree in writing to acknowledge all replies (excess words 5c each), otherwise full rate applies.

The AMERICAN CHEMICAL SOCIETY is vitally interested in the welfare of its members and in seeing that the chemical industry is manned with competent chemists and chemical engineers. These pages are part of our service in that connection. In addition most of the larger sections of the AMERICAN CHEMICAL SOCIETY and several of the smaller ones have active employment committees. Local section secretaries in your area will inform you as to any employment aids that may be available locally.

An Employment Clearinghouse is operated at each national meeting of the SOCIETY for the purpose of bringing together representatives of industry looking for chemists and members and student affiliates in attendance wishing to make such contracts. For further details, consult the preliminary and final programs as printed in the NEWS EDITION prior to each meeting.

In the New York area, special employment facilities are offered by the Employment Bureau of the Chemist's Club, 52 East 41st St., New York, N. Y. In the Chicago area, the Chicago Section maintains an employment service at 505 N. Michigan Avenue, Chicago, Ill.

Those replying to announcements should be careful to send copies and not original documents. Advertising circulars will not be forwarded and to that end all letters will be opened at the forwarding office.

SITUATIONS OPEN

Those announcements in which the letter "P" is part of the address key have paid in full and are not committed to acknowledge replies. The Society regards acknowledgment by employers of all applications as an act of common courtesy but can assume no responsibility for their failure to do so.

EXECUTIVES, CHEMICAL ENGINEERS AND CHEMISTS with exceptional backgrounds of experience should use our confidential and individual method of contacting responsible employers. No limit to territory. We negotiate all overtures. Established 1915. The National Business Bourse, 20 W. Jackson Blvd., Chicago, Ill.

FOOD TECHNOLOGIST. Applications will be welcomed from men with outstanding records to serve as junior chemists in eastern research laboratories, engaged in essential work. Prospects for advancement excellent for men of right qualifications. Please submit record of training and experience, personal history and recent small photo.
Box 76-TP-7, Ind. & Eng. Chem., Easton, Pa.

CHEMIST with some petroleum experience. Needed in Chicago area for development of petroleum products and rust preventives. State age, draft status, degree, and salary desired in opening letter.
Box 79-TP-8, Ind. & Eng. Chem., Easton, Pa.

WANTED—GRADUATE chemist, research experience with drying and semi-drying oils Extensive knowledge of analytical oil determinations required.
Box 17-NP-9, Ind. & Eng. Chem., Easton, Pa.

CHEMIST WANTED: preferably in the field of metallic soaps, though a broad knowledge of organic may be substituted. Should be capable of research and development. Permanent position, aggressive concern, Ohio location. In reply state salary desired, draft status and education in detail.
Box 20-N-9, Ind. & Eng. Chem., Easton, Pa.

MIDWESTERN CHEMICAL company has excellent opportunity for woman chemist to serve as technical secretary and librarian. Give full information and salary expected in first letter.
Box 40-TP-9, Ind. & Eng. Chem., Easton, Pa.

PHARMACEUTICAL CHEMIST in established, well equipped midwest laboratory. Must be able to direct development of profitable ethical medicinals to point of commercial manufacture. Would help if he has contacts in institutions to ease clinical trials. An excellent permanent place for man who fits. Write completely of technical education, field of experience and draft status.
Box 55-TP-9, Ind. & Eng. Chem., Easton, Pa.

METALLURGIST—experienced in research and development of magnesium alloys, capable of conducting independent research and having some experience in production methods of light alloys. Give details of education, experience, publications, references. State age, salary desired. Send small photograph (not returnable).
Box 64-TP-9, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER with experience in chemical plant design, mechanical engineering, product design, and with a thorough knowledge of rubber and plastic technology, to work for plant in Middle West. Must be draft exempt and not employed at your highest skill in any other war plant.
Box 81-TP-9, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER or CHEMIST. Recent graduate with some experience, as assistant in research and development along electrochemical and metallurgical lines. Should be capable analyst and handy with tools. Location New England. Give full details, scholastic record, experience, salary desired and recent photograph.
Box 15 N-10, Ind. & Eng. Chem., Easton, Pa.

WANTED IMMEDIATELY
MECHANICAL OR CHEMICAL

Engineer familiar with the coppersmithing industry in all its branches by west coast corporation. Applicant must be capable of handling men, familiar with tools, dies, patents, shipbuilding pipe design, distillation, drafting, heat exchange, etc. State age, salary open.

Box 20-NP-10, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST wanted: For research on dyestuffs and intermediates. State experience in detail, education, marital status, age, and enclose photo. Location New Jersey.
Box 21-N-10, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST

or chemical engineer for industrial development work in cellulose plastic field with large corporation in upper New York state. Recent graduate preferred. Give training, experience, references and personal data.

Box 24-NP-10, Ind. & Eng. Chem., Easton, Pa.

RESEARCH FELLOWSHIPS in physical chemistry. Eighteen hours' course work can be taken per year towards Ph.D. Women or men with M.S. degree preferred. Submit applications to Thos. De Vries, Department of Chemistry, Purdue University, Lafayette, Ind.

POSITION AVAILABLE in Patent Department of Shell Development Company in San Francisco. This company is the research company for Shell Oil Company, Incorporated, and has a large laboratory nearby for research on petroleum and derivatives for chemical industry. Wanted a chemical specification writer, preferably with sufficient experience for independent work. Law training not needed, knowledge of German and French highly desirable. If interested please write for application form.
Box 28-NP-10, Ind. & Eng. Chem., Easton, Pa.

STARCH CHEMIST for research. Ph.D. or equivalent in practical experience, with background in chemistry and/or technology of starch. Location, Midwest. Give details of training, experience, salary requirements, and draft status.
Box 30-N-10, Ind. & Eng. Chem., Easton, Pa.

EXPERIENCED MAN wanted: An old established firm in the Middle West wishes to employ a man who is thoroughly experienced in the design installation, and afterwards the operation of a plant for the manufacture of synthetic resins. If you are interested please reply to
Box 31-N-10, Ind. & Eng. Chem., Easton, Pa.

WANTED: CHEMICAL Engineer; 1 or 2 years' experience, preferably in pilot plant scale work on the processing of organic chemicals or petroleum products; for research and development work in large kraft pulp mill by-products plant. Location South-East.
Box 32-N-10, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST with 3 or preferably 4 years' chemical training for paint & varnish development laboratory, no experience necessary. Apply L. K. Scott, Devoe & Raynolds Co., Inc., 1481 So. 11th St., Louisville, Ky.

WOMAN CHEMIST. Recent graduate for part time clinical laboratory work and part time graduate study in biochemistry. Stipend and remission of fees. Give complete training, personal data, photograph and date when available.
Box 41-N-10, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ASSISTANT (girl) for research in University located in New York City, college degree and some experience in an organic chemistry laboratory are essential. Experience in handling of small animals is also desirable. Write fully in application, state salary acceptable.
Box 49-NP-10, Ind. & Eng. Chem., Easton, Pa.

CHEMIST ABLE to conduct research work with minimum supervision wanted primarily for development of synthetic drying oils. Man with draft deferment because of physical impairment preferred. Send inexpensive photograph and give complete personal, professional and academic data in first letter. All letters acknowledged. Address P.O. Box 377, Dayton, Ohio.

EXPERIENCED CHEMICAL engineer. Excellent opportunity for man of outstanding qualifications in research laboratories located in the East, occupied with essential activities. Please submit college record, experience, accomplishments, and small photo.
Box 55-NP-10, Ind. & Eng. Chem., Easton, Pa.

CHEMIST WITH sales experience preferred for well-established organization, to contact various industries in Midwest States. Excellent opportunity. State in detail past record and experience, age, salary, references, etc.
Box 57-NP-10, Ind. & Eng. Chem., Easton, Pa.

CHEMISTS WITH Bachelor or Master degrees for positions in laboratories of Analytical Chemistry, Biochemistry, Organic Chemistry and Physical Chemistry in eastern organization engaged in essential activities. Opportunities for qualified men. Submit details concerning training, experience, personal history, and small photo.

Box 56-NP-10, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST, superior type, for eastern research laboratories prominent manufacturer building materials. Must be capable making wide variety of analytical investigations and expert on analysis of silicates. Permanent position, interesting work and opportunity to advance. Reply, giving full details, attaching recent photograph.
Box 58-N-10, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST for research on vitamins in grain products. Preference given to married man with doctor's degree. Please submit information on training and experience, draft status and salary desired, with small photo. Location in Ohio.
Box 59-N-10, Ind. & Eng. Chem., Easton, Pa.

AN ANALYTICAL woman chemist desired by medium sized firm located in vicinity of Newark, New Jersey. Supply details concerning training, experience and personal data.
Box 60-N-10, Ind. & Eng. Chem., Easton, Pa.

(Continued on page 1286)

Address communications to the box number indicated and Mail to Easton, Penna.
The American Chemical Society has no information concerning the position advertised, or in regard to those seeking employment.

(Situations Open Continued)

WANTED: ANALYTICAL chemist experienced in general metallurgical analysis, and able to supervise the operation of spectrograph, for new defense metallurgical plant on West Coast. Married man preferred but applications from women will be considered.
Box 61-N-10, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST, hospital, expert in use of clinico-chemical methods, with some administrative ability. Permanent position. Opportunity for research. Salary $2200 with maintenance. Graduate degree or equivalent experience required. Submit reprints, references, photograph, list of relevant courses and grades to John G. Reinhold, Biochemical Laboratory, Philadelphia General Hospital.

ANALYTICAL CHEMIST, with Bachelor or Master degree, as drug analyst, in south central State Food and Drug Laboratory. Training and experience in drug control and sanitary chemistry essential. Give age, draft status, education, experience, salary desired, and when available.
Box 65-N-10, Ind. & Eng. Chem., Easton, Pa.

RESEARCH FELLOWSHIP in organic analysis available immediately. Work for advanced degree majoring in organic or analytical chemistry. Qualifications: B.S. or M.S. in chemistry. Stipend $770 yearly. Send applications to P. J. Elving, Dept. of Chemistry, Purdue University, Lafayette, Ind.

Excellent opportunity for

TECHNICAL SERVICE MEN

with company manufacturing special adhesive tapes, widely used both by war and peacetime industry. Company is subsidiary of Johnson & Johnson. At present, work will largely involve introduction of and assistance in development of new tapes for applications in essential industries. Applicants should be chemists or engineers with personalities suited to sales service work. In reply, give complete information and attach recent photograph. All correspondence strictly confidential.

INDUSTRIAL TAPE CORPORATION
NEW BRUNSWICK, NEW JERSEY

RESEARCH CHEMISTS. Well qualified research and development men, experienced with rubber, resins, high molecular polymers or adhesives, wanted by rapidly growing eastern company. Permanent positions. Please give complete details in first letter; i.e., education, experience, photograph, salary requirements, etc.
Box 83-N-10, Ind. & Eng. Chem., Easton, Pa

SITUATIONS WANTED
(A.C.S. MEMBERS)

FOOD CHEMIST with over twenty years' wide experience in the Food Industry, in direction, research, process development, quality control, and factory problems. Desires a responsible position.
Box 69-N-8, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. 14 years' experience various fields. Organic, pharmaceutical, cosmetic bio-chemistry. Analysis, Research, Development, Production control. Three languages. Imaginative, inventive, adaptable worker. Married with child. Age 39. Immediately available. Desires position. Location anywhere.
Box 29-N-9, Ind. & Eng. Chem., Easton, Pa.

INDUSTRIAL CHEMIST, with business and executive experience. University graduate, twenty years' excellent record in research, development, sales and service with State, Federal institution and corporation. Publications, patents, sales literature. Desires active employment. References from all employers. Listed in American Men of Science. Draft 3-B.
Box 59-N-9, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST—Experienced in plant biochemistry and pharmaceutical chemistry. Six years' research isolation, identification, analysis plant compounds. Experience in microanalysis, and organic synthesis. Ph.D. 1935. Major organic; minors, physical chemistry, bacteriology. Fifteen publications. Employed. Desires permanent position with chance for advancement. Age 33, married, two children, 3-A, Protestant.
Box 39-T-9, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, Ph.D., industrial organic chemist, 25 years' industrial and research experience, process developments, production problems, among others rayon, cellulose and derivatives. Patents, publications, new projects, languages, business knowledge. Married, one child. Available on short notice.
Box 31-T-9, Ind. & Eng. Chem., Easton, Pa.

INDUSTRIAL CHEMIST seeks position of responsibility in chemical production directly concerned with war effort. Location immaterial. Now employed in East. Five years' industrial experience in plant control and operation chiefly in field of distillation. Experienced in handling labor. B.S. degree in organic chemistry from large middle western university. 3-A draft classification. Protestant.
Box 35-T-9, Ind. & Eng. Chem., Easton, Pa.

SPECIAL PRODUCTS research and development chemist. Twelve years' experience in development and production of automotive, aeronautical, and household special products, including lubricating oils and petroleum specialties. Capable of directing development and production of products in these and allied fields. Now employed but would like to relocate, preferably in Dallas area. Age 39.
Box 52-T-9, Ind. & Eng. Chem., Easton, Pa.

ESSENTIAL INDUSTRY employment desired by a physical chemistry major with minors in organic and chemical and metallurgical engineering. Ph.D. course work and research completed but lack languages and preliminary examinations. Single, 30, 2-A. Prefer processing or metallurgy. Employed.
Box 71-T-9, Ind. & Eng. Chem., Easton, Pa.

SYNTHETIC RESIN chemist. Five years' experience in technical research on synthetic coatings and adhesives. Also experienced in photochemistry and textiles. Has shown originality and has obtained practical results. Married, 2 dependents. Age 29. Harvard training. Now employed.
Box 72-T-9, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST—Spectroscopist, M.S. Experienced in inorganic chemical analysis; also in the development of spectrochemical methods. Familiar with physical methods of analysis. Experience in supervising. Training in physical, organic and inorganic chemistry. No routine. Employed, Gentile, married, draft status 3-A.
Box 78-T-9, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, M.S. 1941. Year's synthetic organic research experience. Thorough chemical training at accredited university including year of organic research and micro-analysis. Desires position as research assistant with view toward future business administration. Age 24. Draft status, 4-F. Available shortly.
Box 80-T-9, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER (B.S.; N.Y. License) with Ph.D. (Physical Chemistry, Chicago) 49, employed. Industrial experience in direction of research and literature studies on fuels, food and explosives. Special experience in photomicrography and report writing. Desires position as Research Director or Assistant Research Director specialising in the development of new products.
Box 16-N-10, Ind. & Eng. Chem., Easton, Pa.

CHEMIST EXECUTIVE

15 years' experience in research, development and production of
ORGANIC FINE CHEMICALS AND FINISHES FOR TEXTILE AND LEATHER
and other fiber materials, full production line in sulf. oils, surface active materials, detergents, starch, protein and resin finishes, synthans, etc.; now employed. Desires new position. Only interested in independent responsible work.
Box 19-N-10, Ind. & Eng. Chem., Easton, Pa.

PHARMACIST-CHEMIST (Ph.D.). Would like to change position. Great experience in deodorization and selective Hydrogenation of fish oils, all control tests, developing of new methods, new pharmaceutical products, emulsions, cosmetics. No draft status, Catholic, first class references. New York or Philadelphia area preferred.
Box 23-N-10, Ind. & Eng. Chem., Easton, Pa.

RESPONSIBLE POSITION wanted by a valuable man now directing development. Age 39. Well experienced in rubber and synthetics, bonding of rubber to metals, chemical bonding of aluminum to itself and other materials, soap chemistry, practical applications of commercial products, etc. Can quickly apply my versatile talents to these, similar, or other fields. Have sound reason for desiring change in position.
Box 25-N-10, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST: M.S. in chemistry 1939, University of Pennsylvania. Organic major, analytical minor. Desires preferably research position with company having war contracts. 3 years' college teaching experience. Available immediately for position in Philadelphia and vicinity. Protestant. Married.
Box 26-N-10, Ind. & Eng. Chem., Easton, Pa.

PHARMACEUTICAL CHEMIST, B.S., Phar.D., Columbia University. Three years of graduate research, one year of product development work. Age 28, draft deferred, member Sigma Xi. Desires position to do research, product development, testing or other.
Box 29-N-10, Ind. & Eng. Chem., Easton, Pa.

YOUNG WOMAN chemist, several years' responsible experience in industrial research organization. Desires editorial or market research position. Expert stenographer; knowledge of French and Spanish. Would consider A-1 secretarial position. Location immaterial.
Box 33-N-10, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, A.M., with 17 years' research and development experience in textiles, paper, printing, coatings, resins, colloids. Special interests in surface chemistry, wetting agents, dispersions, rheology. Age 41, married, one child. Employed midwest, seeking position in New England or North Atlantic States. Excellent references.
Box 35-N-10, Ind. & Eng. Chem., Easton, Pa.

SYNTHETIC ORGANIC chemist. M.S. research and development experience in plastics. Desires organic research position (plastics or other industry) contributing directly to war effort. Young, married, responsible. Presently employed. Metropolitan location preferred.
Box 36-N-10, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL, INORGANIC chemist, Ph.D., with several years' industrial and teaching experience. Supervision: Research on methods, inorganic projects, analysis, control. American, honor societies. Desires position where deferment can be obtained. Any location.
Box 38-N-10, Ind. & Eng. Chem., Easton, Pa.

RESEARCH and DEVELOPMENT chemist, Ph.D., chemical engineer, fermentations, cereal chemistry, foods. Fifteen years director consulting laboratories, some plant experience, excellent record and credentials. Publications, patents, four languages, office experience. Draft 3-A. Wishes responsible position or opportunity for advancement, preferably defense work.
Box 40-N-10, Ind. & Eng. Chem., Easton, Pa.

ORGANIC PH.D. December 1942. Research in synthetic organic Minors, mathematics, biochemistry, bacteriology, age 24. Graduate assistant and fellow for two years. Draft 2-A. Teaching or industrial research or development desired. Location immaterial.
Box 42-N-10, Ind. & Eng. Chem., Easton, Pa.

SYNTHETIC RESINS, paint, varnish, and lacquer products, research chemist, draft exempt, desires position as technical director, superintendent or assistant, 18 years' experience in directing research and production. Thorough knowledge of Government specification work. Employed at present.
Box 43-N-10, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, B.S. 2½ years' experience in Biochemistry, 4 months' industrial experience. Desires position in Organic or Biochemistry, preferably New York or New Jersey area. Married, age 28, deferred draft classification. Excellent references.
Box 44-N-10, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER—Ch.E., Columbia. Seven years' experience inorganic chemical research, development and supervision. Sigma Xi, Tau Beta Pi. Keen, versatile, desirous of responsible position with progressive company. Married, age 31. Available one month's notice.
Box 45-N-10, Ind. & Eng. Chem., Easton, Pa.

EXPERIENCED CHEMICAL Engineer; available for work in defense industry. 18 years' experience in plant and research work. Oils and fats, metallurgy, petroleum, textiles.
Box 46-N-10, Ind. & Eng. Chem., Easton, Pa.

RESEARCH CHEMIST, age 40, Protestant, married, one child, U. S. citizen, draft 3-B. 12 years' experience in various fields: cyanogen compounds, diaze compounds, petroleum refining, biochemistry. Capable in directing research and development work. Languages: Dutch, German, French. Desiring position in directing research and development work in a field connected with national defense.
Box 47-N-10, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST and biochemist, with minor in physical chemistry, Ph.D. 1941, now employed in industrial research laboratory seeks new research position preferably in pharmaceutical industry.
Box 48-N-10, Ind. & Eng. Chem., Easton, Pa.

WRITER on technical subjects desires part-time assignments. B.S. and graduate work in chemistry. Employed in plastics research, New York area. Knowledge of journalism, economics, statistics.
Box 51-N-10, Ind. & Eng. Chem., Easton, Pa.

(Continued on page 1287)

(Situations Wanted Continued)

CHEMIST, CEREAL and Foods, Ph.D. with seven years' industrial and research experience. Married, draft 3-A. Available on reasonable notice.
Box 52-N-10, Ind. & Eng. Chem., Easton, Pa.

DEVELOPMENT & SALES engineer, Ph.D. with fifteen years' experience and currently employed, wants position with healthy reputable rubber company with opportunity to become member of firm. Last ten years have been in technical sales and development work for a large rubber company. Extensive experience with aqueous rubber compounds. Now concerned exclusively with the manufacture of articles from synthetic rubber and substitutes. Qualified to evaluate and develop new products. American citizen, 46, married, two children. Available 60 days. Location U. S., Canada, or Mexico.
Box 54-N-10, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, available for spare time work. Broad training and experience, including catalysis, petroleum and fuels technology, explosion processing, pharmaceutical synthesis, metallurgical chemistry. Specialist in new process development and plant design. Currently employed, with contract permitting outside work of practically unlimited scope. Central eastern U. S. war work only.
Box 63-N-10, Ind. & Eng. Chem., Easton, Pa.

For SYNTHETIC RUBBER, plastics, petroleum industries: Ph.D. 1938 leading mid-Western University. Main experience: carbon black for rubber industry. Preparation, reactions of substituted butadienes, unsaturated aldehydes, aldol condensations. Capable of directing work, resourceful, cooperative. Languages. Employed, available short notice. Single. Two dependents.
Box 64-N-10, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST, Ph.D., now in class 2-A, in charge of small laboratory for pharmaceutical manufacturer, seeks position in closer connection with defense work. Experience in drug analysis and research.
Box 66-N-10, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. Five years' industrial research and development experience in synthetic organic chemistry. Prefer position in charge of a small group with a company doing defense work preferably in the field of organic chemicals, or drugs, plastics and rubber.
Box 73-N-10, Ind. & Eng. Chem., Easton, Pa.

PRODUCTION CHEMIST: Married, draft deferred. Ten years' industrial experience in synthetic and natural hormones, pharmaceuticals, research and development. Supervisor last three years. Responsible war work desirable. Job location immaterial.
Box 74-N-10, Ind. & Eng. Chem., Easton, Pa

PHARMACOLOGIST: Married, draft deferred, B.S., M.S., nine years' industrial experience in pharmacology, endocrinology, bio-assays, physiology, pathology, bacteriology, toxicology, haematology. Last four years director and consultant work. Responsible war work only.
Box 75-N-10, Ind & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, Chemist, B.Ch.E., M.A. organic. 7 years' experience research and plant development in cellulose, foods, petroleum, chemicals. Age 28, married. Draft deferred. Consider chemical engineering position in petroleum, synthetic rubber, or synthetic organic. Location immaterial. Available immediately.
Box 76-N-10, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST. M.S. 1941, course work toward doctorate. Training in organic chemistry includes synthesis, research and micro-methods of analysis. Desires position in research or production. Draft deferred.
Box 77-N-10, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER: B.S. 1937, desires chemical engineering development work in field essential to the war effort. 5 years' experience in industrial application of, and research relating to, resins and plastics. Extra training in plastics, colloidal and organic chemistry, and chemical engineering. Good character and personality, progressive, practical, has ideas and sense of responsibility. American, white, single, age 27, draft, 2-B.
Box 79-N-10, Ind. & Eng. Chem., Easton, Pa.

PETROLEUM SPECIALTY chemist. Broad experience in the development and manufacture of such products as: soluble cutting oils, sulfurized oils, naphthenic acids, metallic salts of organic acids and specialty compounded oils.
Box 80-N-10, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D., with some knowledge of patent law. Six years' experience in technical literature work, including patent and literature searches, abstracting and editing. Desires opportunity to do patent work. Female. Metropolitan N. Y. area.
Box 81-N-10, Ind. & Eng. Chem., Easton, Pa

ORGANIC CHEMIST. M.S., 1940. Industrial research and production experience; organic analysis. Desires position with progressive company which employes on basis of merit.
Box 84-N-10, Ind. & Eng. Chem., Easton, Pa.

SITUATIONS WANTED (NONMEMBERS)

CHEMICAL ENGINEER, first class experience design, installation, development, and operation organic chemical plants. Capable taking complete charge of project from laboratory stage to operating plant. Desire permanent connection with responsibility. Married. One child.
Box 79-T-9, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, M.S., excellent educational background, six years' experience in manufacturing and development of pharmaceutical products. Desires position more closely affiliated to war effort. Age 29, married, draft classification 3-A.
Box 10-N-10, Ind. & Eng. Chem., Easton, Pa.

SECRETARY—ASSIST executive. College graduate with 9 years' diversified experience. Knowledge of chemistry and business administration.
Box 11-N-10, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ANALYST. Age 47, 20 years' laboratory experience. I.C.S. graduate. Desires employment in Eastern States for duration of war.
Box 13-N-10, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER: experienced in maintenance and production of organic chemicals. B.Ch.E. degree. Draft deferred.
Box 18-N-10, Ind. & Eng. Chem., Easton, Pa.

YOUNG WOMAN, 29, college graduate 1934. Majored chemistry. Employed 6 years' in statistical capacity; desires return to technical field.
Box 39-N-10, Ind. & Eng. Chem., Easton, Pa.

GRADUATE ANALYTICAL chemist, 44, desires position at reasonable salary, preferably in war industry. Six years' industrial experience in analytical and chemical process control work. Married, young child, draft classification 3-A. Excellent health, energetic and cooperative.
Box 53-N-10, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST, B.S. 1940, chemical bacteriological, and business training. Presently employed as assistant to director of research in field of synthetic resins—hospital chemist, 1½ years. Interested in work involving more research.
Box 67-N-10, Ind. & Eng. Chem., Easton, Pa.

TECHNICAL RESEARCH Librarian. Young woman, age 22, graduate of recognized college (A.B.—1940). Chemistry major with two years' experience in abstracting, searching, etc. Knowledge of technical French and German and of typewriting. Accurate and conscientious worker, able to accept responsibility. Satisfactory references. New England preferred.
Box 70-N-10, Ind. & Eng. Chem., Easton, Pa.

Industrial News

CONTINUED FROM PAGE 1281

ton, Del. A greaseless substance, called Pro-Tek protective cream, a product of the du Pont laboratories, is applied to the hands, arms, and under the nails. It forms an invisible film which gives physical protection against grime and some irritating substances. At the end of the working period it can be washed off with soap and running water, carrying the grime with it.

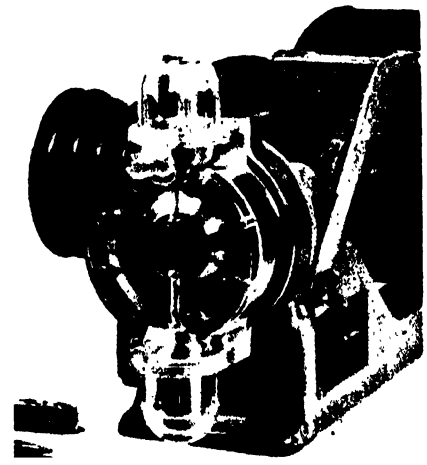
Plastic Fuse for Trench Mortar

A POUND of bar-stock aluminum is saved and made available for vital parts of airplanes by every trench mortar fuse that is turned out by one of the General Electric Co.'s plastics factories. With the huge number of these fuses being made, the saving of aluminum reaches respectable figures.

Electric Furnace Repaired in Operation

WORKING next to tons of molten slag at the base of the largest electric furnace in the world, the men of the mechanical crew of Monsanto Chemical Co.'s Monsanto, Tenn., phosphorus plant have turned a threatened breakdown into a brilliant production victory.

When the big furnace developed a break the men in the plant volunteered to make repairs while the unit was in operation, the first time a job of this magnitude was ever attempted, and the success of the job ensured the continued record-breaking flow of vital elemental phosphorus to war uses.



Lever-Seald Plug Valves

THE Homestead Valve Manufacturing Co., Coraopolis, Penna., has announced a new line of Lever-Seald plug valves for 150 pounds' working pressure. Face-to-face dimensions of each valve in the new line are the same as those of the corresponding size of wedge-gate valve. Thus they are instantly interchangeable with wedge-gate valves, without piping changes. Sizes range from 1½ inches to 10 inches in either semisteel or steel.

Explosionproof Timers

TO MEET the demands for explosion-proof timers suitable for operations in atmospheres containing gasoline, naphtha, petroleum, benzene, acetone, lacquer solvent, natural gas, etc., The R. W. Cramer Co., Inc., Centerbrook, Conn., has placed on the market a line of timers.

Crystalite Reagent Heads

TRANSPARENT Crystalite moldings, which permanently withstand chemical solutions and at the same time permit full visibility of vital working parts, are being used for sight feeders and reagent heads on Chlor-O-Feeders, Chem-O-Feeders, and other water-purification equipment manufactured by %Proportioneers, Inc.%, Providence, R. I. Hypochlorite solution, soda ash, and alum are among the chemicals to which the plastic heads have demonstrated complete resistance with no loss of transparency. The injection-molded Crystalite parts are permanently able to withstand hard knocks and shocks.

Brass and Copper Cleaner

A BRASS and copper cleaner has been developed by the Nielco Laboratories, 19720 Florence Road, Detroit, Mich., to improve cleaning, reduce the time required, eliminate vapor degreasers and the use of bright dip where possible. Two formulas have been developed to meet these requirements, one for use in still tanks and the other for washing machines and agitated tanks.

DRYERS

1 Devine Vacuum Shelf Dryer; 16 shelves; 67" x 167"
2 Devine 5' x 30' Rotary Vacuum Dryers
1 Buffalo 24" x 20" Vacuum Drum Dryer with auxiliaries
1 Electrically heated and operated Conveyor Dryer, 7' x 7' x 6'
8 Rotary Kilns; 7' 6" x 60'; 1/2" steel plate

STILLS

1 10' Dia. Copper Calandria Type Vacuum Pan; print available
1 Devine 100 gal. Cast Iron Vacuum Still
2 Copper Jacketed Vacuum Pans; 100 gal. and 350 gal.
1 1600 gal. Cast Iron Jktd. and Agit. Vacuum Still

MIXERS

3 W. & P. BB Jktd. Mixers; 5 gal., 9 gal. and 50 gal.
2 W. & P. 150 gal. Jktd. Vac. Type Mixers Size 17V11BB
1 W. & P. 200 gal. Unjktd. Mixer Size 17XBB
3 Barber Extra Heavy Duty Steel Jktd. Mixers; 2000 gal.

JACKETED KETTLES

Kettles in copper from 25 gal. to 500 gal.
3 Aluminum Kettles; 2-150 gal. and 1-300 gal.
3 Steel 1200 gal. Kettles with agitators
2 500 gal. Welded Steel Kettles
1 Duriron 475 gal. Jktd. and Agitated Kettle
1 300 gal. Glasslined 42" x 56" Kettle

FILTERS

1 Valles Aluminum Filter; 72 sq. ft. filt. area
2 Sweetland Filters; No. 5 and No. 7
1 42" Sperry 57 plate Filter Press; cast iron
4 Filter Press Skeletons; 3-30" and 1-42"

TANKS

15 Welded Steel Horizontal Tanks; 5000 gal. to 10,000 gal.
1 Rubber Lined 2300 gal. Steel Tank; 10' x 7' x 5'
35 Open Top Steel Tanks; 250 gal. to 5000 gal.

MICRO-ELEMENTARY ANALYSES: C, H, N, S, P, Halogens, Methoxyl, Mol. wt., etc., U.S.P. and other official tests, Purity tests, Microinorganic assays, Spot tests, Micro-distillations, Toxicological investigations, and typical micro-chemical research work. Dr. Carl Tiedcke, 366 Fifth Avenue, New York, N. Y.

WANTED to BUY: Steel autoclave with agitator. Capacity 300 to 1000 gal. Working pressure not less than 500 lbs.
Box 12-N-10, Ind. & Eng. Chem., Easton, Pa.

WANTED: In good condition; one vacuum pump (with mounted motor), one Freas gravity convection incubator, one electrolytic analyser for 110 volt 60 cycle A.C. current. Dept. Chemistry, Saint Augustine's College, Raleigh, N. C.

WANTED: Thorpe, Dictionary of Applied Chemistry, Volumes I to V, Fourth Edition. Advise condition and price. Johns-Manville Research Laboratories, Manville, New Jersey.

WANTED: 5 kilos Caesium Chloride, 500 grams Gadolinium Nitrate, 25 grams Praseodymium Metal, 50 grams Scandium Oxide, 100 grams Gallium, 10 grams Dysprosium Salt, 100 lbs. Boron Trichloride, 100 pounds Pollucite.
Box 69-N-10, Ind. & Eng. Chem., Easton, Pa.

WANTED: Chem. Reviews, Vol. 4, No. 2, Vols. 18 to 27 incl.; Chem. Abstracts Vols. 1, 2, 25, 26, 28, 29; first and second decennial indexes; J. Am. Chem. Soc., Vols. 1 to 38 incl.; J. Chem. Ed., Vol. 12. State condition and price.
Box 71-N-10, Ind. & Eng. Chem., Easton, Pa.

WANTED: Frankly we are swamped with inquiries from Government agencies, war plants, research and industrial laboratories for equipment of every description. We have been commissioned to buy from one to a hundred complete laboratories, stock lock and barrel, or any laboratory equipment of standard make. We urge you to offer us now the equipment you do not need or use. We are prepared to pay the highest possible prices in accordance with Government regulations; which are most liberal. Write or wire us what you have to sell for immediate consideration. The Laboratory Exchange, 24 E. 21st St., N. Y. C.

FOR SALE: Arthur B. Thomas Co. No. 2871-B Mattson Cataphoresis Cell, slightly used. One No. 1135 Bausch & Lomb Colorimeter. Any fair offer considered.
Western Filter Company, P. O. Box 6084, Stockyards Station, Denver, Colorado.

FOR SALE: All Cacodylates, Galacturonic Acid, Histidine Hcl, (d-Ribose), Hafnium Oxide, Europium Oxalate, Sodium and Potassium Metals, 5 kilos Indium Metal, 500 grams Uranium Metal, 5 kilos Germanium Metal, Ground Iron 99.90.
Box 68-N-10, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: J.A.C.S. vols. 44-55 incl. (except no. 1, vol. 46); Ind. & Eng. Chem. vols. 20-33 incl.; Anal. section Ind. & Eng. Chem. vols. 2-12 incl. All unbound but in excellent condition. Any reasonable offer accepted.
Box 72-N-10, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Saccharimeters, Schmidt & Haensch with double Quarts, Wedge compensation, scales reading from minus 100 to plus 100 for tubes to 200 and 400 mm. Also one with single wedge for tubes to 400 mm complete with tubes. These have been completely renewed by company representative in N. Y. fully guaranteed. The Laboratory Exchange, 24 E. 21st St., N. Y. C.

FOR SALE: Pulp balances (never used). We are offering high grade American made balances of standard make in fine polished mahogany glass cases. 150 gr. capacity 1 mg sensitivity complete and inexpensive to serve for many needs in the laboratory, price $27.50. Immediate delivery. The Laboratory Exchange, 24 E. 21st St., N. Y. C.

FOR SALE: Labtest hydraulic presses. 6" × 6" platens for pressures to 10 tons. Complete with self-contained hydraulic unit. Pressure gauge adjustable between platens of heavy rugged construction ready for immediate delivery. Electric heated platens are available, also standard test moulds. Write for complete descriptions. The Laboratory Exchange, 24 E. 21st St., N. Y. C.

FOR SALE: Microscopes, binocular and monocular models, all makes and types. Zeiss sugar refractometer, Valentine sugar refractometer, E & A Agate Mortar Grinder with motor, Gaertner Spectrophotometer, Leits Projection Polarising Microscope with all attachments, Hanovia Ultra-violet Quarts lamps, B & L, Spencer and Leits Microtomes, rotary and sliding models, Stokes water stills, horizontal sterilizing autoclaves, single and double wall models, drying ovens, Incubators, Mullen paper testers, Ball mills, Weston meters, Microscopic accessories, International centrifuges, Voland assay balance and others. Edwards gas Density balance, etc. Write for immediate quotations on any laboratory equipment needed. The Laboratory Exchange, 24 E. 21st St., N. Y. C.

Fat Salvage

THE Chemical Service Corp., 110 South Dearborn St., Chicago, Ill., is collecting exhaust fats to be converted into glycerol, and at the same time is fireproofing and greaseproofing ducts in hotel and restaurant kitchens. The grease accumulated in ducts and exhaust fans is not only hazardous, but reduces their efficiency. It is estimated that the average restaurant exhaust system yields anywhere from 25 to 300 pounds of grease, depending on how long since it was cleaned. Arrangements have been made with renderers to accept such greases to be salvaged for the war effort.

Brass Cleaner

TO REMOVE corrosion, scale, or black oxide from brass surfaces, Hamico No. 480 Brass-Kleen has been developed by the Haas-Miller Corp. Laboratories, 4th and Bristol Streets, Philadelphia, Penna.

ANOTHER large expansion in factory space and production facilities has been made by the Ohmite Manufacturing Co., Chicago, Ill.

An Opportunity

for MANUFACTURERS OF EQUIPMENT FOR THE CHEMICAL, FOOD AND ALLIED INDUSTRIES

to Expand:

An alert, responsible firm of sales engineers with plenty of initiative is interested in representing your products on an exclusive agency basis.

We are in a position to take over completely a territory covering New Jersey, Eastern New York and Connecticut.

This is your opportunity to expand your sales and your product coverage — with no *initial outlay* on your part. Facts and figures are yours for the asking.

The Economic Status of the Members of the American Chemical Society

Approved Report of the Committee on Economic Status

George Calingaert, Walter A. Schmidt, Walter G. Whitman, Frank C. Whitmore, L. W. Bass[1], Chairman

Prepared for the Committee by Andrew Fraser, Jr., Washington, D. C.

Preface

THIS report on the Economic Status of the Membership of the AMERICAN CHEMICAL SOCIETY is the result of cooperation between the Committee on Economic Status and the United States Bureau of Labor Statistics.

The interest of the bureau in this survey stems from the fact that it had made a detailed analysis of the economic status of the engineering profession in the United States for the period 1929 to 1934, the results of which were published as Bulletin No. 682. This survey was conducted under the direction of A. F. Hinrichs, Acting Commissioner of Labor Statistics, by Andrew Fraser, Jr.

A contact was established for the committee with the bureau through the kindness of Charles L. Parsons, Secretary of the AMERICAN CHEMICAL SOCIETY, who was informed that its experience with the engineering survey and its other resources would be made available to the Committee on Economic Status in its proposed survey.

In his capacity as chairman, L. W. Bass agreed to act as liaison for the committee, and in a very short time an agreement was reached with Henry J. Fitzgerald, administrative officer of the bureau.

The principal features of this agreement were that a questionnaire of a form acceptable to both parties was to be reproduced by the SOCIETY. On the return of the questionnaires to the bureau it would transfer the data to punch cards and prepare in its Machine Tabulation Division such information as the committee desired. One stipulation was that as much information as possible would be made available to the committee in time for presentation as a preliminary oral report at the April 1942 convention of the SOCIETY to be held in Memphis, Tenn. The bureau stipulated that full responsibility for the interpretation of the data would rest upon the Committee on Economic Status.

Thanks to the efforts of J. J. Mahaney, technical analyst, and his assistant, Joseph D. Drager, the necessary tabulations were transmitted in accordance with a program laid out by the committee and the bureau jointly.

By the end of February 1942 the committee had given its approval to the procedures that would be required to prepare text tables in time for the Memphis meeting. These procedures were organized in detail by Andrew Fraser, Jr. The tremendous volume of clerical work involved in this task was under the direct supervision of Fred D. Lindsey, assisted by Eugene Ysita and Mrs. Anne De Coursey.

The Committee on Economic Status wishes to express its appreciation for the cooperation of the Bureau of Labor Statistics, the clerical staff, and particularly the membership of the SOCIETY, whose willingness to fill out and return the questionnaires was a major factor in the success of this survey.

Section 1. Scope and Method

The purpose of undertaking this survey was to determine the economic status of the members of the AMERICAN CHEMICAL SOCIETY. In assuming this responsibility in September 1941 the Committee on Economic Status was confronted with a series of problems with respect to the extent and method of obtaining the requisite data. It had, for example, to reconcile the possible information with the fact that the membership embraced not only chemistry, but also the allied field of chemical engineering and other fields of scientific work.

To meet the diversified activities of this group of professional workers it was agreed that their economic status would be reflected in an analysis of answers to questions covering year of birth, sex, educational level, year of entering the profession, geographic environment, annual income, monthly salary rate, occupational status, source of employment, and field of specialization. And such data were to be requested for 9 years in the period 1926 to 1941. It was also agreed that the most expedient method of obtaining this information would be that of a mail questionnaire. In the handling of these problems the committee is indebted to the Bureau of Labor Statistics for its assistance, which resulted in the compilation of a completely precoded questionnaire. Such a questionnaire is believed to be unique in the field of statistical surveys. By furnishing the respondent with all necessary codes pertaining to each question, the considerable clerical time required to edit and code questionnaires prior to the preparation of punch cards is eliminated. The questionnaire was reproduced in the NEWS EDITION of the AMERICAN CHEMICAL SOCIETY, volume 19, page 1246 (1941).

The questionnaire was mailed on November 25, 1941, to the 24,990 regular

[1] Communications regarding this report should be addressed to L. W. Bass, Director, New England Industrial Research Foundation, 137 Newbury St., Boston, Mass.

and junior members of the AMERICAN CHEMICAL SOCIETY who had reported residence in the United States and possessions. The closing date for the survey was fixed for January 25, 1942. By that time the Bureau of Labor Statistics had received and transmitted for the preparation of punch cards 19,009 usable questionnaires or 77.6 per cent of the original mailing list. This high proportion of returns from a mail questionnaire survey is unique. The extent of cooperation reflected is a source of profound satisfaction to the Committee on Economic Status.

ADEQUACY OF THE SAMPLES. For each of the 9 years for which data were requested the number of usable returns ranged from 8,538 in 1926 to 19,009 in 1941 (Table 1). It should be pointed out that the term "major field" as used in this report refers to field of basic education or training as given in response to question 3 of the questionnaire. It is not necessarily a classification of the type of professional work in which a member is engaged, because it is generally known that a small proportion of professional workers transfer to a field of activity different from the one in which the basic training was obtained.

It has already been noted that the returns for 1941 embraced 77.6 per cent of the original mailing list. For years prior to 1941 similar over-all comparisons are not feasible. But since the questionnaire requested information on retirement, the two major factors that might affect the adequacy of these several samples are deaths and turnover in membership. Analysis reveals that even if allowances were made for these two factors, the necessary adjustments would not affect the figures to any appreciable extent.

The question of the distributions of the several samples by age is also important. Fortunately, in these regards, as will be seen in the ensuing discussions on annual incomes and monthly salary rates, there is a consistency of movement from 1926 to 1941.

In terms of membership, therefore, it is reasonable to assume that in any one of the 9 years the returns are adequate and representative. This assumption, it should be noted, makes possible, with only slight qualifications, historical comparisons among the several topics relevant to economic status.

THE COMPONENTS OF THE SAMPLE. Analysis of the 19,009 returns for 1941 by major field, type of membership, and sex (Table 2) shows that the membership of the AMERICAN CHEMICAL SOCIETY is predominatingly male. For all major fields combined 16,104 or 84.8 per cent were male regular members, 1,255 or 6.6 per cent comprised male junior members, whereas only 710 or 3.7 per cent included females. Unfortunately, 940 or 4.9 per cent of members reporting in 1941 did not furnish information with regard to sex. These questionnaires, however, were not discarded. Wherever possible the answers given by these respondents to other questions were included in the tabulations. It was not possible, however, to include the replies from two of the members who actually reported they were both male and female.

Within each of the four major fields of activity the relatively highest proportion of males, 95 per cent, was reported for chemical engineering. The absolute number of the members reporting this field of activity in 1941 was 4,168. The other 5 per cent included 0.2 per cent of female regular members and 4.8 per cent who did not code the questionnaire for sex. In the major field of chemistry on the other hand, out of a total of 13,641, the two classes of male membership covered 90.6 per cent, 4.7 per cent were females, with sex not reported by 4.7 per cent. The highest proportions not reporting sex were found in other fields of science or engineering, and any other field with, respectively, 7.0 and 7.9 per cent. In both of these major fields males also predominate.

Within each of the three classes of membership among which comparisons can be made, the majority of the mem-

A.

bers reported that their major field of activity in 1941 was chemistry. Next in order comes chemical engineering, followed by other fields of science or engineering and any other field. For all members combined the respective proportions are 71.8, 21.9, 4.9, and 1.2 per cent. The corresponding distributions are somewhat similar for male regular and male junior members. However, among female regular members no less than 90.1 per cent reported chemistry as their major field.

For the years prior to 1941 the distributions of the membership by major field are almost uniform, as can be seen by referring to the percentage distributions in Table 1.

It should be remarked here that in any one year a complete response to any one question was not obtained. In general, the answers to any one question in a particular year do not fall below 95 per cent.

Section 2. Educational Qualifications of the Membership

Further light is thrown on the components of the sample by considering the four major fields in relation to educational level, to which question only 0.2 per cent failed to respond. Such comparisons are, of course, possible only for 1941 (Table 3), owing to the fact that the educational level reported for this year would not necessarily have been the same in prior years.

With only 5.3 per cent reporting incomplete college training, or no college training, it is apparent that the membership is predominated by college graduates. Among those with college training the highest proportion—namely, 38 per cent—embraced members who had obtained doctor's degrees. Graduate training at the master's level included 24.1 per cent, whereas 32.4 per cent of the members were classified as having no degree higher than the bachelor's.

This pattern of distribution by college educational level is, however, not common to all four major fields. In these regards, the most striking contrasts occur among the 13,641 members in the field of chemistry. This number, it will be noted, embraced 71.8 per cent of the total returns for 1941. But this proportion comprises no less than 33.5 per cent with doctor's degrees, 16.6 per cent with master's degrees, and 18.1 per cent with bachelor's degrees.

In the field of chemical engineering, on the other hand, there is relatively a decrease in the proportion of postgraduates. The emphasis of this training occurs at the master's level. This is evidenced by the fact that among the 4,168 members reporting chemical engineering as their major field, 2,325, representing 12.2 per cent of the total membership, had bachelor's degrees only, 1,161 or 6.1 per cent had graduated as master's, but only 447 or 2.3 per cent of the total membership reported they had obtained doctor's degrees in chemical engineering.

Among the members classified in "other field of science or engineering" and "any other field" the respective proportions within each of these major fields classified as doctor's, master's, and bachelor's show little variation. In the former field, but relative to the total membership, the proportions range from 1.1 to 1.9 per cent and in the case of the latter field each is less than 1 per cent.

Among male regular members the distributions by educational level and major field are similar to those for the membership as a whole. Relative to male regular members, however, the proportions of female regular members with doctor's and master's degrees are much higher. The respective percentages for females are 46.5 and 31.4 per cent of all female regular members in contrast to 35.9 and 16.2 per cent for all male regular members.

In the case of the 1,255 male junior members, the highest proportions by educational level cover those with bachelor's degrees. The actual proportions in the fields of chemistry and chemical engineering are, respectively, 35.9 and 22.2 per cent of all male junior members. For this same class of membership the corresponding percentages for the two postgraduate levels combined are 16.0 and 4.4 per cent.

Among junior members is to be found the highest proportion (16.9 per cent) with incomplete college or no college training. Of this group as much as 13.0 per cent reported chemistry as their major field.

From this general analysis of the components of the sample the important fact emerges that the membership of the AMERICAN CHEMICAL SOCIETY is not confined to the field of pure chemistry. Also to be noted is the fact that there is a sufficient number of returns from members

engaged in the field of chemical engineering to justify detailed comparisons of economic status with members in the field of chemistry. Among all four fields similar comparisons are not warranted. However, by combining the returns from those classified in "other field of science or engineering" and "any other field" broad comparisons are possible for three groupings of the members with respect to major field of work. The first topic to be presented on this basis is that of geographical environment.

Section 3. Geographical Environment of the Membership

This discussion of geographical environment covers two distinct features. In one of these the emphasis is placed upon tracing changes in the geographical location of the membership in the period 1926 to 1941. This particular analysis also reveals the relative importance of the several locations with regard to employment opportunities. This is followed by an analysis of the distributions of the membership by size or population of community within each geographical division in the year 1941 only.

DISTRIBUTIONS BY GEOGRAPHICAL DIVISION. When the 9 distributions by geographical location for the period 1926 to 1941 were compared, the changes from year to year were seen to be so slight as to justify actual presentation of the data compiled for the years 1926, 1934, and 1941 only (Table 4). The intermediate year 1934 was chosen primarily because, as will be seen later, it coincides with the period of lowest incomes and earnings of the membership. Since both parts of this analysis are based primarily on proportions rather than absolute numbers, it is pertinent to note that in 1941 only 2 per cent of the members reporting failed to answer the questions on geographical location. The respective corresponding proportions for 1926 and 1934 are 3 and 6 per cent. The absolute number of usable returns for the years 1926, 1934, and 1941 are, respectively, 8,237, 13,726, and 18,701.

Without regard to major field of training the data in Table 4 clearly indicate that the Middle Atlantic Region has persistently offered the largest number of employment opportunities to the membership. Furthermore, over the period 1926 to 1941 the proportions reported for this region show little variation. In each of the years, 1926, 1934, and 1941, these averaged approximately one third of the total returns. The actual proportion in 1941 was 34.3 per cent. Among the three states included in the Middle Atlantic Region it is to be noted that 15.5 per cent of the membership in 1941 were located in New York. By contrast the proportions reporting from New Jersey and Pennsylvania were, respectively, 9.2 and 9.6 per cent. Over the period 1926 to 1941 only the state of New Jersey shows a relative perceptible increase from 7.0 per cent in 1926 to 9.2 per cent in 1941.

The area second in importance to the membership as regards employment opportunities appears to be the East North Central Region. For 1926 the reports covered 22.7 per cent of the members reporting. The proportion reported for this region in 1941 was 23.6 per cent. The state data shown for this region also reveal no appreciable change over the period 1926 to 1941. In 1941 the state of Illinois embraced 8.4 per cent of the membership as against 6.7 per cent in the state of Ohio and 8.5 per cent for all other states in the region combined.

Considered together, therefore, the analysis thus far shows that nearly 60 per cent of the membership in each of the 9 years in the period 1926 to 1941 were located in the Middle Atlantic States and the East North Central Region.

Among the other 8 regions of the Continental United States there is also little variation in the several proportions with respect to geographical location. This is evidenced by the fact that while in 1926 the proportions ranged from 2.1 per cent in the Mountain Region to 8.9 per cent in the New England Region, in 1941 the range was from 1.5 to 7.5 per cent, with the same two regions occupying, respectively the lower and upper extremes of the range.

Actually, among all 8 regions only 3 show very slight changes. In the South Atlantic Region, for example, the relative increase in the proportions reported was from 7.5 per cent in 1926 to 9.7 per cent in 1941. Slight decreases on the other hand seem to have occurred in the West North Central Region and the New England area. The decrease reported for the former region was from 8.4 per cent in 1926 to 5.5 per cent in 1941. Over the same period the latter region shows a decrease from 8.9 to 7.5 per cent.

For the data shown in Table 4 with respect to major field, the patterns of geographical location in the Continental United States are virtually the same as that for the membership as a whole.

The United States territories and possessions apparently offered little employment opportunity to the membership. Over the period 1926 to 1941 these geographical divisions accounted for only 0.3 per cent of the returns in any one year. Foreign countries on the other hand claimed the services of 3.5 per cent of the membership in 1926. By 1934 the proportion had declined to 2.0 per cent. In 1941 only 0.2 per cent of the members

1 INCLUDES THOSE NOT REPORTING POPULATION OF COMMUNITY

2 FEWER THAN 100 MEMBERS REPORTED

3 INCLUDES ALL MEMBERS REPORTING OTHER FIELD OF SCIENCE OR ENGINEERING, ANY OTHER FIELD, AND FIELD NOT REPORTED

reporting gave foreign countries as their geographical location.

DISTRIBUTIONS BY SIZE OF COMMUNITY. The distributions by size or population of community shown in Table 5 are based on the 18,701 returns received for the year 1941.

For all geographical divisions and all major fields combined the distributions of the membership in 1941 among the 5 sizes of communities range from 9.2 to 39.7 per cent. The lower extreme of this range refers to communities with populations of under 5,000 persons; the upper extreme on the other hand has reference to communities with populations of over 500,000 persons.

The three intermediate values of this range in proportions do not parallel the increases by size of community. Actually the lowest proportion of 13.7 per cent includes members who reported they were located in communities of from 25,000 to 100,000 population. In the 5,000 to 25,000 population areas as much as 16.8 per cent of the membership were employed. The proportion in areas with populations ranging from 100,000 to 500,000 is 19.9 per cent.

Within each of the geographical divisions the distributions are similar to that for the membership as a whole. Such differences as do exist can be explained on the grounds that there are only a few localities in the United States with populations of over 500,000. Similar remarks apply to the data shown separately for the field of chemistry and the field of chemical engineering. The returns for all other fields have significance only when considered as a whole.

Structure of Biotin

DISCOVERY of the structure of biotin was announced October 9 by Vincent du Vigneaud at a meeting of the New York Section of the AMERICAN CHEMICAL SOCIETY. The discovery is expected to pave the way to the synthesis of this supervitamin, only about 0.1 ounce of which makes up the world supply at the present time.

The empirical formula of the biotin molecule was established about two years ago at the Cornell University Medical College, and the announcement of its architectural structure culminates a series of investigations initiated early in 1940, when biotin was identified with vitamin H and with co-enzyme R. Biotin can now be known as 2'-keto-3,4-imidazolido-2-tetrahydrothiophene-*n*-valeric acid.

Mead Johnson B Complex Award

NOMINATIONS for the 1943 award of $1,000 established by Mead Johnson and Co. to promote researches dealing with the B complex vitamins must be submitted by January 10, 1943. The award will be given to the nonclinical laboratory or clinical research worker in the United States or Canada who, in the opinion of the judges has published during the previous calendar year the most meritorious scientific report dealing with this field. Formal presentation will be made at the annual meeting of the American Institute of Nutrition at Cleveland, April 7, 1943. Nominations, with data relative to the nominee and his research, should be sent to Arthur H. Smith, Wayne University College of Medicine, Detroit, Mich.

Quinine Wanted

IT WAS REPORTED that malaria so weakened General MacArthur's troops on the Bataan peninsula that they were unable to hold out as long as they would if they had been given adequate supplies of quinine. We know that atabrine and plasmochin are being used as invaluable substitutes for quinine, and yet there is some question whether or not they are perfect substitutes. With so many of our armed forces stationed in the tropics as well as in our own South where malaria is an enemy, it would seem that we should uncover all reserves of quinine in this country.

In order to learn something of the possibilities along this line, your President, on his recent New England lecture tour, made an appeal to chemists who might possibly have considerable reserves of quinine. Organic chemists, as is well known, find quinine very useful in preparing pure crystalline derivatives of certain substances, and it was thought that they might have some on hand which they could spare. The results of the appeal were most encouraging. At Yale one pound was offered, at the University of Vermont half a pound, and in Boston a pound or more. At this rate one might guess that 50 or 100 pounds could be secured from the universities and the medical schools. It would certainly be worth several times its weight in gold at this time. At the risk of seeming officious, I am asking every chemist who can sell the Government any amount of quinine at this time to write me, so that I can forward all the letters to the proper medical authorities. If they do not want it, that is their responsibility. Please do not send me any quinine, for that will not be the best way to manage it.

HARRY N. HOLMES
OBERLIN COLLEGE
OBERLIN, OHIO

New Occupational Bulletins

FOUR new occupational bulletins, Nos. 22, 23, 24, and 25, have been issued, all activities certified by the War Manpower Commission as being essential to the support of the war effort, and each definitely including chemists and professional and technical engineers as essential men to these activities. The subjects are as follows:

Occupational Bulletin 22, "Metal Shapes and Forging Activity".
Occupational Bulletin 23, "Educational Services".
Occupational Bulletin 24, "Production of Chemicals and Allied Products Activity".
Occupational Bulletin 25, "Ammunition, Ordnance, and Accessories Production Activity".

Of these four, we are reproducing the following two in full.

Occupational Bulletin 23. Educational Services

1. The War Manpower Commission has certified that educational services are essential to the support of the war effort.

2. This bulletin covers the following essential activities which are considered as included within the list attached to Local Board Release No. 115, as amended:

(a) *Educational services:* Public and private industrial vocational training; elementary, secondary, and preparatory schools; junior colleges, colleges, universities and professional schools; educational and scientific research agencies; and the production of technical and vocational training films.

3. In considering registrants engaged in educational services there must be taken into consideration the following:

(a) The kind of institution in which the registrant is engaged;
(b) the occupation of the registrant in that institution; and
(c) the classroom studies under the registrant's instruction, supervision, or administration jurisdiction. Attached is a list of occupations by institutions and classroom studies in educational services which require a reasonable degree of training, qualification, or skill to perform the duties involved. It is the purpose of this list to set forth by institutions and classroom studies the important occupations in educational services which must be filled by persons capable of performing the duties involved in order that the essential portions of the activity may be maintained. Item 4 of the list does not include classroom studies but occupations which shall be considered in the same manner as any other occupations. The entire list is confined to occupations which require more than six months of training and preparation.

4. In classifying registrants employed in these activities, consideration should be given to the following:

(a) The training, qualification, or skill required for the proper discharge of the duties involved in his occupation;
(b) the training, qualification, or skill of the registrant to engage in his occupation; and
(c) the availability of persons with his qualifications or skill, or who can be trained to his qualification, to replace the registrant and the time in which such replacement can be made.

Critical Occupations

1. ELEMENTARY, SECONDARY, AND PREPARATORY SCHOOLS

(a) Superintendents of elementary, secondary and preparatory school systems; and
(b) Teachers who are engaged in full-time instruction in one or more of the following subjects:

Aeronautics
Biology
Chemistry
Mathematics
Physics
Radio

2. JUNIOR COLLEGES, COLLEGES, UNIVERSITIES AND PROFESSIONAL SCHOOLS, EDUCATIONAL AND SCIENTIFIC RESEARCH AGENCIES

(a) Presidents, deans, and registrars in junior colleges, colleges, universities, and professional schools; and
(b) Professors and instructors engaged in full-time instruction and research in one or more of the following subjects:

Agricultural sciences
Architecture, naval
Astronomy
Bacteriology
Biology
Chemistry
Dentistry
Engineering sciences
Geology
Industrial management
Mathematics
Medicine and surgery
Metallurgy
Meteorology
Navigation, aerial and marine
Oceanography
Pharmacy
Physics
Physiology
Veterinary sciences

3. PUBLIC AND PRIVATE INDUSTRIAL VOCATIONAL TRAINING

(a) Superintendents of public and private industrial vocational training; and
(b) Teachers who are engaged in full-time instruction in one or more of the following subjects designated to prepare students for war activities:

Trade, vocational and agricultural subjects (such as, machine shop practice, aircraft, sheet-metal work, and similar subjects) and in vocational rehabilitation.

4. PRODUCTION OF TECHNICAL AND VOCATIONAL TRAINING FILMS

(a) Persons engaged full-time and exclusively in the production of technical and vocational training films for the Army, Navy, and war production industries.

Animator
Cameraman
Cutter
Film editor
Project supervisor
Technical consultant
Technical writer
Sound engineer

Occupational Bulletin 24. Production of Chemicals and Allied Products Activity

1. The War Manpower Commission has certified that the production of chemicals and allied products is an activity essential to the support of the war effort.

2. This bulletin covers the following essential activities as listed in the amendment to Local Board Release No. 115:

(a) *Production of chemicals and allied products:* Glycerin; turpentine, rosin and other naval stores; wood tars, oils, acids, and alcohols; lubricating oils and greases; animal and vegetable oils; fertilizers; tanning materials; salt; synthetic rubber; primary coal-tar products; plastics; compressed and liquefied gases; refined sulfur; sulfuric and other acids; caustic and other sodas; industrial alcohols; electrochemical and electrometallurgical products such as carbide, sodium and potassium metals and high-percentage ferro-alloys; drugs and medicines; insecticides and related chemical compounds; nylon and other synthetic textile fibers used in military equipment exclusively; grease and tallow; candles. (Explosives, flares, and other fireworks generally classified as chemical products are included with ammunition.)

3. The following list of occupations in the production of chemicals and allied products are occupations requiring a reasonable degree of training, qualification, or skill to perform the duties involved. It is the purpose of this list to set forth the important occupations in the production of chemicals and allied products which must be filled by persons capable of performing the duties involved, in order that the activity may maintain efficient production. This list is confined to those occupations which require six months or more of training and preparation.

4. In classifying registrants employed in these activities, consideration should be given to the following:

(a) The training, qualification, or skill required for the proper discharge of the duties involved in his occupation;

(b) the training, qualification, or skill of the registrant to engage in his occupation; and

(c) the availability of persons with his qualifications or skill, or who can be trained to his qualification, to replace the registrant and the time in which such replacement can be made.

Critical Occupations

Accountant, cost
Bacteriologist
Biologist
  Immunologist
  Nematologist
  Parasitologist
  Pathologist
Blacksmith (all around)
Bleacher operator
Bricklayer, ref.
Calender operator
Carpenter, maintenance
Centrifuge operator
Chemical operator
  (A title covering workers who actually operate equipment that requires the exercise of independent judgment, extensive responsibility for product or equipment, and the application of acquired skill, such as, autoclave operator, acetylator operator, still operator. It does not include "operators" who tend equipment in accordance with specific instructions, such as contact acid operator or drum filler.)
Chemist
Coppersmith
Double-rolling-mill operator
Dialyzer operator
Electrician (all around)
Engineer, professional and technical
Engineer, power house
Entomologist
Filterman, paraffin
Fire chief
Foreman, chemical operations
Gas-producer man
Glass blower
Glycerin refiner
Instrument repairman
Lead burner
Lubricating oil treater
Machine fixer, rayon
Machinist (all around)
Manager, employment and personnel
Manager, production
Manager, traffic
Master mechanic, maintenance
Mechanic, maintenance
Molder, plastics
Oxygen-plant operator
Pharmacist
Physicist
Pipe fitter
Processman, rayon making
Rubber coverer
Sheet-metal worker (all around)
Soap maker
Spinning-bath man
Tool-and-die maker
Viscose blancher
Welder (all around)
Yardmaster

Planographed copies of these bulletins for use by local boards can be furnished from this office on request, but to meet the expense thereof three cents in stamps should be forwarded for each copy required.

CHARLES L. PARSONS, *Secretary*

AMERICAN CHEMICAL SOCIETY
1155 SIXTEENTH ST., N. W.
WASHINGTON, D. C.

Portrait of Alexander Lowy Presented

A PORTRAIT of the late Alexander Lowy, professor of organic chemistry in the Department of Chemistry, University of Pittsburgh, since 1918, has been completed. This memorial was established by the chemistry alumni and the many friends of Dr. Lowy as a tribute to a great teacher and a great man. It is to be presented on October 30 by Alexander Silverman, head of the Department of Chemistry, to Chancellor John G. Bowman, who will receive it in behalf of the university.

National Industrial Chemical Conference

IN CONNECTION with the 1942 National Chemical Exposition, scheduled for November 24 to 29 in Chicago, a National Industrial Chemical Conference will be held. On November 25 plastics and paper will be discussed, Norman L. Shepard presiding. On November 26 there will be a joint meeting with the Chicago Section of the AMERICAN CHEMICAL SOCIETY featuring the electron microscope. On November 27 the subject will be "Food and the Relation of Food to the Chemistry of Plants and the Soil", and "The Cyclotron and Its Uses in Research", while on November 28 a Symposium on Industrial War Problems will be offered.

A continuous program of industrial movies will be shown during the exposition, and the War Production Board is preparing a special exhibit to demonstrate the reclamation and recovery of solvents, paints, oils, and by-products.

Conference on Electron Microscope

A CONFERENCE on the electron microscope is to be a feature of the National Chemical Exposition, scheduled for November 24 to 29 in Chicago, under the auspices of the Chicago Section of the AMERICAN CHEMICAL SOCIETY.

RCA is making available an electron microscope that will be set up at the exposition, with qualified attendants to explain its operation and possibilities. V. K. Zworykin is to talk on "The Electron Microscope in Relation to Chemical Research".

In addition, G. L. Clark, University of Illinois, is arranging for a conference to be held November 27 and 28 of all laboratories and research workers that at present own electron microscopes. There are some forty in use in the country, and this is the first time the research workers using them have had a group meeting to discuss their use, swap ideas on techniques, and possibly allocate fields to prevent duplication and overlapping of work. In connection with the conference an exhibit of the best micrographs made by various workers is being arranged.

Utilization of Scientific Workers in the War Effort

THE *Chemical Bulletin*, official organ of the Chicago Section of the AMERICAN CHEMICAL SOCIETY, contains in its September 1942 issue an informative article by B. E. Schaar on "Utilization of Scientific Workers in the War Effort". This discusses the governmental setup where the scientific and technical skills are most likely to be needed, listing the agencies of greatest interest to scientific workers, and gives several suggestions as to ways of answering the question "What can I do?"

Defense Activities in Minneapolis

A MIMEOGRAPHED news letter is issued monthly by the Minneapolis Defense Council, Inc.. 125 City Hall, Minneapolis, Minn. The letter for September 28 is an 18-page publication that discusses the salvage campaign, blackout tests, women's activities, the volunteer service bureau, and service men's recreation.

Correction

CHEMICAL AND ENGINEERING NEWS wishes to correct an error in the title of the picture appearing on page 1198 of the September 25 issue, which actually shows *new* members of the staff of the Central Technical Laboratory of the Armstrong Cork Co. in Lancaster Penna., and is not a photograph of the entire organization. The entire staff numbers several times the group pictured.

Fibers of Brazil

C. E. NABUCO DE ARAUJO, JR.
Caixa Postal 970, Rio de Janeiro, Brazil

THE industrial utilization of Brazilian fibers may be divided into two periods: the first includes the fibers used from the beginning of our colonization, and the second covers those utilized during the industrial period which began 20 years ago.

Cotton

Cotton was used by the aborigines and, especially due to Jesuit influence, had an important place during the colonial period. The difficulty of obtaining fabrics from Portugal encouraged the Jesuits to teach the art of weaving cotton. This development became so important that the Portuguese Government, almost three centuries later, authorized the employment of weaving experts in the first factories built in the colony.

Cotton exportation was started soon after the discovery of Brazil by Cabral and steadily increased up to the nineteenth century. Export commenced to decline soon after the War of Secession, regaining a place of prestige only after the coffee crisis in 1940. Table I shows that cotton production in Brazil in 1941 was more than four times as great as that of the 1925–29 average. With such a crop Brazil began to occupy an important position in worldly production, being exceeded only by the United States of America, India, and Russia. Fabrics made from Brazilian cotton are well known to other South American countries, which purchase more than $5,000,000 worth yearly.

Table I. Cotton Production

Year	Tons	Index
1925-29 (av.)	119,090	100
1930	95,486	80
1931	112,789	95
1932	76,416	64
1933	151,253	127
1934	284,604	239
1935	297,306	250
1936	351,543	295
1937	405,543	341
1938	448,700	377
1939	475,000	398
1940	468,695	393
1941	521,600	438

Cutting and sun drying sisal in the state of São Paulo

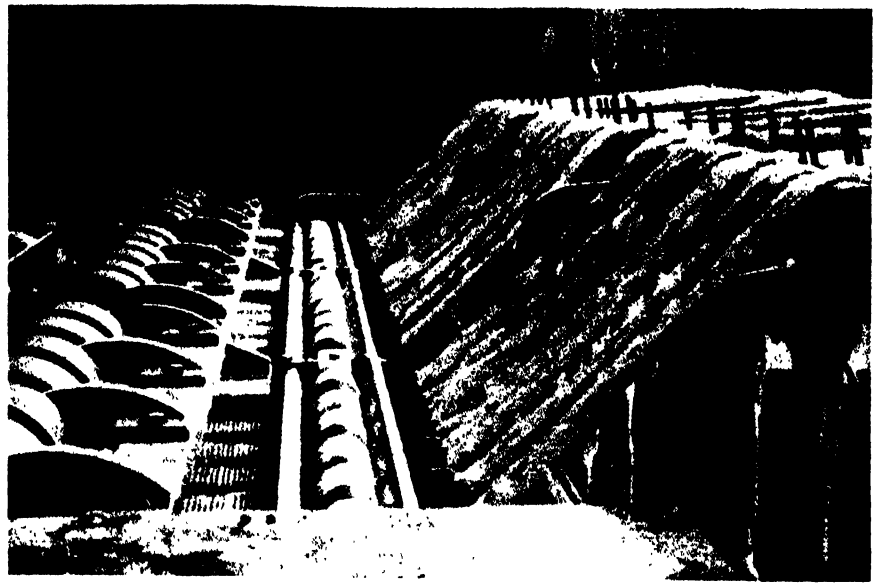
Other Textile Fibers

During the last 20 years progress in rayon production has been considerable, especially the utilization of native raw material, cotton linters. From 32 tons in 1926, production reached approximately 8,000 tons in 1941, manufactured by three factories at São Paulo; prospects are that this figure will increase in the next few years. Rayon is made by the cellulose acetate, viscose, and nitrocellulose processes. The Brazilian Government is encouraging natural silk growing by the creation of experimental centers of sericulture in several states. The extraordinary possibilities of sericulture in the Amazon Valley are known, where one culture of silkworms per month or 12 per year are possible. Brazil produces about 900 tons of cocoon and 100 tons of raw silk per year.

Linen is now widely cultivated in the states of Rio Grande do Sul and Paraná. In Rio Grande do Sul it is grown especially for its linseed oil content, whereas in Paraná it is utilized by the spinning and weaving industry founded by European settlers.

Wool production has also reached a high level during the last 30 years. The number of sheep has increased threefold, and today we are producing approximately 18,000 tons of wool. About one third is consumed in the domestic market. Wool production in Brazil is exceeded in South America only by Argentina and Uruguay.

Indigenous Coarse Fibers



The most interesting fibers for this study are those which have been utilized recently for the manufacture of bags, rope, cord, string, hawser, fabric, etc.

Piaçava (*Attalea funifera* Mart.) is ob-

tained from a wild tree which grows abundantly in the state of Baía. Another variety (*Leopoldina piaçaba*) is found in the Amazon Valley, in Maranhão, and in the Tocantins River valley. The fiber found in Baía is harder and longer, and is generally preferred for the manufacture of brooms, carpets, brushes, and cords. However, there is no cultivation or systematic planting of this palm tree. The mesocarp of the Amazon variety has a nutritive value similar to that of the babaçú. Brazil produces approximately 7,000 tons of piaçava per year, of which 5,000 tons or 70 per cent is exported.

Among fibers recently utilized industrially, caroá *Neoglaziovia variegata* Mez is important. Research carried out in the United States and in Brazil has demonstrated the strength of this fiber for use in several products, including paper. Caroá is found in large quantities in most of the northern states of Brazil, from Baía to Piauí. It grows in a dry warm region of more than 8,000,000 hectares and may be considered a Brazilian plant, since there seems to be no reference to it in any other country. It used to be harvested by the most primitive processes. However, more modern methods are avoiding the wastage of smaller leaves of the shorter fibers, the industrial utilization of which is being steadily improved. Caroá fiber has an average moisture content of 9–11 per cent, approximately 70 per cent cellulose (of which more than 67 per cent is alpha-cellulose), 12 per cent woody matter, and the balance soluble material. Caroá is composed chiefly of lignocellulose. The fibers are not uniform and have a yellowish color.

Caroá has been largely employed as a substitute for jute and in the manufacture of rope, string, tarpaulins, carpets, and paper. Lately, caroá has been blended with cotton in the manufacture of summer fabrics. Bags made with caroá are lighter and more resistant and have a better appearance than similar ones prepared with Indian jute. Cocoa, castor seeds, and more recently coffee are almost exclusively exported in caroá sacks. The residue left after the separation of the caroá fiber is used as cattle fodder.

Treatment of caroá fiber at Caruaru, Pernambuco

Caroá can be harvested at any season. It is defibered by appropriate machinery, sent to the dryers, and baled for spinning. Mucilaginous and agglutinating substances are separated by mechanical and chemical processes, leaving the fiber ready for spinning. The fiber later goes to the beaters and smoothers, is treated by an oil-water emulsion, and is cut and carried through combers, carders, stretchers, and twisters, before spinning. The construction of a large factory for the production of cellulose is under study, with the purpose of utilizing the residues of decortication. Light and thin papers used in air mail correspondence and in copy books are now being manufactured; it is planned to make also thicker paper, as well as cardboard, cloth, paper bags, etc.

In 1941 the production of caroá fiber reached about 5,000,000 kg. In 1943, with the installation and operation of more than 2,800 machines to separate the fibers, production is expected to reach more than 10,000,000 kg.

The papoula de São Francisco or Brazilian hemp (*Hibiscus ferox*, *Hibiscus radiaturas* Cav., *Hibiscus unidens* Linn., all similar to *Hibiscus cannabinus* L.) grows on the banks of the São Francisco River which winds through the states of Minas Geraes and Baía. Recent plantations have been started in the state of São Paulo. It is a wild plant which is easily cultivated on siliceous-argillaceous land. The fiber is being used to a small extent in the manufacture of string, rope, cord, and sacking. Its seeds produce a drying oil which can be used in paint and varnish. Papoula de São Francisco is composed chiefly of lignocellulose. The fibers are uniform and yellowish in color. They contain 73–77 per cent cellulose, 10–11 per cent moisture, 0.5–1 per cent ash, the balance being impurities.

Guaxima or uacima are the usual names given to certain plants of the Malvaceae Esterculiaceae, and Tiliaceae families. The most important, however, the malva violeta (*urena lobata*, L.) and malva veludo (*Pavonia malacophila*), are found in the northern part of Brazil in São Paulo. The fiber of these plants is being used, without mixture with any other fiber, in the manufacture of bags, cord, rope, string, fishing lines, etc. Malva violeta is also known as aramina in São Paulo; malva veludo is called "carrapicho" in northern Brazil. Carrapicho is native to Baía and Pernambuco.

The fibers of all types of guaxima are uniform and are whitish yellow in color. They are also composed chiefly of lignocellulose—65–73 per cent in the *Urena* types and 75–77 per cent in the *Pavonia* types. Moisture varies from 11 to 14 per cent and the ash content, from 0.2 to 0.5 per cent.

Tucum is a palm tree which yields an excellent fiber and is especially suitable for fish nets because of its extraordinary resistance, flexibility, and durability. Its nuts yield an oil similar to olive oil. The residue left after extraction of the oil is

Sun drying papoula de São Francisco fiber

Table II. Properties of Fibers

used as cattle feed. These trees belong to the *Bactris* and *Astrocaryum* genera; the most important is *Bactris setosa* Mart., a thorny plant about 3 meters high with thorny and fan-shaped leaves 2 meters in width.

The chemical composition of tucum fiber is similar to that of the others described. It is chiefly lignocellulose, and is uniform and greenish in color. About 10 per cent moisture, 1–2 per cent ash, and 81 82 per cent cellulose make up tucum fiber.

Ramie cultivation has recently been started by farmers in the Amazon Valley. It is the only fiber comparable in resistance to tucum. However, ramie has not yet been industrially utilized, although it has been mixed with jute and other Brazilian fibers in the manufacture of bags and cords. Ramie consists mainly of cellulose, water, and natural impurities; the individual fibers are about 25 cm. in length.

Curauá (*Bromelia sagenaria* A. da C.), paco-paco (*Psendabutilon spicatum* H. B. K.), and malvalistro (*Sida micratha* St. Hil.), also known as malvaiso or malvapreza, are wild plants. The first two grow in the northern states from Ceará to Pará, and the latter grows in central and northern regions. Macambira (*Bromelia laciniosa* Mart.) is also found where caroá grows—i. e., the north where fibers of the plants generally known as gravatás are encountered. The fiber of these species is commercially exploited only on a small scale. However, the adaptation of these species to industrial uses has been demonstrated by technical research. Malvalistro fibers are very uniform, have a good tensile strength and a golden yellow color. The fiber is composed of 61–65 per cent cellulose, 0.5–1.5 per cent ash, and 11–12 per cent water, besides natural impurities. Macambira has a yellow color, and is composed of about 70 per cent cellulose, 0.5–1 per cent ash, and 11–12 per cent water. Both fibers are lignocellulose in nature.

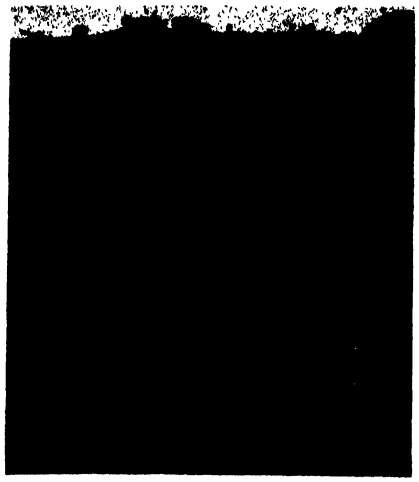
Paco-paco is similar to malva laranja (*Wissadula* sp.), and its fiber is composed of lignocellulose with about 73-74 per cent cellulose, 0.5–0.7 per cent ash, and 12–13 per cent water. The fibers are uniform and white, and have good tensile strength.

New Zealand Flax

Foreign Fibers

Farmers of the Amazon valley have tried to cultivate not only ramie but also Indian jute. No practical results were obtained from seeds secured in either São Paulo or from Japan. The following year,

Cutting papoula de São Francisco



seeds from India were employed, but the fiber produced did not show the same characteristics as the Indian product. In 1934 some good samples of *Corchorus capsularis* were raised. Since then plantations have been gradually improved, and a crop of about 400 tons of fiber is expected this year.

"Juta dos Parintins" is the name given to the jute obtained in the Amazon valley. Brazilian jute is similar in composition to that from India. The fibers are very uniform and have good tensile strength. With a whitish yellow color, the fibers contain 71–72 per cent cellulose, 12–13 per cent water, and about 0.7 per cent ash.

Another foreign fiber which has grown well in some Brazilian soils is sisal (*Agave sisalina* Perrine). The best results have been obtained in Baiá and Paraíba. Sisal is being mixed with other native fibers in the manufacture of binder twine, cord, and rope. Brazilian sisal fiber is uniform but harder and less flexible than other native fibers. It is composed of about 70–71 per cent cellulose, 1–1.5 per cent ash, and 10–11 per cent water.

Some of the properties of fibers cultivated or native in Brazil are given in Table II.

A recent government decree has made it obligatory to use native fibers in the manufacture of burlap bags, rope, string, cord, and various fabrics. This is contributing to the industrialization of a great

Caroá plantation in the state of Pernambuco

variety of native fibers and thus enabling the country to become independent of importations of these products.

Brazil is also exporting to other South American countries, not only the raw fibers but also fabrics produced locally, as well as some clothes in which caroá and other native fibers are mixed with cotton as raw material.

Atabrine in Mass Production

ATABRINE, substitute for quinine, is now being produced at the rate of about a half billion tablets per year, according to Science Service. High-speed laboratory machines are spewing tablets of the bright yellow crystals at an ever-increasing rate.

Known chemically as quinacrine hydrochloride, atabrine has been admitted to the new edition of the U. S. Pharmacopoeia. Supplies of chemicals to make the medicine are reported as adequate for our needs, and as production goes up, cost goes down.

Reclaimed Rubber Tires for Civilians

THE B. F. Goodrich Co., Akron, Ohio, has announced that from a technical and manufacturing standpoint the rubber industry can provide the country's motorists with the replacement tires they need, using available reclaimed rubber and other materials being produced under the government program. Factories are prepared to produce the tires as soon as permission from Washington is received.

The Chemist's Chance—But Is the Chemist Ready?

MAY I contribute a little wind to fan the flame which Mr. Eisenschiml kindled in the March 25 issue of CHEMICAL AND ENGINEERING NEWS (page 368)?

I most heartily agree with Mr. Eisenschiml that the chemist's chance has arrived but I am not thoroughly convinced that the rank and file of the profession are prepared for the mountainous task facing us. It is my opinion that the parable of the "Ten Virgins" applies to chemists today (see Matthew, Chapter 25, verses 1 to 14, inclusive). However, most of us should be classed with the five foolish and not the five wise. We have not provided ourselves with the "essential" oil which it takes to make our light shine when the bridegroom arrives.

Why do I take this point of view? Not because I am one who stands as a success in the profession, for I am only a "mine run" chemist. I thoroughly believe that the chemist does not apply the same keen analytical ability to his personal problems that he applies to technical problems. Most of us assume that we are very important to the general welfare of society which is probably true. But most of us are employed by practical businessmen who are in business to make money and not for the general welfare of society.

More than 20 years ago I sat in a general meeting of the AMERICAN CHEMICAL SOCIETY at Chicago and listened to Mr. Wilson, president of Wilson and Co., the great meat packers. Mr. Wilson made one remark which angered me and kept me angry for several years. But that remark of a mature and highly successful businessman which angered me as a youth has given me hope in maturity. Mr. Wilson's statement was, "You chemists will have to learn the businessman's language because he won't learn yours". Even a generation ago we had flaming youth, and I certainly flamed white hot at the idea that I should have to learn to be a businessman so that I could do my job as a chemist. But years of experience and observation have taught me the wisdom of his words. Chemistry, today, is big business—tremendously big business—and the chemist who has not caught the meaning of a "chemical age" in the terms of practical business has nothing but the laws of chance to depend upon for his personal success. May I say from my own personal experience that the rare occasions in my life when that will-o'-the-wisp called success has flitted in my vicinity it has been when I was able to correlate what little I knew about useful chemistry and practical business into a hard-headed business deal which either made or saved the company money. In this connection I think of chemists like Dr. Burton (Standard Oil of Ind.), Dr. Baekeland and Mr. Redman of Bakelite fame; also, A. B. Davis of Hilton-Davis Co. and a few others. Yes, my colleagues, I am thoroughly convinced after more than 20 years of investigating Mr. Wilson's statement that he was correct. The chemist must learn the businessman's language and he must learn it with astounding rapidity if he is to acquire the place in the sun which he desires for himself and his profession.

There has been much discussion of the differentiation between the routine analyst or chemical technician and the chemist or chemical technologist. Perhaps it is a bit disconcerting to most of us who call ourselves chemists, but it is none the less true, that before one can emerge from analyst to chemist he must learn the meaning of the results he is turning out daily in terms of their utilitarian value to the industry and to the particular phase of the business involved. Being an analyst is only one phase of being a chemist, a pertinent fact many chemists have ignored.

Only a few days ago I was rummaging in a second-hand book store in search of a used set of the textbooks supplied by the Alexander Hamilton Institute for their course in modern business administration, when I noted on the shelves two books on Abraham Lincoln by our own Otto Eisenschiml. Why do I mention this? Only to illustrate my next point that success in chemistry involves writing or authorship. It may be papers on one's own research but for the most of us it resolves itself into expressing some simple chemical fact in clear, concise, and entertaining language so that business executives and engineers can read, will read, and after reading will take action! That takes literary ability of a rare and convincing nature.

The chemist must be a convincing and an entertaining speaker. To succeed in modern industry he must have the silver tongue of the late William Jennings Bryan and the chemical astuteness of Louis Pasteur or Michael Faraday, both of whom founded professions.

The Apostle Paul once said, "I am all things to all men". No doubt he was the Biblical prototype of the modern chemist who must be analyst, businessman, author, orator, salesman, and, as all chemists learn sooner or later, plumber, pipefitter, carpenter, mechanic, baker, beggar, candlestickmaker.

This is the only way except luck by which a man can become a chemist in this day of swift-moving events. The man who is not willing to make of himself a polygon of achievements will probably not go very far as a chemist but he will be a howling success as a bellyacher.

September 14, 1942.

Developments in Lake Texcoco

ALICE R. GERSTEL, Calzada Villalongín 158, Mexico, D. F., Mexico

When in 1520 Hernán Cortés, the conqueror, reached the Valley of Anáhuac, 7000 feet above sea level, he found the Aztec capital Tenochtitlán—today Mexico City—built on numerous islands within an enormous lake. In this lake many of his Spanish soldiers drowned when attacked by the Aztec warriors, and with the soldiers were lost the rich legendary treasures of Moctezuma, the king whom they had "conquered".

Lake Texcoco, an inland sea without outlet and enclosed by mountains on all sides, then covered a great part of the upland valley. During the intervening centuries the lake shrank more and more; at the end of the past century it covered about 44 square miles. As the lake receded, the city encroached upon the lake, and during the rainy season the outlying districts were frequently flooded. To eliminate this danger, the government decided finally to carry out the age-old project of Netzahualcóyotl, King of Texcoco, to drain the lake. In 1900 the tunnel of Tequixquiac, 7.5 miles long, was built, and a great part of the lake drained into the Salado River, affluent of the Tula River which discharges into the Moctezuma, then into the Panuco, and finally into the Gulf of Mexico.

Popular belief had it that the lake was drained to recover the drowned treasures of Moctezuma, but as waters receded the lake surrendered no treasure and not even fertile land on which to grow crops, for the soil was highly alkaline.

Although the danger of flood was eliminated, a new danger arose. Every year during the spring months, just before the beginning of the rains, wind storms would swirl clouds of dust over the city. Water supplies became infected, and for days on end the natives felt the grit of the contaminated dust between their teeth and in the bloody spume many coughed up.

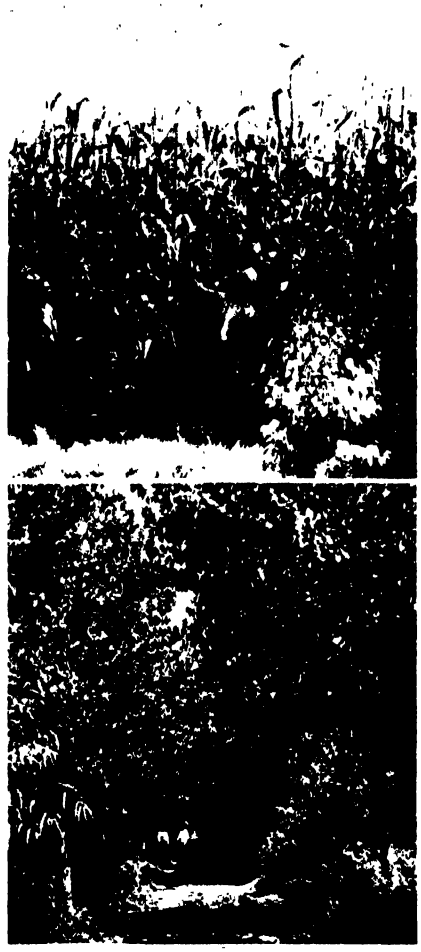
Above. Air view of the *Caracol*, showing the snail-like construction and the colors in the different ponds. *Below.* Concrete walls separating the ponds of the *Caracol*

Present Status

Unsettled conditions during the first decades of the century prevented attempts to do away with the new and remnants of the old danger. In 1936 President Cárdenas started an enormous development with the aim of solving several problems together: (1) satisfactory flood protection for the City of Mexico, (2) elimination of dust storms, (3) increased economic and cultural standard for the 50,000 natives from the lake villages who lived miserably on fishing and wild duck hunting, (4) improvement of 70,000 acres of alkaline barren lands, and (5) exploitation and utilization of enormous amounts of salts contained in the water and the subsoil. The purpose of this latter plan was to create an industrial center to produce caustic soda, soda ash, potash, sodium sulfate, and borax, and eliminate imports of these chemicals, amounting to 100,000 tons per year.

Today with more than $3,000,000 invested in the development, much has been accomplished. Twenty-seven thousand acres of the total surface of the lake have been reclaimed. Of these, 750 acres have been planted with 1,500,000 trees, mostly eucalyptus which are noted for their ability to thrive in alkaline soil. Poplars and other types of trees are planted also, and rich meadows are springing up. Now under cultivation are 3,700 acres, growing crops of corn, wheat, oats, barley, sorghum, beans, sunflower, soybeans (a novelty in Mexico), and fodder beets. More than 25,000 acres have been trench-ploughed, raked, and leveled.

There are two problems in reclaiming the land for farm use. The first involves draining the salty water, and the second, a supply of water for irrigation. Construction of 6,800 miles of subsurface drains is taking care of the first problem. There are 279 miles of surface drains, into which the subsurface drains discharge; the surface drains discharge into canals which, in turn, feed into a main canal 21.7 miles long, and this leads to the *Caracol*, a solar evaporation basin.



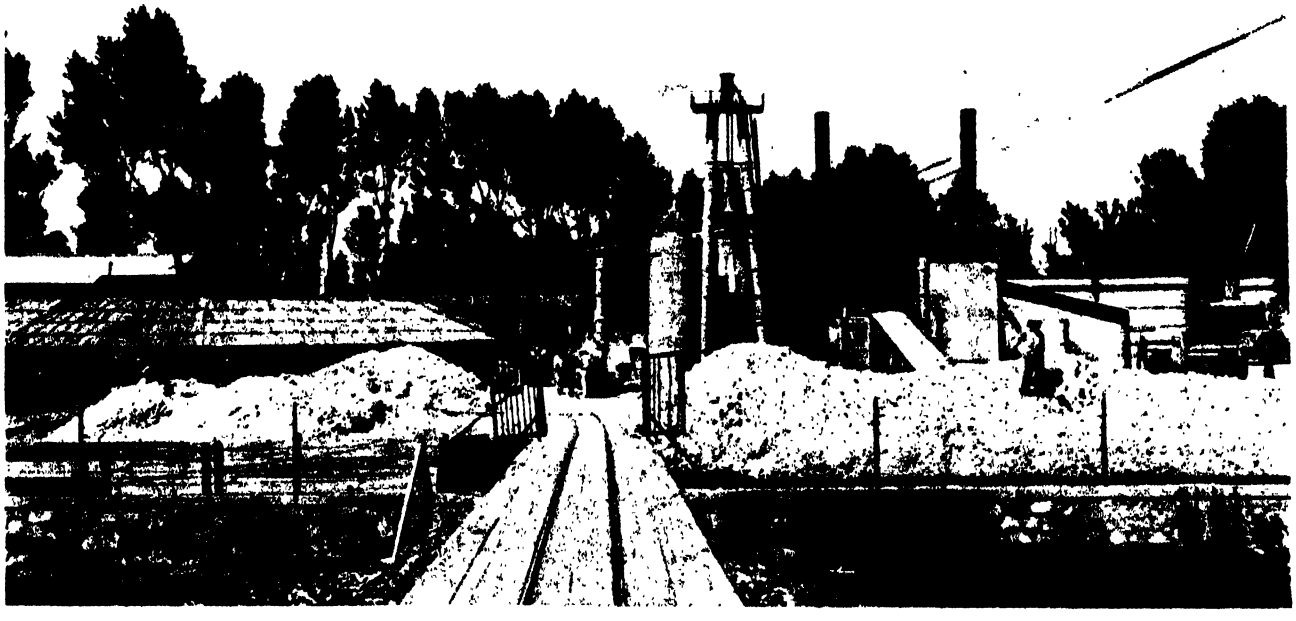
For the irrigation of the reclaimed lands, more than fifty artesian wells with a total depth of 18,000 feet have been sunk.

The waste waters of Mexico City are also being used through a sewer canal; and the Unido and the Guadalupe Rivers have been diverted into the area, the flow being controlled by two main and eight secondary intakes. All of the canals are provided with locks to regulate flow. There are also two distributing ponds, controlled by four irrigation pumping plants with a capacity of 18,000 gallons per minute. Another 756-horsepower pump with a capacity of 90,000 g. p. m. also provides water, and there is an auxiliary plant, mounted on a boat, with a 60-horsepower pump and 4,500 g. p. m. capacity.

Salt Plant

The experimental salt plant is in charge of Hermion Larios, a member of the AMERICAN CHEMICAL SOCIETY. José L. Favela is head of the whole development, called "Works of the Valley of Mexico"; he conceived most of the general plan and directed its execution. Mr. Larios is the inventor of the *Caracol* (snail), a storage basin for solar evaporation completed only a few months ago, which owes its name to its snail-like form. It is a huge canal about 12 miles long running between walls of concrete slabs; it circles from an outer spire, which serves as a storage tank, in spiral form to the center. The waters of the *Caracol* cover 2,025 acres, and it has a total evaporation capacity of 78 inches. Rainfall averages 27 inches per year, so that the effective evaporation of the *Caracol* becomes 51 inches. This ingenious salt work, unique in the world, has a total evaporation capacity of 10,000,000 tons of water per year.

To protect the levees against the force of the waves, 41 miles of concrete slabs have been used to cover them. These



Corn (above) and Eucalyptus growing on land reclaimed from the highly alkaline Texcoco Lake

slabs separate the winding waters of the *Caracol* into various ponds, connected with one another by small subterranean outlets 24 inches in diameter. The water that comes into the *Caracol* from the main salt canal takes one year to reach the center of the basin. The difference of level between the outer spire and the center is 7.8 inches, and the water moves by gravity without need for pumping or siphoning. The difference in concentration, as well as the various kinds of organic matter settling on the bottom, gives the waters in the subsequent spirals different colors which vary from light gray and clear green to dark muddy brown in the center, where the viscosity is highest.

The amount of salts obtained by the solar evaporation system depends upon the initial concentration of the water entering the *Caracol*. Actually there are about 10 kg. (22 pounds) of salt per cubic meter of water in the outer spiral, and 300 kg. (660 pounds) per cubic meter when the water leaves the center and goes to the crystallizers. Thus the concentration achieved during the evaporation is thirty fold. The main canal first brings the water into a sump and thence it is fed into the first spiral of the *Caracol* by a pumping plant of 480 horsepower and 43,500 g. p. m. capacity.

In addition to the main canal that brings the brine to the *Caracol*, 47 wells also collect salt water; each has a depth of 66 feet. This will eventually increase the quantity of salts available. Once the reclamation of the remaining barren lands (about 27,000 acres) is completed, there will be, says Mr. Larios, salts for some 1500 hundred years still in the subsoil. As the subsoil solutions have a higher concentration, the production of salts by the *Caracol* system will also increase. The *Caracol* is continuous in operation and has an average capacity of 100,000 tons per year. It can hold many million tons of salts in case it is not run to capacity. In July 1942 the *Caracol* held about 100,000 tons of salts, representing approximately $5,000,000. The salts in the *Caracol* are concentrated to the saturation point, are pumped into a

Experimental plant Netzahualcóyotl on Lake Texcoco with piles of trona in the foreground

5,600-foot canal, and from there go to the 20 crystallizers with sun evaporation. These crystallizers cover a surface of 1356 square yards each. When crystallized, the salts are provisionally stored in huge tight cones in the open air; in the Mexican landscape among palms and eucalyptus trees these resemble incongruous heaps of snow.

From the crystallizers the salts are transported in wagons to the plant Netzahualcóyotl. This plant is small and primitive, and was not intended for commercial production but only for scientific experiment. Consequently the processing is not carried out with an eye to efficiency. Nevertheless the plant pays its own expenses by processing about 20 tons of salts per day. The salt is roasted, dissolved, filtered, recrystallized, and centrifuged, and is being sold as sodium decahydrate carbonate to various soap factories at about $50 per ton. The plant is mainly concerned with the methods of salt separation, and produces carbonate of 99 per cent purity and raw carbonate of 80–90 per cent purity; this latter is used as such or transformed into caustic soda elsewhere.

Future Capacity

Several projects for the exploitation of these enormous salt riches have been discussed. The *Caracol* contains sufficient salts to warrant great industrial development. The 100,000-ton salt capacity represents the entire consumption of Mexico. If other countries eventually became consumers, the *Caracol* could be amplified or another one built, and the higher initial concentration of the subsoil salts would also increase the capacity.

After the saturation of the brines, the separation of the salts can be performed by various systems: solar evaporation, carbonation, freezing, and steam evaporation (as used by the American Potash and Chemical Corporation). Official figures claim that the actual capacity of the *Caracol* is about 20,000 tons of caustic soda, 13,000 tons of sodium carbonate, 6,000 tons of potash, 2,000 tons of sodium sulfate, and 2,600 tons of borax, representing a total commercial value of about $3,500,000 per year, besides 50,000 tons of sodium chloride which actually has a market price of about $17 per ton.

The consumption of salts in Mexico is relatively high. The glass factory Vidriera Monterrey consumes about 13,000 tons of sodium carbonate a year. The entire country consumes 16,000 tons of caustic soda. Caustic soda is one of the items most needed. With the scarcity of this and similar chemicals and the growing industrialization of Mexico and Latin America as a whole, projects for exploitation of the *Caracol* seem commercially promising. So after hundreds of years, the popular belief may come true. The mysterious lake may finally surrender its treasure; however, it will not have the splendor of gold and diamonds but the cool sober gleam of salt crystals.

Rubber Substitute from Dairy By-Products

EXPERIMENTS in the development of a rubberlike substance from by-products of dairy processors have been carried out for some weeks by scientists of the National Dairy Products Corp. The B. F. Goodrich Co. has carried on developmental work looking toward practical utilization of the product. The work done to date has been examined in detail by officials of the War Production Board.

At present the process is still in the test-tube stage. Experiments carried out thus far give some reason to hope that material suitable for recapping tires might eventually be developed in this manner.

The War Production Board has expressed interest in the process. The National Dairy Products Corp. is building a pilot plant with its own funds. No estimate of the final uses of this project, or of the tonnage which might possibly be produced, can be made until these steps have been taken.

Antitrust Prosecutions Postponed

PROSECUTIONS of 21 chemical companies and 65 of their officials upon charges of violating the antitrust laws are to be postponed until after the war. The charges were contained in six separate indictments returned by a Federal Grand Jury sitting at South Bend on June 26, 1942, citing illegal restraints of trade in the manufacture and sale of formic acid, sulfuric acid, oxalic acid, chromic acid, muriatic acid, and bichromates of soda and potash. All these chemicals, the indictments stated, are essential in the war program, and the major part of the domestic output is controlled by the defendant companies.

The Acting Secretary of War and the Acting Secretary of the Navy stated in letters to the Attorney General that, in their opinions, the trial of these cases at this time would seriously impair the war effort. In accordance with the procedure established by the President on March 20, 1942, the Attorney General agreed to petition the court for a postponement of the trials until after the war.

New Transparent Plastic

THE development of an entirely new transparent plastic having many times the abrasion resistance of other clear plastics has been announced by the Columbia Chemical Division of the Pittsburgh Plate Glass Co., Pittsburgh, Penna. Because of priorities and other restrictions, however, this new plastic is not yet in commercial production, and is not expected to be available for any but experimental purposes for several months.

The new plastic, called C. R. 39, is one of a group of resins resulting from many years of research activity. It does not dissolve in acetone, benzene, toluene, alcohol, gasoline, or any of the common solvents. Its resistance to abrasion is 10 to 30 times greater than other clear plastics. It retains its shape even when exposed to high atmospheric temperatures and can be formed into large sheets, either clear or laminated, by the application of extremely low pressures. In transparent sheets its strength, weight, clarity, and impact resistance are comparable with other transparent resins.

In its primary form C. R. 39 is a clear, low viscosity liquid which, in the presence of a catalyst and heat, hardens into a crystal-clear solid. Layers of fabric, paper, and the like can be impregnated with the liquid material and cured under low pressure to form sheets or shaped objects with a minimum of expense for tooling.

Chemical Collections for New York Fund

J. J. LINCOLN., sales manager of the Air Reduction Co., and chairman of the chemical section of the Greater New York Fund's 1942 campaign reports that the section so far has collected $49,998, $44,995 of which was given by firms.

Data Published on Selective Service

BECAUSE of the wide interest in this subject and the need for obtaining trained men for our Production Army, we give below references to information we have published on occupational deferments, including those of men in training, and the need for technically trained persons. Future developments will be brought to the attention of our readers.

POTOMAC POSTSCRIPTS

Price Regulations

UNIFORM licensing and registration provisions for distributors of chemicals have been written into 14 maximum price regulations and schedules by the Office of Price Administration. Supplementary Order 11, issued August 6, made distributors of the products covered by these 14 schedules subject to licensing and registration provisions but excluded all retail sellers from its scope, leaving them subject to the licensing and registration provision of the General Maximum Price Regulation. The new amendments write these provisions into each of these schedules for informative purposes. The provisions automatically grant a license as a condition of doing business. Courts may suspend the license of a person who, after a warning from OPA, violates a price regulation.

The amendments apply to the following schedules and regulations:

Amendment 1 to Revised Price Schedule 21—Formaldehyde.

Amendment 1 to Revised Price Schedule 31—Acetic Acid.

Amendment 1 to Revised Price Schedule 34—Wood Alcohol.

Amendment 3 to Revised Price Schedule 38—Glycerine.

Amendment 3 to Revised Price Schedule 42—Paraffin Wax.

Amendment 2 to Revised Price Schedule 78—Oxalic Acid.

Amendment 3 to Revised Price Schedule 79—Carbon Tetrachloride.

Amendment 3 to Revised Price Schedule 80—Lithopone.

Amendment 2 to Revised Price Schedule 98—Titanium Pigments.

Amendment 1 to Revised Price Schedule 99—Acetyl Salicylic Acid.

Amendment 1 to Revised Price Schedule 103—Salicyclic Acid.

Amendment 1 to Maximum Price Regulation 179—Pine Oil.

Amendment 2 to Maximum Price Regulation 191—Cotton Linters and Hull Fibers.

Amendment 1 to Maximum Price Regulation 192—Imported Cresylic Acid.

Agricultural Insecticides and Fungicides. The OPA has acted to bring into appropriate relationship ceiling prices for agricultural insecticides and fungicides, which are governed by two regulations: The General Maximum Price Regulation, which covers sales by manufacturers and wholesalers to dealers, and Maximum Price Regulation 144, which covers retail prices including sales by manufacturers and wholesalers directly to consumers.

In the new amendment to Regulation 144, the Price Administrator readjusts the ceilings over manufacturers' and wholesalers' sales to consumers so that these prices, in keeping with customary trade practice, will be the same or slightly higher than the maximum prices that may be charged on sales to dealers. The method originally provided for persons, other than manufacturers, selling only at retail is retained.

The amendment provides that a manufacturer or wholesaler selling insecticides and fungicides to consumers shall establish his maximum price by adding his typical differential for this class of sales to his maximum price to dealers. This differential in dollars and cents between his price to dealers and consumers is the one the seller observed during the month in which he delivered to consumers of the same class the largest quantity of a particular insecticide in the 12-month period ending March 31, 1942.

Chemical Woods. To ensure an adequate supply of saw or veneer mill wood wastes in wood distillation plants producing methanol, acetic acid and charcoal, the Office of Price Administration has freed sales of these so-called "chemical woods" from price control. Approximately 75 per cent of chemical woods already are exempt from the General Maximum Price Regulation, while saw or veneer mill wood wastes have been temporarily excepted in Amendment 22 to Supplementary Regulation 1. The new action, contained in Amendment 31 to Supplementary Regulation 1, under the General Maximum Price Regulation, makes this exemption of veneer and saw wastes permanent and of general application. The amendment went into effect October 13.

The exemption will not have any effect on the general price structure as the mill wastes are such a small factor in the distillation plants' total cost of production that any increased costs for these materials can be absorbed easily.

Ethyl Alcohol. To aid WPB efforts to increase production of high proof ethyl alcohol, a special pricing formula has been issued for the relief of whisky distilleries which are converting their facilities to the production of industrial alcohol.

The pricing formula, contained in Amendment 2 to Revised Price Schedule 28, is intended to provide relief to whisky distilleries which have converted to the production of 188 proof or higher ethyl alcohol and whose costs of production during the initial stages of production may be abnormally high. This amendment, effective September 23, 1942, gives such converted distilleries the choice of selling industrial alcohol at the maximum prices prevailing or at the maximum prices computed pursuant to the formula contained in the amendment.

Sales of ethyl alcohol of 188 proof or higher, commonly known as industrial alcohol, by the Defense Supplies Corp. to the Government, its agencies, or any person using the alcohol to fulfill a government contract are exempt from the provisions of Revised Price Schedule 28, the specific regulation governing certain formulas of the product, and from the General Maximum Price Regulation.

All industrial alcohol under the control of the WPB is to be allocated to the Defense Supplies Corp. for purchase, and this agency either will sell the alcohol for war needs or store it as a stockpile.

Fats and Oils. Specific dollars-and-cents prices have been established on wool grease, raw soap stocks, recovered or acidulated soap stocks, distilled fatty acids and stearic and oleic acids. Previously, under Revised Price Schedule 53 (Fats and Oils), these articles had ceilings represented either by their October 1, 1941, price or 111 per cent of their November 26, 1941, price, whichever was higher. The new specific ceilings set in Amendment 11 on wool grease and Amendment 12 on the other products, reflect the *average* of such previous ceilings.

This latest OPA move follows the general policy of eventually replacing ceiling prices for some 125 major fats and oils, initially established by the freeze technique, with specific industry-wide maximums. This previously has been done in cottonseed oil, corn oil, peanut oil and many other important fats and oils. Specific ceiling on crude dry centrifugal wool grease, has been set at 20 cents per pound for carlots f. o. b. producer's plant in returnable drums. This reflects the average price on the freeze dates. There was a considerable disparity between individual ceilings on processed wool grease on those dates under the freeze technique, due to differences in inventory or raw material buying policies of the various wool grease merchandisers. This will be eliminated by the new amendment which sets a uniform price. Ceiling prices also are set on other grades and varieties of wool grease. The new maximums are established in Amendment 12 for such raw soap stocks as cottonseed foots, corn foots, and soybean foots. Ceiling on tallow fatty acids, delivered in tank cars in the east, is set at 12 cents per pound. Maximums on soybean fatty acids from foots, soybean fatty acids, from crude, corn fatty acids, and peanut fatty acids are based on studies made by OPA. In each case the produce has been allowed average actual costs, plus $^3/_4$-cent per pound margin. Ceiling price of $15^7/_8$ cents per pound for double pressed stearic

acid, delivered east of the Rockies in carloads in bags is approximately the average maximum under the previous ceilings. Oleic acid ceilings are set at approximately the average at which most sellers did business during the freeze dates.

Fertilizers. Amendment 3 to Maximum Price Regulation 135 by the OPA clarifies the method to be followed in establishing maximum prices for new grades of mixed fertilizers, superphosphate and potash, as well as certain changes in the requirements regarding terms of payment.

Ceiling prices for the fertilizers governed by the regulation are established on the basis of the seller's "average prices" or "schedule prices" in effect during the base period, February 16 to 20, 1942. Where a fertilizer cannot be priced by this method the published price of any manufacturer during the same period is applicable. In the case of a new product or grade not marketed during the base period, the measure provides that the seller submit to OPA a proposed maximum price in line with the level of the maximum prices established for comparable quantities, grades and kinds of fertilizers sold to consumers under the same terms and conditions.

Amendment 3 limits more specifically the maximum price which may be established for a new product by providing that this price must be in line with the prices the seller has set for comparable fertilizers according to the "average price" or "price schedule" methods. The amendment also requires seller to submit to OPA the basis on which his proposed price was determined.

Formaldehyde. Sales of formaldehyde in containers of the 45-pound size are subject to the maximum prices established by Revised Price Schedule 21 (Formaldehyde), effective August 20, 1941, irrespective of whether the containers are full. The regulation applies to all sales of this chemical "in containers of 45 pounds or more", with maximum prices for deliveries in smaller containers governed by the General Maximum Price Regulation.

Revised Price Schedule 21, established f. o. b. maximum prices for formaldehyde ranging from $0.0425 per pound for tank cars (70,000 to 72,000 lbs.) to $0.0950 per pound for 45 pound kegs shipped in less than carload lots.

Furfural. Agricultural components of furfural have been exempted from price control, OPA announces. Products affected include cottonseed hulls, cottonseed hull bran, oat hulls, and other agricultural commodities which may be used in production of furfural at a later date. Corn cobs, also used in making furfural, have not been under price control previously, but the other named items were under the General Maximum Price Regulation. This step, effected through Amendment 30 to Supplementary Regulation 1 under the General Maximum Price Regulation, is necessary because the synthetic rubber demand requires that present productive capacity of furfural be tripled. The amendment became effective October 3, 1942.

A new government plant is being erected in the South, where it is favorably located because the principal raw materials for furfural—cottonseed hulls and cottonseed hull bran—are produced nearby.

Solvents. Revision of the maximum prices for fermentation acetone, normal fermentation butyl alcohol and normal fermentation butyl acetate, to reflect recent changes in market conditions for these basic chemicals has been ordered by the Office of Price Administration. The revision, contained in Amendment 2 to Maximum Price Regulation 36 (Acetone) and Amendment 2 to Maximum Price Regulation 37 (Butyl Alcohol and Esters Thereof), establishes ceiling prices of 14.25 cents per pound for normal fermentation butyl alcohol and 7 cents per pound for fermentation acetone, delivered in tank cars in Eastern territory. In addition, the maximum price for normal fermentation butyl acetate is fixed at 14.75 cents per pound.

The adjusted prices for butyl alcohol and acetone produced by fermentation reflect the recent decline in the price of acetone, and they will allow manufacturers to obtain a yield sufficiently high to enable the necessary production of these important chemicals. Because of the joint product nature of butyl alcohol and acetone the prices of the two products are closely related, and a decrease in the market price for one increases the cost of production of the other.

The revision does not alter differentials for shipments to Western territory or those for shipments in drums in carload or l. c. l. lots.

Soybean Oil, Corn Oil, and Peanut Oil. Specific "dollars and cents" price ceilings have been established in Amendment 7 to Revised Price Schedule 53 (Fats and Oils), effective September 30, 1942, for various grades and qualities of soybean oil, corn oil and peanut oil. Except for certain refined oils where price spreads over the crude article were either abnormal or subnormal, these new ceiling prices, which will be uniform for every seller in the industry, generally approximate the individual maximums previously set under the freeze technique contained in Revised Price Schedules 53 and 92. In these schedules, the ceiling was each seller's October 1, 1941, sales price or 111 per cent of his November 26, 1941, figure.

Soybean oil and peanut oil under the new amendment are subject to the fats and oils regulation and removed from Revised Price Schedule 92. The latter schedule, therefore, has been revoked by an order issued simultaneously with this amendment.

WPB Activities

Chlorinated Hydrocarbon Solvents. The provision of Order M-41 which permits users of carbon tetrachloride for purposes assigned a B-2 rating to consume 100 per cent of the amount used in the base period has been restored. The 100 per cent provision, in effect from August 1 to September 30, is now restored until December 31. A rating of B-2 is assigned users for these purposes: degreasing machines other than those used for Army and Navy contracts; packaged spotting and cleaning preparations; dry cleaning establishments; and manual cleaning of other than metal parts of electrical equipment. Such users now may consume 100 per cent of their average monthly consumption for the year ending September 30, 1941.

Chromium. Restrictions on the use of chromium chemicals have been removed by the Director General for Operations. Order M-18-b, as amended June 27, restricted the amounts of chrome chemicals that could be used in the manufacture of pigments, chromic acid, roofing materials, or in tanning leather, and restricted all use in any month to one-twelfth the amount used in the base period. The new revision removes these restrictions. Inventory is limited to a 30-day supply, and regular reports are required on Form PD-54. The action will not result in making available any more chrome chemicals, nor will it permit the use of any additional chrome ore in the manufacture of chrome chemicals. The over-all amount of chrome that can be converted to chemicals is regulated by Order M-18-a.

Dyestuffs. Civilian quotas for all anthraquinone dyes for the fourth quarter will remain at 70 per cent of 1941 consumption, under provisions of Order M-103, as amended. The nine anthraquinone dyes previously set aside for military use will continue in this category.

Other changes effected by the amended order are the removal of restrictions on the use of blue and green dyes for coloring leaded gasoline and the prohibition of sale and use of *m*-toluylene diamine in the developing of diazotized dyes after November 1. *m*-Phenylene diamine can be used as a substitute. Sale and use of anthraquinone as a discharging and stripping agent in textile printing are also prohibited, and alpha-amino-anthraquinone is placed under the anthraquinone vat dye quota.. The change was made because consumers who use this dye restrict themselves generally to vat dyes in their operations.

Nickel. Use of nickel, except where specifically authorized by the Director General for Operations, has been restricted by the War Production Board

in a revision of Conservation Order M-6-b to implements of war and other products certified by the Army-Navy Munitions Board to be essential in the successful prosecution of the war. Previously, the order prohibited the use of nickel in a long list of products, and permitted the use of nickel in all other products only on specific allocations by WPB. This provision is retained in the revised order. However, the general exemption from these restrictions in favor of the armed services, A-1-k or better orders, and where necessary for compliance with safety regulations, is removed. Implements of war are defined as combat-end products, complete for tactical operations, including aircraft, ammunition, armament, ships, tanks, and other military vehicles, and parts to be incorporated in such implements. The term does not include facilities or equipment to be used in the manufacture of such items. The amended order also contains a rephrased provision relating to the use of nickel for products not appearing on the prohibited list. No substantial change in control is involved here, and the section is rewritten only for the purpose of clarity.

Oils. Tightened control over three imported oils—tung, oiticica, and rapeseed—has been ordered by the Director General for Operations. The order, amending M-57, requires specific authorization of the director to use tung oil after November 1, except for users of 35 pounds or less in a month. Until that date existing regulations will prevail. These permit use of tung oil on ratings of A-2 or higher, on orders placed by the Defense Supplies Corporation, for food can linings for human consumption, for outside can coatings necessary in food processing, and to comply with underwriters', health, sanitary, or safety regulations.

Control of oiticica oil, a substitute for tung oil imported entirely from Brazil, follows exactly that of tung oil, and is made necessary because of failure of the Brazilian crop. Tightened control of rapeseed oil, which also comes from South America, is the result of restricted shipping. Its principal uses are in the manufacture of heavy machine oils and synthetic rubber. Order M-77 is amended to set up the new controls, which follow the provisions of those over tung and oiticica oils. The standard chemical forms PD-600 and PD-601 are provided for requests for allocations for all three oils and for reports from distributors.

Scales, Balances, and Weights. Limitation Order L-190 limits the production of clinical, mailing, parcel post, and dietetic scales to 25 per cent of 1941 production, limits manufacture of industrial and scientific scales for inventory to 30 days' supply, and prohibits use of brass in major parts of industrial scales, and in all weights except small ones used for analytical balances. Restriction is also placed on the sale of industrial, scientific, clinical, mail, and parcel post scales to rated orders, and dietetic scales are limited to doctors' prescriptions. Production of commercial scales for retail trade and production of household scales are also prohibited.

The order prohibits the production of repair parts for household scales, but permits their manufacture for all other scales up to 150 per cent of the 1941 production, in order to reduce replacement requirements and facilitate the continued use of existing equipment. The order restricts production which consumed approximately 10,000 tons of materials in 1941.

Sulfamic acid has been placed under complete allocation control by the Director General for Operations. Allocations, under Order M-242, will take effect on on November 1. The regular chemical forms, PD-600 and PD-601, are to be used for requests for allocation and for reports by distributors.

Thermoplastics. The effective date of the scheduling provision of Order M-154, governing use of thermoplastics, previously postponed to October 1, has been again postponed to November 1. The order is being revised to provide proper control for all types of thermoplastics, due to the increased military demand, and the new amendment allows additional time for completion of the revision. Order M-154, which set up a ladder of uses for thermoplastics, was issued on June 27, and provided for scheduling of operations by manufacturers to begin on July 15. That later was postponed until August 15 to give manufacturers time to change operation schedules.

Supplementary Order M-154-a, which places polyvinyl butyral under allocation control, has been revoked by the Director General for Operations, since Order M-10 as amended October 10 includes all vinyl polymers in its allocation control, thus obviating the need for M-154-a.

Vinyl acetate, used in the manufacture of rubber substitutes and in the synthesis of sulfa drugs, has been placed under complete allocation control by the Director General for Operations. Allocation will take effect on November 1, according to the terms of the order, M-240, although the director may issue specific directions on use or deliveries. Form PD-600 is to be used for requests for deliveries and Form PD-601 for reports from distributors. Deliveries of 25 pounds or less in any one month may be made without regard to allocation.

Vinyl Polymers. Order M-10, which sets up an allocation system for polyvinyl chloride, has been amended to cover all vinyl polymers. All of these materials are used as rubber substitutes and many are interchangeable. Increasing demand due to the rubber shortage has made complete allocation necessary. No other substantive changes are made in the order. The same forms, PD-33 and PD-36, will be used as in the past.

Additional Advisory Committees Appointed by WPB

The War Production Board has announced the formation of the following new industry advisory committees:

Chromium Chemical Producers Industry, J. W. Wizeman, government presiding officer. George A. Benington, Mutual Chemical Company of America; Arthur F. Brown, Imperial Paper and Color Co.; Clyde Marlatt, Martin Dennis Co.; H. B. Prior, Prior Chemical Corp.; and H. A. Goman, Natural Products Refining Co.

Mercury Producers Industry, R. J. Lund, Government presiding officer. B. C. Austin, B. C. Austin & Co.; Worthen Bradley, Bradley Mining Co.; H. W. Gould, New Idria Quicksilver Co.; A. E. Humphreys, Humphreys Gold Corp.; W. W. Kelly, Texas Mercury Co.; F. Eugene Newbold, New Almaden Corp.; L. K. Requa, Idaho Almaden Mines Co.; H. D. Tudor, Mercury Mines; and S. H. Williston, House Heaven Mines, Inc.

Paper Industry Technical Development Industry, John G. Strange, government presiding officer. C. M. Connor, Glassine Paper Co.; Walter G. Hendrich, Byron Weston Co.; L. S. Johnson, Cornell Wood Products Co.; Harold R. Murdock, Champion Paper & Fibre Co.; H. A. Rothchild, Kimberly-Clark Corp.; M. O. Schur, Brown Co.; and W. R. Barber, Crown Willamette Paper Co.

Pyroxylin and Vinyl Resin Coated Paper and Fabric Industry, E. H. Bucy, government presiding officer. L. E.

Carpenter, L. E. Carpenter & Co.; Frank V. Friedlander, C. R. Whiting Co., Inc.; Robert A. Harper, Holliston Mills, Inc.; G. M. Jackson, Western Shade Cloth Co.; J. C. Lippmann, Textileather Corp.; John W. F. Young, Federal Leather Co.; F. J. McCormick, Permatex Fabrics Corp.; W. E. Masland, Masland Duraleather Co.; Walter V. Shearer, The Plastic Coating Corp.; F. F. Sommers, Chicago Rubber Clothing Co.; and J. K. Weidig, Zapon-Keratol Co.

THERMOSETTING PLASTICS PROCESSORS INDUSTRY, Frank H. Carman, government presiding officer. Donald H. Dew, Diemolding Corp.; George K. Scribner, Boonton Molding Co.; William H. Milton, Jr., General Electric Co.; Thomas J. McIntyre, Macklin Co.; Milton P. Higgins, Norton Co.; W. A. Blume, The American Brake Shoe & Foundry Co.; Dr. R. T. Halstead, Johns-Manville; D. J. O'Conor, The Formica Insulation Co.; Dr. G. E. Landt, Continental-Diamond Fibre Co.; M. A. Chapman, Mica Insulator Co.; John T. Ehleider, Insulating Tube Co., Inc.; and Leonard T. McCloskey, Taylor Fibre Co.

Referee Board Announces Operating Staff

THE operating staff for the Referee Board of the Chemicals Branch, WPB, has been announced by Donald B. Keyes, Chairman. Dr. Lawrence A. Monroe, of Philadelphia, will serve as executive secretary to the board, assisted by Dr. W. M. Langdon, of Elizabeth, N. J., both devoting full time to the work of the board. Cooperating with them on a part-time basis will be Carl Monrad, A. L. Elder, C. W. Lenth, E. M. Houts, and Walter Munster, all of whom are now officials of the Chemicals Branch in various capacities and will take on the work of the board in addition to their present duties.

These staff members will collect data on various problems for submission to the board and will make preliminary reports on problems submitted to them. The Referee Board is composed of 12 chemists and chemical engineers who report their findings as to the merits of competing chemical processes submitted to the War Production Board and who act in an advisory capacity in the assigning of chemical raw material research problems to various laboratories throughout the country.

WPB Urges Businessmen Not to Go to Washington

THE War Production Board again urges businessmen that whenever they wish to obtain information from WPB they should go to their regional or field offices before going to Washington. The announcement reported that there are 12 regional and 127 field offices scattered thoughout the country, which were established in order to save businessmen the trouble of coming to Washington, and also to prevent an overload of work in Washington.

Regional offices are located in Boston, Mass., New York, N. Y., Philadelphia, Penna., Atlanta, Ga., Cleveland, Ohio, Chicago, Ill., Kansas, Mo., Dallas, Tex., Denver, Colo., San Francisco, Calif., Detroit, Mich., and Minneapolis, Minn.

WPB Regulates Tank Car Uses

THE new priorities schedule of tank car uses issued by the WPB gives the Office of Defense Transportation a specific mandate to distribute the Nation's 143,000 tank cars on a basis of first-needs first. With the bulk of the country's tank cars transporting the petroleum which formerly moved in oil tankers, the need for cars to transport war-essential chemicals and vegetable fats and oils has become critical. WPB has ordered the ODT to give these latter items preferential treatment in the allocation of cars.

Certification of Necessity for Priority Action 1 issued by WPB set up five classes of materials and commodities transported in tank cars and directed the ODT to execute priorities in the following order: Class A, transportation of materials consigned to or for the Army or Navy, Maritime Commission, War Shipping Administration, or Lend-Lease; Class B, transportation of certain chemicals, edible and nonedible fats and oils, and other foods and commodities; Class C, transportation of petroleum and petroleum products into the Eastern district in quantities certified by the Office of Petroleum Coordinator subject to review by the Director General for Operations of WPB; Class D, transportation of petroleum and petroleum products, other than automotive gasoline, within the Eastern district and into or within the other four districts of the country in quantities certified by OPC; Class E, transportation of automotive gasoline within the Eastern district and into or within the other districts as certified by OPC, subject to review by the Director General for Operations of WPB.

Silver in Electrical Conductors

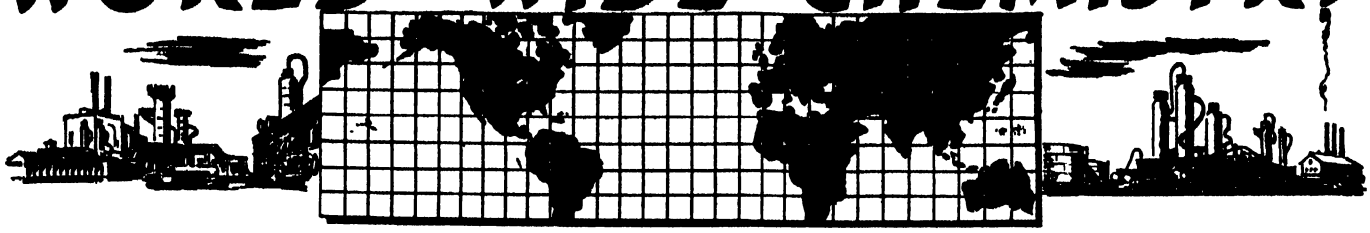
THE War Production Board has announced that substituting silver for copper in electrical conductors had saved in the last few months 24,000,000 pounds of copper. The silver is going into bus bars, windings for transformers, and similar electrical appliances. The Treasury has allotted 34,000 tons of silver to the Defense Plant Corp., which lends it to plants, which must return it to the Treasury after the war.

OPA Creates Standards Division

OPERATING sections of OPA's newly created Standards Division and their executive heads have been announced by Dexter M. Keezer, Deputy Administrator and acting director. The Standards Division was set up to provide OPA's operating divisions with the technical assistance necessary to incorporate quality definitions in price, rent, and rationing regulations.

Initially, the new division will have seven sections as follows: Food and Drugs (which also will handle paints and chemicals for the present); Textiles, Leather, and Apparel; Consumer Durable Goods; Home Furnishings; Lumber and Building Materials; Agricultural and Industrial Machinery; and Rubber and Rubber Products. Sections to handle fuel and petroleum products; chemicals and paints; transportation equipment; paper, paper products, and containers; and metals and metal products, as well as a commodity testing branch, are being organized.

Chemical Workers Union Scored by War Labor Board



THE National War Labor Board unanimously decided to deny a maintenance of membership clause to the Chemical Workers Union, AFL, because the union had violated its no-strike pledge by calling a 5-day strike in July of the 700 employees at the two plants of the Monsanto Chemical Co. and the New England Alcohol Co., at Everett, Mass.

Economic Stabilization in Nonferrous Metals

PAUL V. MCNUTT, chairman of the War Manpower Commission, has announced that the War Manpower Commission's employment stabilization plan of 1942, covering nonferrous metals and lumbering activities in the 12 western states, includes all mines producing ores from which the following metals are produced, as well as all milling, smelting, and refining operations in connection with the production of the following metals:

Aluminum, including alunite and bauxite ores
Antimony
Arsenic
Beryllium
Chrome
Cobalt
Columbium
Copper
Magnesium
Manganese
Mercury
Molybdenum
Tantalum
Tin
Titanium
Tungsten
Uranium
Vanadium
Zinc
Zirconium

WORLD-WIDE CHEMISTRY

Control over the chemical industries in Great Britain has been tightened in various directions during the past month. Lactic casein and liquid paraffin have been subjected to control. Licenses are required for quinine and all other cinchona alkaloids, including totaquina and quinetum, cinchona itself, and any synthetic product which is used against malarial infections. The Ministry of Supply has become the sole importer of raw mica. The control of purchasing and shipment of palm kernels, hitherto vested in the Ministry of Food, has been transferred to the Colonial Office. Phosphates can no longer be used on grass land; this applies to basic slag, super and ground mineral phosphates, and bone and compound fertilizers containing phosphates. Rubber dentures will be replaced by products made of acrylic resins. The technical fat-producing and bone-using industry has been organized under a concentration scheme. The supply quota for cosmetics has been reduced further and now stands at 20 per cent of the standard period June 1939 to May 1940, though 50 per cent is permitted to firms in approved areas. Most important of all, the Ministry of Fuel and Power has begun a campaign for utmost economy in the use of coal and other fuels which is bound to affect important chemical works.

New Restrictions on Exports Are Imposed

All exports to Aden, Sudan, Cyprus, Egypt, Palestine, and Transjordan are now subject to license. Although exports to these countries, which must now be carried around the Cape instead of passing through the Mediterranean, have been limited to essential goods for some time, the change is likely to result in a further curtailment of shipments. A similar effect is expected from the decision of the Colonial Governments in East Africa (Kenya, Uganda, Tanganyika, and Zanzibar) to grade all imports in three priority classes. All import licenses for United Kingdom goods have been recalled for review in these territories. A move in the same direction took place earlier in British commerce with South Africa. All these territories make heavy calls on shipping space because of the long distances covered, and a curtailment of exports to these destinations is therefore important.

Export licenses are now required for ethyl cellulose and preparations thereof; manganese sulfate; mixtures of, or containing, potassium hydroxide; unexposed sensitized photographic film; insecticides, fungicides, and weed killers containing arsenic compounds; chlorinated naphthalenes, cyanides, fluorides, metaldehyde, nicotine or its salts, petroleum oils, pyrethrum or its extracts, or silicofluorides; iron oxides and pigments containing iron oxides, including ochres, siennas, and umbers; rotenone, roots containing rotenone whether ground or not; extracts containing rotenone and preparations of any of these; bacteriological products not of a kind used solely for veterinary purposes; antigens, including toxins, toxoids, and tuberculins, but not including vaccines, antiviruses, and bacteriophages; sera, including antitoxins and antitoxin globulins.

Alternative to Tung Oil Is Found in West Africa

A small source of a vegetable oil intermediate in properties between oiticica and tung oil has been located by the Imperial Institute in Sierra Leone, West Africa. It is produced from the kernels of the poyak tree, which is closely related to oiticica, and has a specific gravity at 15.5° C. of around 0.96, refractory index at 20° C. of 1.502 to 1.518, saponification value around 190. The oil was found to be compatible with natural and synthetic resins, and drying properties were inferior to tung oil but much better than for linseed oil. About 50 to 100 tons of kernels could be shipped annually at present, but as the residual meal left after the extraction of the oil is not suitable as a feeding material for animals, it would probably be preferable to carry out the extraction locally.

Seaweed Survey Is Organized at Ministry of Supply Request

A survey of seaweeds found around the British coasts has been organized by the Marine Biological Society and carried out by a number of scientists from Cambridge. It is hoped that seaweed will provide a useful material for feeding and fertilising and also for the production of certain chemical products of which there is now a shortage. Similar efforts have been made in Ireland where commercial utilization has made some progress.

British Pharmaceutical Manufacturers Work on New Antibacterial Product

Reference to a new antibacterial product, Penicillin, with exceptional properties was made in the daily press. According to a letter in the *Times* by F. H. Carr, chairman of the research panel of the Therapeutic Research Corporation of Great Britain, Ltd., five different research laboratories of leading pharmaceutical houses, working with two important university laboratories under the aegis of the corporation, have for some time past put their most intensive effort in the field of Penicillin. Similar collaborative work is being undertaken by the staffs of certain American firms, and arrangements have been made for a full interchange of information between the two research groups. The task confronting the investigators is formidable. Apart from other considerations, Penicillin is unstable under many conditions, and to make possible its large-scale manufacture it has been necessary to discover the means of rendering it stable during the isolation and purification stages. The work is still far from completed, but it is hoped to publish before long some of the scientific results. The original discovery, about 13 years ago, that the mold *Penicillium notatum* possessed strong bactericidal powers is due to Alexander Fleming, of the research department at St. Mary's Hospital, Paddington, London; and to him is due also the suggestion that the substance might be found to have important applications in medicine and surgery. Isolation of therapeutic Penicillin and its separation from the toxic substances, also produced by the mold, was first effected

---

EDITOR'S NOTE. Those interested in further details should address the correspondent whose name and address appear for each country, and enclose sufficient international coupons to prepay the reply. United States stamps should not be sent.

by H. W. Florey, of the School of Pathology, University of Oxford, who investigated the subject on behalf of the Medical Research Council, and effectively paved the way for the more intensive attack now being made under the aegis of the Therapeutic Research Corporation. Clinical trials and *in vitro* tests have shown its antibacterial properties to be remarkable. It is said that Penicillin can completely inhibit bacterial growth in a dilution of 1 in 25,000,000 and that it can act as a partial inhibitor in a dilution six times as great, while it is apparently innocuous when given to human beings even in comparatively large doses.

Medical Research Council Advises on Insecticides

A committee of the Medical Research Council has studied insecticides against bedbug infestation. A detailed technique for the safe application of hydrogen cyanide as a fumigant has been worked out. Sulfur dioxide was found unsuitable as a general fumigant. Caution is advised with regard to *n*-butyl carbitol thiocyanate and dodecyl thiocyanate. The insecticidal power of heavy naphtha seemed to follow approximately the degree of unsaturation, indene and coumarone being the major unsaturated constituents. It is suggested that the naphtha should not be washed with sulfuric acid of more than 35 per cent strength. Addition of 2 per cent of liquid carbolic acid containing at least 90 per cent of cresols causes a marked increase in potency. Heavy naphtha is a useful contact insecticide and still more effective in its vapor action. It is recommended that the distillate, before final rectification, be washed with 5 to 10 per cent caustic soda solution and with sulfuric acid preferably of 25 per cent strength.

Scientific Advisers Appointed for the Ministry of Production

Captain Oliver Lyttelton, Minister of Production, has appointed I. M. Heilbron, professor of organic chemistry, Imperial College of Science and Technology, T. R. Merton, treasurer of the Royal Society, and W. A. Stanier, chief mechanical engineer of the London Midland and Scotland Railway, to act as full-time scientific advisers to his Ministry. The demand for a central scientific and technical board to assist the government in the utilization of modern scientific developments has been raised often in and outside Parliament, and the Lord Privy Seal, a member of the War Cabinet, was hitherto mainly responsible for the promotion of scientific methods and findings in government departments. Most of these have their own scientific advisers. There are also such general research bodies as the Department for Scientific and Industrial Research with its various affiliated organizations (the National Physical Laboratory, Building Research Station, etc.) and the Imperial Institute. The three scientific advisers appointed by the Minister of Production will keep in touch with the scientific advisers of the Service and Supply Departments. They will be responsible to the Minister of Production but work under the immediate supervision of the Lord Privy Seal. The organization chosen for this nucleus of a Central Scientific Board shows all the signs of a compromise, but it may serve as the basis of a Ministry of Science which is bound to become necessary at some future date.

Plant for Petroleum Detergents Is Erected

The Shell Refining and Marketing Co., Ltd., has erected a special plant for the large-scale manufacture of sodium secondary alkyl sulfates for use as detergents. The raw material is a by-product of British petroleum refineries which is cracked to produce a mixture of olefins. This is fractionated, and one of the carefully isolated fractions is sulfated, neutralized with soda alkali, and purified. The final product, marketed under the trade name "Teepol" by Technical Products Ltd., is a clear pale yellow liquid at temperatures down to 15° to 20° C.

Comparative Notes Issued in Fireproofing Chemicals

The Timber Development Association (London) has issued notes on the fireproofing of timber either by impregnating or by surface coating. They deal with the power of different chemicals to render timber fire resistant and the corrosive and rotting action of some of these products. Special attention is called to hygroscopicity and leaching out of water-soluble chemicals. Monammonium and diammonium phosphate are (following information supplied by I. C. I., Ltd.) described as good fireproofing agents for stopping flame, even at low concentration, and preventing afterglow or smoldering both in light and heavy concentration. In this respect triammonium phosphate is inferior. The ammonium phosphates have comparatively little corrosive effect on metal, though on mild steel and wrought iron some slight attack occurs during the initial stages which helps to form a thin resistant coating of iron phosphates on the surface of the metal. Although ammonium phosphates may be dissolved out to a great extent if exposed to water for some time, experiments have shown that ammonium phosphate is held very retentively by most woods. In atmospheres of lower humidity than 92 per cent no moisture will be deposited on wood treated with mon- or diammonium phosphates.

The effect of ammonium sulfate on flames is small in low concentration, but in very high concentrations (of the order of 20 per cent) its effect is marked. It has no appreciable effect on glow or smoldering, is more corrosive to metals than are the phosphates, and increases the hygroscopicity of the timber to a greater extent; it can be leached out of the wood by prolonged and continuous action of water.

Ammonium borate has a moderate effect on flame when present in large quantities and a very good effect in stopping afterglow whether in low or heavy concentrations, but it is not available in commercial quantities in England, and information on other aspects is limited.

Ammonium chloride has a noticeable effect in suppressing flame at low concentrations and a very marked effect at high concentrations which also suppress glow. It is highly corrosive to most metals, can be leached out of timber, and timber impregnated with it becomes damp above 79.5 per cent humidity.

Magnesium chloride has a similar effect on flame, but the glow is reduced and not stopped completely whatever the concentration may be. It is corrosive to iron and steel, though less so than ammonium chloride, has a mild action on copper, and timber treated with it becomes damp even in comparatively dry atmospheres; it is largely upon this dampness that magnesium chloride relies for its fireproofing effect.

Agricultural Salt Is Used as Potash Substitute

Agricultural salt has been used as an alternative to potash on mangolds, sugar beet, and cabbage, and it is claimed that, applied at the rate of 5 hundredweight per acre, it is a profitable and useful fertilizer. When used in conjunction with a good dressing of sulfate of ammonia, it is said to act as well as muriate of potash. On sandy soils which are often deficient in potash, salt has given very promising results. In sugar beet and mangolds sodium is said to act like potash. Agricultural salt proved most effective on light and medium soils.

G. Abrahamson

150 Halfway St.
Sidcup, Kent, England
September 16, 1942

Uruguay soon expects to become independent of imports of fish oils with high vitamin A content, and may even have an exportable surplus. A plant to prepare fish liver oil on a commercial scale is now nearing completion near Montevideo.

Very interesting figures were recently disclosed by the Federal Council for Foreign Trade regarding the consumption and national production of cement. Considering the consumption of 281,447 metric tons as the index 100, the increase in the last ten years showed the following indexes: 110, 121, 160, 171, 200, 230, 237, 260, 269, and 276, the last corresponding to a consumption of 776,846 metric tons in 1941. Local production increased from 167,115 metric tons in 1931 to 767,506 in 1941, while imports decreased from 114,322 metric tons in 1931 to only 9,943 in 1941, when only special types of cement were imported. Brazil started to export cement to other South American countries in 1938, when 6 metric tons were sent abroad, to attain 603 metric tons in 1941. The picture will probably be changed, owing to the shortage of fuels; local production will decrease and importation increase without affecting the consumption, which will continue to increase, owing to the expansion in building activities.

Consumption of Coal Is Increasing

The consumption of coal during the last ten years showed a picture similar to that of cement. For a consumption of 1,780,000 metric tons in 1931, a little more than 490,000 metric tons were produced locally, the balance being imported from Europe and the United States. In that year one metric ton of coal was worth only 87$000 (about U.S. $4.35), the main consumer was the Central do Brasil Railway, and coal imports represented about 6 per cent of total Brazilian importation. Only a little less than 2 per cent of Brazilian coal was consumed by the Central do Brasil Railway. In 1932, consumption decreased about 3 per cent; but since 1933 both consumption and national production have presented increased figures. More than 1,000,000 metric tons were produced in 1938 and in 1941 Brazilian production of coal was 1,408,000 metric tons.

Importation of coal since 1933 has been very irregular, decreasing in 1934, to increase in 1935 and decrease again in 1936, attaining in 1937 the highest peak with 1,707,852 metric tons. Imports of coal into Brazil attained the lowest level in 1941, when only 1,057,946 metric tons were imported. Exports of Brazilian coal were very irregular up to 1940 when 6,900 metric tons of coal were exported, increasing in 1941 to 61,434 metric tons. The price of imported coal in 1941 was approximately three times that of 1931, and the principal consumer of coal in Brazil, the Central do Brasil Railway, consumed in 1941 more than 156,000 metric tons of national coal, representing about 30 per cent of its total consumption. The Federal Government is considering the utilization for fuel purposes of shales and bogheads existing in large quantities in Brazil.

Arsenic Is Produced by Three Companies

Consumption of arsenic in Brazil was about 1,820 metric tons in 1941, 1,203 metric tons of which were produced locally and the balance imported from United States and Japan, the first contributing more than 93 per cent of total importation. Local production of arsenic shows a very irregular picture up to 1937, when 717 metric tons were produced; however, in 1938 production was only 520 metric tons. Since 1939 the Brazilian production of arsenic appears to show signs of improvement and, starting with 713 metric tons in 1939, reached 1,088 metric tons in 1940 and 1,203 metric tons in 1941. Imports of arsenic have been steadily decreasing. In past years Brazil exported arsenic, but since 1925 when 68 metric tons were sent abroad, no export figures have appeared in Brazilian statistics.

At present, arsenic is produced by three companies which work the gold deposits in the State of Minas Geraes: the St. John del Rey Mining Co., in Nova Lima; the Cia. Minas da Passagem, in Passagem, near Mariana; and the Cia. Brasileira de Mineração, in Juca Vieira. However, the largest producer is the St. John del Rey Mining Co., that obtains arsenic as a by-product of gold, like the two other producers. After extraction of gold, the balance which contains arsenical pyrites is burned to produce white arsenic. Arsenic is used in Brazil mainly in the manufacture of insecticides and in the glass and pharmaceutical industries. Two more gold mines are planning to produce arsenic, both of them located in the State of Minas Geraes.

Vegetable Oils Are Important

Vegetable oils are of basic importance for many industries, and Brazil is contributing on a large scale in supplying them to the war efforts of the United Nations. Production of vegetable oils in Brazil is being increased from year to year, reaching in 1941 an estimated total of 500,000 metric tons, both from fruit and extracted oil. Brazil up to the outbreak of the first world war was an importer of vegetable oils. Since 1914 production of cottonseed and castor oils has been developed, linseed plantations made in several states of Southern Brazil, and tung and oiticica oils cultivated in São Paulo and in the northeast, respectively. In 1933, Brazil appeared as an exporter of vegetable oils, sending abroad 291 metric tons. Development has been rapid since the outbreak of the present war, and in the 3 years between 1939 and 1941 exports increased from 34,140 to 56,370 metric tons, represented by coconut oil, cumarú oil, ucuuba grease, linseed and oiticica oils, murumuru grease, andiroba, babassú, cottonseed, copaiba, and castor oils, and several others.

Considering the importance of the production of oiticica oil for the economy of Northeastern Brazil, the Federal Council for Foreign Trade adopted a resolution approved by the Federal Government, by which the following measures were settled: establishment of standardized types of oil demanded by foreign trade; supervision of exports and issuing of certificates of quality; extension of technical assistance to manufacturers in order to make oil of approved types; registration of oiticica factories and control through the Ministry of Agriculture; study of official specifications for the different types of oiticica oil within the limits preferred by importers. The resolutions decided against the compulsory use of oiticica oil in paints and varnishes produced in Brazil, which had been proposed. In spite of efforts towards the production of oils developed by the Federal Government, the exportation of vegetable fruits and seeds is still important in foreign trade. Export of fruits and seeds increased from 76,323 metric tons in 1931 to 281,316 metric tons in 1941. The Brazilian flora is recognized as one of the most opulent in the world and it is estimated that more than 50,000 different species of plants are found in Brazil.

Gasoline Substitutes Are Being Studied

Because of the lack of tankers, Brazil has had to restrict consumption of gasoline and other petroleum products which are imported mainly from other American countries, such as the United States, Venezuela, Dutch West Indies, Peru, and Ecuador. Since July 19 no private cars have been allowed to run, with exception of those used by Brazilian authorities and heads of foreign diplomatic missions. At the same time, the Federal Government stressed to the Comissão Nacional de Gasogênio the importance of developing and intensifying the production of gas producer equipment. A little more than 1,000 gas producers are in traffic throughout Brazil, the majority of them in busses, trucks, and lorries. Steps were taken by the Comissão to promote a program permitting the construction of about 10,000 producers throughout Brazil of which São Paulo will contribute 50 per cent.

Two different types of gas producers are being utilized in Brazil, one using wood as fuel and the other such forms of carbon as wood charcoal. The best known wood-burning gas producer plants existing in Brazil are the trade-named Metropolitana, Imbert, Ferta, and Imbraz. Char-

coal producers' equipment existing in Brazil is of the cross-draft type, and the trade-named Light, Mechanica, Gohin Poulenc, C. E. G., and Sully are among the better known producers. Charcoal made from almost any wood is being used as fuel for gas producers. The Ford Motor Co. and the General Motors Corp. are reported as producing trucks and busses equipped with gas producers. Only a few passenger motor car owners are using gas producers, owing mainly to the high prices charged by the gas producer manufacturers.

The Instituto do Açucar e do Alcohol, controlling the production of sugar and alcohol in Brazil, permitted the sugar mills to start milling 30 days before the date previously established, and efforts are being made to intensify the plantation of more sugar acreage. Rules governing production of anhydrous alcohol, prices for beverage and motor fuel alcohol, and elimination of the export quota for sugar were proposed by the institute and approved by the Federal Government. Wood, shale, bogheads, and other similar products are also being used in place of petroleum fuel oils.

Cottonseed and other vegetable oils are also being used not only as substitutes for lubricating oils but also for fuel purposes. Babassú oil is being used in motor boats and in tractors crossing rivers and roads in the northern states of Brazil. Studies are now being carried out by the Federal Government for the development of sewage gases for fuel and power purposes. A Diesel motor representative reported that good results will be obtained with the use of gas producers in Diesel motors, and tests will be carried out in the very near future in the presence of interested people. In an effort to intensify the use of substitutes for petroleum products, a national meeting will be held in October, under the sponsorship of the Touring Club of Brazil, in which technicians of all Brazilian states will discuss problems related to the development of such substitutes.

Chemists Will Meet at Santiago

American chemists will attend during January 1943 the Fourth South American Chemical Congress to be held in Santiago do Chile. The previous meetings were held in Argentina (1926), Uruguay (1930), and Brazil (1937), and the Chilean committee plans the fourth beginning January 7. During eight days the members of the congress will visit the most important manufacturing centers of Chile, and will discuss the papers to be presented by American chemists. A main theme of discussion will deal with the present mineral resources, and it is hoped that the papers will contribute to a better knowledge of present conditions of the mineral industry in all countries.

Trade with Canada Improves during 1942

In spite of difficulties in shortage of freight space, Brazilian trade with Canada showed a good improvement during the first six months of the current year. The trade balance this year shows a credit to Brazil of more than four million U. S. dollars. The most important products exported to Canada during that period were raw cotton, vegetable waxes, rubber, cotton linters, and coffee. Banana flakes and industrial diamonds appeared for the first time in the statistics as export products. Imports from Canada are of many different types, the principal ones being sewing machines and their accessories. The first six months of 1942 showed favorable trade for Brazil, while the same period of 1939 and 1940 showed an adverse trade balance for Brazil.

C. E. Nabuco de Araujo, Jr.

Caixa Postal 970
Rio de Janeiro
September 29, 1942.

The situation on raw materials, chemicals, steel, and the like is becoming more difficult here day by day. Even vital industries do not get enough. Causes are scarcity of export licenses from the United States, which is still the main supplier, and lack of shipping space.

It is generally hoped that the coming journey of President Juan Antonio Rios to Washington, which probably means breaking off relations with the Axis, will ease matters. Because of that, Oscar Zárate, head of the Dirección General de Sanidad, is to go to the United States heading a cooperative purchasing commission, which will buy some $600,000 worth of drugs. Dr. Zárate's journey has been put off continually since May, but now it seems that conditions have improved enough to justify the expense.

Serious Gasoline Situation Has Arisen

One of the gravest problems is gasoline. During June and July the ration for private riders was 3 gallons a month. In August it was 10 gallons, not because of abundance but because of lack of storage space; in September it is still 10 gallons if you can get it, and from October 1 on private riders are forced off the street. The lent Argentine tanker *Los Pozos* will probably go back to the owners, so that everything will have to be carried from Talara, Peru, to Chilean ports in scarce drums aboard the two school ships of the navy and the regular coastal steamers.

The government is doing everything possible to avoid a catastrophe in the industrial life of the country. Months ago a commission was appointed to study possible substitutes for gasoline, composed of the following representatives of industry, army, navy, and government: Alberto Gómez Del Fierro, Eduardo Nef, Gustavo Vicuña, Felipe Altamirano, Ignacio Toro, General Froilán Arriagada, José Gielmi, Oscar Tenhamm, Rodolfo Mebus, and Mayor Carlos Guiraldes. The commission has made a report in two parts.

The only quick solution seems to be to employ generators of gas from charcoal or wood, as has been done for some years in some parts of Europe. That would be a solution only for trucks, in the opinion of the committee, because of the weight of the generators, but might eventually save valuable valuta, until now used to import gasoline and Diesel oils, in normal times also. Two kilograms of charcoal should replace one of gasoline or Diesel oil, which would allow trucks the same mileage but at lower speed, the latter circumstance saving tires, which are scarce also. (The government meanwhile has decided to try it out and, through the Corporación de Fomento, has offered to lend truck owners who wish to switch over to gas generators up to 70 per cent of the cost. For this 1,000,000 pesos have been made available. The generators can be made in Chile. No information is available, how many, if any, trucks have been converted.)

Solutions possible in a relatively short time involve the use of alcohol, bituminous slate, and bituminous coal. Mixing alcohol with gasoline is being done already with about 300,000 liters monthly of dehydrated alcohol, by-product of the sugar refineries. The quantity of alcohol from that source could possibly be increased by some 8,000 liters more, at the best. It should be possible to produce large quantities of alcohol from wine or by dry distillation of wood, and a mixture of gasoline with 30 to 35 per cent of alcohol has proved acceptable in several European countries. The possible production of industrially pure alcohol by enlarging existing factories is estimated by the commission at 17,800,000 liters annually.

Hydration of coal should be possible with the soft coals of the mines in the provinces of Bio-Bio, Cautin, and Valdivia, but would need much time to build plants, as the necessary equipment cannot be made in Chile right now. The most promising measure would be exploitation and distillation of bituminous slate. The most important deposits, known so far, are at Lonquimay and El Pular. The most practical would be the first, as it lies near the railroad being built from Manzanar to Malalcahullo, province of Cautín, which will be ready in about 16 months.

Meanwhile there has been a public laboratory demonstration in the Sociedad Científica de Chile, made by Jorge Ville-

gas, chemical engineer, and Victor Torrealba, mineralogist. In this laboratory trial, at a temperature of 250° to 300° C., 140 grams of kerosene were distilled from 1 kg. of pulverized slate. Although a laboratory trial does not prove very much, several chemical engineers have made calculations on the basis of working with sufficient capital, the result being that the cost price in industrial distillation should not be above 2.00 pesos per liter, without calculating any money made by by-products, such as heavy oils, paraffin, etc. The wholesale price of gasoline is now 2.00 pesos per liter, including duty and taxes. It is planned to form an exploitation company with low-priced shares with the help of the Corporación de Fomento. The studies are being continued under supervision of the Instituto de Ingenieros de Minas de Chile.

Mining Institute to Have Headquarters in Santiago

The central office of the Pan-American Institute of Mining and Geological Engineering will be settled permanently at Santiago de Chile, with branches in all American countries. The statutes of this newly formed institute were drawn up during the congress of mining engineers, held at Santiago last January, and have been approved meanwhile by all 17 countries represented.

Metal Prices Are Established

New price regulations have been settled between the Metal Reserve Co. and the Chilean Government. The new contract will be in effect for six months. The negotiations were presided over by the Minister of Economy and Trade, Pedro Alvarez.

The price of refined copper was increased 10 per cent to 5.00 pesos per kg. Until now the government has subsidized small refiners with 0.50 peso per kg., but from now on the Metal Reserve Co., will pay that in the price.

The price of copper concentrates increases 5 per cent over the value of short ton dry concentrate. Moreover, 60 grams of gold per ton are now allowed, instead of only 35. In future bags are not to be charged, which means a price increase to producers of 50.00 pesos per metric ton.

Copper in gold concentrates are to have only U. S. $0.01 discount per pound of copper, instead of $0.02.

Several expenses, charged until now to producers of gold ores and concentrates, will be paid by the Metal Reserve Co., which means a saving of 170.00 pesos per ton of concentrates to producers.

Tolerances for silica and copper, in manganese ore until now 12 per cent, have been upped to 16 per cent silica and 0.33 per cent copper.

The representatives of the Metal Reserve Co. manifested a big interest in the Chilean deposits of cobalt, lead, molybdenum, tungsten, and zinc, and promised good prices as soon as producers should be able to supply considerable lots.

Prices of mercury have not changed.

Government Studying the Rubber Situation

The undersecretary of the Corporación de Fomento, Mr. Del Pedregal, recently gave an interview to the press about the rubber situation. The tire factory, under construction near Santiago, about which I wrote in my last letter, is the Sociedad Nacional de Neumáticos S. A., joint undertaking of the General Tire and Rubber Co., of Akron, Ohio, and the Corporación de Fomento. The buildings are ready, and a small but sufficient supply of rubber from Brazil and Ecuador is guaranteed, but the U. S. Government has not yet given export licenses for the equipment.

All rubber goods have been declared products of vital necessity, export of which is prohibited.

The government is financing studies of the industrial possibilities of a plant named Hulla or Huyulla, which grows in parts of the provinces of Tarapacá and Atacama, and seems to have rubber-bearing possibilities. Although nothing is known generally about the Hulla plant, it is interesting in view of the coming visit to this country of O. D. Hargis of the U. S. Department of Agriculture. Mr. Hargis is said to be very much interested in experiments in planting guayule in Chile, because the climate of the northern provinces is very similar to that of Southern California and parts of Mexico.

Valeria Root Not Cultivated in Chile

In your issue of February 10 there was a short notice that valeria root is planted intensively in Chile and could be exported. That is entirely wrong. There are, if any, very small cultivations of valeria root here, and although I know that trade pretty well, I have never heard of its cultivation in Chile.

Copper and Brass Products Are Being Manufactured

The Maquimetal Ltda., Santiago, division of the Sociedad Manufacturera de Metales "Mademsa", S. A., Santiago, is now manufacturing on a large scale copper and brass plates, tubes, and wire. The army-owned Fábrica de Material del Ejército makes in its Santiago plant copper and brass products, on a smaller scale, as well as manganese steel armor plates. Copper and other wires are made by several smaller factories. This evolution of the Chilean metal industry is helped by government edicts, that the foreign-owned refiners of electrolytical copper are obliged to sell to Chilean industries at cost price, in fact, actually 4.80 pesos per kg. Maquimetal is preparing to produce zinc from Chilean ore.

Grants Made by the Corporación de Fomento

300,000 for exploring and starting mining of pyrites in the province of Atacama, department Copiapó

1,000,000 to the Sociedad Minera La Coruña, at La Coruña, province of Coquimbo, department Illapel, for increasing their capacity of 48 per cent manganese ore from 500 to 1,000 tons monthly

4,000,000 to the Cía. Carbonifera de Lirquén, at Lirquén, province and department of Concepción, for building a thermal centrale of 1,000 h. p. and enlarging its equipment, to be able to increase production from 109,000 tons in 1941 to 180,000 of bituminous coal in future

300,000 to the Cía. Azufrera Aguas Calientes, district Tacora, province and department of Arica for opening new sulfur deposit

1,228,000 to the Cía. Agrícola de Purranque Ltda. for building a wheat dehydrator

120,000 to the Cía. Minera Popete, province of Coquimbo, for prospecting for tin

3,000,000 to a company to be formed which will solve the shipping problem by towing barges on the Pacific coast, also for international traffic. The head office of this company will be at San Antonio, province of Santiago, department Melipilla.

Use of tin plate for anything but canning foodstuffs and pharmaceuticals has been strictly prohibited. The quota for Chile, settled by the U. S. Government, is 9,000 metric tons for 1942, but until now less than half of it has come in.

The Junta Nacional de Abastecimientos, the Chile office which subdivides Chile's quota of allocated materials, will open a branch office in the United States, to be able to coordinate better with the Export Control Office of the Board of Economic Warfare.

The Sociedad Astilleros y Maestranza Valdivia Ltda., at Valdivia, province and department Valdivia, is starting to build a big Bessemer steel foundry.

The Fábrica Nacional de Vidrios Planos S. A. at Lirquén has doubled its capital to 30,000,000 pesos and tripled output of window glass. This factory is exporting to all South American countries, and is the most modern factory of its kind south of the United States.

It is said, although I could not get confirmation of it, that the Sociedad Nacional Industrial de Alcoholes "Indalcona" is preparing production of acetic acid and acetone at a plant at Requinoa.

RODOLFO ZOELLNER I.

CASILLA 3593
SANTIAGO
September 7, 1942

Continental Europe

Germany

An order has been issued by the German Price Commissioner for the reduction of cartel prices, and the chemical industry is one of those which are likely to be affected by the new order and feel some concern about its possible effects. Before the order was issued the cartels had been asked for proposals about price reductions, but this voluntary action does not seem to have given satisfactory results, and the price commissioner has therefore decided to fix prices himself. The position in the chemical industry is rather more complicated than in others, as the same products may be obtained by different processes. They may be principal objects of production in one factory and merely by-products in another plant. Nevertheless the price commissioner intends to fix binding prices in accordance with costs as established by him in a typical efficient plant. In general, the costs allowed will be those of the most efficient producer; other firms have either to adjust their production methods or to bear a loss.

This intention seems to have aroused a great deal of opposition even from official representatives of the chemical industry, who point out that low costs, though undoubtedly important, are not the only factor to be taken into consideration. In the choice of the material availability at home and possibility of substitution are regarded as no less important, and substitution may in many cases result in higher prices. It is argued that if low costs are the only determining factor, the utilization of many waste products from other processes will become impossible, with the result that the demand for essential raw materials in short supply will increase. It is said that the examination of all these questions in detail will take considerable time. In the meantime negotiations with the price commissioner have begun.

French Chemical Workmen Are Transferred to Germany

The chemical factories belong to one of the six industrial groups in which direct negotiations between German and French organizations have taken place with a view to the transfer of skilled workmen from France to the Reich. It is reported that the I. G. Farbenindustrie alone wishes to employ 7,000 French workmen, probably largely in its plants at Mannheim, Ludwigshafen, and Oppau which have been visited on various occasions by the Royal Air Force. The willingness of French industrial firms to cooperate with German companies in the transfer of workmen will depend somewhat upon the present form of the placement of German orders with French firms, comments a neutral paper, the *Neue Züricher Zeitung*. In recent months it has been noticed in France that German contracts have been cancelled or allowed to expire, with the result that substantial numbers of workers in French factories had to be paid off. It is intended to transfer these unemployed workers in *Betriebszellen*—i. e., groups of workers who have been employed together in one factory—to German industrial centers where, it is hoped, they will acclimatize easier if they have all their colleagues with them. The recruiting of labor for German chemical factories has been extended to the unoccupied zone and enjoys the full support of the Vichy authorities, while French chemical manufacturers are reluctant to dismiss their skilled workers and thus deprive themselves of the possibility of resuming operations speedily when conditions change. Several firms, for instance, in the oil refining business, which have had to close down their plants entirely, retain their staffs of specialized workers with that in mind, and the German authorities seem to make special efforts to release these workmen for employment in Germany.

Vegetable Caoutchouc to Be Cultivated in Eastern Europe

The Ost-Gesellschaft für Pflanzenhautschuk und Guttapercha m. b. H. has been formed with the small capital of 30,000 marks as one of the so-called trust companies which have been created by the German authorities for the special purpose of encouraging the production of certain important commodities in occupied territories of eastern Europe. The company is to assist in the cultivation and processing of vegetable caoutchouc and gutta-percha.

Another company formed in eastern Europe is the Pankreas-Verwertungs-Gesellschaft m. b. H., which is to collect pancreas glands from slaughter yards in Latvia, Lithuania, Estonia, and Ukraine. Owing to the shortage of insulin, which has led to the introduction of an insulin ration card for diabetics, a large organization for the collection of glands from German slaughter yards was drawn up a long time ago, but this has not apparently solved its task in a satisfactory manner.

Leather Fibers Treated with Synthetic Resins

A leather substitute was made before the war from leather fibers (derived from waste leather) and latex, but the latter material is now replaced by emulsions of synthetic polymerization products, usually on the basis of polyvinyl or polyacrylic acid compounds. It is stated that waste leather tanned with chromium products has better strength, wear, and suppleness than leather treated with vegetable tanning materials, but must be detanned with a slightly alkaline solution before use. Products made with polyvinyl acetate are said to be stronger, while polyacrylic acid esters seem to give a greater degree of flexibility, but both are inferior to latex in wear resistance, partly because of their greater moisture absorption. Fats, softeners, and repellents are normally included in the material to give special properties. The sheets in which the material is eventually obtained require careful drying.

I. G. Farbenindustrie Subsidiary for High-Molecular Paraffins

The Gesellschaft für Synthese-Produkte m. b. H. has been formed in Frankfort (Main) by the I. G. Farbenindustrie A.-G. for the processing and treatment of high-molecular paraffins. The company has the right to establish branch works abroad and to take over existing equipment of a suitable type.

Removal of Hemi-Celluloses from Textile Cellulose Studied

The removal of hemi-celluloses from pulp intended for use in the manufacture of artificial rayon and staple fiber has attracted considerable attention from German chemists, also in connection with the use of new raw materials such as straw and reed. Beside alkaline processes, the possibility of treating celluloses with a pentosan content with 58 to 60 per cent sulfuric acid has recently been investigated. It is claimed that theoretically cellulose with α-cellulose content of 95 per cent can be obtained in this way, which, however, is not easily applicable on an industrial scale. "Prehydrolysis" has been tried out by several producers with apparently satisfactory results. If carried out at high pressure an excellent textile cellulose with 1.8 per cent pentosan only may be obtained by use of a solution containing 0.57 per cent hydrochloric acid, 0.66 per cent hydrobromic acid, or 2.54 per cent sulfuric acid. Work with hydrobromic acid seems to have given the highest cellulose production with the highest α-cellulose content. Use of a mixture containing 0.5 per cent of sulfuric acid and 0.5 per cent of hydrobromic acid gave 31.28 per cent of a very good cellulose with an α-cellulose content of 98.43 per cent from rye straw. The type and strength of acid to be used depend in part upon the temperatures at which the work is carried out. Entirely different results have been obtained with acids, in varying strengths, at different temperatures and pressures.

Tincture of Iodine Replaced by Indigenous Substitution Product

A new substitute for tincture of iodine, called Kodan tincture, has appeared on the German market. It is a brown liquid

with a slight smell of thymol and contains in alcoholic solution chlorobenzylates of the alkyl amides of dimethylaminoacetic acid, chlorodimethylphenol, and chloroxydiphenylmethane. The phenols, which are not soluble in water but soluble in lipoids, have a deep effect on the skin. It is claimed that the tincture wets the skin well without irritating it. It does not corrode metal instruments and the brown dyestuff can be easily removed from linen.

Iodine Recovered from Flue Dust

Flue dust as obtained in German blast furnaces by electrical gas purification contains between 0.001 and 0.2 per cent of iodine, and experiments for the recovery of the iodine have been carried out at the Heinrich Bierwes plant of the Mannesmann tube works. The flue dust, 19 tons of which are obtained every 24 hours with 0.025 to 0.035 per cent of iodine, is first concentrated by thorough boiling with water, resulting in a dry substance which contains largely sodium and potassium chloride and carbonate, organic compounds, fluorine, ferric oxide, and iodine. The organic compounds are removed by calcination at about 700° C. The remaining salts are dissolved, leaving the ferric oxide as a residue which is separated. Next the material is precipitated with calcium chloride in order to eliminate the fluorine as far as possible. The remaining clear solution is slightly acidified with hydrochloric acid and distilled, when it yields between 80 and 90 per cent of the original iodine content. The potash salts in the flue dust can be recovered in the form of potassium chloride of 98.5 per cent purity and may contribute towards the costs of the process. The economic side of the recovery process seems not to have been examined yet.

Concentration Ordered in the Cosmetics Industry

An order issued by the government limits the manufacture of cosmetic products to firms which made them in 1938 and have continued production ever since. No less than 1,600 firms were engaged in the manufacture of cosmetics before the war, but most of these have been compelled to close down, owing to shortage of raw materials, and the number of firms which have been officially entrusted with the manufacture of toilet preparations by the Reich Office for Chemistry is below 100. In recent years, however, outsiders believed to number several hundreds have entered the market, with the result that, as the *Frankfurter Zeitung* reports, the market has been inundated with doubtful products. The new concentration measure is directed against these firms.

New Motor Car Engines Designed for Liquid Gases

The use of gases in motor engines has made considerable progress in various countries of Europe, particularly in Italy where natural deposits of methane gas are available, but also in smaller countries like Hungary, Holland, and Denmark. In Denmark gas engines using natural gas have been introduced into small sea-going vessels like fishing boats. In Germany no natural gas deposits are available, but greatly increased use has been made of liquid gases obtained by compression of butane and propane from Fischer-Tropsch plants for synthetic gasoline. In 1936 about 4,000 road vehicles were running on liquid gases in Germany, by 1939 the number had risen to 33,000, and the present circulation is said to be several times larger. The use of liquid gases has been encouraged by the fact that at times their use was virtually unrestricted because the Fischer-Tropsch plants had to dispose of the growing output obtained automatically in the course of their normal operations. At other times restrictions were imposed in order to safeguard supplies of butane for industrial purposes, but in general owners of liquid gas vehicles have fared better than others.

Lately there has been a tendency to encourage the use of liquid gases by technical adjustments in engine design. It is claimed that the motor itself need not be altered for liquid gases if Otto motors are used, while for Diesel engines conversion to the Diesel-gas process, which is characterized by the use of small quantities of Diesel oil for starting, etc., is recommended. The high antiknock value of the liquid gases would permit the use of engines with a higher compression ratio than is usual in gasoline or Diesel engines, but users are reluctant to order these specialized engines because they cannot be converted back to the use of liquid motor fuels. although it is stated that these special gas engines consume about 15 per cent less gas than ordinary converted motors. There are now about 700 gas filling stations in various parts of Germany exclusively for liquid gases, and distribution is also helped by mobile distributing stations—i. e., tank cars which are sent wherever they may be needed. Distribution is still a major problem in the utilization of liquid gases.

Sweden

Synthetic rubber is now produced from sulfite alcohol in a pilot plant at the rate of 100 kg. a day by Mo and Domsjö, an important firm in the cellulose industry. A larger plant is under construction and will, when completed, have a capacity of 200 tons of synthetic rubber which will be marketed under the trade name Modo. The Industrial Commission assists Allmänna Svenska Elektriska A.B., a firm of electrical manufacturers, which is experimenting with synthetic rubber in its plant at Västeras. Meanwhile the rubber-yielding plant Taraxacum Kok-Sagys has been cultivated on trial plots in Sweden, and laboratory experiments are also carried out with several local types of dandelion.

Less Cellulose for Paper and Rayon

The output of fodder cellulose, which according to official plans is to reach 550,000 metric tons in the year ending June next, has assumed considerable proportions, with the result that supplies of wood pulp for the paper industry and of cellulose for rayon manufacture are meeting with some difficulty. Between 40 and 50 per cent more wood will be required to meet all demands, and cellulose manufacturers complain that the prices for fodder cellulose compare unfavorably with those received from rayon producers. Swedish cellulose plants seem to have concluded large contracts for the export of textile cellulose to rayon factories in Continental Europe, and these may not be fulfilled.

New Pharmaceutical Factories to Be Built

Two new pharmaceutical factories are to be built in Sweden by Astra A. B. Apotekarnas Kemisker Fabriker and by Apoteksvarucentralen Vitrum. The plant to be built by the former firm at Södertälje will be the largest pharmaceutical factory in the Scandinavian countries. The latter firm hitherto specialized in the manufacture of insulin, a shortage of which is reported from several European countries.

Zinc Paints to Be Made in Closed Cyanide Plant

A. B. Glücksmans Metallaffär has bought from the Swedish Government the cyanide plant now lying idle at Trollhättan. The company intends to treat zinc scrap in the plant and later to use zinc concentrates. The products of the plant will comprise ammonium chloride, zinc white, and zinc gray in addition to metallic zinc. Hitherto about 5,000 tons of scrap zinc have been exported annually from Sweden, so that the company should find no difficulty in securing the raw material for its plant.

Shale Oil Producer Applies for Permit

The Company for the Lime and Stone Industry has asked the Swedish Government for a permit for the erection of a shale oil plant at Skoellersta near Tarsta in the district of Naerke, where oil shale

has been exploited industrially for some time. It is intended to build a plant at an expenditure of 300,000 kronor and to treat 20,000 tons of shale and 12,500 tons of limestone annually for the production of 550 tons of shale oil and 7,500 tons of burnt lime. It was announced only a short while ago that another plant which commenced production during last spring will produce 25,000 to 30,000 tons of shale oil and 10,000 to 15,000 tons of sulfur annually.

Denmark

Dansk Sojakagefabrik has been compelled by shortage of imported raw materials to reduce its production of oil cakes for Danish farmers. It is now announced that the firm has been experimenting during recent months with a new synthetic rubber product which will be marketed under the trade name Aetylan. It is produced from alcohol, and chlorine, kaolin, sodium sulfate, and sulfur are mentioned as materials used in the production. While the new product does not compare with other synthetic rubbers in all properties, it is said to be suitable for shoe soles and driving belts. Its use for bicycle tires is under development.

Quartz Sand Found In Jutland

Large deposits of quarts sand suitable for the manufacture of high-class optical glass have been discovered in Jutland. A process has been worked out by S. A. Andersen for the reduction of the iron content of the sand to 0.2 per cent, so that it can be used for the manufacture of optical glasses for which formerly 24,000 tons of quarts sand had to be imported. These imports are in future to become superfluous. The only window glass factory in Denmark, which has been closed for the past two years because of the lack of coal, has now been reopened.

Dry Blood Plasma to Be Produced

Dansk Albumin Fabrik A.S., a firm which has been producing technical blood albumin for use in the plywood industry for a number of years, has now formed a new department for the manufacture of dry blood powder and plasma for use in the food industries.

Medicinal Herbs to Be Cultivated

A survey of medicinal herbs growing wild in Denmark has been undertaken, and their systematic collection is to be organised. Det Danske Medicinal- og Kemikalie-Kompagni reports that the cultivation of medicinal plants and collection of herbs have made good progress. The cultivation of poppy for the production of opium preparations was especially satisfactory. Vitamin products are being made from halibut, carrots, and spinach. The production of cod liver oil increased, but that of tunny liver oil was insufficient.

France

In contrast to other European countries, France pursued before the war a policy of importing crude mineral oils and refining them in large plants in the four import ports of Marseilles, Bordeaux, Nantes, and Rouen. Three of these are now in the occupied zone, and Marseilles alone is left to Vichy France. Owing to the interruption of oil imports, however, all the French refineries have had to curtail operations drastically, and war damage has also caused great difficulties, with the result that none of the importing refining companies has been able to show a profit in recent years. Typical of the conditions prevailing in the French oil-refining industry is the position of the Raffinerie de Berre, which reports that the plant was closed down almost completely until the second half of 1941, when some sections were reopened for the treatment of substitutes which, however, do not permit anything like complete use of the plant facilities. The company endeavors to hold its technical staff together, so as to be able to resume operations later on.

Grande Paroisse to Distill Lignite

The Société Chimique de la Grande Paroisse has commenced construction work on a plant for the treatment of lignite and production of liquid fuels at St. Hilaire on the Allier river in Central France. It was only recently that the company acquired a concession for the exploitation of lignite deposits in that district, and the new plant is being built under an agreement with the Vichy Ministry for Industrial Production. Apparently the company intends to use its own process for the distillation of lignite.

Three-Year Plan for Cellulose Factories

The Société Française de la Cellulose is to spend 100 million francs on the erection of several factories for the production of cellulose from *Arundo donax* in Provence. During the next three years a plant with a capacity of 120,000 tons per annum is to be built. It is stated that *Arundo donax* (reed) has a very high α-cellulose content. The company will operate its own lignite and sulfur mines and will also produce enough chlorine and sodium sulfate for its purposes. German interests are reported to participate in the enterprise.

French Rubber Supplies Insufficient

The total French rubber supplies consist at present of 1,500 tons of reclaim a month, a quantity which covers only a fraction of the demand which in peace time was estimated at 60,000 tons per annum. Normally France used to rely on the production of plantation rubber in Indo China, and since this source has been lost to Japan, schemes have been prepared for the encouragement of rubber cultivation in French possessions in West Africa. The production of synthetic rubber has also been studied, but since France does not possess a surplus of coal, oil, or alcohol at present, the plans have been dropped for the time being, as construction materials are also difficult to obtain.

Italy

The Azienda Generale Italiana Petroli (AGIP) has increased its capital from 500,000,000 to 1,000,000,000 lire. The new funds are to be used mainly for financial transactions in connection with the nationalization of foreign oil companies operating in Italy. Twenty-one companies, mostly belonging to the combines of Shell, Standard, and Vacuum, are affected by the transaction. Some of these own large refining and storage plants. A recent law provides for the appointment of an expert commission to assess the value of the properties handed over to the AGIP. As the AGIP is a semiofficial company financed by the state and the sums fixed by the commission as representing the value of the foreign oil interests will presumably be paid into blocked accounts, the transaction causes no financial difficulty. The "nationalization" will probably be followed by a "rationalization", since the oil supplies available in Italy do not permit the maintenance of the large distributing organization built up by importers before the war.

Forty Barytes Deposits Exploited

About forty deposits of barytes are at present exploited in Italy, and the annual production is stated to exceed 50,000 tons. The principal deposits are found near Trent, on the island of Sardinia, in the Val d'Aosta, in Valassina, and in Tuscany. It is reported that the output of lithopone is now sufficient to meet local demands, but the supply of other paints is far below requirements.

Synthetic Rubber Industry Plants Are Amalgamated

The Società Italiana per la Produzione della Gomma Sintetica and Società Italiana Gomma Sintetica, the two companies

formed jointly by the official Istituto per la Riconstrucione Industriale and the rubber company Pirelli, have decided to merge. The former company had a capital of 6,000,000 lire, but this has been reduced to 3,600,000 lire in order to cancel the loss of 2,440,000 lire incurred during operations so far. No information about plans for commercial production are available yet, nor is it easy to see how a substantial output of synthetic rubber is to be accomplished, considering the lack of suitable raw materials and metals for equipment. Mineral turpentine oil is to be used in the manufacture of synthetic rubber.

Gasworks Increase Output of Liquid Hydrocarbons

Although the provision of coal meets with considerable difficulties, the Italian gasworks, it was officially stated, are now producing 50 per cent more gas than in 1936 and three times as much as in 1929. The output of benzene, toluene, and xylene for war purposes is eight times the quantity provided during 1914 to 1918 when, of course, it was very small indeed. Some gasworks have experimented with wood and lignite as a raw material, but careful neutralization with ammonia is necessary, especially in the case of lignite, and the quantity used is limited.

Spain

The Union Resinera S. A. has raised its capital from 75 to 125 million pesetas, and will use new funds for plant extensions. The company has acquired further pine forests and intends to build a new factory in the Sierra de Cazorla. Plant for the use of waste products is to be extended. The production of celluloid is to be started under patents from the French chemical producer, St. Gobain. Export licenses for resin and turpentine oil are granted in rare cases only, it is reported from Spain.

Oil Refinery Moved from Canary Islands

Compania Española de Petroleos S.A. has dismantled part of its refinery at Santa Cruz de Tenerife (Canary Islands) and transferred it to Cartagena (Spain), where it is to be rebuilt and to be extended by addition of modern equipment. The Compania de Investigación y Explotaciones Petrolíferos S. A. reports that the exploration and prospecting work was continued throughout 1941 and new oil concessions were taken up, but the results so far obtained do not yet permit any conclusions as to whether profitable oil production is possible in Spain. The Spanish Government has encouraged the development of substitute fuels, but in this field also little progress has yet been made. The distillation plant at Puertollano is still the only one of its kind in the country.

Aluminum and Magnesium Production to Be Increased

Aluminio Español S.A., hitherto the only light metal producer in Spain, has decided to increase the annual output from 1,300 to 2,000 metric tons at a cost of 4,500,000 pesetas. Another Spanish company, Empresa Electro-Mecánica de Cordoba, intends to build an aluminum plant with a capacity of 8,000 tons per annum. The establishment of a magnesium industry is also intended. Investments of 20 million pesetas would be required, and the erection of suitable plant would take two years, but no definite decision has yet been taken.

Southeastern Europe

New Fertilizer Factory Formed in Yugoslavia

The Chemical Factory, Ltd., which was formed in March by the Prager Chemischer Verein, successor to the Aussig chemical combine and now under German control, and a group of Croatian industrialists will shortly commence the production of sulfuric acid, copper sulfate, superphosphates, and other chemical fertilizers. The capital of the company is 50 million kuna, 20 million of which have been paid in.

New Process to Use Asphalt Oils in Hungary

A new process for the extraction and utilization of asphalt oil from the bituminous deposits at Derna-Tataros and Bodnos in the district of Bihar has been developed by Julius Nyula. These deposits contain between 10 and 20 per cent of asphalt oil which has penetrated the stone. A heavy crude lubricating oil is produced by treatment with benzene, benzol, or other solvents, and this may be processed further to yield equal parts of a lubricating oil and an asphalt suitable for road construction. It is claimed that the lubricating oil can be blended to advantage with that obtained from the Hungarian mineral oils at Lispe. A commercial plant is to be ready for production within twelve months.

Shale Oil Plant to Be Built in Bulgaria

Two 600-foot wells have been drilled near Bresnik, 25 miles west of Sofia, where oil shale deposits are known to exist. Plans have been prepared for the erection of a plant capable of an output of 20,000 tons per annum of liquid fuels from either shale or lignite, large deposits of which are also available in the country. A sulfuric acid plant is to be erected in the vicinity of the state coal mines at Pernik.

Aluminum Production Planned in Yugoslavia

Croatian Aluminum, Ltd., has been formed in Agram with a capital of 20,000,000 kuna by the Vereinigte Aluminium-Werke A. G., the German aluminum trust, and the Croatian Government for the exploitation of local bauxite deposits and the erection of alumina and aluminum plants.

Magnesium to Be Produced in Hungary

The Hungarian State Iron, Steel, and Engineering Works have obtained a license from I. G. Farbenindustrie for the production of metallic magnesium (Elektron) in Hungary. A new company, the Hungarian Magnesium and Elektron Co., has been formed for the utilization of the I. G. Farbenindustrie process.

Quinine Production in Western Hemisphere

A CONTRACT has recently been signed, designed to increase cinchona bark output in Guatemala and Ecuador, between the Defense Supplies Corp. and the American Quinine Co. Plans for developing cinchona plantations, laboratories, and methods of grading and testing the bark are also included. Charles Cosse, president of the company, has gone to Guatemala with a production staff, to establish cinchona plantations that are expected to yield 1,500,000 pounds of bark in 5 to 10 years.

Magnesium Plant Begins Operation

A NEW plant for the manufacture of magnesium was put into operation in New South Wales, Australia, in July. The process being used in the plant includes the treatment in a heated vacuum of finely ground calcium carbide with calcined magnesite. The metal thus obtained is remelted and refined under special fluxes.

Critical Chemicals from Argentina

ARGENTINA may prove to be a source of some of the critical chemicals needed by America's war effort, according to a report from the Armour Research Foundation's field party now making an industrial survey of the South American nation.

Chief among the critical products found in Argentina are beryllium in the oxide form, butyl alcohol, acetone, acetic acid and methanol, and asbestos.

Mexican Rubber Program Expanded

More than 1,500,000 Hevea rubber seedlings are ready for cultivation on demonstration plantations in southern Mexico, as a part of the broad inter-American program for expansion of rubber growing in the western hemisphere, according to a report from the Office of the Coordinator of Inter-American Affairs. The site of the first Mexican plantation has been selected at Las Palmas, State of Chiapas. Four additional demonstration plantations are planned in time for seeding this season, in the States of Chiapas, Tabasco, and Vera Cruz.

Each plantation, averaging about 1,000 acres, with 750 acres planted to rubber, will be planted with high-yielding, bud-grafted Hevea trees a year or two old.

Bauxite Output Declines in Dalmatia

According to figures credited to the German press, output of bauxite in Dalmatia has declined from 404,418 metric tons in 1938 to 274,195 tons in 1940 and to 211,111 tons in 1941. This decline is attributed to the absence of sea transport facilities and to the failure of the railways to handle greater quantities of the mineral. The mines are located in territory now forming part of Croatia.

New Chemicals Made in Britain

New British-made chemicals, states a recent report from the United Kingdom, include acid calcium ammonium phosphate and the salicylacetates of sodium, potassium, and calcium. The phosphate is to be used as a substitute for cream of tartar in baking powder; its raising power is claimed to equal that of calcium acid phosphate. The salts of salicylacetic acid possess greater solubility, are more easily absorbed, and have more anti-rheumatic value than aspirin, it is stated.

Canadian demands for emergency metals and minerals has spurred an aggressive search for new sources of base metals. New aluminum-producing units have been placed in production as a part of the Canadian effort, and that country now furnishes about 40 per cent of the United States' requirements.

Recent experiments in Eire have shown that laminarin, a seaweed product, is a source of glucose and alcohol and that it might be used as a basis for adhesives, according to an industrial report of the Department of Commerce. Yields of 13 to 16.9 gallons of ethyl alcohol per ton of air-dried weed were obtained.

NECROLOGY

Alfred N. Finn

Alfred N. Finn, chief of the Glass Section, National Bureau of Standards, died September 21, 1942, at Lincoln, Nebr. He had been in ill health for the past year and had retired from active work about six months ago.

Mr. Finn was born in Denver, Colo., in 1882. He received his A.B. in 1906 and M.A. in 1909 from the University of Denver. After several years as an instructor at the University of Denver he was appointed in 1911 as an assistant chemist at the National Bureau of Standards. His work dealt with cements, paints and oils, boiler waters and boiler compounds, protective coatings for metals, and corrosion of ferrous and nonferrous alloys. In 1919 he accepted a position as chief chemist and metallurgist for the Hydraulic Steel Co., Cleveland, Ohio, but later returned to the Bureau as chief of the Glass Section.

Mr. Finn was an authority in glass technology and had charge of the bureau's production of optical glass. He also directed the making of a glass disk 70 inches in diameter and 11 inches thick for use as a reflector in an astronomical telescope now in use at the Ohio Wesleyan University.

Mr. Finn had been a member of the American Chemical Society since 1911 and was also a member of the American Ceramic Society, American Society for Testing Materials, the Washington Academy of Sciences, Optical Society of America, and the American Institute of Chemists.

Ross Aiken Gortner

Ross Aiken Gortner, chief in the Division of Biochemistry, University of Minnesota, died September 30. Dr. Gortner was born at O'Neill, Nebr., March 20, 1885. After graduation from Nebraska Wesleyan University in 1907 he earned his M.S. degree from the University of Toronto in 1908 and his Ph.D. degree from Columbia University in 1909. An honorary Sc.D. was conferred on him in 1932 by Lawrence College.

Dr. Gortner went to the University of Minnesota in 1914 as associate professor in the Division of Soils from the Station for Experimental Evolution at Cold Springs Harbor, N. Y., where he formed his close personal and scientific association with J. Arthur Harris, who probably exerted more influence on Dr. Gortner's scientific thinking than any other one person. Dr. Gortner transferred to the Division of Biochemistry of the University of Minnesota in 1916 as associate professor and was made full professor and chief of that division in 1917, which position he held at his death.

Dr. Gortner's contributions to scientific journals number more than 300. The chief fields covered are the black animal pigments, the melanins; proteins, especially the cereal proteins and their relation to the properties of flour and dough; colloids, especially their physicochemical properties and the role of water in living processes.

His major contributions to scientific thought include "Outlines of Biochemistry", "Selected Topics in Colloid Chemistry", which contained the lectures given at Cornell University in 1935–36 in connection with the George Fisher Baker lectureship, and a third volume prepared by Dr. Gortner and colleagues in 1936 entitled "J. Arthur Harris, Botanist and Biometrician".

His intense enthusiasm for science and especially for the field of biochemistry, his exceptional fund of scientific knowledge in many fields, and his easy, familiar delivery made him an inspiring teacher. He gave freely and liberally of his time and thought to the research problems of his own graduate students as well as to those of his colleagues both in the Division of Biochemistry and in other divisions of the University, and in the early days of the development of graduate work in the Division of Biochemistry spent many hours in the laboratory working with his students. Dr. Gortner was active in many graduate student activities outside scholastic work.

Dr. Gortner was honored with appointment to many positions of responsibility in scientific research and education. In the National Research Council he was serving at his death on committees on the chemistry of colloids, chemistry of proteins, and organic chemical nomenclature for the American Society of Biological Chemists and the American Chemical Society. For three years he served on the executive committee of Sigma Xi, and on December 31, 1941, was made president of the society. Last May he was awarded the Osborne Medal by the American Association of Cereal Chemists. He had been a member of the American Chemical Society since 1909.

Arthur D. Hirschfelder

Arthur D. Hirschfelder, professor of pharmacology at the University of Minnesota, died October 11 at the age of 63.

After being graduated from the University of California, Dr. Hirschfelder studied at Stanford University, Heidelberg, and the Pasteur Institute. He received the M.D. degree in 1903 from Johns Hopkins University, where he spent his

internship and later held a staff position. He went to the University of Minnesota in 1913, and was head of the pharmacological section of the Medical School.

Dr. Hirschfelder had been a member of the AMERICAN CHEMICAL SOCIETY since 1914 and was Chairman of its Minnesota Section in 1917. He belonged to the American Association for the Advancement of Science, Society of Pharmacology, Society of Experimental Biology, Society for Clinical Investigation, and American Medical Association (chairman of the section on pharmacology and therapeutics, 1917). His interests included internal medicine, lead poisoning, antiseptics, mosquito repellents, and the determination and clinical variations of magnesium.

Edward G. Lunn

EDWARD G. LUNN, research chemist with the Bureau of Engraving and Printing, Washington, D. C., died September 19 at Niagara Falls, N. Y., at the age of 45.

Dr. Lunn was a native of New York City and a graduate of the University of California. For the past five years he had been employed as research chemist with the Bureau of Engraving and Printing, and prior to this worked for nine years as a chemist with the Naval Research Laboratory. He had been a member of the AMERICAN CHEMICAL SOCIETY since 1921.

Richard A. Moll

RICHARD A. MOLL of the Esso Laboratories-Chemical Division died suddenly on September 1.

Mr. Moll, who was graduated from Syracuse University in 1932, was with the Hewitt Rubber Corp., Buffalo, N. Y., between 1932 and 1940. He joined the Standard Oil Development Co. in April 1940 and at the time of his death was Group Leader in charge of the Rubber Service Laboratory of the Esso Laboratories-Chemical Division. A paper by Mr. Moll and his associates, R. M. Howlett and D. J. Buckley, dealing with Perbunan properties and compounding was presented before the Division of Rubber Chemistry, at the Buffalo meeting of the AMERICAN CHEMICAL SOCIETY.

Mr. Moll had been a member of the SOCIETY since 1940.

Orrin W. Pineo

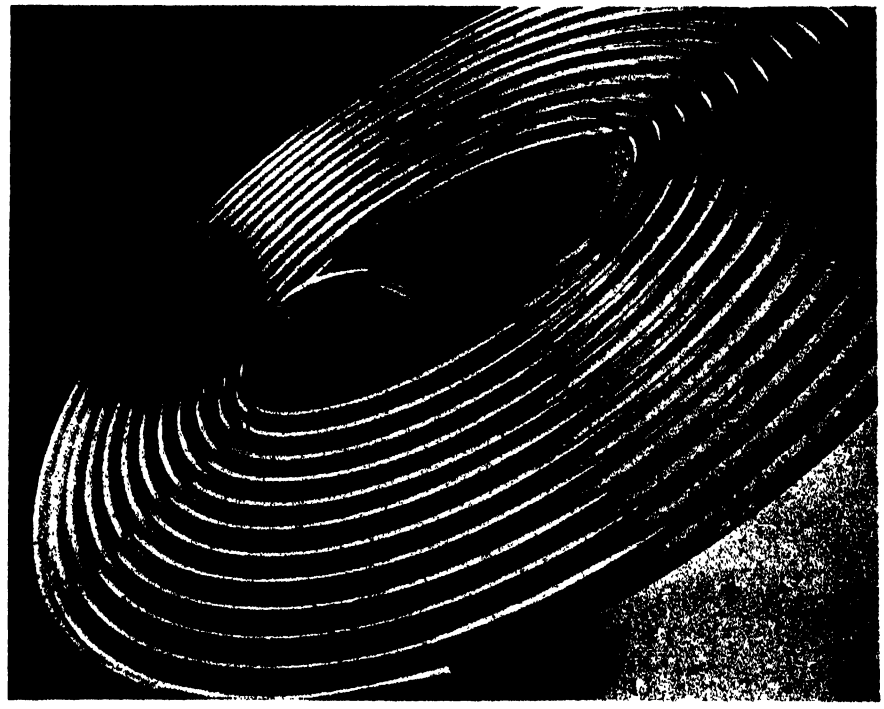
ORRIN W. PINEO, physicist, died September 5, 1942, in Milo, Maine. He was born at Katahden Iron Works, Maine, September 28, 1908, and was graduated from Massachusetts Institute of Technology with a B.S. degree in 1929. From 1929 to 1933 he worked with A. C. Hardy at M. I. T. on the development of an automatic recording visual range spectrophotometer which was later commercialized by the General Electric Co. During 1932-33 he held the Textile Foundation's senior fellowship. From 1933 to 1934 he worked independently on the development of automatic spectrophotometers with Adam Hilger, Ltd., in London and contributed to a book published by this company on the subject of "The Practice of Absorption Spectrophotometry".

From 1935 to 1940 he was employed by the Calco Chemical Division, American Cyanamid Co., at Bound Brook, N. J., where he did further work on the development of spectrophotometers, taking out many patents. During the past two years Mr. Pineo had been engaged in work for the war effort, being located in Washington, D. C., and Princeton, N. J.

Morris A. Pozen

MORRIS A. POZEN, consulting chemist and specialist in food chemistry, died September 29 in Brooklyn, N. Y., at the age of 55. Born in Russia, Mr. Pozen came to this country at an early age and received his doctor of pharmacy degree from George Washington University. In 1909 he was awarded the American Pharmaceutical Association Prize. While serving as assistant chemist and then chemist in the Department of Health, Washington, D. C., he was also collaborating chemist in the Bureau of Chemistry of the Department of Agriculture from 1909 to 1920. He then joined the Schwarz Laboratories as chief chemist, where he remained until 1930.

Mr. Pozen was at one time editor of Brewery Age and author of "Successful Brewing", published in 1935.



Carbon Black by Gas Explosion

A METHOD of making carbon black by a gas explosion has been developed at the University of Kansas by George W. Stratton and Delos E. Winkler, and is said to produce 30 pounds of carbon black from 1,000 cubic feet of a mixture of natural gas and chlorine. Present industrial methods recover only from 0.5 to 2 pounds from the same amount of gas. Dr. Stratton proposes to secure the chlorine from the salt deposits of central Kansas, using petroleum wastes from nearby oil fields to furnish cheap power for steam generators.

Arc Welding Movie

GENERAL ELECTRIC'S film, "The Inside of Arc Welding", is being used extensively in speeding and facilitating the training of arc-welding operators.

Over 2000 reels of this 16-mm. film are in regular use throughout the United States alone, while numerous reels are being used in England, Canada, Brazil, and South Africa. Of these, 30 complete sets are being used by the U. S. Navy in its training programs, and 25 sets by the War Department.

Plastic Replaces Tin Pipe

Flat coils of transparent Tenite pipe are now used in cooling systems for the beverage-dispensing industry. This pipe, manufactured by Tennessee Eastman Corp., Kingsport, Tenn., may be readily coiled, bent, formed, or curved to fit almost any condition. Inquiries should be addressed to North Penn Co., 72 Fifth Ave., New York, N. Y.

Air Raid Precautions for Chemical Works

R. WALTERS, National A. R. P. Co-ordinating Committee, British Information Services, London, England

AIR raid precautions for the chemical industry present many special problems, but before any of these can be tackled the general measures for the protection of industrial premises must be applied. The objects of these measures may be briefly summarized as: the protection of personnel, the protection of plant, and the establishment of a system which will involve the least disturbance to production.

Only then is it possible to consider the particular difficulties of the chemical industry. With chemical undertakings, the nature of the products means that in most cases A. R. P. organizations have to give special attention to antigas measures. The corrosive or poisonous nature of many chemicals will be equivalent to, or worse than, those of the familiar war gases, and it is fortunate that equipment designed to protect against the latter will, if available in sufficient quantity and handled with expert knowledge, afford a means of dealing with the former.

Acids and Alkalies in Tanks

In works where large tanks of strong acids or alkalies, or pipe lines carrying these substances are used, special attention should be paid to the following points:

An immediate inspection should be carried out of such plant, following an air raid in the district, as there may be cracks caused by distant explosions.

Adequate supplies of a neutralizant should be stored near by.

Drains should be adequate, near to the particular hazard, and dams should be built to direct the escaping fluid into sumps or drains, and keep it away from other plants.

Good supplies of water for flushing down are needed.

It will obviously be better to build a blast wall around tanks, rather than to cover with sandbags or similar obstacles that would make inspection difficult. For protection of underground pipe lines, trenches should be dug on either side to break the effect of the shock wave; such trenches would also serve to trap escaping fluids. It may be necessary to provide extra shut-off or non-return valves. The first aid parties in such works should fully understand the properties of the materials likely to be splashed about if the plant were hit, and the appropriate treatment. A good decontamination center, with changes of clothing ready, will be needed.

Chlorine Stored in Railroad Tanks

A serious hazard in paper and dye works, both to the workers and the nearby district, is liquid chlorine in railroad tanks. The siding into which these are shunted should be protected with blast walls and a sump and hose should be provided. The ordinary gas mask is designed for only small concentrations of gas, and in such a situation special masks or breathing apparatus should be available. This warning applies equally to refrigeration plants using liquid ammonia. The special masks should be kept in the open as near as possible to the hazard, in a glass-windowed case, so that rescue operations can be speedily carried out by those first on the spot.

Apparatus and Plant

The question of inspection after a works has been hit is most important. Apparatus such as autoclaves, steam economizers, high-pressure air and steam plant, which may suffer only minor damage at the time, can cause serious casualties and dislocation if explosions occur subsequently. Representatives of the workers should join in the inspection in order to maintain confidence, and if there is any doubt, tests should be carried out before restarting. In most cases, an adequate system of recording pressures, temperatures, etc., will serve to warn of any abnormality, but sometimes it may be more convenient to install automatic devices to give an alarm signal.

Where quantities of organic solvents of an asphyxiating nature are used, breathing apparatus will normally be supplied, and probably the most serious risk is of fire and subsequent explosion. A special measure of protection against incendiaries would be worth while under these circumstances, consisting of a layer of shingle or sandbags, supported if necessary by timber supports which could be made of salvaged wood. Stores of inflammable or dangerous materials should be dispersed if at all possible. In any event inflammable material should be kept away from main structural steel members, as the load-bearing capacity is destroyed at comparatively low temperatures.

Check Fire Extinguisher

A checkup should be made on the type of fire extinguisher available and, if necessary, its effectiveness against the particular inflammable fluid should be tested by the fire party. The conditions under which a fire may turn into an explosion should be fully understood by the firemen, and timely evacuation should be provided for.

Perhaps the one thing which stands out clearly in dealing with the special question of A. R. P. in chemical undertakings is the necessity for the fullest training of the personnel. Owing to ignorance of the properties of chemicals, there exists the possibility of panic developing, or alternatively a lack of appreciation of dangers. All members of fire parties and first aid personnel should be given simple instruction in the nature and properties of the substances used in the works, so that they may readily understand the reason for counter measures, and thus promote individual sense of responsibility with consequent increase in initiative.

Given a well-trained A. R. P. personnel of this type, the chemical industry should reach as high a level of safety in air raids as any other.

Ethylene Oxide Hazard

CONSIDERABLE hazard may be present in working with certain high-pressure reactions involving ethylene oxide. There were two instances in the past year when this substance, in combination with other organic chemicals, inexplicably entered into reactions which went out of control, and the resultant explosions were in each case exceedingly violent. In one case the ethylene oxide was reacting with certain mercaptans, and in the other with an alcohol. Circumstances alone prevented disastrous consequences.

A number of war research projects today are using or contemplating the use of ethylene oxide in reactions of this general nature.

The two explosions mentioned were both of a treacherous nature, since in each instance the reaction had been conducted successfully a number of times before it got out of control. The work can be done with safety if the proper precautions are taken, and it is recommended that the initial investigations be carried out in small quantities, using special bombs designed for pressures of 100,000 pounds per square inch and upward, in order to learn the safe limits of operating technique.

Electrolytic Tinplating to Save Tin

THE desperate necessity of conserving our tin has resulted in great dependence on the comparatively new electrolytic tinplating industry, which is now being expanded to take care of a large portion of the United Nations' tinplate needs, according to J. H. Hopper, General Electric Co., in a paper presented before the annual convention of the Association of Iron and Steel Engineers at Pittsburgh.

A year ago, there were only two continuous tinplating lines capable of handling strip 30 inches wide at speeds above 300 feet per minute. By the end of the year fourteen new lines will be in operation; by the middle of 1943 there will be 26, most of them designed to handle 36-inch strips at speeds above 600 feet per minute.

Typical Program Time and Temperature Cycle

Program Capacitrol

AUTOMATIC ENFORCEMENT of . . . . YOUR HEATING or COOLING CYCLES

Wheelco UNIVERSAL Controllers, with Program Control integrally incorporated, will permit you to produce MORE, BETTER — WITHOUT WASTE.

These Controllers provide dependable enforcement of any heating or cooling cycle, with completely automatic temperature regulation, plus the Proved-in-Service Superiority of "Electronic Principle" Control, which eliminates the faults inherent in all mechanical controllers.

Program Control is effected by means of a synchronous motor driven disc, which is so contoured as to move an arm, mechanically coupled to the temperature setting lever of a Wheelco "Electronic Principle" Controller, to produce the desired program. Discs can be contoured in your own shop.

UNIVERSAL Program Controllers are available as Capacitrols, Potentio-trols or Resistance Therm-otrols, and adaptable to all types of processes for measuring, indicating and controlling temperatures from −50 to +3600°F., or equivalent °C.

Write for your FREE copy of Bulletin No. Z6000.

National Power Show

ALREADY more than 150 exhibitors have taken space at the 15th National Exposition of Power and Mechanical Engineering, to be held at Madison Square Garden, New York, N. Y., November 30 to December 4. As heretofore, the power theme will dominate the exposition. The range of exhibits includes refractories, coal and ash-handling equipment, dust collectors, insulation, combustion controls, indicating and recording instruments for the power house, boiler tubes, pumping, piping, all types of valves, steam traps, steam specialties of many kinds, and a variety of power plant supplies.

Rosin's Good Qualities . . . PLUS

It's true that Poly-pale Resin is being substituted profitably for natural rosins. But in addition to rosin's good qualities, Poly-pale supplies values that are unobtainable with rosin.

For instance, Poly-pale is more widely and more completely soluble than rosin. It is not subject to rosin's well-known tendency to crystallize in certain processes.

Poly-pale Resin has a higher melting point, lower acid number, higher viscosity, and is practically free of metals. And Poly-pale Resin has a much lower rate of oxygen absorption than regular rosin, either gum or wood. Its derivatives, such as synthetic resins and resinates, tend to retain these superior qualities.

We have put the pertinent facts about Poly-pale —chemical and physical properties, data of use to formulators—in a revised 2nd edition of the booklet "Poly-pale Resin." Mail the coupon for your copy.

. . . The Choice of the War Industries

because

1 they are backed by 35 years of the broadest possible experience in the Process Industries

2 they offer the widest selection in filter types, each best for certain work.

DOES your filtration problem involve hot, sticky pulps . . . fast-settling solids . . . fine, suspended particles. . . . colloidal mixtures . . . corrosive solutions . . . volatile liquids . . . or just ordinary "run of mill" pulps?

Oliver United, with so many different types of filters at its disposal, can take care of problems just like those . . . has been doing so, in fact, for many years. Its experience covers all phases of filtration and clarification. Its record shows the installation of more than 16,000 filters of different types throughout the world.

Isn't it significant, then, that companies with vital war projects decided that Oliver United was the best place to contact for filters? Isn't it logical that you can find Oliver United filters today handling such vital war materials as Alumina and Aluminum—Copper—Magnesium—Chemicals such as Explosives and Arsenal Products—Steel—Catalysts and numerous other strategic products?

And *now* you will find Oliver United filters included in the Synthetic Rubber program with many under construction for that industry.

So, why not let Oliver United Engineers help you devise the proper filtration or clarification step for your problem?

Heat Transmission. *William H. McAdams.* 2nd ed. xiv + 459 pages. McGraw-Hill Book Co., Inc., 330 West 42nd St., New York, N. Y., 1942. Price, $4.50.

DURING the past 10 years the first edition of this book has been the standard reference and text for practicing and student engineers in all fields concerned with the transfer of heat. The stated purpose of this second edition is to make readily available to such engineers the many relatively inaccessible developments in heat transmission which have occurred since the first edition appeared. The result has been a complete, well-integrated digest of the entire literature with essential data presented clearly and in usable form. A quantitative idea of the extent of the literature in the last decade and the thoroughness with which it has been covered may be had from the excellent bibliography which has been increased from 414 to 789 references.

In the second edition the subject matter has been treated under the same chapter headings as before, but a new chapter entitled "Applications of Design" has been added which covers compactly the various factors influencing heat exchanger design, with special attention to optimum operating conditions. The section, "Heat Transfer to Boiling Liquids", is almost entirely new, and the chapter on "Radiant Heat Transmission" by Hoyt C. Hottel has been extensively revised. The other chapters have been thoroughly amended by the inclusion of new data which, in general, confirm previous correlations; new correlations cover, among other things, heating and cooling liquids in the streamline and transition regions, gravity flow of liquids in layer form, and flow past finned surfaces. New methods of calculation are given for net radiation between bodies within enclosures, unsteady conduction in special shapes, and two-dimensional heat flow. Under this last heading, reference might well have been made to the methods of Function Theory, a branch of mathematics which has been so much associated with the electrical field that its applications to other potential problems have not been widely recognized.

Worthwhile innovations are the addition of abstracts at the beginning and practice problems at the end of each chapter. The nomenclature has been revised to conform to accepted standards, but some inconsistencies occur—e. g., Y is used for the MTD correction factor in Chapter VI and F in Chapter XI. The tables of physical properties, etc., have been revised and expanded; it is unfortunate, however, that these include data on the viscosity of steam and the thermal conductivity of water which are now considered unreliable (Tables XXIV and XXVI in part). However, the reviewer has been advised by Professor McAdams of a proposed footnote to Table XXVI which will correct the data given therein.

In its revised form, this book should become increasingly useful as a text and as an authoritative source of information and reference in the field of heat transmission, and it should be the nucleus of any library in that field.

KARL A. GARDNER

Organic Reactions. Vol. I. Edited by *Roger Adams.* vi + 391 pages. John Wiley & Sons, Inc., 440 Fourth Ave., New York, N. Y., 1942. Price, $4.00.

THIS book, the first in a projected series, will be welcomed by organic chemists. Twelve type reactions have been selected for critical presentation, following this general pattern: historical introduction and mechanism, scope and limitations of the synthesis, tabular presentation of substances synthesized, experimental procedure for selected members. These reactions were presented: Reformatsky (by R. L. Shriner), Arndt-Eistert (W. E. Bachmann and W. S. Struve), Chloromethylation of Aromatic Compounds (R. C. Fuson and C. H. McKeever), Amination of Heterocyclic Bases by Alkali Amides (M. T. Leffler), Bucherer (N. L. Drake), Elbs (L. F. Fieser), Clemmensen (E. L. Martin), Perkin

✓ NEW TOOLS FOR THE PROCESS INDUSTRY

Amberlite

ION EXCHANGE RESINS

TYPICAL EXAMPLES OF THE WIDE FIELD OF USE OF THE AMBERLITES

✓ *FORMALDEHYDE PURIFICATION*

Aqueous formaldehyde, as normally produced by the catalytic oxidation of methanol, contains methanol, methyl formate, and formic acid as impurities. To the resin manufacturer particularly, this last impurity and its removal have presented a vexing problem.

When formic acid is neutralized by alkalies, the impurities in aqueous formaldehyde are increased, and when activated carbon is used the process is both cumbersome and expensive.

When aqueous formaldehyde is passed through a bed of AMBERLITE IR-4, not only is the formic acid removed without adding other impurities, but traces of copper, iron and other heavy metals are also completely removed.

✓ *SYNTHETIC RUBBER PRODUCTION*

AMBERLITE Ion Exchange resins are providing a timely answer to the problem of producing pure water economically and in the huge quantities required by the synthetic rubber industry.

Water passed through these synthetic resins meets the rigid requirements of purity required for processing synthetic elastomers since it is equal or superior to distillate or condensate.

Furthermore, the AMBERLITE process makes possible the production of pure water in almost unlimited quantities with a minimum of equipment and space for operations—important advantages in these materials-scarce times.

✓ *OTHER IMPORTANT APPLICATIONS*

Through the use of AMBERLITE Ion Exchange resins, excellent results have been obtained in many water conditioning processes, including softening of water and reduction of bicarbonate alkalinity.

The versatile AMBERLITES are highly valuable in the recovery of copper, manganese, nickel and other strategic materials from wastes. The purification of fine chemicals, drugs and dyestuffs is another important AMBERLITE application.

For detailed information on AMBERLITE resins, write today. The Resinous Products & Chemical Company is the only company licensed to produce these synthetic resins in the United States.

OTHER RESINOUS PRODUCTS & CHEMICAL COMPANY SYNTHETIC RESIN DEVELOPMENTS

Synthetic Resin Plywood Adhesives

TEGO—a phenolic resin film, is the standard plywood adhesive where maximum durability is essential. AMBERLITE — water soluble phenol formaldehyde resin adhesives, and UFORMITE — urea formaldehyde resin adhesives, cover a wide range of applications in the plywood industry.

Synthetic Resins as Coatings

AMBEROLS (modified oil-soluble phenol formaldehyde resins) paved the way for the modern, quick-drying varnishes. DURAPLEX alkyd resins, UFORMITE urea formaldehyde resins, and ACRYLOID polymers of acrylate and methacrylate esters have extended the use of synthetic resins in paints, varnishes, lacquers, printing inks, coated fabrics, and floor coverings, and are now being used extensively to speed our victory program.

Resin Emulsion Paints

The use of alkyd resin emulsions as clear coatings, primers, and — in pigmented form — as paints, has resulted in coatings requiring no volatile solvents. This emulsion, AQUAPLEX, is the base for quick-drying paints.

Paraplex Resins

PARAPLEX resins are tough, rubbery products of varying softnesses, outstanding as resin plasticizers for nitro-cellulose and ethyl-cellulose.

THE RESINOUS PRODUCTS & CHEMICAL COMPANY

HAND OPERATED WASH BOTTLE

No contact with the mouth is necessary. Compression of the rubber bulb produces a forceful, steady stream of fluid which can be conveniently directed to any desired point—a one hand operation. For most effective operation, the flask is held as illustrated, with the fingers gripping the rubber bulb. Simple design permits exceptionally sturdy construction.

S-9380—SARGENT HAND OPERATED WASHING BOTTLE. Consisting of Pyrex glass ring neck, flat bottom flask, delivery tube and pressure bulb.

Capacity	500 ml	1000 ml

(J. R. Johnson), Acetoacetic Ester Condensation (C. R. Hauser and B. E. Hudson, Jr.), Mannich (F. F. Blicke), Fries (A. H. Blatt), and Jacobsen (L. I. Smith).

Most of the chapters are 25 to 40 pages long, with extremes at 14 and 56 pages. Clear expository writing, excellent covering of subject matter, and uniform editorial supervision stand out as features in each chapter. The commendable practice is retained of placing references at the bottom of each page. The physical make-up of the book is all that could be desired. Subsequent volumes in the series will be awaited with interest.

CHARLES D. HURD

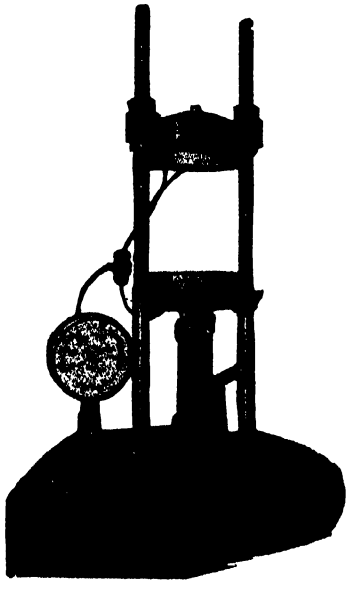
Physical Chemistry. *Frank Thomson Gucker, Jr.*, and *William Buell Meldrum.* 1st ed. 683 pages. American Book Co., 88 Lexington Ave., New York, N. Y., 1942. Price, $4.00.

THIS is an introductory text for a two-semester course in physical chemistry. By selecting appropriate portions it may be adapted to a one-semester course. The topics covered are those found in most elementary texts on physical chemistry, with somewhat more attention given to subjects of particular interest to premedical students. An entire chapter is devoted to osmosis and osmotic pressure, another to indicators, and a third to enzymes. The discussion of photochemistry is confined to a single reaction, and except for the parachor there is no reference to any relationship between physical properties and molecular constitution.

In the reviewer's opinion the segregation of some of the mathematical derivations will convince the student either that the mathematics is too difficult for him, or that it is not essential to an adequate understanding of physical chemistry. Most students will benefit by having struggled with these derivations, even if they never comprehend them fully. That they are essential is confirmed by the presence in the remainder of the text of frequent references to the derivations in the last chapter.

The book is characterized by exceptional clearness and appears to anticipate many of the difficulties which the beginning student might have. The results of recent research are included where significant and are well blended with the older work. Occasionally one regrets the simplifications. For example, on pages 91–3, the discussion on the heat capacity of gases would have been more realistic had it considered both the contribution of the vibrational degrees of freedom to the residual energy and the application of the quantum theory.

There are not many errors. On page 162 the figure is a plot of C_v, although one would infer from the text that C_p is plotted. On the following page it appears that the θ of Debye is identical with the θ of Lewis and Gibson, which is not the case. On pages 593 and 596 the temperature of the triple point for water should be +0.0098°. In calculating the figure given in the text the effect of dissolved air in the water at the freezing point was neglected. The formulas for N_2, N_2O, and NO on pages 68 and 69 are not consistent with the best physical data.



The text is amply supplemented by graphs and tables of experimental data and the laboratory methods by which such data are obtained are adequately described. The problems and exercises, included at the end of nearly every chapter, are simple. Each chapter closes with a reading list, accompanied by brief statements of the scope or difficulty of the book or journal article referred to. A table of atomic weights gives the names of the investigators who determined the most recent values, with the date and the method by which each atomic weight was determined. Throughout the book are attractive photographs and brief, informative footnote biographies of eminent

chemists. More than ordinary effort has gone into the mechanical features, such as the index, detailed table of contents, list of symbols used, and typography. The book represents an interesting and welcome addition to the already large number of texts in the field of physical chemistry.

WALTER B. KEIGHTON

Elements of Heat Transfer & Insulation. *Max Jakob* and *George A. Hawkins.* 1st ed. John Wiley & Sons, Inc., 440 Fourth Ave., New York, N. Y., 1942. Price, $2.50.

THIS book represents a definite contribution to the literature on heat transfer and is especially valuable to students as an introduction to the subject. The work seems to cover the entire field in a general way and includes several chapters on phases of the subject which are not generally covered in other texts. The engineering designer looking for a satisfactory reference book will perhaps be somewhat disappointed in this work. As such it appears to devote too much attention to the derivation of formulas and might well include more charts and design curves.

The authors have included numerous examples and have gone to unusual detail in outlining the method of solution. The chapter on thermal conductivity appears to cover the subject particularly well. It includes many useful tables on thermal conductivity of vapors, liquids, and insulating and refractory materials, together with conductivity of metals and alloys. The chapter on conduction of heat in the unsteady state describes in great detail the derivation of formulas covering this phase of the subject. Much of the information in this chapter is not generally found in most other texts on heat transmission. The subject of steady state heat conduction in bodies with heat sources is treated briefly in this book.

I found the chapter on introduction to the dimensional analysis of convection extremely interesting and instructive reading and recommend it highly for anyone interested in the fundamental basis of heat transfer and fluid flow relations.

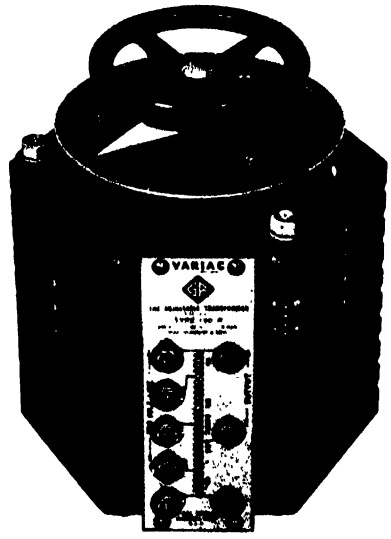
Some readers may be disappointed in the manner in which the chapter on heat transfer by forced convection is presented. The authors might have devoted considerably more space to this important phase of heat transfer. It has been fairly well established that the rates of heat transfer for fluids in turbulent flow of pipes cannot be represented accurately by a single formula as was attempted by the authors. This, of course, does not apply when dealing with liquids in streamlined flow through pipes and a single formula as shown by the authors has been found to correlate experimental data in a satisfactory manner. Transfer rates for heating of fluids flowing normal to banks of staggered tubes is again presented by the authors in a single formula. Such a formula definitely will not cover this type of flow from the turbulent region through the viscous region and a curve might better have been used. This chapter might well have included reference to methods of calculating heat transfer rates for flow normal to banks of tubes in line and on the outside of tubes in baffled heat exchangers.

The chapter on heat transfer by the combined effect of conduction and convection presents information which is not generally found in older texts on heat transmission. This chapter derives the formula for log mean temperature difference for the simple cases of parallel and contraflow but does not introduce the very useful and generally accepted correction curves for mixed flow.

The authors devote little space to heat transfer in condensing and boiling. They might well have presented a portion of the most up-to-date data on these two interesting subjects. The knowledge of these subjects is in a rapid state of flux and recent formulas for calculating heat transfer rates in these phases of the subject are very empirical and do not lend themselves readily to mathematical analyses. This might have led the authors to devote such a small amount of attention to this chapter.

A good general introduction on the subject of heat transfer by radiation is included. The final chapter of the book entitled "Heat Transfer and Pressure Drop" presents interesting sidelights to the subject, including the basic idea of Reynolds analogy, but includes no really useful fluid flow relations.

The book is interesting and instructive and should constitute a worthwhile addition to anyone's library on the subject of heat transmission.



E. N. SIEDER

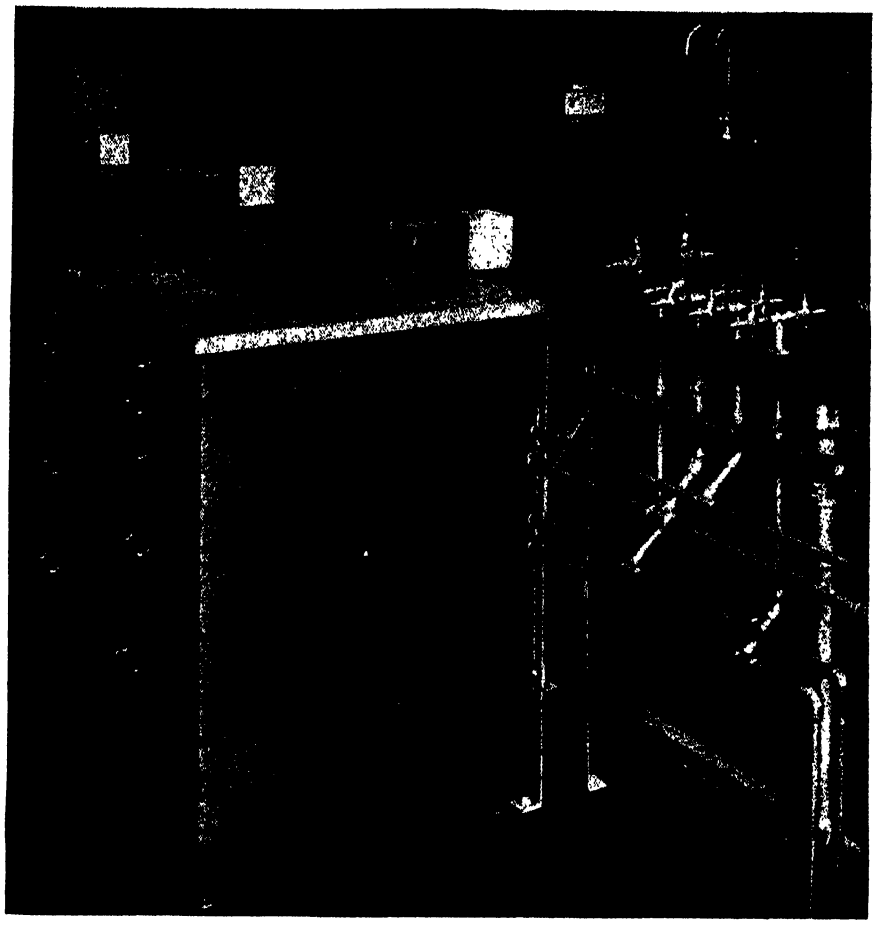
Combustion Efficiencies in Domestic Heating Plants

CIRCULAR 44, "Combustion Efficiencies as Related to Performance of Domestic Heating Plants", by Krats, Konzo, and Thomson, is a 30-page booklet available at 40 cents a copy from the University of Illinois, Urbana, Ill.

VARIACS are widely used in Heat Control

For ovens, heaters and furnaces, as well as for centrifuges and other A-C operated devices which must operate at exactly the right voltage, General Radio Variacs provide the desired control. There are 9 models with power ratings from 170 watts to 7,000 watts. The smaller sizes are particularly well adapted for use in laboratory and experimental set-up to demonstrate or prove chemical process equipment.

The use of Variacs in a typical heat control system was described in a recent article in Industrial and Engineering Chemistry. Reprints are available and a copy will gladly be sent on request. Ask for Bulletin No. 796.



VARIAC—*the original continuously variable autotransformer supplying an output voltage from zero to above line voltage.*

The Bell Laboratory...new and different in design

A new idea in laboratory design, movable individual units with tops of Alberene Stone, created by Bell Telephone engineers and Voorhees, Walker, Foley and Smith, Architects, for Bell Telephone Laboratories, Murray Hill, N. J.

...uses time-proven Alberene for working surfaces

Photograph shows four typical units set up, and space for another. The laboratory contains hundreds of them, all with Alberene Stone tops. Some units, such as the one in the background, are equipped with sinks. In addition to supplying this material, we dismantled Alberene Fume Hoods, long used in the Bell Telephone Laboratories in New York City, moved them to Murray Hill, N. J., and reassembled them; additional proof of the lasting economy of Alberene Equipment.

Despite the heavy demand for our material due to Industry's Victory Drive, ample stocks are available and shipments can be made promptly. Your inquiry will have immediate, executive attention.

Polarimetry, Saccharimetry, and the Sugars

THE increasing applications of polarized light, especially in carbohydrate chemistry, has led to many requests for information. In Circular 440, National Bureau of Standards, by Frederick J. Bates and associates, an attempt is made to answer such inquiries. Emphasis has been placed on the applications of polarimetry in carbohydrate chemistry.

The subject matter presented is divided into five parts. The first, consisting of 115 pages, covers an original mathematical treatment of the physical phenomena and a description and discussion of the physical equipment, such as polarimeters, saccharimeters, and accessory apparatus utilized in the study and applications of polarized light.

Part II, 275 pages, relates to the analysis and properties of sugar products such as raw and refined sugars, honey, and sirups. It includes an extensive discussion of the polarimetric and chemical methods utilized for the determination of sucrose, invert sugar, reducing sugars, pentosans, dextrose, levulose, and other sugars. Sections are devoted to the important physical properties of the sugars and their solutions, notably density, refractive index, color, turbidity, viscosity, acidity, electrical conductivity, solubility, and boiling point.

Part III, 140 pages, is devoted to the preparation and properties of the sugars and their derivatives. It includes discussions of the optical activity of organic compounds and of the structures, configurations, and reactions of the sugars. Methods are given in detail for the preparation of 24 important sugars and for numerous sugar derivatives. The text is supplemented by an extensive table which lists the important sugar derivatives and gives physical constants and literature references.

Part IV, 9 pages, gives general information concerning the standard samples of sucrose and dextrose issued by the bureau and concerning tests of equipment which the bureau is prepared to conduct.

Part V, 235 pages, contains 78 reference tables of numerical data and a résumé of the work of the International Commission for Uniform Methods of Sugar Analysis and the United States Customs regulations governing the weighing, taring, sampling, classification, and polarization of imported sugars and molasses.

RAYMOND Laboratory Mill

. . . an ideal unit for TECHNICAL SCHOOLS and ENGINEERING COLLEGES

This compact grinding mill... long popular among industrial laboratories...is widely used for class instruction work and student research courses in chemical and physical laboratories.

It offers special advantages for such purposes:—

Simple to operate — Motor-driven with hand-operated feeder. May also be furnished with power-feed, using a separate variable speedmotor.

Fineness control — By changing screen, see illustration below. Set of 5 screens with different size perforations, supplied with mill.

Accurate results — Produces the *same character* of finished material as large commercial pulverizers . . . an important feature in developing new products.

Easy to take apart — Removable cover gives quick access to grinding chamber for cleaning or changing screens.

Sturdy construction — Will stand hard service, and grind any dry material except abrasives.

Interior view of Raymond Laboratory Mill, showing rotor with swing-hammers and screen in base of mill.

Raymond Laboratory Mills and Separators will be on display in our Booth #111 at the Chicago Chemical Show, Sherman Hotel, Nov. 24-29.

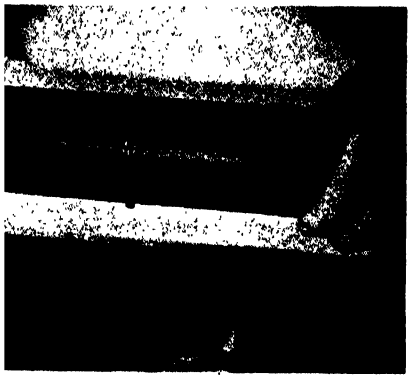
Surface Area of Colloidal Carbons

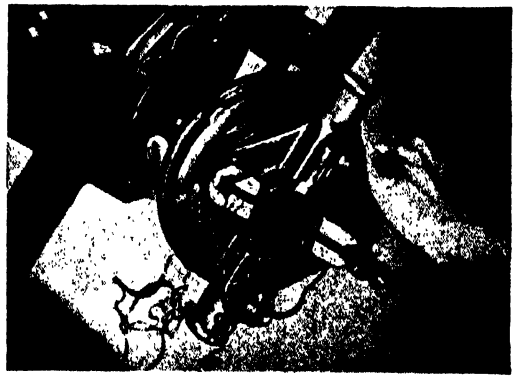
VOLUME III in the series on Columbian colloidal carbons has recently been issued by the Columbian Carbon Co. Research Laboratories, New York, N. Y., as a 96-page booklet entitled "The Surface Area of Colloidal Carbons". This is very well illustrated by photomicrographs and charts, and includes a bibliography of 69 items. It is the first important research to be completed in the field of the electron microscope.



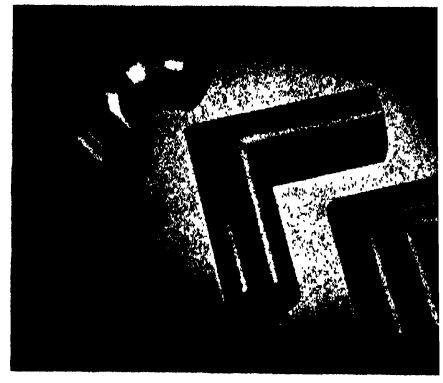
The discussion is divided into two parts, the measurement of surface area by the electron microscope, and the role of surface area in rubber reinforcement. Studies conducted during the past six months have shown that the role played by surface area is even more essential in synthetic rubbers than in natural rubber, and the importance of carbon structure has been confirmed.

Achievements in Chemistry

A BIBLIOGRAPHY of achievements in chemistry from 1930 to 1941, by Lloyd McKinley, head of the Department of Chemistry, University of Wichita, Kansas, has been issued as Bulletin 11 of the University of Wichita. This is a 60-page booklet, available at 15 cents a copy, which lists achievements in chemistry under 48 headings, from abrasives to x-rays, in addition to 55 periodicals, and 73 book publishers.



Welded in one minute!



Saran pipe is easily welded by pressing lengths together after heating on 350°F. hot plate. Joint has strength equal to that of the pipe itself.

Threaded with standard tools!

Saran pipe can be threaded with standard pipe threading equipment. Operation exactly parallels cutting of standard pipe threads on metallic pipe.

Welded joints easily made

Standard welded fittings, such as tees and elbows, are easily fabricated with saran pipe. Standard flanges available in sizes ½"-2".

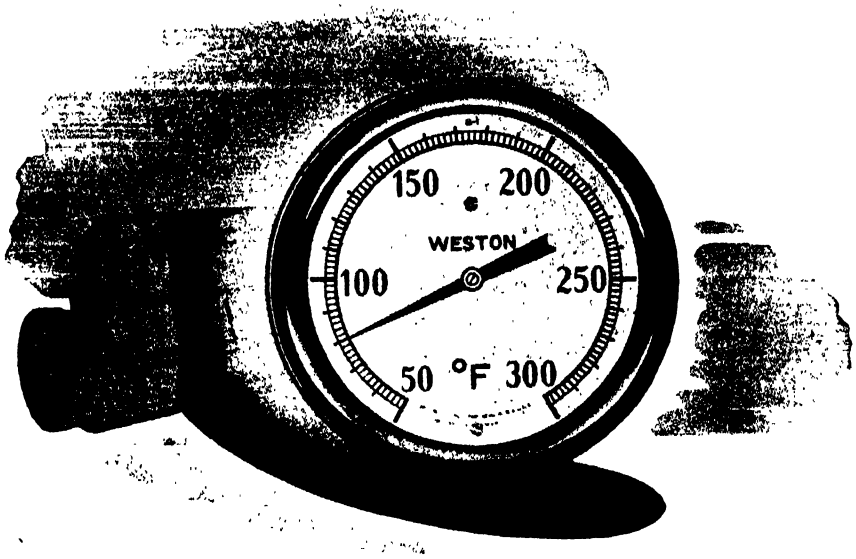
THE PICTURES above answer three basic questions about the new saran pipe. Equally important is its remarkable chemical resistance. These factors give this first practical thermoplastic pipe almost unlimited possibilities in the chemical industry.

Saran pipe is noncorrosive, non-scaling, and is heat resistant to 170° F. Furthermore, the weight of saran pipe is only ¼ the weight of comparable sizes of iron pipe!

The wide adaptability of saran pipe suggests countless applications saving strategic rubber and metals as well as valuable time. Write to the Plastics Sales Division for free booklet, "Practical Data on a New Plastic Development."

THE DOW CHEMICAL COMPANY, MIDLAND, MICHIGAN

War Control Handbooks



Two new war control handbooks, one digesting price and priority regulations and the other summarizing controls on imports and exports, have just been published by the *N. Y. Journal of Commerce.*

Every OPA price ceiling or rationing order and every WPB L, M, and P regulation is covered in the 32-page "War Controls Guide". Industries and commodities are listed alphabetically along with a brief digest of the various OPA and WPB regulations and amendments affecting each item. Over 2,100 individual rulings have been edited, weeded out, and indexed.

The "Import-Export Control Index" lists all existing controls in imports and exports along with the shipping priority rating and licensing symbols assigned to the various commodities. The import section includes a complete breakdown of WPB Order M-63 and an outline of the forms and information importers are required to furnish. Commodity numbers, general license ranges, and shipping priority ratings are presented in the export section.

Copies of either handbook may be had at 25 cents each from the *N. Y. Journal of Commerce*, 63 Park Row, New York, N. Y.

THE ALL-METAL THERMOMETER

stands shaking up...without breaking down

The reason why the WESTON Thermometer can "take it" is found in its simplified, all-metal construction. There is but one moving element, and even that part is made of enduring metal. There is no gas or liquids . . . no capillary . . . no fragile members. Thus the WESTON not only resists ordinary breakage but it also stands up in applications where vibration is present . . . maintaining its high initial accuracy (within 1% over entire scale) over far longer periods. Available in types, sizes, ranges and stem lengths for Diesel and many industrial applications. Descriptive literature available on request. Weston Electrical Instrument Corporation, 660 Frelinghuysen Avenue, Newark, N. J.

WESTON all-metal temperature gauges are available in both angle and straight stem types; scale diameters up to 6"; stem lengths from 2" to 24".

WESTON *All-Metal* TEMPERATURE GAUGES

Storage of 1,3-Butadiene

Because of the importance of synthetic rubber to the war program and the lack of experience in the storage of the raw materials used in its manufacture, the Pittsburgh–Des Moines Steel Co., through its Chemical Storage Fellowship at the Mellon Institute, Pittsburgh, Penna., has prepared Research Bulletin 7.381-B, which reports work on 1,3-butadiene. This is a 36-page publication, illustrated with tables and charts. The research indicates that 1,3-butadiene should be stored at about 32° F.

Bulletins on the storage of styrene, isobutylene, and acrylonitrile are in preparation.

Identification of Fibers and Fabrics

The Research Bureau for Retail Training, University of Pittsburgh, and the Fisher Scientific Co. have published a little 56-page booklet on "Identification of Fibers and Fabrics", which was produced with the cooperation of the Multiple Industrial Fellowship on Commodity Standards of Mellon Institute. The booklet gives the procedure of testing, with appendixes of the fabric families, classification of fabrics according to fabric families, and man-made fibers. Copies may be purchased for 80 cents each from the university or from the Fisher Scientific Co., 717 Forbes St., Pittsburgh, Penna.

Standards on Coal and Coke

The American Society for Testing Materials has issued its 1942 edition of the compilation covering 27 methods, specifications, and definitions of terms developed through its Committee D-5. Changes include modifications in standard methods of laboratory sampling and analysis of coal and coke (D271-42). The compilation includes specifications for classification of coals by rank and by grade, requirements for gas and coking coals, and specifications for sieves for testing purposes.

Copies of this 130-page publication may be obtained from the A. S. T. M. Headquarters, 260 South Broad St., Philadelphia, Penna., at $1.35 per copy.

Manual Sheet TC-4 of the Manufacturing Chemists' Association is a 9-page leaflet, which forms the first comprehensive instruction sheet of a general nature to be issued covering the unloading of tank cars containing inflammable liquids. Copies may be obtained from the association, 608 Woodward Bldg., Washington, D. C., at 12 cents each.

Learn new uses of alternates and substitutes

Attend the

1942 NATIONAL CHEMICAL EXPOSITION

AND

NATIONAL INDUSTRIAL CHEMICAL CONFERENCE

★

Chicago

Sherman Hotel

December 24–29

Chemistry has gone to war! Research directors, chemists, plant managers, engineers and executives who attend the Exposition, will find a vast store of knowledge available concerning new methods and materials. Men high in their respective fields will impart interesting data vital to both America's war effort and to civilian economy.

INDUSTRIAL MOVIES

A continuous showing will provide a liberal education in chemical processing. Subjects covered will include plastics, rayon, chemical stoneware, glass, bread, coke, white lead, glass insulators, gelatin capsules, steel, aluminum and many others important to the American way of life.

COMMERCIAL EXHIBITS

An imposing list of leaders in every field will display and introduce many new items to the profession. These remarkable exhibits, in themselves, will completely justify attendance.

SCIENTIFIC EXHIBIT

The "Electronic Microscope" will be exhibited by RCA Manufacturing Company. See actual micrographs from this Electronic Microscope.

SPECIAL EXHIBITS

The War Production Board (W.P.B.) exhibit demonstrates reclamation and recovery of vital chemical products.

"Successful alternates and substitutes"—the extensive exhibit prepared by Dr. Harrison E. Howe.

"New Chemicals"—a significant exhibit by W. J. Murphy.

Robert E. Wilson to Receive Perkin Medal

ROBERT E. WILSON has been selected to receive the Perkin Medal of the Society of Chemical Industry for 1943. This medal is awarded annually for outstanding work in applied chemistry and the medalist is selected by a committee representing the five chemical societies in the United States. The medal will be presented on January 8, 1943, at a meeting to be held at The Chemists' Club, New York.

In 1922 Dr. Wilson became assistant director of research of the Standard Oil Co. of Indiana, where he did outstanding work in pioneering the application of chemical engineering principles in the oil industry. In 1929 he was placed in charge of the newly formed Development and Patent Department, and in 1931 became a director and in 1933 a vice president of the company. In January 1935 he became vice chairman of the Pan American Petroleum & Transport Co. Outstanding achievements have been made in the development of refining processes under his direction. Since February 1937 he has been president of the Pan American Petroleum & Transport Co., The American Oil Co., and other subsidiaries.

Dr. Wilson is a Director of the AMERICAN CHEMICAL SOCIETY and a member of eight scientific organisations.

Perry R. Cassidy, former executive assistant, The Babcock & Wilcox Co., is now lieutenant colonel in the Engineer Corps, U. S. Army.

Bradley Dewey, president of the Dewey and Almy Chemical Co., Cambridge, Mass., has been appointed deputy rubber administrator by William M. Jeffers, and is on leave of absence from his company for the duration. This company, one of the pioneers in synthetic rubber research in the United States, was the second in this country to use rubber latex on a commercial scale and one of the first to substitute synthetic rubber for the natural product. In 1938 Colonel Dewey visited many of the leading European rubber factories

Bradley Dewey

and laboratories and returned to the United States to start intensive research in Buna S rubber. Materials to erect a synthetic rubber plant with its own funds were granted the company in December 1941 and the plant went into operation in August.

Esther A. Engle has accepted a position with the Technical Service Division of the Commercial Solvents Corp., Terre Haute, Ind. The duties of this division include the introduction of the company's new products and the preparation of technical literature and advertising. Miss Engle was formerly of the Chemistry Department of Cedar Crest College, Allentown, Penna., and Chairman of the Lehigh Valley Section of the AMERICAN CHEMICAL SOCIETY.

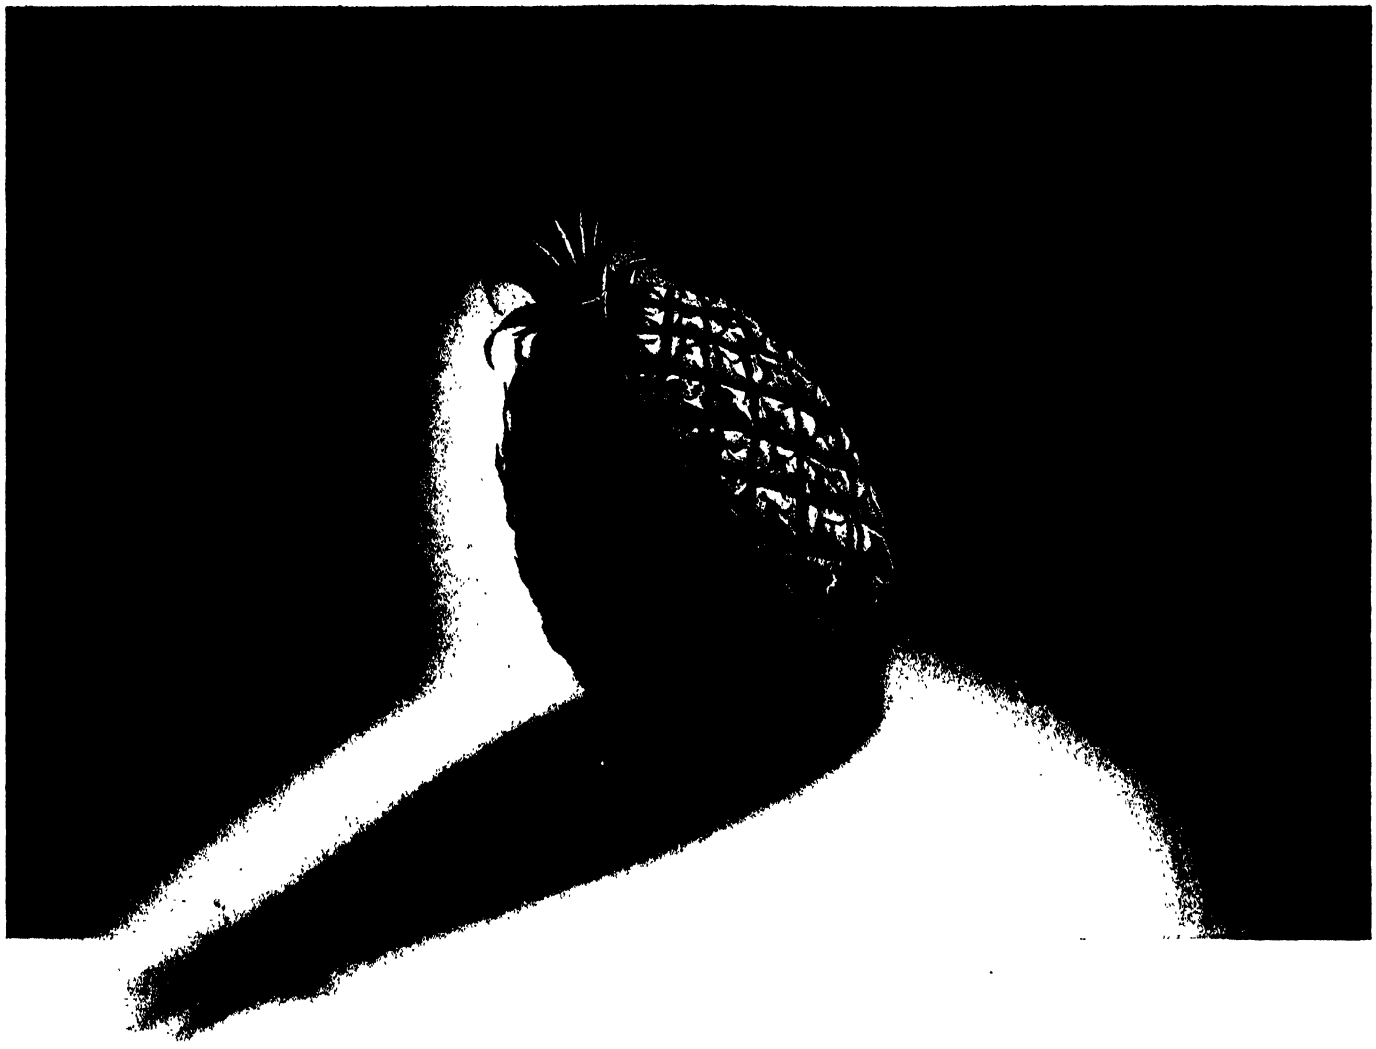
Ernest R. Epperson has been named research instructor in the Department of Chemistry and Chemical Engineering at the Michigan College of Mining and Technology, Houghton, Mich. Mr. Epperson was formerly with the Missouri State Highway Department, Bureau of Materials and Tests.

I. **Fankuchen,** formerly of Cambridge University, England, has been added to the graduate teaching staff of the Polytechnic Institute of Brooklyn. He will present a lecture and laboratory course in "Chemical Analysis by X-ray and Electron Diffraction Methods".

Dean Cobleigh Becomes Acting President of Montana State College

THE Montana State Board of Education announced September 16 the appointment of Dean William M. Cobleigh as acting president of Montana State College to succeed President A. L. Strand, who resigned October 15. Dean Cobleigh has been active in chemistry and engineering since he was first appointed to the faculty of Montana State College in 1894 as assistant in chemistry. In 1907 he became head of the Department of Chemistry and held that position until 1929 when he was made dean of engineering and professor of chemical engineering.

Margaret Garver has been appointed assistant biochemist at the Armour Research Foundation, as the first woman on the research staff. Miss Garver was on the administrative staff of the foundation before her new appointment, in charge of the National Registry of Rare Chemicals.



Henry J. Guzewicz and **Joseph E. Moran,** formerly associated with The Dicalite Co., are now serving in the armed forces of the United States.

Anson R. Kendall has accepted a position as assistant professor of chemistry at the Michigan College of Mining and Technology. He was formerly professor of chemistry at Dakota Wesleyan University.

William S. Kennedy has left the War Department, Elwood Ordnance Plant, and has accepted a position as associate engineer in the Engineering and Operations Division, Pantex Ordnance Plant, Amarillo, Texas.

C. G. Kirkbride has been placed in charge of all chemical engineering development being conducted by the Field Research Laboratory of the Magnolia Petroleum Co., Dallas, Tex. He was employed previously by the Pan American Refining Corp., Texas City, Texas.

Gordon M. Kline, chief of the Organic Plastics Section, National Bureau of Standards, recently returned from Great Britain, where he spent a month observing developments in war applications of plastics. During his visit he was guest speaker at luncheon meetings of the British Plastics Federation, the Plastics Group of the Society of Chemical Industry, and the annual meeting of the Institute of the Plastics Industry in London. Dr. Kline made the trip as a representative of the U. S. Government in response to an invitation from the British Ministry of Supply.

TOUGH CUSTOMER!

Take a look at this . . . then consider about a pint and a half of pure yellow juice. A big order, but that is what the beverage industry expects from the average pineapple . . . and that is what it gets.

Fifteen years ago this statement could not have been made. A pineapple *was* a pretty tough customer. Armored shell disposed of, the crushed pulp contains fibres, grit and foreign matter . . . all of these filtration removed but left an almost colorless liquid of inferior nutritive value . . . and far from the pineapple juice we drink today. Centrifugal force scientifically applied gave the desired answer.

At high rates of through-put the Sharples Super-Centrifuge was able to select between the undesirable solids and those proteins and albumens that contribute so much to taste and nutrition.

There is no other way in which the wanted and unwanted solids can be so separated, and Sharples Centrifugals have become standard equipment in the pineapple and many other fruit juice industries.

Colonel H. A. Kuhn, Commanding Officer of the New York Chemical Warfare Procurement District for the past four years, has been assigned to duty in the

Colonel H. A. Kuhn

Office of the Chief, Chemical Warfare Service, Washington, D. C. His position as Commanding Officer of the New York District has been assumed by **Colonel Patrick F. Powers.**

Josiah K. Lilly, chairman of Eli Lilly and Co., has been named the 21st recipient of the Remington Medal, in recognition of his distinguished services to pharmacy.

Members of the AMERICAN CHEMICAL SOCIETY receiving awards in the $200,000 progress program of the James F. Lincoln Arc Welding Foundation are **Carlton G. Lutts**, Boston Navy Yard, who received a $500 award, and **L. P. Skinner, Jr.**, Southern Acid & Sulphur Co., Inc., Port Arthur, Texas, who received a $100 award.

Lieutenant Colonel Willard Machle is now with the Armored Force Medical Research Laboratory, Fort Knox, Ky., where he is serving as director of research. The laboratory is to concern itself with physiological and medical problems arising in the operation of armored vehicles.

George M. Machwart has left the University of Maryland to join the chemical engineering faculty of the Michigan College of Mining and Technology as associate professor. He will aid in the installation of the new chemical engineering laboratory now being completed.

E. T. Mitchell has resigned his position as a member of the faculty of the College of the Holy Cross, where he taught for the past four years, and has joined the research staff of the B. B. Chemical Co., Cambridge, Mass.

Thomas H. Miller has been named chief of the Metals Economics Division, Bureau of Mines, U. S. Department of the Interior, Washington, D. C.

Harry S. Owens is now employed as an assistant chemist at the Western Regional Research Laboratory, Albany, Calif. He was previously assistant professor of chemistry at the University of Idaho.

The following received Ph.D. degrees in agricultural and biological chemistry at The Pennsylvania State College in August 1942 and have accepted appointments as listed: **James Russell Oyler**, Nutrition Foundation Research Fellow at Columbia University; **Isadore Zipkin**, first lieutenant, Sanitary Corps, U. S. Army; **Laurence L. Layton**, Research Department, Distillation Products, Inc., Rochester, N. Y.; **Gertrude H. Spremulli**, Ranger Aircraft Engines, Farmingdale, L. I., N. Y.; **Seymour S. Block**, Joseph E. Seagram & Sons, Lawrenceburg, Ind.

Henry A. Roemer, Jr., formerly manager of sales of steel and wire products, has been made assistant general manager of sales of the Pittsburgh Steel Co., Pittsburgh, Penna., and **Norman F. Melville** has succeeded him as manager of sales.

OK'd by the Best!

Sure we're bragging, but—when companies like duPont, Socony-Vacuum, Shell Oil and Warner Quinlan use our tachometer we've got a right to be proud. Portable—less than 2 lbs. in weight, Jones Hand Tachometers are ideal for speed and rating checks on revolving platens, generators, turbines and motors of all types.

DO YOU HAVE A PROBLEM IN *ASPHALT SPECIALTIES?*

Are you having difficulty finding asphalt specialties to meet your individual requirements . . . a source of supply that you can rely upon to give *specialized* service?

Wishnick-Tumpeer, Inc. is equipped to give you this service. Our two centrally located refineries are designed specifically for selectively blending and processing asphalts to exact customer requirements. These products are Pioneer Asphalt Specialties—known for more than forty years for high quality. Once a specification has been established, Pioneer products are controlled carefully to these standards during the refining process and are subject to rigid laboratory inspection. Through its pilot plant the laboratory can manufacture finished products in which the asphalt specialties are used. Thus tests can be made from the customer's own viewpoint, and our staff of trained technologists and engineers is in a position to make recommendations for improvements and help to eliminate undesirable factors.

Among the industries served by Wishnick-Tumpeer are the rubber, paint, paper, roofing, insulation, refrigeration, road building, construction and waterproofing industries. The Pioneer line is a complete line and Witco service is specialized service. Let us help you solve your problems in asphalt specialties.

The L. S. O. G. Exchange

Edited by A. A. Ashdown, Ed. F. Degering, J. E. Hawkins, and S. L. Redman

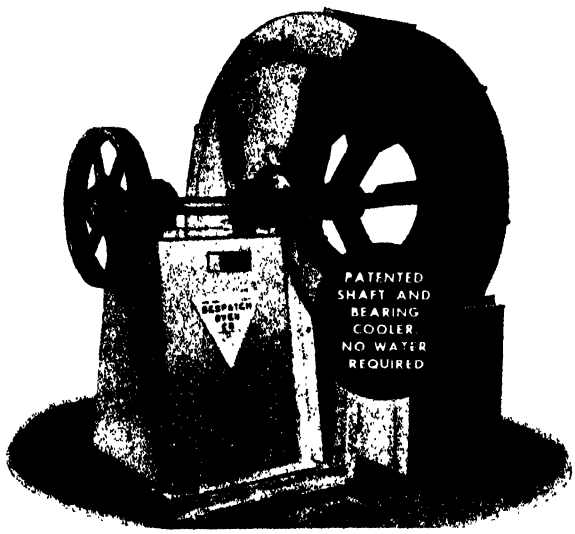
Send items to Ed. F. Degering, Department of Chemistry, Purdue University, Lafayette, Ind.

THE Montana Section of the A. C. S. was chartered April 30, 1928, after a campaign of some two years to obtain a membership large enough to petition for a section. The section endeavors to band together the chemists in the state so that they can become acquainted with each other and work harmoniously to further the profession of chemistry in a territory where individual chemists are separated by great distances. It is thought that affiliation with the A. C. S. facilitates bringing these scattered chemists together, for this affiliation makes it possible to have more outside speakers.

With the nearest section about 500 miles away, the travel expense to Bozeman has been great. The problem has been to finance outside-speaker expenses, although section members cheerfully pay additional assessments for this purpose. In the early days of the section's existence its small $50 yearly budget did not even permit one outside speaker except through cooperation with other sections in the Northwest. This very unfortunate condition was somewhat relieved through the persistent efforts of Edward Lyons of Parke, Davis and Co., and others. It is now possible to have a larger number of outside speakers through cooperation with the national office. It is felt, however, that there is still a need for more speakers for the smaller sections.

Acquiring new members outside the state educational institutions has been difficult because most of the industrial chemists of the state are connected with mining, smelting, or the production of such things as sugar, petroleum products, cement, fertilizer, and sulfuric acid. Since these people have rather specific interests, it is difficult to get them to come to meetings that are held 100 to 200 miles away. To try to overcome this condition two of the meetings each year have been held in Butte, Helena, Missoula, or Anaconda nearer these people in industry and with programs of interest to them.

The programs are usually kept fairly general in order to interest as large a percentage of the membership as possible as well as nonmembers in related lines. Reports of members who have attended national meetings also help to maintain interest.



Members of the Montana Section are loyal boosters, and it is seldom that some do not drive from 100 to 200 miles to attend monthly meetings.—RAY WOODRIFF, *Montana Section.*

Washington Section Claims Oldest Officer

ON SEPTEMBER 12 Christian Heurich, one of the members of the board of managers of the Chemical Society of Washington, celebrated his 100th birthday anniversary. Mr. Heurich is president of the Christian Heurich Brewing Co. of Washington, D. C., and has been a member of the AMERICAN CHEMICAL SOCIETY for 35 years.

THE daily papers a few days ago carried a dispatch from Alabama to the effect that Private Theodore E. Borst of Clinton, N. Y., had sold a patent in the field of agricultural chemistry to the du Pont organization. Private Borst is a member of the 54th Chemical Company, entering the army from Middletown, Conn. Further inquiry reveals that some error was made, inasmuch as du Pont has never purchased a patent from Private Borst and never has had any patent negotiations with him.

NEW 1600°F. FANS

Despatch announces a complete line of all welded heavy duty acid resistant fans having capacities ranging from 1000 to 20,000 C.F.M. These fans have been thoroughly tested on Despatch ovens and dryers over a period of seven years. They are now offered to the trade for the first time.

Choose a Despatch fan for your next heavy duty, acid resistant fan requirement. Note the improved performance and the long trouble-free service it will provide.

Write for design and construction details, prices and performance data.

New Containers

CREATION of new types of containers to meet the conditions of war is one of the more important packaging developments which have taken place in the last year and a half, the WPB reports. The containers industries are highly specialized, and, as a result, have not been able to convert their facilities to the production of a large volume of direct war items. "Conversion" in the containers industries has meant instead, the invention of new types and adaptations of old types to meet the peculiar requirements of war.

The steel shipping container industry, for instance, has turned out an American version of the "blitz" can, a multi-purpose 5-gallon can which is used by the armed forces for carrying all sorts of liquids. This container can be used for water, oil, or gas, and can be carried by one or two soldiers. Although made of heavy steel, the cans are designed to float even when full. Another new type of container is a heavy paper-board carton which has been designed for overseas shipments. Not long ago, it was thought impossible to ship commodities abroad in anything less than wood or wire-bound boxes.

Jars and bottles, replacing metal cans for distribution in civilian channels, and for the Army in some instances, are being furnished by the glass container producers. The collapsible tube industry is producing tin and lead tubes for burn ointments, medicinal products, and of course, shaving cream and toothpaste.

Butadiene from Grain

AUTHORIZATION to build a pilot plant for making butadiene from grain by first fermenting the grain to produce butanediol has been received from the Rubber Reserve Co. by Joseph E. Seagram & Sons, Inc., and work on the plant in Louisville already has begun.

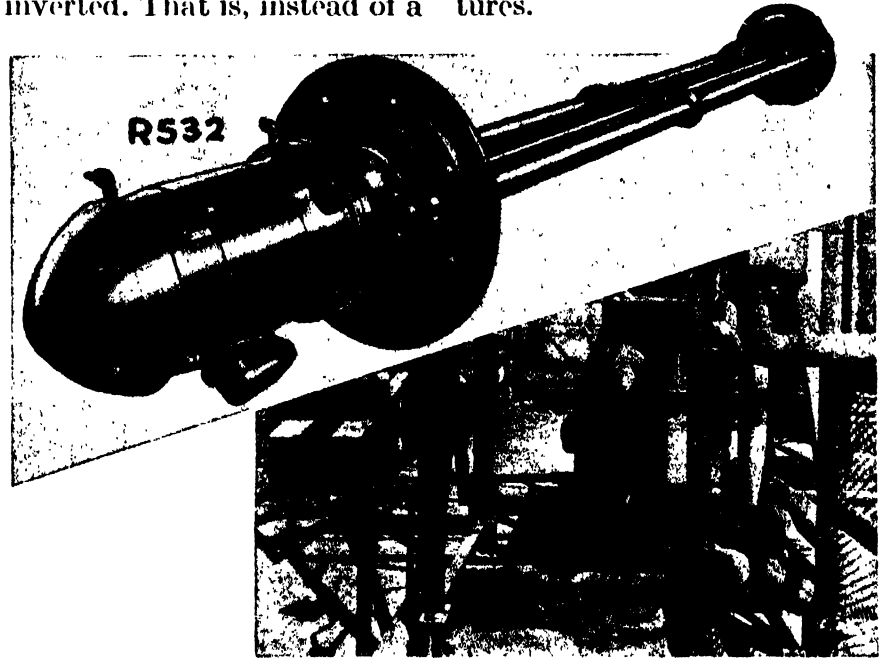
The Rubber Reserve Co. is to assist "in having a priority rating assigned which will make it possible to obtain early completion of the pilot plant, and in obtaining delivery of the materials".

Preliminary estimates indicate that a commercial sized plant, capable of producing 20,000 tons of butadiene a year, could be built in from 6 to 8 months from when materials were available, and that the butadiene could be made from between 15 and 20 cents a pound.

The pilot plant that has been authorized will be capable of handling 250 bushels of grain a day. Initial operation of parts of the process is expected by December 15; the plant will be entirely completed by January 15. While construction of the pilot plant is going on, experiments with the butanediol process are being conducted in various parts of the Seagram plant not needed for war alcohol production.

Design and Material Equally Important in Coke "Breeze" Pumps

"Water-ends" of Amsco-Nagle centrifugal pumps are always made of metals best suited to withstand the corrosive or abrasive conditions under which each specific pump must operate. Three pumps recently made for a petroleum refinery were fitted with water-end parts of manganese steel.



These pumps, one of which is pictured before and after installation, are Amsco-Nagle 3" type "SW" units with 11" impellers. They handle, in a coking unit quenching system, water containing petroleum coke "breeze" which, being excessively abrasive, has a severe scouring action that is satisfactorily resisted by the 13% manganese steel.

The design plays an equally important part in the successful operation of these pumps, which have been on the job over a year and a half. Notably, the water-end inlet is inverted. That is, instead of a side or bottom inlet, the liquid enters from the top of the casing. This eliminates air or gas binding. Simple, liberal slippage seal adjustment is provided.

In addition, intermediate and steadying sleeve bearings, in split yoke retainers, are lubricated from above the floor plate. The tubular structural members serve a dual purpose, one as an outlet pipe and the other as a duct for lubricant to the submerged bearings.

This is only one of many cases where Amsco-Nagle Pumps are economically serving the process industries. Amsco-Nagle Pumps are available in horizontal and vertical shaft types, from ¾" to 12" pipe, with impellers up to 28½" diameter and for capacities as great as 8,000 g.p.m. and heads as high as 200 ft.

Bulletin 940 thoroughly covers the many design features.

OFFICES IN PRINCIPAL CITIES

Net sales of the **Masonite Corp.** for the fiscal year ended August 31 amounted to $17,044,152, a new high record and an increase of $4,111,176 over the previous year. Operations of the company are continuing on a 4-shift, 24-hour day, with the major portion of output going into the war program. Between January and September there was a 50 per cent turnover in its personnel. The company is now paying local wood producers approximately 100 per cent more than in 1938, and its hourly wage rate is 50 per cent above what it was in 1938.

The Pennsylvania Salt Manufacturing Co., for its fiscal year ended June 30, 1942, reports net earnings of $1,421,170 after deducting taxes and setting aside $200,000 for reserve for contingencies and unknown taxes. These net earnings amount to $9.47 a share, a decrease of 13.8 per cent compared with the previous year. Dividends amounting to $7.25 per share were paid during the year.

Directly or indirectly more than three quarters of the company's total production goes into the war effort, and the increasing demand for its products resulted in sales of $19,552,300, 19.7 per cent above the preceding year and the highest in the company's history. The company has undertaken the erection of three plants for the production of essential chemicals, and in addition approximately $3,500,000 has been expended for new plants and improvements and extensions to present facilities.

Procter & Gamble Co. in the September quarter reports sales on about the same level as a year ago. The second quarter sales were adversely affected by anticipatory buying in the initial months of the war.

Overly Biochemical Research Foundation

On September 14, the semiannual directors' meeting of the Overly Biochemical Research Foundation was held at its recently completed laboratories, 254 West 31st St., New York, N. Y. The foundation is a nonprofit organization incorporated under the laws of the State of New York.

The research staff includes James S. Wallerstein, chemist, who is also the president of the foundation; Arthur L. Schade, microbiologist; and Kurt G. Stern, biological chemist, formerly of Yale University, assisted by a number of qualified technicians. The board of directors is made up of Dean Burk, Archibald Sinclair, Leo Edelman, Leo Stieglitz, O. Alan Rose, Leonard M. Wallstein, and others. The foundation has received a grant from the Max Wallerstein Memorial Foundation towards the costs involved in the construction of the laboratories and the operating expenses during 1942–1944.

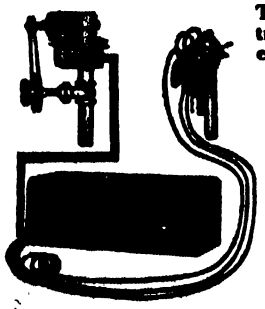
The two main lines of investigation concern the development, in concentrated and stable form, of polyvalent bacteriophage preparations active against bacillary dysentery, and the improvement of methods to produce certain strategic materials, such as glycerol, by fermentation processes.

F. J. Stock, formerly deputy chief of the Health Supplies Branch, War Production Board, has been appointed chief of the new Drugs and Cosmetics Section, Chemicals Branch, War Production Board. Deputy chief is **C. A. Willard**, and consultants are **Floyd Thayer**, **A. B. Pacini**, **John Williams**, and **Dan Dahle**. Unit chiefs are: Biologicals and medicinal chemicals, **J. T. Batson**; botanicals and imports, **T. F. Currens**; vitamins and agar, **Mark Merrell**, and cosmetics, **Robert Blair**.

Chester M. Suter, professor of organic chemistry and chairman of the Department of Chemistry, Northwestern University, has been appointed director of chemical research of the Winthrop Chemical Co., Inc., Rensselaer, N. Y.

Procter Thomson, Chemical Division, Procter & Gamble Co., Ivorydale, Ohio, is the representative of the Cincinnati Section of the American Chemical Society on the War Products Advisory Committee of Cincinnati.

R. G. Verdieck, Ph.D. in chemistry, St. Louis University, and **Wm. C. Eastin**, B.S. in chemistry, University of California, have joined the staff of the research and development department, Westvaco Chlorine Products Corp., New York, N. Y.



Herbert A. Winkelmann, technical director, Dryden Rubber Co., was the speaker at the first meeting of the season of the Midwest Section, American Association of Cereal Chemists. On October 5 he addressed the section on "Facts About Synthetic Rubber".

Who Makes It?

The following chemicals are wanted by The National Registry of Rare Chemicals, Armour Research Foundation, 35 West 33rd St., Chicago, Ill.:

2-Chloro-3-nitrophenoxyacetic acid, 2,4-dichloro-alpha-naphthalene, 2,4-dichloro-beta-naphthoxyacetic acid, disilicon hexachloride, quinizarin-6-sulfonic acid, quinizarin boric acid, 2-alpha-methyl indole, cyclohexene oxide, 2-chlorocyclohexenone, and *d*-ribose-5-phosphoric acid.

DENSITY CONTROLLER for PULPS

The Massco-Adams Density Controller, first used in ore classifiers, now has many applications in non-metallic and chemical plants—including potash and phosphate plants, washing coal, etc. Maintains *visual* control of density by motor-operated regulation of dilutant supply valve. Also available with standard chart recorder or with arm and weights for sink and float process. Widely optional location. *In writing, please describe your problem.*

KEEP 'EM FLOWING!

We refer to the vapors being removed from thousands of Condensers and Processing Vessels by Croll-Reynolds Steam Jet Evactors. Production Equipment for this apparatus is being pushed to keep up with what seems to be an ever-increasing demand. Now, even more than ever, we are eager to help the operators of the many thousands of Croll-Reynolds Evactors get the maximum performance from existing equipment.

In some cases vacuum can be increased by merely changing the nozzles. Capacity can often be increased by changing the nozzles and throats or by re-machining them. It is our policy to keep in stock rough castings for throats and suitable materials for nozzles which can be promptly machined for individual conditions on prevailing priorities. Complete new Evactors for vacuum to a small fraction of 1 mm. are still being made subject to crowded conditions on ordnance equipment.

Listed publications should be requested directly from the company concerned. Use business stationery, mention bulletin numbers, and refer to this journal. Publications will be sent free unless otherwise noted.

Accident Prevention. This card-case size booklet gives details of off-the-job accidents, and how to prevent them. Concise enough to be read in 10 minutes, yet complete enough to convince every American worker that his presence in mine, factory, or office every working day is essential to victory. Copies may be obtained at $2.50 per hundred. *Booklet CEN.* National Conservation Bureau, 60 John St., New York, N. Y.

Arc-Welding Accessories. An illustrated 32-page bulletin presents a complete line of General Electric accessories. *Bulletin GEA-2704B CEN.* General Electric Co., Schenectady, N. Y.

Centrifugal Separation. A new technical bulletin on the theory and practice of applying centrifugal force to chemical and industrial operations. This authoritative bulletin is divided into four parts: theoretical discussion, functioning of centrifugal bowls, centrifugal design, and installation and operation, and is being used as a textbook in one of the maritime academies. *Bulletin CEN.* The Sharples Corp., 2356 Westmoreland St., Philadelphia, Penna.

Cleaning Compound. A new folder describes the properties and uses of "Quiksil". It claims that this oil-absorbent material is better than wood shavings, can be re-used, eliminates sawdust, sand, and sweeping compounds, keeps floors dry, will dry up kerosene, gasoline, and various solvents and eliminates slip hazards on all types of floors. *Folder CEN.* Trojan Products & Mfg. Co., 3130 South Wabash Ave., Chicago, Ill.

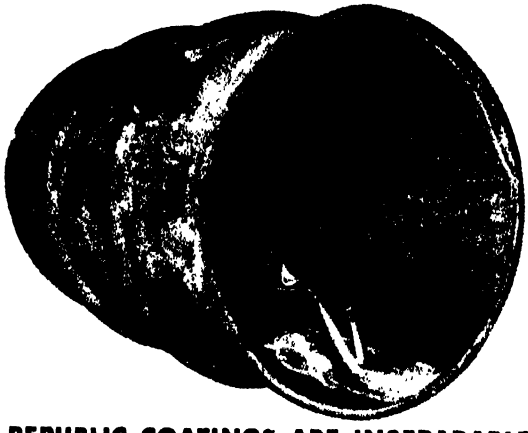
Control Instruments. This bulletin contains detailed information on a compensated control for zone temperature control work. Heat anticipation is provided only when needed and in the amount required by a particular weather condition. These controls eliminate overheating and drafts, may be used in old or new buildings, and are adaptable to one- or two-pipe systems, and any type of heating system. *Bulletin F-1756 CEN.* Barber-Colman Co., Rockford, Ill.

Conveyors. A new, 4-page pamphlet on all types of conveyor systems, adaptable to the chemical process industries and to the war plants, to keep material rolling at a high pace. Illustrations show units at work in chemical, paper, textile, oil, glass, metal working, and other vital industries. *Pamphlet CEN.* Standard Conveyor Co., North Saint Paul, Minn.

Glassware. A new 16-page catalog describes new lines, such as blood bank bottles, lamp sulfur determination apparatus, fritted disks, distilling receivers with standard-taper ground joints, etc. An alkali-resistant (boron-fired) glassware, and 43 new items in Lifetime Red actinic glassware are described and illustrated. *Catalog, Supplement 1, CEN.* Corning Glass Works, Corning, N. Y.

Health and Safety Manual. Probably one of the first publications of its kind, this manual is devoted exclusively to the problems of women in industry. A section is devoted to the proper attire for women in the shop. Maintenance of good physical condition and hazards to be avoided in various occupations are also taken up. *Manual CEN.* Allis Chalmers Mfg. Co., Milwaukee, Wis.

Material Handling. An attractive, new, 16-page bulletin on manganese steel chain for conveying and elevating. Specifications and illustrations are included. *Bulletin 742-C N CEN.* American Manganese Steel Division, American Brake Shoe and Foundry Co., Chicago Heights, Ill.



Micromax Thermocouple Pyrometers. In 56 illustrated pages this book gives first-hand information on indicators, recorders, and controllers, and the thermocouples and accessories used with them. *Catalog N-33A-CEN.* Leeds & Northrup Co., 4934 Stenton Ave., Philadelphia, Penna.

Motor Fitness Manual. An illustrated 40-page bulletin discusses how to get the most service out of old and new motors, selection and application of motors, types of motor enclosures, etc. *Bulletin GED-1017 CEN.* General Electric Co., Schenectady, N. Y.

Pipe-Line Tracyfier. This bulletin describes a superseparator for separating any liquid and solid particles from any gas or vapor: water from air; water from steam; drops of oil from vapor, etc. The unit is applicable in steam lines to stills, dryers, processes, dye vats, cookers, on small engines, pumps, turbines, etc., tar and oil burners, and so on. Illustrations and line drawings, specifications and dimensions are also included. *Bulletin 1565 CEN.* Blaw-Knox Co., Pittsburgh, Penna.

Pumps. A new, 4-page bulletin on paper stock pumps of the centrifugal type. Specifications and construction features are given. These pumps will handle stock up to 6.5 per cent consistency and can be used for higher consistencies in special cases. They can be driven by motor, belt, or pulley. *Bulletin W-360-B1A CEN.* Worthington Pump and Machinery Corp., Harrison, N. J.

Repub LEAD COATINGS THE Accepted Homogeneous Bond

Republic's bonding process combines the corrosion resistant qualities of chemically pure lead with the structural strength of steel to provide process equipment that will stand up under the toughest conditions.

REPUBLIC COATINGS ARE INSEPARABLE • NON-POROUS • TIN FREE

Republic's exclusive "tin-free", non-metallic flux permits the bonding of lead to steel with a bond that is inseparable — comparable to Class 2 A.S.M.E. Welding. Republic homogeneous coatings expand and contract with the base metal — no embrittlement . . . no cracking . . . no buckling.

Republic homogeneous lead coatings are extremely dense, with a finer, more uniform grain. Their non-porous structure prevents the development of "pin-hole" rusting through the pores of the lead.

Republic homogeneous lead coatings have a melting point 19 deg. F. above that of typical cast lead; a Brinnell H twice that of cast lead. There are no slag inclusions such as occur with cast homogeneous work.

Republic lead coatings may be applied in any thickness, ⅛" to ½" or more without affecting either the density or the purity of the lead. *Republic lead coatings contain less than three hundredths of one per cent of impurities.*

Specify Florite Desiccant

For Efficient Dehydration of GASES and LIQUIDS

FLORITE, the new granular drying agent, is now being used successfully for dehydrating natural gas, propane, gasoline, air, nitrogen, carbon dioxide and other gases and liquids where high drying efficiency is required.

It selectively adsorbs 4 to 20% of its weight in water, depending upon the particular application, and is regenerated by heating to 300-350°F. FLORITE is hard, stable, non-corrosive, non-poisonous, and is available in a variety of particle size classifications.

VICTORIES
THAT DON'T APPEAR IN OFFICIAL COMMUNIQUES

Victories are won daily by unsung heroes in the battle for production that goes on incessantly in process industry plants across America.

These skilled production men know they can rely on Roots-Connersville Blowers, Gas Pumps and Exhausters, Meters, and Inert Gas Generators. They are widely used in handling, measuring, or proportioning the various elements that enter into making chemicals, explosives, acids, plastics, and other materials so urgently needed.

Since we build both Rotary Positive and Centrifugal equipment, our recommendations are always unbiased.

Our long experience is at your service if we can be helpful in suggesting ways to use your present equipment to better advantage. War-time demands naturally control production schedules, making it advisable to study future requirements as far ahead as possible.

Industrial Literature

CONTINUED FROM PAGE 1344

Rubber Conservation. A timely booklet on the conservation of conveyor belting in industrial plants. Contains a step-by-step, illustrated procedure, with interesting examples of savings made and rubber conserved. Headings include the saving of rubber by making vulcanized repairs promptly, salvaging belts for smaller drives, and special splicing. *Booklet CEN.* B. F. GOODRICH Co., Akron, Ohio.

Spectrophotometer. This new, 8-page bulletin describes uses of the Coleman Universal spectrophotometer. Test tubes for samples and instantaneous readings give high speed. Turning one knob permits selection of any color or light band required. Information on many tests is given, such as molybdenum, manganese, chromium, and other metals, copper in foods, determinations of vitamins, quinine, chlorophyll, chlorine, and other materials. Many curves and references are also included. *Bulletin CEN.* WILKENS-ANDERSON Co., 111 North Canal St., Chicago, Ill.

Stainless Steels. This 12-page booklet is divided into two parts. The first deals with the selection of stainless steels for chemical process equipment, mentioning metallurgical developments that have facilitated construction of such equipment. The second part discusses solutions to fabrication problems and the functions of alloying elements used in stainless steels. *Booklet Form 5201 CEN.* ELECTRO-METALLURGICAL Co., 30 East 42nd St., New York, N. Y.

Starting Switches. This new bulletin describes a line of manual starting switches for motors rated up to 1 h. p., 110 to 200-volt a. c. and ¼ h. p., 115 to 230 volt d. c., for starting and overload protection of small motors used on unit heaters, refrigerating machines, pumps, compressors, etc. In addition to illustrations and descriptions, this bulletin includes dimensions, diagrams, and prices. *Bulletin CEN.* ALLEN-BRADLEY Co., 1311 South First St., Milwaukee, Wis.

Staybelite Resin. This hydrogenated rosin is discussed in a new 8-page booklet. Physical and chemical properties are given, along with graphs showing the rate of oxygen absorption and other characteristics. Many applications are discussed, such as use in adhesives, rubber compounding and reclaiming, and paper, ceramics, and soap industries, special solder fluxes, linoleum waxes, cordage, rock wool, etc. *Booklet CEN.* HERCULES POWDER Co., Wilmington, Del.

Steel Tubing. This new pamphlet describes a variety of seamless steel tubing for the industries. Standard shapes are illustrated, as well as special shapes and parts, including round, square, rectangular, oval, streamlined, and hexagonal units. *Pamphlet CEN.* SUMMERILL TUBING Co., Bridgeport, Montgomery Co., Penna.

Testing Apparatus. A new, very complete, 96-page catalog gives comprehensive information on testing apparatus for the petroleum industries and on equipment

for standard methods of testing asphalt, bituminous materials, automotive and aviation fuels, and lubricants, conforming to specifications of the A. S. T. M., Federal Specifications Board, and other governing bodies. This catalog is profusely illustrated, and has a complete cross index. Also included are many laboratory utilities, an up-to-date compilation of data on thermometers used for petroleum inspections; dimensions, sizes, and prices on each type of apparatus. *Catalog 700 CEN.* PRECISION SCIENTIFIC CO., 1736 North Springfield Ave., Chicago, Ill.

Valves. A timely bulletin on the repair and upkeep of various types of valves. The steps taken to repair leaky gate and globe valves are explained and illustrated, with hints on how to reclaim discarded valves and on keeping these units in good operating condition. This is the fifth of a series on piping pointers for peak production. *Bulletin CEN.* THE CRANE CO., 836 South Michigan Ave., Chicago, Ill.

Vibrating Screens. A new pamphlet describing two types of high-speed vibrating screens designed for high capacity and efficiency at low operating costs. Also included are specifications, dimensions, and typical installations. *Pamphlet 128 CEN.* ROBINS CONVEYING BELT CO., Passaic, N. J.

Waxes. A 4-page pamphlet describes two special waxes for use in paper, rubber, coating, cosmetic, dental, adhesive, and other industries. These waxes are made from mid-continent crude oils and are microcrystalline rather than amorphous in character. Properties and specifications are also included. *Pamphlet CEN.* BARECO OIL CO., Box 2009, Tulsa, Okla.

Aluminum Flux

A FREE-FLOWING flux for the gas welding of aluminum and aluminum alloys is being manufactured under the trade-name "Flo-Ez-Flux" by Park Stewart, 1031 Carbis St., Worthington, Penna.

Flo-Ez-Flux is being used to gas weld either wrought, cast, or high tensile aluminum or aluminum alloys, of any size or shape where welding is possible. It is being widely employed in the aviation industry.

THE angle compressor of Clark Bros., Inc., Olean, N. Y., is said to have the advantage over the older horizontal-type compressor in speed of installation. Its compact design permits it to be almost completely assembled before shipment.

Have you a Corrosion Problem?

INVESTIGATE *Beckman* pH CONTROL

An efficient solution to many plant corrosion problems—often without the need for hard-to-get corrosion-resisting alloys!

TODAY, more than ever, it will pay you to investigate what Beckman pH Control can do in solving YOUR corrosion problems. For, with Beckman-controlled processing operations, corrosion can often be licked without need for costly and hard-to-get corrosion-resisting materials . . . because Beckman pH Control takes the "corrosion" *out* of process solutions *before* they contact valuable plant equipment. *For example . . .*

IN COOLING SYSTEMS, the water, through absorption of atmospheric CO_2 in the cooling towers (forming carbonic acid), tends to become increasingly acidic as it is recirculated, leading to excessive corrosion of machines, condensers, and other plant equipment. In addition, in many plants chemicals used in process solutions may leak into the cooling water through condenser leaks or breaks, causing damaging corrosion of plant equipment.

SOLUTION: Many plants now guard against these costly dangers by installing Beckman pH Control on the cooling water circuit. Leaks into cooling system are instantly detected — cooling water is *automatically* maintained at optimum pH for minimum corrosion!

IN PAPER PLANTS, the whitewater treatment leaves the pulp highly acid. This acid pulp, feeding into the wet end of the machine, corrodes the costly wire screens and paper machinery. Result — short screen life, high upkeep, expensive maintenance.

SOLUTION: In many paper mills this problem is being solved by Beckman-controlling the whitewater treatment to neutralize excess acidity *automatically* before the pulp enters the machine. By thus maintaining a pH controlled pulp, corrosion is not only minimized, but the properties of the finished paper are greatly improved . . . *a two-way saving!*

LET US HELP *YOU!* Chances are *you* can reduce corrosion — *and at the same time increase plant efficiency* — through the intelligent application of Beckman pH Control. Let our engineering department make recommendations to fit *your* particular problem.

Beckman THE LEADING NAME IN pH

CASEIN
and Its Industrial Applications

EDWIN SUTERMEISTER AND FREDERICK L. BROWNE

A.C.S. Monograph No. 30
Second Edition, Completely Rewritten

Casein production in the U. S. has in the last decade leaped into an important position. Technical research on many new casein products has brought about such far-reaching changes in manufacturing processes that a second greatly expanded edition of this Monograph, originally published in 1927, became essential.

In addition to increased use in the paper, leather and glue industries, three spectacular developments have tremendously enlarged the demand for casein, namely, plastics; casein paste paint; and casein fibre, which may soon rival rayon in commercial importance. These recent developments are described in detail and critically evaluated.

On the theoretical side great progress has been made toward a better understanding of this complex protein. The organic and physical chemistry of casein are discussed at length, and avenues for further research are opened up.

CHAPTERS

Introduction.
Casein in Milk and Its Isolation, Frederick L. Browne.
The Organic Chemistry of Casein, Ross Aiken Gortner.
The Physical Chemistry of Casein, Frederick L. Browne.
The Manufacture of Casein, Arnold O. Dahlberg.

PROPERTIES OF GLASS

GEORGE W. MOREY
The Geophysical Laboratory, Washington, D. C.

A.C.S. Monograph No. 77

The swift emergence of glass from a sphere of limited utility to a position of eminence in which it is now challenging the supremacy of both steel and cotton makes this treatise on its properties indispensable to all engineers, chemists and physicists. The researches of the past two decades have resulted in important advances in our understanding of the constitution and structure of glass.

Dr. Morey's book, more than 10 years in preparation, gives detailed and critical discussions of all phases of the physics and chemistry of glass, including viscosity, heat capacity, optical and elastic properties, strength, hardness, etc. It deals fully with the extent to which these and other properties are affected by the composition and annealing technique. The chapters, entitled respectively "The History of Glass" and "The Constitution of Glass" in themselves constitute a broad treatment of subjects of general interest. The attempt has been made to include all measurements on glasses of known composition. The many tables contain a wealth of valuable data.

561 Pages **20 Chapters, Illustrated** **$12.50**

A NEW Tool for Organic Chemists—

THE RING INDEX

A List of Ring Systems Used in Organic Chemistry

By AUSTIN M. PATTERSON AND LEONARD T. CAPELL

Until this book appeared in 1940 there was no single source in any language where the structural formulas, names and numberings of the thousands of parent organic ring systems could be found. Even the latest edition of Beilsteins Handbuch, with its supplements, does not contain half of them.

Features of the Entries. The Ring Index lists over *4,000* ring systems. It covers the literature up to, and partly through, 1939. Here are some of the features for each ring system: (1) A structural formula showing the standard numbering of the system according to rules drawn up for the International Union of Chemistry. (2) Other numberings that have appeared in the literature. (3) A serial number which serves to identify the system. (4) The preferred name and other names given to the system. (5) Literature references, including a reference to Beilstein if the system is described there.

Arrangement. The ring systems are arranged from the simplest to the most complex, beginning with single rings, then systems of two rings, then those of three rings, and so on up to nineteen-ring complexes. If one knows the structure of a system he can easily find it in its proper place by one or two very simple rules. On the other hand, if one knows the name of a system he can quickly locate it through the very complete *Index of Names* at the back. The *Introduction* explains the features of the book and the principles on which the preferred names are constructed. The *Appendix* reprints the Rules for Numbering Ring Systems from the *Journal of the American Chemical Society*.

Uses. Since there is no other similar compilation, the Ring Index is an indispensable reference work for organic chemists and for others who have to do with cyclic organic compounds. Some of its uses are: (1) Ascertaining the accepted structure of a ring system if the name is known. (2) Finding the name or names of the system if the structure is known. (3) Finding the numbering of a system. (4) Identifying a particular system if there are two or more isomeric forms, or if there is a confusion in names. (5) Discovering what systems of a particular type have been reported in the literature, and where. (6) Naming and numbering a newly discovered ring system. (7) As a reference book in teaching.

Industrial applications. Organic chemistry, and in particular the chemistry of cyclic compounds, is playing a large part in chemical industry today. On this account the Ring Index should be in every industrial chemical library.

Reinhold Publishing Corporation, 330 W. 42nd St., New York, N.Y.

EMPLOYMENT INFORMATION

RATES to be paid in advance. Standard setting 5c a word, minimum charge $2.00 each; include 8 words for box address. Exceptions see ⟶ Display, $10.00 per column inch. 2 inches maximum, larger units at regular display unit rates. No discounts or allowances.
SEND advertisements with remittance to INDUSTRIAL AND ENGINEERING CHEMISTRY, 332 West 42nd St., New York, N. Y., to reach there not later than 10:00 A.M. on the 5th and 20th, closing dates for editions of CHEMICAL and ENGINEERING NEWS of the 25th and 10th, respectively. Insertions made in order of receipt provided necessary remittances are complete. EMPLOYERS are requested to mention in their announcements the section of the country in which the open position is located to ensure replies only from those who are geographically available.
In printing these advertisements the SOCIETY assumes no obligations as to qualifications of prospective employees or responsibility of employers.

UNEMPLOYED members of the AMERICAN CHEMICAL SOCIETY seeking employment for themselves are allowed in one calendar year 3 announcements free (one per issue) set in standard style and limited to 50 words each, including 8-word box address, and 3 additional standard announcements at 50% of regular rate. Further announcements and excess words at full rate.

EMPLOYED members of the AMERICAN CHEMICAL SOCIETY seeking new positions are permitted 3 standard announcements during the calendar year at 50% of the regular rate—include 8 words for box address.

EMPLOYERS seeking chemists and chemical engineers are permitted 3 standard announcements, not to exceed 50 words each including box address and not more than one per issue, during the calendar year without charge, provided they agree in writing to acknowledge all replies (excess words 5c each), otherwise full rate applies.

The AMERICAN CHEMICAL SOCIETY is vitally interested in the welfare of its members and in seeing that the chemical industry is manned with competent chemists and chemical engineers. These pages are part of our service in that connection. In addition most of the larger sections of the AMERICAN CHEMICAL SOCIETY and several of the smaller ones have active employment committees. Local section secretaries in your area will inform you as to any employment aids that may be available locally.

An Employment Clearinghouse is operated at each national meeting of the SOCIETY for the purpose of bringing together representatives of industry looking for chemists and members and student affiliates in attendance wishing to make such contracts. For further details, consult the preliminary and final programs as printed in the NEWS EDITION prior to each meeting.

In the New York area, special employment facilities are offered by the Employment Bureau of the Chemist's Club, 52 East 41st St., New York, N. Y. In the Chicago area, the Chicago Section maintains an employment service at 505 N. Michigan Avenue, Chicago, Ill.

Those replying to announcements should be careful to send copies and not original documents. Advertising circulars will not be forwarded and to that end all letters will be opened at the forwarding office.

SITUATIONS OPEN

Those announcements in which the letter "P" is part of the address key have paid in full and are not committed to acknowledge replies. The Society regards acknowledgment by employers of all applications as an act of common courtesy but can assume no responsibility for their failure to do so.

FOOD TECHNOLOGIST. Applications will be welcomed from men with outstanding records to serve as junior chemists in eastern research laboratories, engaged in essential work. Prospects for advancement excellent for men of right qualifications. Please submit record of training and experience, personal history and recent small photo.
Box 76-TP-7, Ind. & Eng. Chem., Easton, Pa.

CHEMIST with some petroleum experience. Needed in Chicago area for development of petroleum products and rust preventives. State age, draft status, degree, and salary desired in opening letter.
Box 79-TP-8, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER or CHEMIST. Recent graduate with some experience, as assistant in research and development along electrochemical and metallurgical lines. Should be capable analyst and handy with tools. Location New England. Give full details, scholastic record, experience, salary desired and recent photograph.
Box 15-N-10, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST wanted: For research on dyestuffs and intermediates. State experience in detail, education, marital status, age, and enclose photo. Location New Jersey.
Box 21-N-10, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST

or chemical engineer for industrial development work in cellulose plastic field with large corporation in upper New York state. Recent graduate preferred. Give training, experience, references and personal data.

Box 24-NP-10, Ind. & Eng. Chem., Easton, Pa.

CHEMIST ABLE to conduct research work with minimum supervision wanted primarily for development of synthetic drying oils. Man with draft deferment because of physical impairment preferred. Send inexpensive photograph and give complete personal, professional and academic data in first letter. All letters acknowledged. Address P.O. Box 377, Dayton, Ohio.

EXPERIENCED CHEMICAL engineer. Excellent opportunity for man of outstanding qualifications in research laboratories located in the East, occupied with essential activities. Please submit college record, experience, accomplishments, and small photo.
Box 55-NP-10, Ind. & Eng. Chem., Easton, Pa.

CHEMISTS WITH Bachelor or Master degrees for positions in laboratories of Analytical Chemistry, Biochemistry, Organic Chemistry and Physical Chemistry in eastern organization engaged in essential activities. Opportunities for qualified men. Submit details concerning training, experience, personal history, and small photo.

Box 56-NP-10, Ind. & Eng. Chem., Easton, Pa.

PHARMACEUTICAL CHEMIST acquainted with analytical and control procedure for established pharmaceutical house in the New York area. State full details.
Box 12-TP-10, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER—Recent graduate or few years' experience; for pilot plant research; location small town 25 miles from Philadelphia. Apply by letter outlining training and experience, slary desired.
Box 14-TP-10, Ind. & Eng. Chem., Easton, Pa.

WANTED: Instructor in General Chemistry and Qualitative Analysis. B.S. required. Immediate employment. $1720-$2220 per year. George Walker, Principal, New Bedford Textile School, 1191 Purchase St., New Bedford, Mass.

WANTED: competent chemist—Ph.D. or D.Sc. Must be graduate of acknowledged school. Must possess sound scientific background, some industrial experience desirable. Wanted for research work with nationally known manufacturer of photographic material. Photographic hobbyist preferred. Adequate compensation and excellent future opportunities assured.
Box 17-TP-10, Ind. & Eng. Chem., Easton, Pa.

A MIDDLE Western industrial organization is seeking one or two men, preferably under 35 for adhesive research. Actual industrial experience in this field is desirable but not essential. Excellent opportunity for one familiar with adhesives, starch conversion and raw materials, such as starch, dextrins, glues, gums, resins, etc.
Box 20-TP-10, Ind. & Eng. Chem., Easton, Pa.

CHEMIST or CHEMICAL Engineer for midwest producer of corn products. Position calls for laboratory used in connection with plant problems, operation of pilot plant equipment, and sales service work. Prefer applicant under 30 years of age. State age, experience, draft status, and salary expected.
Box 21-T-10, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST Ph.D.—wanted for Newark, N. J., industry. Recent graduate or with a few years' experience preferred. For individual research involving synthetic resins. Sound training in synthetic organic, physical organic, and physical chemistry essential. Give experience, education, and salary expected.
Box 23-TP-10, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER—Recent Ph.D. from accredited university to handle development research in synthetic resins. Permanent responsible position in Newark, N. J., industry. Give experience, education, and salary expected.
Box 24-TP-10, Ind. & Eng. Chem., Easton, Pa.

RESEARCH ASSISTANTSHIP in Biochemistry. Must be a woman or have draft deferment. B.S. in Chemistry or Biochemistry. For work on proteins and enzymes. Limited time for graduate work. Salary $1500. University of Southern California School of Medicine, Department of Biochemistry, Los Angeles, California.

WANTED: Organic Chemist for research work on grinding wheels. Intimate knowledge of synthetic resins desirable. Bay State Abrasive Products Company, Westboro, Mass.

LOS ANGELES manufacturer has opening for chemist as laboratory assistant to conduct research and development work in field of industrial cleaners and related products. Position offers excellent opportunity and permanency for qualified applicant. Reply stating education, experience, age, draft classification and record of previous employment.
Box 26-T-10, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST A.B., for literature searching, abstracting, and report writing in research department of drug company. Chemistry major. Knowledge of German and typing desirable, also some acquaintance with literature of organic chemistry and medicine, including references, salary desired. Send photo. New York State.
Box 27-T-10, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST with good basic training in organic and analytical chemistry for laboratory and literature research and technical secretary in pharmaceutical and vitamin company. Location New York City. Give details of education and experience with salary desired.
Box 29-T-10, Ind. & Eng. Chem., Easton, Pa.

PROGRESSIVE MIDWEST concern desires a research man to conduct organic syntheses. Ph.D. preferred; 3-A draft status. Give details of training and experience; references. State salary expected. Good connection for right man.
Box 30-T-10, Ind. & Eng. Chem., Easton, Pa.

WANTED—BIOCHEMIST or organic chemist with some biochemical training with a B.S. or M.S. degree for work in a biochemical laboratory in a middle-western university town. Arrangements for part time graduate work may be made if desired. Supply details of training, experience, draft status, personal history, religious preference, and a small recent photograph.
Box 32-TP-10, Ind. & Eng. Chem., Easton, Pa.

CHEMIST, Man or Woman, with A.M. or Ph.D. for research fellowship in New England University to work in the field of synthetic organic chemistry. Practically full time for research. Stipend up to $2000, depending on experience, for eleven months. Send transcript of record, names of references and small photograph.
Box 33-TP-10, Ind. & Eng. Chem., Easton, Pa.

WOMEN CHEMISTS: Applications invited from women chemists for positions in a growing industry where few technically trained women have been employed. Openings in analytical, research and development, with probability of continuation after war. Location East.
Box 44-TP-10, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST—Graduate within past 5-10 years. Background organic chemistry, synthetic resins. Wanted for technical sales correspondence, preparing technical bulletins, library work, reports, etc. Excellent and unusual opportunity for right person. Location small New York State town. Give complete information, salary expected, recent photograph.
Box 49-TP-10, Ind. & Eng. Chem., Easton, Pa.

CHEMIST with Ph.D. or S.D. degree, not older than 30 years, needed by research institute in Western Pennsylvania for study of war problems.
Box 50-TP-10, Ind. & Eng. Chem., Easton, Pa.

BIOCHEMIST, Ph.D. and assistant professor in Southern medical school. Thorough training in biochemistry with background in clinical application preferred. Man with initiative and imagination desired. Excellent opportunity for research. Wanted immediately. Give full details in first letter including minimum salary and photograph.
Box 51-T-10, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST, excellent opportunity with a research laboratory close to New York City. Please state education, experience, draft status, salary expected, and send recent small photograph.
Box 54-TP-10, Ind. & Eng. Chem., Easton, Pa.

(Continued on page 1350)

Address communications to the box number indicated and Mail to Easton, Penna.

The American Chemical Society has no information concerning the position advertised, or in regard to those seeking employment.

(Situations Open Continued)

WANTED: INSTRUCTOR in inorganic chemistry by college located in the East. Department on approved list of A.C.S. Salary dependent on qualifications.
Box 61–T–10, Ind. & Eng. Chem., Easton, Pa.

LACQUER CHEMIST, Independent formulator wanted by long established manufacturer located 15 miles from New York City. Man with deferred draft status desired. Give complete details relating to products which you have made. Position is permanent. Plant is 85% on defense.
Box 67–T–10, Ind. & Eng. Chem., Easton, Pa.

RESEARCH and PLANT Chemist with Ph.D. degree desired by progressive Tobacco Company. Training and experience in Plant Biochemistry necessary. Must be qualified to plan and conduct research. Give training, experience, draft status, personal data, salary expected and recent photo in first letter.
Box 68–T–10, Ind. & Eng. Chem., Easton, Pa.

CHEMIST for research and development who has had varied practical experience in coatings such as lacquers, synthetics and enamels. One having had experience with paper products preferred but not essential. Splendid opportunity and permanent position with a company now engaged in war work. State technical education, experience, age, and draft status. Correspondence strictly confidential.
Box 71–TP–10, Ind. & Eng. Chem., Easton, Pa.

SITUATIONS WANTED
(A.C.S. MEMBERS)

FOOD CHEMIST with over twenty years' wide experience in the Food Industry, in direction, research, process development, quality control, and factory problems. Desires a responsible position.
Box 69–N–8. Ind. & Eng Chem., Easton, Pa.

CHEMICAL ENGINEER, Ph.D., industrial organic chemist, 25 years industrial and research experience, process developments, production problems, among others rayon, cellulose and derivatives. Patents, publications, new projects, languages, business knowledge. Married, one child. Available on short notice.
Box 31–T–9, Ind. & Eng. Chem., Easton, Pa.

PHARMACIST-CHEMIST (Ph.D.). Would like to change position. Great experience in deodorization and selective Hydrogenation of fish oils, all control tests, developing of new methods, new pharmaceutical products, emulsions, cosmetics. No draft status, Catholic, first class references. New York or Philadelphia area preferred.
Box 23–N–10, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST: M.S. in chemistry 1939, University of Pennsylvania. Organic major, analytical minor. Desires preferably research position with company having war contracts. 3 years' college teaching experience. Available immediately for position in Philadelphia and vicinity. Protestant. Married.
Box 26–N–10, Ind. & Eng. Chem., Easton, Pa.

PHARMACEUTICAL CHEMIST, B.S., Phar.D., Columbia University. Three years of graduate research, one year of product development work. Age 28, draft deferred, member Sigma Xi. Desires position to do research, product development, testing or other.
Box 29–N–10, Ind. & Eng. Chem., Easton, Pa.

YOUNG WOMAN chemist, several years' responsible experience in industrial research organisation. Desires editorial or market research position. Expert stenographer; knowledge of French and Spanish. Would consider A-1 secretarial position. Location immaterial.
Box 33–N–10, Ind. & Eng. Chem., Easton, Pa.

SYNTHETIC ORGANIC chemist. M.S. research and development experience in plastics. Desires organic research position (plastics or other industry) contributing directly to war effort. Young, married, responsible. Presently employed. Metropolitan location preferred.
Box 36–N–10, Ind. & Eng. Chem., Easton, Pa.

EXPERIENCED CHEMICAL Engineer; available for work in defense industry. 18 years' experience in plant and research work. Oils and fats, metallurgy, petroleum, textiles.
Box 46–N–10, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER, available for spare time work. Broad training and experience, including catalysis, petroleum and fuels technology, explosion processing, pharmaceutical synthesis, metallurgical chemistry. Specialist in new process development and plant design. Currently employed, with contract permitting outside work of practically unlimited scope. Central eastern U. S. war work only.
Box 63–N–10, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST, Ph.D., now in class 2-A, in charge of small laboratory for pharmaceutical manufacturer, seeks position in closer connection with defense work. Experience in drug analysis and research.
Box 66–N–10, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. Five years' industrial research and development experience in synthetic organic chemistry. Prefer position in charge of a small group with a company doing defense work preferably in the field of organic chemicals, or drugs, plastics and rubber.
Box 73–N–10, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER: B.S. 1937, desires chemical engineering development work in field essential to the war effort. 5 years' experience in industrial application of, and research relating to, resins and plastics. Extra training in plastics, colloidal and organic chemistry, and chemical engineering. Good character and personality, progressive, practical, has ideas and sense of responsibility. American, white, single, age 27, draft, 2-B.
Box 79–N–10, Ind. & Eng. Chem., Easton, Pa.

EXECUTIVE CHEMIST. Over twenty years' experience in manufacture of mechanical rubber goods, latex, synthetic rubber. At present head of own company. Unable to raise capital necessary to convert to war work. Desires executive or technical position where unusual talents and ability can be used to fullest extent. Able to handle men. Familiar with labor problems.
Box 13–T–10, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST—Ph.D. February 1943 from an eastern university. Well grounded in organic synthesis. Single, 24, 2-A in draft. Physical chemistry minor. Eastern location preferred.
Box 15–T–10, Ind. & Eng. Chem., Easton, Pa.

RESEARCH DIRECTOR, Ph.D., assistant at two world renowned universities. 12 years' research experience in organic synthesis and biochemistry (hypnotics, analeptics, vasoconstrictors, antiseptics, vitamins, hormones). 5 years' research director of French industrial laboratory, one year research director of American industrial laboratory. Desires similar position in large industrial research laboratory or university. Age 36, first citizenship papers, draft status 2-B.
Box 31–T–10, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. Strong on synthesis. Unusual academic record. Four years' industrial experience. Work on diolefines, unsaturated alcohols, aldehydes, acids and derivatives, aldol condensations. Imaginative, responsible. Draft 3-B. Employed, available short notice.
Box 34–T–10, Ind. & Eng. Chem., Easton, Pa.

PROJECT LEADER with company wishing to inaugurate concentrated research program in the field of synthetic antimalarials, sulfonamides and new types of therapeutic agents. Ph.D. 1941 with one year industrial experience. Good professional contacts. Original ideas. Married, age 28. Draft 2-B.
Box 35–T–10, Ind. & Eng. Chem., Easton, Pa.

PLASTICS CHEMIST, 8 years' experience in research, development, and production of synthetic resins as applied to molding compounds, laminating and impregnating solutions. Thoroughly experienced in molding, shop practice and supervision. Age 29, married, children. Graduate study, patents, publications.
Box 37–T–10, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST. M.S. from leading eastern university. Excellent organic background. 6 years' experience in research and analysis. Research or development desired but will consider any exceptional opportunity. East or Midwest. Age 30, single, 3-A, Christian, employed, available short notice.
Box 38–T–10, Ind. & Eng. Chem., Easton, Pa.

WOMAN CHEMIST, B.S. (1942) in Chemistry. Also had training in Accounting. Would like position in either field. Location immaterial. Single, 22. Employed at present.
Box 39–T–10, Ind. & Eng. Chem., Easton, Pa.

ASSOCIATE PROFESSOR of analytical chemistry in a medium-sized university desires change. Author of successful textbook and numerous papers. Also experienced in teaching general and organic chemistry. Will consider industrial research.
Box 40–T–10, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, M.S., 1939. Year of synthetic organic research; 2½ years' industrial experience, mainly control and research on explosives and related materials; also experience testing petroleum products, and in general commercial analysis. Now employed, desires more opportunity for advancement, in any applied organic field, as fine chemicals, pharmaceuticals, synthetic rubber, explosives, etc. Age 28, single, draft deferred. Location unimportant. Available on reasonable notice.
Box 41–T–10, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST: 16 years' broad experience in research, development, production and consultation; technical director of research for western division of large chemical industry; special research on magnesium products, slats and refractories; patents; publication; good background in mathematics, physics, engineering, bacteriology and crystallography; M.S. degree University of California; desires position on West Coast; age 39; married; one child; available immediately.
Box 42–T–10, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST, Ph.D. 27 years' experience general analysis. Desires position as senior analyst. Employed at present. Married.
Box 43–T–10, Ind. & Eng. Chem., Easton, Pa.

PHYSICAL CHEMIST, M.A. 1939. Two years with major petroleum corporation and one with well-known research institute. Most of course work for doctorate at large mid-western university. Thermodynamics, colloid chemistry, electrochemistry, advanced organic, physics, mathematics. Research. Sigma Pi Sigma. Read German, French, Russian. Age 28, married, draft deferred.
Box 45–T–10, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. 1942. Large Eastern University. Minor, physical chemistry. 6 years' teaching, 4 years' research. Extensive training in organic synthesis. Intelligent, conscientious, adaptable. Five languages. Publication in preparation. Aged 29, single, unemployed. Draft 2-A. Desires organic research in war industry preferably in the East. Available November.
Box 47–T–10, Ind. & Eng. Chem., Easton, Pa.

CHEMIST GRADUATE executive. Twenty-five years' varied experience including research and production on foods, food packaging, latex, plastics, and explosives. Seeks contact with essential industry.
Box 48–T–10, Ind. & Eng. Chem., Easton, Pa.

BIO-ORGANIC CHEMIST Ph.D. May, 1942. Research experience in organic enzyme vitamin (pyridoxine and pantothenic acid chemistry). Formerly employed on vast industrial vitamin project. Papers being published. Member Phi Beta Kappa, Phi Lambda Upsilon, Sigma Xi. Interested in research vital to war effort in above fields. East only.
Box 53–T–10, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST—M.S.—preparing for Ph.D. during evenings. Have 3½ years' industrial experience in synthetic organic research including pharmaceuticals, wetting agents, aromatics, esters. Employed—Draft 2-B. Desire position of more responsibility and advancement in research and development field, preferably with company doing at least part war work. Salary commensurate with responsibility and duties. Available on adequate notice. Location—preferably Metropolitan area but other areas will be considered.
Box 55–T–10, Ind. & Eng. Chem., Easton, Pa.

INDUSTRIAL CHEMIST, Eastern University graduate. Grad. work. Single, Protestant, American. Six years' experience analytical and development. Superv. control—lab. Foods, fats and oils; soaps; solvent extraction, alkaloids; Biological examination milk and water supply. Some teaching. Must relocate defense work. Immediately available.
Box 56–T–10, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER (1929) seeks research, development or engineering in East, Midwest or South. Experience proteins, adhesives, resins, coatings, impregnation, emulsions, process and production. Patents. Draft 3-A. Desire permanent connection of responsibility in defense or essential civilian industry.
Box 57–T–10, Ind. & Eng. Chem., Easton, Pa.

ANALYTICAL CHEMIST: M.S. 1940 with two years' experience in analytical research. Single, 25, draft classification 2-B. Would prefer vital work but must have postwar possibilities. Location immaterial.
Box 58–T–10, Ind. & Eng. Chem., Easton, Pa.

YOUNG PH.D., 1941, analytical-inorganic, chemical engineering minor, 2-B. Protestant, American born, interested in available research and development positions.
Box 59–T–10, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL-ENGINEER, Highpolymers, 8 years' plant and research experience in viscose rayon and cellophane plants, 5 years' experience in polymerisation processes, styrene, acrylic and other highpolymers, first citizenship papers. Age 39, owner of pilot plant laboratory. Desires position to serve Nation more effectively.
Box 70–T–10, Ind. & Eng. Chem., Easton, Pa.

ORGANIC CHEMIST, Ph.D. Rensselaer Polytechnic Institute, 1941. Employed. Experience in cellulose and synthetic resins. Desire synthetic organic chemical research with responsibility. Age 26, excellent health, American, unmarried, draft 4-F. Read French and German. Sigma Xi. Available on two weeks notice. Prefer New York City area.
Box 72–T–10, Ind. & Eng. Chem., Easton, Pa.

COLLOID CHEMIST. Woman. M.S., Mass. Tech. Outstanding research and development, plant, and sales service experience. Adhesives, coating, emulsions, impregnating, inks, paper, tanning, grease and waterproofing, wetting agents, detergents. Capable associate for busy executive. Can direct research, analyse reports, write, speak, get things done. Mentally flexible; good natured. Prefer New York area; would act as New York representative, for outside concern.
Box 73–T–10, Ind. & Eng. Chem., Easton, Pa.

CHEMIST: B.S. Chemistry, M.S. Agr. & Biological Chem. Three years' graduate research on sulfite waste utilization, 21 months as analyst in Experiment Station and soil mechanics. Past two years in pulp mill laboratory on research and pollution. Employed but available on short notice. Desires position in research or development. Age 29. Draft 3-A. West or Midwest preferred.
Box 78–T–10, Ind. & Eng. Chem., Easton, Pa.

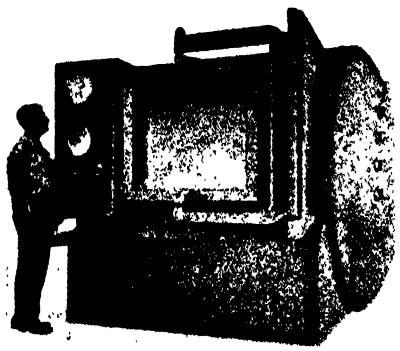
(Continued on page 1351)

(Situations Wanted Continued)

ORGANIC CHEMIST, Ph.D. 10 years' experience pharmaceutical research and development abroad and in U. S. A. Four languages, 34 years of age, 3-A, married, one child. Friendly alien, first papers. Desires change into more essential industry.
Box 77-T-10, Ind. & Eng. Chem., Easton, Pa.

CHEMICAL ENGINEER—B.Ch.E. Age 26, 3½ years' experience in supervision of production, chemical plant design and pilot plant research in heavy chemicals, research drugs and foods. Also 4½ years' chemical plant experience as research chemist, control chemist and chemical plant operator. Seeking 100% war work in production supervision or chemical plant design. Draft status 2-B.
Box 81-T-10, Ind. & Eng. Chem., Easton, Pa.

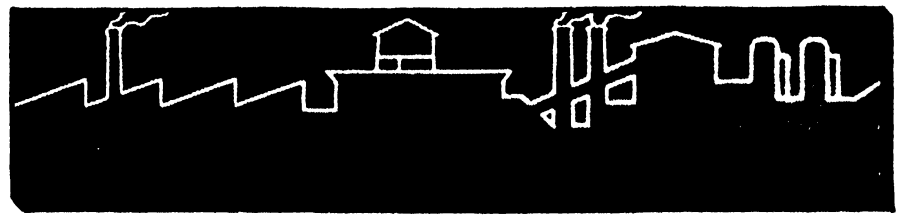
SITUATIONS WANTED (NONMEMBERS)



ORGANIC CHEMIST, Ph.D. 10 years' experience research and production aromatics and pharmaceuticals. Desires position research and development laboratories where abilities and resourcefulness will be recognized. Patents and publications. Age 35, Married. Draft 3-A.
Box 52-T-10, Ind. & Eng. Chem., Easton, Pa.

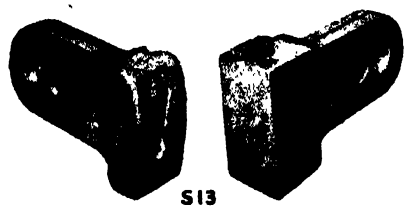
PH.D. age 47, experience in organic chemistry, big successes in research, owner of inventions and patents, synthetics, textile chemicals, emulsions, plastics and fibres. Desires suitable position.
Box 69-T-10, Ind. & Eng. Chem., Easton, Pa.

RESEARCH LIBRARIAN. College woman; experienced in literature and patent searches in organic chemistry and synthetics; languages. Library administrator; can assume responsibility. Not interested in abstracting or typing. Location immaterial.
Box 82-T-10, Ind. & Eng. Chem., Easton, Pa.



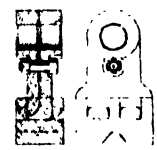
Stratosphere Chamber for Parts Testing

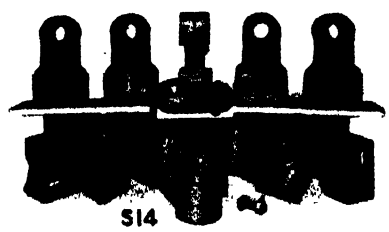
TO TEST the mechanical parts of aircraft, as well as radio used in high altitude work, the Kold-Hold Manufacturing Co., Lansing, Mich., has developed and built a stratosphere chamber that operates between the temperatures of +200° and −75° F. with an internal pressure variation from ambient at the location of the unit to 3 inches of mercury absolute. Both the pressure and temperature variations are controllable throughout their ranges. The first such unit was designed and built for the Philco Corp. of Philadelphia, for testing radio parts for bombers. Work is now under way on similar chambers for Ford and other large manufacturers of similar types of equipment.



This stratosphere unit, which has an interior chamber volume of approximately 186 cubic feet, uses Freon-12 as a refrigerant. Humidity control is from 25 to 95 per cent, relative to all temperatures above +40° F., or at a fixed bottom temperature of +32° F. Below this level, absolute humidity will correspond to the air saturation at the coil temperature, which will average 15° to 20° lower than the chamber temperature.

A NEW metal-enclosed assembly of gang-operated oil fuse cutouts for economical short-circuit protection and switching has been announced by the General Electric Co., Schenectady, N. Y.





Three-Part Pulverizer Hammer

THE Clark renewable tip pulverizer hammer (patent applied for), announced by the American Manganese Steel Division of The American Brake Shoe & Foundry Co., Chicago Heights, Ill., is a child of the times, for metal conservation is its design feature. The hammer consists of a weighted manganese steel head connected to the rotor by two matching arms or bars of manganese steel. On the lower end of each bar are hooks which engage internal pockets in the head. The bars are bolted together under the eye so that they form a one-piece arm, yet they are easily disengaged from the service-worn head by unbolting.

S13

S14

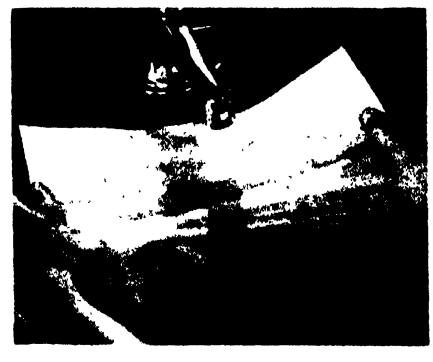
S-13 shows a closed type hammer as made and as worn in service. New complete hammer weighed 110 pounds; arms 57½ pounds; head 52½ pounds. Worn complete hammer weighed 74 pounds; arms, still completely serviceable, 57 pounds; head, scrapped, 16½ pounds. Over two thirds of the metal in the head was consumed in use before it was necessary to discard it. The line drawing shows the method of securing the head on bar hooks and bolting bars to form a one-piece arm. S-14 is a set of new Clark hammers of slightly different design, having the advantage of more bearing on the supporting shaft and visible hooks on shanks when assembled. These smaller size open type hammers have a complete weight of 48 pounds; bars 28 pounds; and head 20 pounds.

Thumb-Spray Attachment for Extinguishers

SOME fires are fought with a spray as well as a solid stream, but most standard fire extinguishers discharge only a solid stream. Consequently, a thumb-spray nozzle attachment has been developed by the Pyrene Manufacturing Co., Newark, N. J., for converting present extinguisher equipment to wartime needs. It simply clamps over the ⅜-inch hose and nozzle of any standard soda-acid, foam, gas cartridge, or pump tank fire extinguisher

Filter Cartridge

THE new Mersorb filter cartridge, recently introduced by the Mine Safety Appliances Co., Braddock, Thomas, and Meade Streets, Pittsburgh, Penna., for use with any of the company's standard M. S. A. cartridge respirators, provides protection for 70 hours against light concentrations of metallic mercury vapors, as compared with the 10-minute service life of activated charcoal cartridges, largely used in the past.



The chemical cartridge respirator, for which the Mersorb cartridge is designed, is a low resistance, twin-cartridge-type respirator used for protection against light concentrations of organic vapors and acid gases, whether occurring separately or in combinations.

Instantaneous Fluorescent Lighting

FLUORESCENT lighting fixtures employing a new method of ballasting to give positive, instantaneous starting are available for industrial plant lighting applications. With this method, the lamps come on fully at the turn of the switch just as in the case of incandescent lighting. The fixtures are made by R. & W. Wiley, Inc., 777 Hertel Ave., Buffalo, N. Y.

Aqualized Paper Fabric

A SIGNIFICANT aspect of the wartime search for substitutes is the use of paper to replace priority materials. Aqualized paper, a product of the Brown Co., New York, N. Y., is a substitute for cloth and burlap.

The individual cellulose fibers in the paper are effectively interlocked and fastened, giving an inherent wet strength all the way through the sheet independent of any coating or sizing on the surface. Some types are highly absorbent, while other types repel water.

MISCELLANEOUS

BUSINESS OPPORTUNITIES • FOR SALE • WANTED • ETC.

Five cents a word, minimum charge $2.00; display available at $7.50 per inch; in advance. No discounts or allowances

MICRO-ELEMENTARY ANALYSES: C, H, N, S, P, Halogens, Methoxyl, Mol. wt., etc., U.S.P. and other official tests, Purity tests, Microinorganic assays, Spot tests, Micro-distillations, Toxicological investigations, and typical micro-chemical research work. Dr. Carl Tiedcke, 366 Fifth Avenue, New York, N. Y.

SPECTROGRAPHIC ANALYSES: Petroleum derivatives, styrene, toluene, xylenes, and other organic chemicals. Metals in alloys, ores, foods, pharmaceuticals, plastics, inorganic chemicals. Photometric control of production. Research. Hubbard Laboratories, 125 West Hubbard Street, Chicago, Illinois

WANTED: Die Neuere Harnsaurechemie, H. Blits, one copy.
Box 10-T-10, Ind. & Eng Chem , Easton, Pa

WANTED: Industrial & Engineering Chemistry; Analytical Edition only; Vol. 1-12 incl. unbound; or Vol. 1-13 incl. bound; good condition; state terms in letter.
Box 11-T-10, Ind. & Eng. Chem , Easton, Pa.

WANTED: Journal Physical Chemistry any copies in Vol. 5—29 Chemical Abstracts 1910, 1911. 1912. 1913, 1934. 1935, 1936, 1937, 1938, 1939, Decennial Indexes any odd parts, Journal Chemical Education 1939-1941, Electronics 1930, International Critical Tables any odd volumes, Friedlander Fortschritte der Teerfabrikationen Vol. 1-17. B. Login & Son, Inc., 29 East 21st Street, New York, N. Y.

WANTED: Journal of American Chemical Society, Vol. 1-25 inclusive or set of several volumes ending with Vol. 25.
Box 22-T-10, Ind. & Eng. Chem., Easton, Pa.

WANTED: FRIEDLANDER Fortschritte der Teerfarbrikationen, Volumes 19 and 22. Reply to Phoenix Color & Chemical Co., Inc., 24½ Van Houten St., Paterson, N. J.

WANTED: LABORATORY Apparatus, Equipment. Singly or complete laboratories. Highest possible prices can now be realized by disposing your surplus or equipment not in use. We are ready to purchase anywhere in the U. S. A. for immediate cash. Hundreds of orders are in our hands for every possible instrument used in the laboratory. Refractometers, Polarimeters, Balances, Testing machines, Scott, Olsen, Mullen, Suter, etc., Microscopes, Micrometers, Micro accessories, Centrifuges, Ovens, Spectrometers, etc. Write us fully what you have available. The Laboratory Exchange, 24 E. 21st St., N. Y. C.

WANTED: One Scott tensile strength testing machine, pendulum type, suitable for cloth, paper, leather, etc., should be in the order of 3000 pounds, motor type, but motor does not need to be attached.
Box 80-T-10, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Chemical & Scientific Periodicals, sets volumes and back copies. Also Books no longer to be had at the publishers. B. Login & Son, Inc., 29 East 21st St., New York, N. Y.

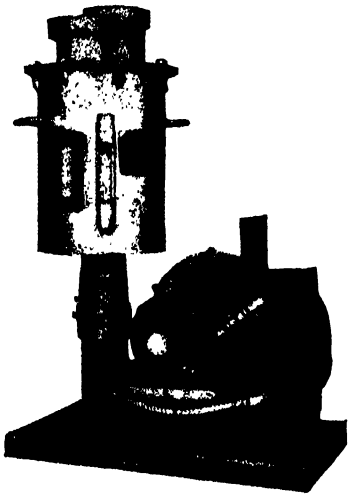
Flat Spiral Reinforced
BLOCK TIN COIL
For Sale
90 lineal feet 1" I.D.-295 wall.
5' overall diameter
MEARL CORP., EASTPORT, MAINE

FOR SALE: Faraday Society, Transactions, 1918-1936, 1941; Physical Society of London, Proceedings, vols. 1-53 (1874-1938); International Critical Tables, set; Zeitschrift fur Physik, vols. 1-114 (1920-1939), mostly bound. W. Westerfield, 7 Hobart Street, Bronxville, N. Y.

FOR SALE: Immediate delivery; guaranteed condition; reasonably priced. Microscopes, Colorimeters, (3) Schmidt Haensch Precision Double Wedge Saccharimeters, Valentine Abbe Refractometer, Microtomes, Drying Ovens, Incubators, Centrifuges, Horizontal Autoclaves, Hoskins Muffle Furnaces, Emerson Calorimeter, torsion balances, Weston meters, microscopic accessories, Gaertner Spectrophotometer, Watson Spectrometer, Mullen Testers, Agate Grinder, Edwards Gas Density Balances, etc. Write us your needs for immediate quotations. The Laboratory Exchange, 24 E. 21st St., N. Y. C.

FOR SALE: Pulp balances. Save your analytical balance for general laboratory. These fine pulp balances are excellent. In glass case with drawer. 150 gr. capacity 1 mg sensitivity. Ready for immediate delivery (never used) F. O. B. $27.50. The Laboratory Exchange, 24 E. 21st St., N. Y. C.

FOR SALE: Labtest hydraulic presses. New 6 x 6 self-contained 10 tons capacity. Heavy durably built with electric heated platens, gauge, adjustable between platens. Ready for immediate delivery. Test moulds are available. Write for complete descriptions. The Laboratory Exchange, 24 E. 21 St., N. Y. C.



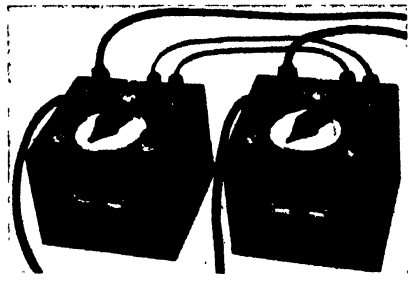
FOR SALE: 500 grams Uranium Metal, two kilos each Columbium, Germanium, Indium, Potassium, Tantalum, Titanium, Vanadium Metals, 50 pounds each Calcium and Manganese Boride, 300 pounds Copper-Magnesium Alloy, Hafnium and Rhenium Salts, 10 pounds Ceylon Bearing Sapphires.
Box 74-T-10, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: One Seibert Chemical Microscope, Calibrated Stage, Polarizing, 5 eye pieces, 4 objectives, 1 analyser, slides and cover glasses, 1 daylight microscope lamp, 1 plastic reagent block, arranged according to Chemot & Mason Volume II. A buy at $350.00 Private.
Box 76-T-10, Ind. & Eng. Chem., Easton, Pa.

FOR SALE: Journal of Society of Chemical Industry Volume I, 1884 to 1932, bound, in good condition, $100.
Box 79-T-10, Ind. & Eng. Chem., Easton, Pa.

Lectrobreathers

LECTROBREATHERS, developed by the Pittsburgh Lectrodryer Corp., 1047 32nd St., Pittsburgh, Penna., are used to prevent the entrance of atmospheric moisture into oil and chemical tanks. They permit only dry air to enter the tank when it



is emptied or when air enters owing to temperature drops.

Glass Bottles for Petroleum Products

SUBSTITUTION of glass bottles for tin cans in packaging certain petroleum specialty products and lubricants, which will divert to the current nationwide tin conservation drive 255 tons of tin plate a year for the war effort, has been announced by Standard Oil Co. of Indiana. Tin plate thus saved will make approximately 2,000,000 tin cans of the standard No. 2 size for military rations.

Electronic Timer

A NEW electronic timer designed for single actuation as well as for sequence timing and recycling in continuous operation has been announced by the Photovolt Corp., 95 Madison Ave., New York, N. Y.

The function of the timer is to close or open an electrical circuit for a preset time interval. When the timer is actuated, a charged condenser begins to discharge, the rate of discharge being controlled by adjustable resistors. Simultaneously with the actuation, amplifier tubes energize the relay. When the discharge of the condenser is completed, the amplifier tubes become inoperative and the relay is de-energized. The timer thus operates without clockwork or motor, in fact without any mechanically moving part except for the relay.

The range of the timer is from 0.05 to 20 seconds but other ranges may be obtained if desired.

Bubbles of Cellophane in War Uses

CHEMISTS have accomplished the feat of trapping air in a continuous stream of cellophane bubbles. The resiliency and buoyancy of the resulting product open up a large field of interesting possibilities for its application.

The material, known as "Bubblfil", has been developed by E. I. du Pont de Nemours & Co., whose Rayon Division is now manufacturing it in its Tennessee plant. The Office of Price Administration has set a price ceiling of $1.25 per pound, which applies so long as the production is under 1,000 pounds per day. Commercial sale must wait on war necessities, chiefly those in which it could take the place of kapok or sponge rubber.

Tests already made show that the cellulose bubbles are fully as buoyant as the imported kapok, which comes from the seed pod of a Javanese tree. Bubblfil has also been tried in the air compartments of lifeboats and life rafts, where kapok is no longer being used because of the limited supply, and for bridge pontoons, formerly filled with sponge rubber.

Surface Conditioner for Brightening Steel

THE Hanson-Van Winkle-Munning Co., Matawan, N. J., has developed a new type product called "Surbrite", a steel surface conditioner.

Surbrite is a free-running powder prepared in two types for addition to hydrochloric acid and sulfuric acid pickles. Its use in small quantities as additions to regular acid pickles produces bright, smut-free surfaces when iron and steel are pickled.

CHEMICAL AND ENGINEERING NEWS

PUBLISHED BY THE AMERICAN CHEMICAL SOCIETY
VOLUME 20 NOVEMBER 10, 1942 NUMBER 21

A. C. S. Candidates for 1943

MEMBERS of the AMERICAN CHEMICAL SOCIETY whose brief biographies follow have been proposed by the Local Sections for nomination for President-Elect and for Councilors-at-Large in accordance with the Constitution and Bylaws governing elections to these positions.

President-Elect

Thomas A. Boyd was born at Fairview, Ohio, October 10, 1886, received his B.Ch.E. degree from Ohio State in 1918, and then became a member of the research division of the Dayton Metal Products Co. where he remained until 1919. At that time he joined the General Motors Corp. where he has since done much work in the chemistry of motor fuels and the mechanics of their combustion. Since 1923 he has been head of the fuel department at General Motors Research Laboratories. A member of the AMERICAN CHEMICAL SOCIETY since 1919, he has been active both in Local Section and national Society affairs, serving as Divisional Chairman as well as Local Section Chairman and Local Section Councilor. Other affiliations of Mr. Boyd include membership in the A. A. A. S., the A. S. T. M., the Society of Automotive Engineers, American Petroleum Institute, and the Michigan Academy.

Mr. Boyd has written many articles on subjects related to his field, and his books include one on "Gasoline. What Everyone Should Know about It" published in 1918, and another on "Research, Pathfinder of Science and Industry" published in 1935.

Carl Shipp Marvel was born near Waynesville, Ill., September 11, 1894. He received his A.B. from Illinois Wesleyan in 1915, and his Ph.D from the University of Illinois in 1920. An instructor at that university during 1920–21 he advanced

to full professorship in 1930, which post he still holds. During these years and since his interests have been in the field of organic chemistry with special reference to identification of compounds, polyynes, organo-metallic compounds, free radicals, rearrangements, polymerization, and natural products. He has been a member of the AMERICAN CHEMICAL SOCIETY since 1915, during which time he has served as Divisional and as Local Section Chairman and as Local Section Councilor. Other activities have included membership on the editorial board of "Organic Syntheses" 1923–31, and in the American Association for the Advancement of Science.

Thomas Midgley, Jr., was born at Beaver Falls, Penna., May 18, 1889. He received the M.E. degree from Cornell in 1911. After employment with the National Cash Register Co. that year he began research work on automobile tires which he carried on during 1912–14, thereafter becoming superintendent of the Midgley Tire and Rubber Co. for two years. Then followed work with Charles F. Kettering and later with the General Motors Research Corp. where he became chief of the fuel section. Since 1924 he has been vice president of the Ethyl Gasoline Corp. (now the Ethyl Corp.) and of Kinetic Chemicals, Inc., since 1930, as well as director of the Ethyl-Dow Chemical Co. since 1923. Among many honors received for his achievements in chemistry (which include use of tetraethyllead as an antiknock compound and synthesis of certain organic fluoride compounds for antifreeze reagents as the best known) are the Nichols Medal of the AMERICAN CHEMICAL SOCIETY, the Willard Gibbs Medal of the Chicago Section of the A. C. S., and the Priestley Medal, also of the SOCIETY. Other awards have also been made for his work, including the honorary degree of doctor of science from the College of Wooster in 1936. A member of the SOCIETY since 1921, Dr. Midgley has contributed much to its progress and has served as a Director since 1930, and as chairman of the board since 1934. He is also a member of the American Association for the Advancement of Science, the Society of Automotive Engineers, and other scientific organizations.

Linus Carl Pauling was born at Portland, Oreg., February 28, 1901, and received his B.S. degree from Oregon State College in 1925. A fellow at the California Institute of Technology from 1922 to 1925 he received his Ph.D. in 1925, and became director of the Gates and Crellin Chemistry laboratories in 1937. During the intervening years he was a Guggenheim Memorial Foundation Fellow, a lecturer at California, and a visiting professor at M. I. T., and progressed from the position of assistant professor in theoretical chemistry at the institute to the directorship he now holds. In 1937–38 he was the George Fisher Baker lecturer at Cornell.

Dr. Pauling's work on determination of structure of crystals and molecules, application of quantum mechanics to chemistry, the chemical bond, line spectra, etc., has won him wide recognition. Honors bestowed upon him include the AMERICAN CHEMICAL SOCIETY Award in Pure Chemistry of which he was the first recipient. He is a member of the National Academy, the Philosophical Society, and a fellow of the Physical Society. As a member of the AMERICAN CHEMICAL SOCIETY since 1920 he has contributed much to the organization, and has served as a Local Section Councilor.

W. T. Read, dean of the School of Chemistry, Rutgers University, N. J., was born at College Station, Tex., March 8, 1886. He received his A.B. degree from Austin College, an A.M. in 1908, and an A.M. from the University of Texas in 1915. Thereafter he was an instructor in chemistry at the University of Texas, an assistant at Harvard University, chemist at the Bureau of Economic Geology of Texas, instructor and then assistant professor at Yale University where he received the Ph.D. degree in 1921. From 1925 to 1930 he was professor at the Texas Technological College, from which post he went to his present one.

During World War I, Dr. Read served as 1st Lieutenant in the Chemical Warfare Service, and since 1923 he has acted as director of the students' course of the Exposition of Chemical Industries. A member of the A. C. S. since 1907, Dr. Read has been interested in its progress, and has held offices as Councilor and as Chairman of the North Jersey Section. He is also a member of the American Instititute of Chemical Engineers and of the American Institute of Chemists, as well as of the Society of Chemical Industry (London). His work has been in organic and industrial chemistry with reference to semicarbazide, hydrazine, hydantoin derivatives, and boiler feed waters. As the author of several publications he is perhaps best known for his book on "Industrial Chemistry" published in a second edition in 1938.

Ernest H. Volwiler, vice president in charge of research and development at the Abbott Laboratories since 1933, was born in Hamilton, Ohio, in 1893. A graduate of Miami University, he received his Ph.D. from the University of Illinois in 1918. He became assistant in chemistry at Miami, then at the University of Illinois, and later was a fellow at the same institution, leaving to become research chemist at Abbott Laboratories in 1918. Chief chemist since 1920, he became a member of the board of directors and the director of research in 1930.

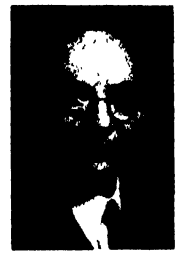
Dr. Volwiler has been a member of the AMERICAN CHEMICAL SOCIETY since 1916, and has held many offices in the organization including that of Divisional Chairman, Councilor-at-Large, Divisional Secretary, and Local Section Chairman as well as Councilor. During 1922–24 he edited the *Chemical Bulletin* of the Chicago Section. He has also served as president of the Association of Illinois Chemists and of the Chicago Chemists Club.

Holder of many patents for medicinal compounds, Dr. Volwiler is also a contributor to chemical and medical journals, and among his writings is a chapter on "Synthetic Drugs" published in a book on "Fighting Disease with Drugs".

Dr. Volwiler has been a major in the Chemical Warfare Service since 1925.

Hobart H. Willard, professor at the University of Michigan since 1923, was born in Erie, Penna., in 1881. He received his A.B. and A.M. degrees from the University of Michigan, was a fellow at Harvard University thereafter, and received his Ph.D. from the latter in 1909. At Michigan he served successively as instructor in chemistry, assistant professor, and associate professor until he attained full professorship in 1923.

During World War I he directed the Chemical and Metallurgical Laboratory, Bureau of Aircraft Production, of the Detroit District. He served on the National Research Council Division of Chemistry and Chemical Technology from 1934 to 1937, and was a Director of the AMERICAN CHEMICAL SOCIETY (which he joined in 1902) from 1934 to 1940. He is now serving as a member of the Advisory Board of the *Analytical Edition* of *Industrial and Engineering Chemistry*, and was Associate Editor of the *Journal of the American Chemical Society* from 1922 to 1931.



In addition to A. C. S. membership, Dr. Willard is affiliated with the A. A. A. S., the Electrochemical Society, and the National Research Council. He is the author of numerous papers on analytical and inorganic chemistry and has been co-author of several textbooks in his field.

Robert R. Williams was born in Nellore, India, February 16, 1886, but came to this country to graduate from the University of Chicago in 1908, with an M.S. degree. Thereafter, until 1915, he was a research chemist in the Philippine Islands where he began work which was to lead later to the successful synthesis of vitamin B_1. He was in the U.S. Department of Agriculture 1915–18, a chemist with Western Electric Co. 1919–24, and has been a chemical director at the Bell Telephone Laboratories since 1925. He also served as a research associate at Teachers College, Columbia University, from 1925 to 1935. In addition to the work for which he is best known, Dr. Williams has also done much on submarine and on textile insulation, and is an expert on industrial research management. He has been granted numerous patents, has written many papers, and is co-author of an authoritative book on "Vitamin B_1 and Its Use in Medicine".

A member of several scientific societies, including the American Association for the Advancement of Science, Society of Experimental Biology, and Society of Biological Chemists, Dr. Williams has been a member of the A. C. S. since 1913, during which time he has contributed his services in many ways, his offices including that of Local Section Councilor.

Councilors-at-Large

M. L. Crossley, director of research of the Calco Chemical Division, American Cyanamid Co., Bound Brook, N. J., was born at Saba Island, D. W. I., July 3, 1884. He was educated at Brown University where he received the Ph.B. degree in 1909, M.S. in 1910, and Ph.D. in 1911. From 1909 to 1911 he was instructor in chemistry at Brown University, associate professor at William Jewell College from 1911 to 1913, lecturer in organic chemistry at Wesleyan University in 1913–14, and associate professor of chemistry and acting head of the department from 1914 to 1918. From 1918 to 1936 he was chief chemist of the Calco Chemical Co., and since 1936 has been director of research. From 1916 to 1918 he was consulting chemist of the Barrett Co.

The AMERICAN CHEMICAL SOCIETY assumes no responsiblity for the statements and opinions advanced by contributors to its publications.
Published by the AMERICAN CHEMICAL SOCIETY, Publication Office, 20th & Northampton Sts., Easton, Penna. Editorial Office, 1155 16th St., N. W., Washington, D. C.; Telephone, Republic 5301; Cable, Jiechem (Washington). Advertising Department, 332 West 42nd St., New York, N. Y.; Telephone, Bryant 9-4430. Entered as second-class matter at the Post Office at Easton, Penna., under the act of March 3, 1879, as 24 times a year on the 10th and 25th. Acceptance for mailing at special rate of postage provided for in Section 1103, Act of October 3, 1917, authorized July 13, 1918.
Annual subscription rate, $2.00. Foreign postage to countries not in the Pan American Union, $0.60; Canadian postage, $0.20. Single copies, $0.15. Special rates to members.
No claims can be allowed for copies of journals lost in the mails unless such claims are received within 60 days of the date of issue, and no claims will be allowed for issues lost as a result of insufficient notice of change of address. (Ten days' advance notice required.) "Missing from files" cannot be accepted as the reason for honoring a claim. Charles L. Parsons, Business Manager, 1155 16th St., N. W., Washington, D. C., U. S. A.

From 1915 to 1917 he was Chairman of the Connecticut Valley Section of the AMERICAN CHEMICAL SOCIETY, and in 1924 and 1934 was president of the American Institute of Chemists. He is also a member of the Society of Chemical Industry, Faraday Society, Chemical Society (London), and the American Association for the Advancement of Science. He is particularly interested in work in dyes and pharmaceuticals, and has done much pioneer work in the study of the sulfa drugs.

George Glockler was born in Munich, Germany, September 7, 1890, received his B.S. and M.S. degrees from the University of Washington at Seattle, and his Ph.D. from California in 1923. From 1916 to 1921 he was an analytical chemist in Japan. He was national research fellow at the California Institute of Technology for three years, then American Petroleum Institute research associate at the University of Minnesota for a similar period. From associate professorship in inorganic chemistry, Dr. Glockler advanced to professorship in physical chemistry in 1936, which position he held until 1940 when he left Minnesota to become head of the department of chemistry and chemical engineering at the University of Iowa.

In the field of physical chemistry Dr. Glockler's work has concerned itself with resonance and ionization potentials, chemical activation by electrical discharge and by controlled electrons, light scattering by solids, liquids, and gases. He is co-author with S. C. Lind of a book on "Electrochemistry of Gases and Other Dielectrics" and has contributed many papers to A. C. S. journals and other scientific publications. He is a fellow of the American Physical Society, a member of the A. A. A. S., and a research associate of the Naval Research Laboratory. A member of the AMERICAN CHEMICAL SOCIETY since 1921, Dr. Glockler has given much time to its affairs, his offices in the Local Section having included service as Chairman, Secretary, and Councilor.

Webster Newton Jones was born in Rich Hill, Mo., on July 29, 1887, and received his A.B. from Missouri in 1908, his A.M. in 1909. Thereafter he taught chemistry at Missouri, Harvard, Purdue, Maine, and Montana before becoming research chemist at the B. F. Goodrich Co. in 1919. In 1920 he received the Ph.D. degree from Harvard, but continued at the Goodrich company until 1932, at which time he was general superintendent of the processing division. In 1932 he became director of the college of engineering at Carnegie Institute of Technology, Pittsburgh, a position he now holds. Dr. Jones has been chiefly concerned with rubber chemistry and products, but has also devoted his attention to the selection of technical personnel and to chemical prices, serving as a chemical expert on the War Trade Board in 1919.

Dr. Jones is a member of the National Inventors Council, the A. A. A. S., the American Institute of Chemical Engineers (of which he was president in 1939–40), the Society for the Promotion of Engineering Education, and the AMERICAN CHEMICAL SOCIETY since 1908, as well as a number of other professional and fraternal organizations.

O. E. May was born at New Albin, Iowa, on August 22, 1901. He received his A.B. from Columbia College, Iowa, in 1924, his M.S. from Minnesota in 1926, and his Ph.D. from George Washington University in 1929. From 1923 to 1936 he was in the U. S. Department of Agriculture in Washington, leaving to become director of the Regional Soybean Industrial Products Laboratory of the department at Urbana, Ill. In the summer of 1942 he was appointed director of the Northern Regional Research Laboratories at Peoria, but returned recently to engage in administrative work in the Bureau of Agricultural Chemistry and Engineering in Washington.

In addition to his work on the industrial utilization of soybeans and soybean products, Dr. May has been concerned with vapor pressures of industrial organic intermediates, mold metabolism, acid formation by molds, mold fermentation mechanisms, and the effect of air pressure increases on oxidative mold fermentations. He has contributed numerous papers to the scientific literature, and has been active in the affairs of the AMERICAN CHEMICAL SOCIETY which he joined in 1927. He has served as Treasurer of the Washington Section, also as Secretary.

W. Albert Noyes, Jr., professor of physical chemistry, University of Rochester, was born in Terre Haute, Ind., April 18, 1898, and received his A.B. from Grinnell College in 1919 and his D.Sc. from the University of Paris in 1920. He was teaching fellow at the University of California in 1920–21, instructor in chemistry in 1920–22; assistant professor at the University of Chicago, 1923–29; associate professor at Brown University

1929–35 and professor 1935–38; professor of physical chemistry at the University of Rochester since 1938. In 1918–19 he was 2nd Lieutenant in the Signal Corps, and since 1936 has been Lieutenant Commander in the U. S. Naval Reserve Corps. At present he is a consultant for the Chemical Warfare Service and engaged in special work for the National Defense Research Committee. He has been Councilor of the AMERICAN CHEMICAL SOCIETY, Assistant Editor of *Chemical Abstracts*, and Chairman of the Division of Physical and Inorganic Chemistry. His principal interests lie in the fields of electrochemistry, discharge through gases, vapor pressures, thermal reactions, and photochemistry. He is a member of the American Association for the Advancement of Science, Physical Society, American Academy, and the Illinois Academy.

George Scatchard was born at Onconta, N. Y., on March 19, 1892, received his A.B. from Amherst College in 1913, and his Ph.D. degree from Columbia in 1917. He served as assistant in chemistry at Columbia 1914–17, was associate professor at Amherst during 1919–23, and National Research Fellow at M. I. T. during 1923–24. He advanced from assistant professorship at M. I. T. in 1924 to full professorship in 1937, a position he now holds.

Dr. Scatchard's chief interests lie in the fields of organic and physical chemistry, his work dealing with war gases, physical properties of optically active components, reaction rate in solutions, mixtures of nonelectrolytes, electrolytes in solution, and liquid junction potentials. He has contributed much to the scientific literature on these subjects.

A member of the AMERICAN CHEMICAL SOCIETY since 1913, Dr. Scatchard is also a member of a number of other scientific organizations, including the American Academy of Arts and Sciences. In World War I he served as a 1st Lieutenant in the Sanitary Corps.

R. L. Shriner was born in St. Louis, Mo., on October 9, 1899, received his B.S. from Washington University there, his M.S. and Ph.D. from the University of Illinois, the latter in 1925. He was an instructor in chemistry at Washington University during 1921–22, associate research and assistant professor at the New York Experiment Station 1925–27, and then became assistant professor at the Uni-

versity of Illinois. He advanced to a professorship there in 1935, leaving to become professor of chemistry and chairman of the department at Indiana University, Bloomington, Ind., in 1941.

Dr. Shriner's work has concerned itself with identification of organic compounds, salts of nitro compounds, waxes, catalysis, drugs, alkaloids, sulfoxides and sulfonanilides, mutarotation, etc., and he has contributed considerably to the literature on these subjects. He has published numerous articles and a number of books as well, among the latter "Systematic Identification of Organic Compounds" of which R. C. Fuson is co-author.

A member of the A. A. A. S., of the Editorial Board of the *Journal of Organic Chemistry*, and of the AMERICAN CHEMICAL SOCIETY since 1919, Dr. Shriner has been identified with both Divisional and Local Section activities of the A. C. S. He has served in turn as Divisional Chairman, as Local Section Secretary, and as Local Section Councilor.

Robert B. Sosman was born in Chillicothe, Ohio, March 17, 1881, received his B.S. degree from Ohio State in 1903, S.B. from M. I. T. in 1904, and Ph.D. from the same institution in 1907. From 1906 to 1908 he worked in the laboratory of Arthur D. Little, became an assistant director at the Carnegie Institution of Washington's Geophysical Laboratory where he remained from 1908 to 1928, and then took up his present work as research chemist with the U. S. Steel Corp., Kearny, N. J.

Dr. Sosman served also as consulting chemist to the Ordnance Department of the U. S. Army in 1918, was lecturer on geophysics at M. I. T. during 1925–26, and has been a national councilor of the Ohio State University Research Foundation since 1937.

Subjects of interest to Dr. Sosman include aqueous solutions at 0° to 300°, gas thermometry to 1600°, specific volume of minerals at fusion, refractory oxides, iron-oxygen system, silica and silicates, geophysics, and industrial pyrometry. He has been the author of many papers on these topics, as well as of books dealing with the properties of silica and with the pyrometry of solids and surfaces.

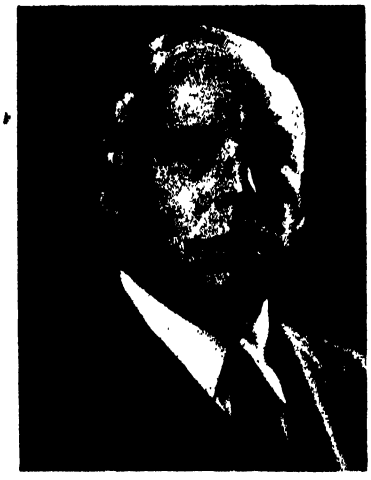
A member of several scientific societies, including the A. A. A. S., the Ceramic Society, Physical Society, the Washington Academy, and the AMERICAN CHEMICAL SOCIETY, Dr. Sosman has been active in A. C. S. circles. A member since 1904, he has held the offices of Chairman, Secretary, and Councilor for his Local Section.

Vincent du Vigneaud was born in Chicago, Ill., on May 18, 1901, received his B.S. degree at Illinois in 1923, his M.S. in 1924, and his Ph.D. degree from Rochester in 1927. Since that time he has served as assistant biochemist at the Philadelphia General Hospital and at the Pennsylvania Graduate School of Medicine. He was at the Kaiser Wilhelm Institut and at the medical school of Edinburgh during 1928 and 1929. Returning to this country he became professor and head of the department of biochemistry at the George Washington School of Medicine in 1932 after two years spent as associate at the University of Illinois. In 1938 he became professor and head of the department of chemistry at Cornell Medical School, which position he still holds.

Dr. du Vigneaud's work includes studies on the chemistry of insulin and posterior pituitary hormones, intermediary metabolism, amino acid, peptide, and protein chemistry. His researches on vitamins have culminated recently in the announcement of the discovery of the structure of biotin, the empirical formula of the molecule having been established two years ago.

In recognition of his contributions to science the Hillebrand Prize of the Chemical Society of Washington was awarded to Dr. du Vigneaud in 1936. A member of many scientific societies, including the A. A. A. S., New York Academy, Society of Biological Chemistry, Chemical Society (London), Dr. du Vigneaud has belonged to the A. C. S. since 1930, and has been a committee member as well as a Local Section Councilor.

Report of Committee on Economic Status



THE survey of the economic status of the membership of the AMERICAN CHEMICAL SOCIETY it is hoped will appear in three sections, the first of which was published on page 1289 of the October 25 issue of CHEMICAL AND ENGINEERING NEWS. Because of space limitations it was decided not to use the issue of November 10, as this is a special number devoted largely to the National Chemical Exposition. Remaining sections of the report will probably appear on November 25 and December 10.

Many members will probably wish to purchase copies of the report bound under a single cover. The committee is therefore arranging to have a supply of reprints prepared immediately following publication of the last section.

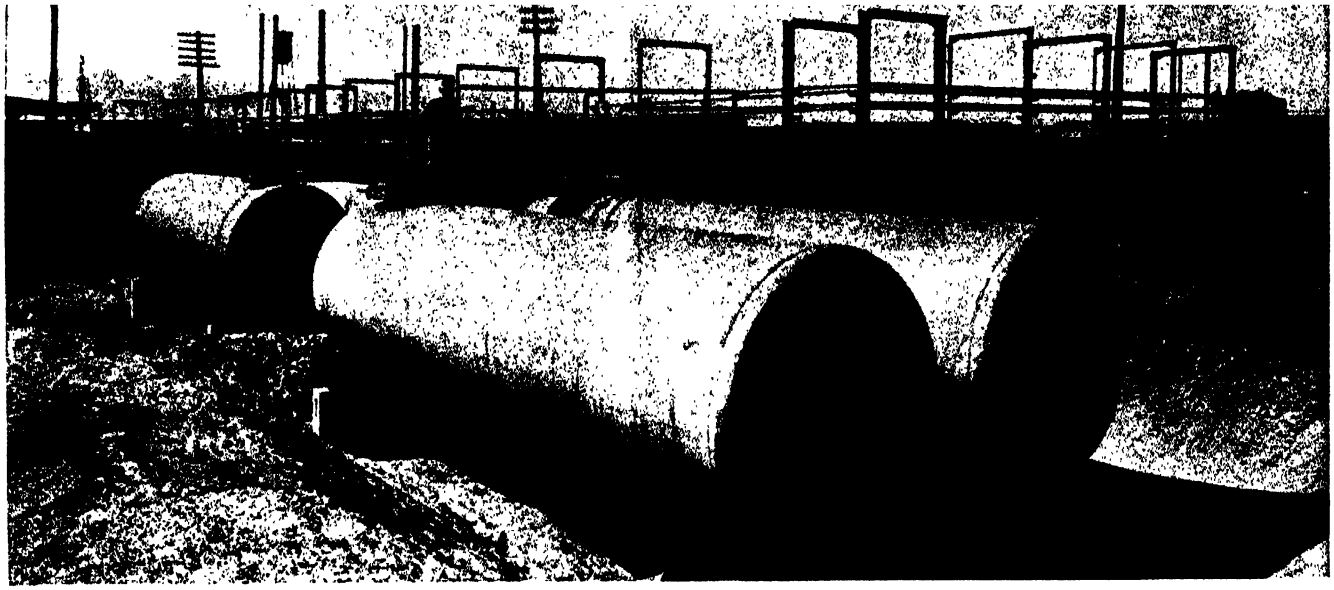
Nomenclature in Quantitative Analysis

THE Division of Analytical and Micro Chemistry, AMERICAN CHEMICAL SOCIETY, has appointed a committee to take up the problem of nomenclature for analytical methods. M. G. Mellon, Purdue University, is chairman, and the other members of the committee are H. V. Churchill, Aluminum Co. of America, N. H. Furman, Princeton University, and S. E. Q. Ashley, General Electric Co.

Nichols Medal Award to Arthur B. Lamb

THE Nichols Medal Jury of Award for 1943 has announced that the Nichols medalist for 1943 is Arthur B. Lamb, professor of chemistry, Harvard University, and Editor of the *Journal of the American Chemical Society*. The award will be made at a joint meeting of the New York Section of the AMERICAN CHEMICAL SOCIETY and the Society of Chemical Industry at The Chemists' Club, New York, N. Y., March 5, 1943.

Dr. Lamb has published numerous papers for over 20 years dealing with the aquo- and ammonio-metal salts, more recently on the rate of attainment of equilibrium in aquo-ferric, rhodium aquopentammine, and cobalt carbonateo-pentammine salt solutions, as well as on the adsorption of gases by solids, and other topics. He is a recognized authority on inorganic chemistry.



This award comes to Dr. Lamb in his 25th year as Editor of the *Journal of the American Chemical Society*.

Ellis Blade, formerly chief engineer of the Spring Division, John Chatillon & Sons, is now a production engineer with the Signal Corps, with headquarters in Washington, D. C.

ACTION ON THE AMERICAN CHEMICAL FRONT

Here and in issues to follow we give facts about some origins which show that in America genius continues to flourish.

The basic ingredient of Ameripol, the synthetic rubber developed by the B. F. Goodrich Co. in a 16-year research program, is butadiene. Here butadiene is stored at a plant in cylinders under pressure. All materials used in Ameripol are found in America.

Introduction

AMERICANS act swiftly and effectively when need appears. Our chemical industry evidences that. World War I revealed great gaps in our chemical economy; and plants to practice the intricate, and then strange, syntheses of drugs, dyes, and a thousand other chemical products appeared miraculously. Cornfields gave way, producing units between plant and harvest. The miracle was hidden then by the grief and travail—the blood, sweat, and tears—of creating totally new enterprises to meet unexpected needs quickly.

Now, again, the exigencies of war have created new and unforeseen shortages that must and will be met. Now, as before, the urgency of the need has made performance seem slow, has encouraged carping criticism of earnest effort. Even the ingenuity and inventiveness of Americans are questioned. But only foresight has failed. Diplomatic and military defeats created a shortage of rubber so complete and so sudden that we as a nation were set back on our heels. In the ensuing turmoil fruitless argument and faultfinding consumed precious time. That lag shook confidence in the acumen of our scientists and the ability of our industry. These misgivings suggested to the uninformed that American science is an alien borrowed art and that American scientists are parasites thriving only on the inventions and discoveries of others.

That is patently false. No one can view American accomplishments in science without being deeply impressed. Our vaunted Yankee ingenuity has merely assumed a new garb. The pioneering spirit, which carved a great nation out of a wilderness, today animates the research workers of the country, thrives in advancing science, engineering, and industry.

Obviously, the answer to critics lies in knowledge. Only lack of facts can foster misunderstanding. Consequently it will be worth while to review some of the fields in which Americans have pioneered in industries based on science. That is done in the following pages.

Rubber Technology

WILLIAM C. GEER[1], 624 Highland Road, Ithaca, N. Y.

BECAUSE of its history, the word "rubber" carries several implications, and in any except the most highly technical writings one all-important conception should be explained and emphasized. Raw or crude rubber cannot, without the aid of other substances, be made into articles which would perform a fraction of the service rendered by the merchandise with which we are familiar. There are but few exceptions and they are products which, strictly and chemically speaking, should not be classified under the heading of "rubber".

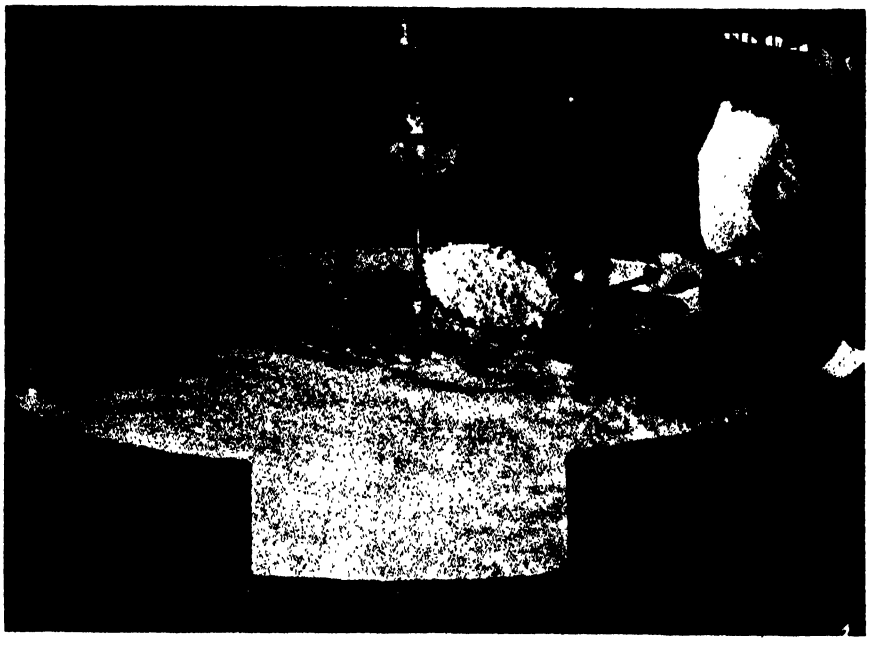
Automobile tires, for instance, if made only of raw rubber, whether from a plantation in the Far East, a wild tree in the Amazon Valley, or out of the chemist's kettle, might carry a car around the block without a breakdown but certainly not much farther. Other substances must be mixed with raw rubber and in different proportions for each of the thousands of well-known articles. Thus, the rubber mixture, or "compound" as it is colloquially expressed, involves a considerable science and constitutes the foundation of the rubber industry.

[1] Formerly vice president in charge of research and development of The B. F. Goodrich Co.

During the early years of the past century, efforts were made to use raw rubber directly in the form of various articles. The qualities were low and the little rubber industry had practically collapsed when the American, Charles Goodyear, in 1839 made the first of that series of four discoveries each of which today is necessary to rubber compounds. Goodyear discovered that sulfur, when mixed with crude rubber and heated, produced a profound change. This method shortly thereafter became known as vulcanization and is still so designated. From then until now sulfur has become as necessary to rubber articles as rubber itself. The crude rubber is weak and thermoplastic, whereas vulcanized rubber is much stronger and not thermoplastic. However, the time then required for the vulcanization process was measured in hours and still the finished article did not exhibit many desirable characteristics.

In 1906 Oenslager, in Akron, Ohio, found certain organic chemicals which, when used in small quantity (1 per cent or less) with rubber and sulfur, not only shortened this time but greatly improved the strength and other physical properties. As a class these substances were termed

"organic accelerators" and many different ones are in current use. Modern vulcanization is measured in minutes rather than hours, and the tensile strength, as well as other properties of equivalent compositions, has been more than doubled, with corresponding increase in service value to the consumer.



For many years vulcanized rubber did not age well. It "perished" too easily. It was conceived that this perishing was due to oxidation. Several American investigators, working independently about 1910 to 1915, found how small amounts (about 1 per cent) of certain organic compounds which were not accelerators of vulcanization preserved the physical properties of rubber products during long periods of time.

Methods and apparatus were devised which permit the rubber chemist, after a few days of testing, to estimate the number of years which a given rubber compound will last. At least one of these numerous "antioxidants" is included in tires, shoes, and other largely used articles, with the result that rubber goods may be stored from 5 to 10 years with but little alteration of service value.

A fourth group of materials are essential in rubber mixtures which must withstand abrasive effects, such as the treads of automobile tires, the outer cover of conveyor belts, and the soles of rubber shoes. These substances are called "reinforcing agents". The one most valuable and that upon which rubber technologists depend to give maximum abrasive wear is a finely divided carbon made from the incomplete combustion of natural gas. Although the first use of this substance, known to the industry as carbon black, probably was in England, its development and utilization for the treads of automobile tires began in this country about 1915. A rubber mixture which contains the right amount of carbon black will outwear steel or any other known material by a ratio of 10 to 1.

To prepare Ameripol, the B. F. Goodrich "liberty rubber" compounded from oil, soap, and natural gas for use in tires and other rubber products, the raw product, fresh from the coagulating vats, is broken up and sheeted on a wash mill. Here lumpy material is squeezed into thin sheets which are then cut to a standard size and thoroughly dried.

From the polymerizers there comes a thick milky white liquid which is similar in appearance and form to the virgin latex of the rubber tree. The synthetic latex is stirred in large vats where it is stabilized in order to give the finished rubber resistance to heat and oxygen. Then the rubber content is solidified in another vat by coagulating it with dilute acid. This milklike curd is then washed by agitating it, as shown above, in the vat.

Place these chemical achievements together and add to them two contributions made by the American engineers—namely, the multi-ply cord tires and the large section tires (formerly known as balloon tires)—and the sum is modern transportation. Without them the volume of crude rubber used during 1940 for tires alone would have been fivefold that consumed and at a cost of some one billion dollars more than was actually paid.

Quite naturally, at the moment, the attention of the people of this country is centered upon synthetic rubber. There are some six varieties of synthetic rubber which exist in the form of many types and grades. Well over a thousand different synthetic rubbers are known to those who specialize in this field, and no one of them is a chemical duplicate of natural crude rubber or possesses all the physical properties of that material. Of these six varieties, four of them—namely, neoprene, Thiokol, Koroseal, and butyl originated in this country. Wholly satisfactory tires can be made from neoprene, but for large-scale, rapid, and economical production, preference has been given to a fifth which is a copolymer of butadiene with styrene, called "Buna S".

Even though butadiene was first polymerized in Russia in 1910, American chemists prefer the copolymers (Ameripol, Chemigum, Hycar, and Amprene) which are the products of their own exhaustive research. The author has dropped the

name "Buna S" and has adopted the term "Amprene" which was suggested to him by a group of American rubber chemists because it is distinctly an American product.

The grades and types of this variety of synthetic rubber are quite different. American rubber chemists must, and do, understand what other substances and how much are to be used with each, for they have a wide and thorough scientific and practical knowledge of the numerous grades and of the many essential compounding ingredients—accelerators, antioxidants, plasticizers, and reinforcing agents.

The methods of mixing the compounds are not the same as for natural rubber. Thus, new techniques and somewhat complicated ones have been worked out in our factories. All this information and experience are of vital consequence to the users of the vulcanized article (tires) for, let me repeat, the raw material must be associated with other substances if high quality is to be realized in the finished product.

The synthetic rubber comes from the wash mill in flesh-colored sheets. By drying, the color becomes a light amber. A workman holds a sheet of dried synthetic rubber, at left, and dried natural rubber. The rubber is crude No. 1 Smoked Sheet and like the synthetic is raw or unvulcanized at this stage, with corrugated surface.

The reclaiming of vulcanized rubber was taken up early after the discovery of vulcanization and has had a large and successful development in this country. Marks, about 1899, in Boston, invented the reclaiming method which has become the most practical and which yields the product of the highest quality. In principle it is still employed, although the reclaimers have improved it in detail and the use of reclaimed rubber has advanced steadily over the years.

Boiled down to its simplest terms, reclaimed rubber is a plasticized vulcanized rubber derived from rubber articles which, during the process of reclaiming, have been freed from cotton or other fabric. Therefore a certain point should be made clear: Reclaimed rubber does not possess the same physical properties as crude rubber. It has specific and valuable uses in many compounds. But in tires and articles subject to abrasion and heat, the service rendered is less than in articles made only with natural crude rubber.

Then again, it is general practice to mix some crude rubber with reclaimed rubber in practically all articles in which reclaimed rubber is specified. But there is no method known by which this new rubber can be separated from the reclaimed rubber after vulcanization. We cannot unscramble eggs and we cannot unscramble vulcanized rubber articles and obtain the original ingredients, whatever they may have been. This means that scrap articles such as tires, tubes, shoes, belting, packing, hose, matting, and so on, must be sorted, reclaimed separately, and the reclaimed rubber from each of these grades used in similar articles, or in those of lower service requirements.

A logical question is: How familiar is the rubber industry in this country with the several grades, varieties, and types of crude rubber other than those which have come from the plantations? Literally thousands of species of trees, shrubs, vines, and plants contain some rubber. The standard quality is that from the *Hevea brasiliensis* tree, native in the Amason Valley and cultivated in the Far East. For many years rubber from the Castillos, Ceara, Manihot, and other natural trees has been used. The qualities are various and require specialized techniques for different articles, but we are well able to handle them all. Guayule rubber, the shrub rubber native in Mexico and obtained from plantations in California, has been in steady use in the rubber industry for the past 30 years. The industry can absorb all that can be produced economically.

Studies have been made from time to time upon native American plants which contain low percentages of rubber, but these are not so well known to the rubber industry because the quantities available have been small and the high cost of collection has discouraged their thorough study. When and if large amounts of rubber from Cryptostegia, Asclepsis, Chrysothamus, and others become available, I am sure that the issue will be met and that these grades will be employed in any quantity in which they may be produced.

If those who are technically minded wish support of the foregoing assertions, reference is suggested to "The Chemistry and Technology of Rubber", edited by C. C. Davis and J. T. Blake, (A. C. S. Monograph No. 74, 1937) in which is listed a large number of citations to original literature.

Summing it all up, American chemists have discovered and developed new and superior varieties and types of synthetic and reclaimed rubber. The technicians of the rubber industry lead the world in knowledge of all grades of rubber and of those substances necessary for use with raw rubber in order to give high quality to the vulcanised product. They must be supplied with the raw material—whether natural crude or synthetic rubber, whether guayule or Cryptostegia. They must be

After 14 days' immersion in oil at 160° F., a miniature tire of natural rubber swelled 40 per cent in diameter and 180 per cent in volume. A miniature tire of synthetic rubber, known as Hycar OR, showed no effects of its oil bath, retaining its original dimensions. W. L. Semon holds the two tested tires, while an untested tire in the foreground indicates original size.

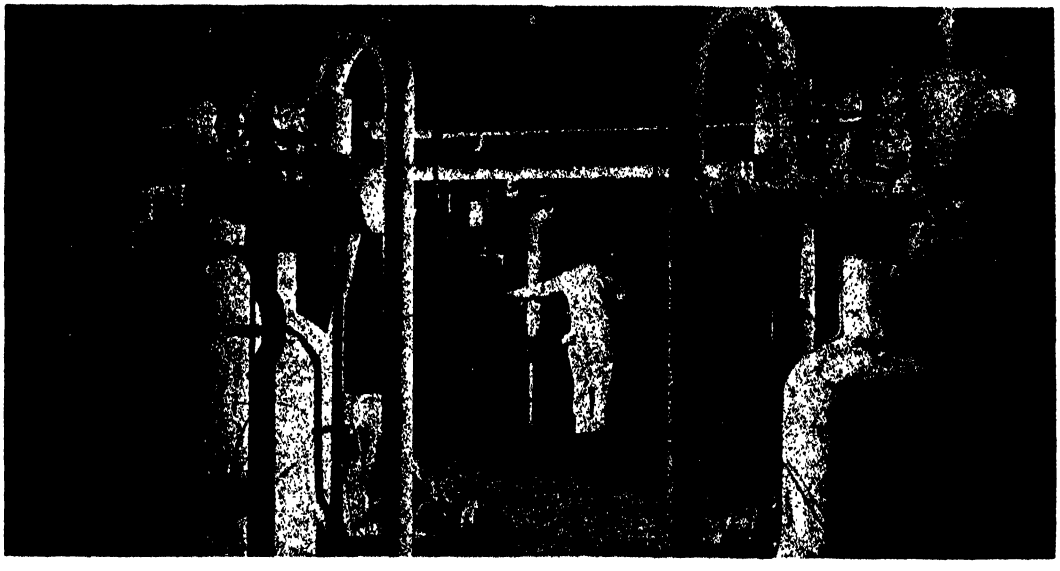
allowed freedom in their research and not be hampered by orders and directions from officials who do not understand the technology of rubber.

Under such conditions, the American rubber chemists and the American rubber industry can maintain their leadership and can be depended upon to produce for the military services, and for the country, continued high service values in articles made of that truly remarkable substance—rubber.

Accelerators and Antioxidants in the Rubber Industry

PAUL I. MURRILL, R. T. Vanderbilt Co., Inc., 230 Park Ave., New York, N. Y.

THE centennial of the discovery of the vulcanization of rubber by Charles Goodyear was appropriately celebrated in 1939 by the chemists of America and the world generally. For two thirds of the century since that discovery the rubber industry was an art, but during the last third of a century it became a science in which American chemists were leaders. The change-over coincides approximately with the work of George Oenslager on organic accelerators and his discovery in 1907 of the advantages of aniline for that purpose. The discovery was not patented but was kept a secret within the B. F. Goodrich Co.'s organization as long as possible. However, the knowledge gradually reached other rubber chemists and started them on a search for other and better accelerators. The first U. S. patents on accelerators were issued in 1915 to Hofmann and Gottlob, and on this basis the claim was made (and accepted for a time) that the Germans were entitled to all the honors. However, in 1933, after weighing the claims of various workers in the field, the Perkin Medal of the Society of Chemical Industry was awarded to Oenslager for his priority and achievements.



During the period 1915 to 1925 the names of Boggs, Price, DeMeeus, Murrill, Bedford, Sibley, Scott, Moloney, Nikaido, Lorents, Cadwell, Bradley, Ricard, Naylor, Weiss, Ostromislensky, Sebrell, Chute, Russell, Morton, Young, North, Shepard, Fisher, Trumbull, and Winkelmann appear prominently among those who were granted U. S. patents relating to accelerators and give a good indication of what chemists in the United States were doing, though the list is incomplete.

The advantages accruing to the rubber industry and to all users of rubber products, which means the entire Nation, may be briefly summarized as follows:

Temperature of vulcanization was lowered, saving steam.
Time of vulcanization was shortened, saving labor and equipment and increasing output.
Quality of the product was improved, giving greatly increased useful life.

The use of antioxidants in rubber articles was a direct outgrowth of the work on accelerators, since it was soon observed that the presence of certain accelerators, together with the less severe conditions of cure, gave products which had a longer life when subjected to the action of light, heat, and oxygen, either separately or together. This led to a study of other chemicals more or less related to the known accelerators and to the discovery that certain chemicals were effective in retarding oxidation, although they had no effect on time or temperature of vulcanization. One of the earliest patents in this field was issued to Gray and Winkelmann in 1924, and in succeeding years the names of many of the chemists already mentioned reappear in the literature.

Although chemists in foreign countries have not been idle and their contributions to the rubber industry cannot be ignored, it may be said truthfully that the industry has never been dependent on foreign sources of information for the knowledge and the materials needed for the highest quality of rubber articles. The automobilist needs only to compare the mileage obtained on his tires in 1915 with what he got in 1935, especially if this is done on the basis of miles per dollar, to get a clear picture of what the rubber chemists of the United States have done for him. With the present shortage of rubber and the necessity of getting the greatest possible life from what we have, it is clear that wartime economy owes much to American rubber chemists.

The first step in making nylon at Delaware du Pont plant is evaporation of water from the chemicals shipped from the du Pont plant in West Virginia. Nylon intermediates are pumped into large tanks to begin processing that turns them into strong, elastic, truly synthetic fibers and other materials.

Thiokol

BEVIS LONGSTRETH, Thiokol Corp., 780 North Clinton Ave., Trenton, N. J.

THE several types of synthetic rubber being marketed under the brand name "Thiokol"[1] are the result of research initiated in the early 1920's and carried on uninterruptedly since then by Thiokol Corp. For the past 12 years, the company has maintained a staff of rubber chemists and itinerant engineers who have worked closely with the entire rubber industry and industries outside the rubber field whose interest in synthetic rubber dates back several years. This practical experience and acquaintanceship with production problems have proved particularly valuable in gearing the company's work to war production.

As many chemists know, the basic chemical reaction involved in the manufacture of Thiokol synthetic rubber is that between sodium polysulfide and ethylene dichloride. Investigation and variations of this basic reaction have resulted in the development of literally hundreds of different types of Thiokol synthetic rubber. These products differ from each other not only in properties but also in form. Today crude Thiokol synthetic rubber and Thiokol latices, emulsions, and dispersions are being marketed. The potential number of different Thiokol materials is infinite; in fact, many rubber chemists consider the basic Thiokol reaction the beginning of an entirely new field of sulfur chemistry. If this is so, credit for development of the field belongs to J. C. Patrick, the inventor of the polysulfide reaction products.

Drawing off latex in plant of Thiokol Corp.

By incorporating one or another form of Thiokol synthetic rubber into their manufacturing processes, the rubber industry and others have developed an impressive list of products. Well up on this list are industrial hose of all types, stamped and molded goods, airplane self-sealing fuel tanks, barrage balloon cloth, inflated rubber equipment, packings and gaskets, and coatings for concrete and metal. The primary reason for Thiokol synthetic rubber being used in these products is its freedom from attack of petroleum products, resistance to aromatics, and high impermeability.

No statement about Thiokol synthetic rubber would be complete without mention of a recent development which in importance may well transcend the combined importance of all previous developments in which the material has played a part—the use of Thiokol synthetic rubber for tire retreads and possibly completely new all-synthetic tires and tubes. In the opinion of both the automotive and rubber industries, Thiokol offers the fastest and most economical means of producing enough synthetic rubber to retread the millions of tires needed to run the automobiles of war workers.

Recently, the Tire Committee of the Automotive and Rubber Industries recommended a program which would put 1,000,000 Thiokol retreaded tires on the road every month, starting before the close of 1942.

Thiokol retreaded tires, extensive tests show, deliver an average of 7,500 miles of wear. Tires completely made of the material have run 8,000 to 10,000 miles in the Arizona desert. On the production side of the picture, plants similar to that which would be required to produce the new type of retreading material have in the past been put into operation in considerably less than six months.

Lastly, the raw materials required to make Thiokol are available in Continental United States.

Neoprene

This story is based upon information furnished by E. I. du Pont de Nemours & Co., Inc., Wilmington, Del.

Neoprene lining in air hose resists the effects of hot oil through air line

THE infant synthetic rubber industry is being called upon to provide hundreds of thousands of tons of resilient material for our planes, our tanks and trucks, our ordnance, and our industrial machinery. This industry, working at top speed, is going to produce this material as rapidly as possible and as soon as possible. Unfortunately, the current newspaper controversy on synthetic rubber has tended to confuse the background of this industry, a background on which our Nation is building for future success.

Materials produced synthetically and having rubberlike properties are not new to American industry. The rubber industry has been using such materials for over 10 years. Rubber manufacturers know how to compound synthetic rubber, they know how to make products from it, and they have the experience to utilize any type of synthetic that is produced in this country.

Most of this experience was gained through working with neoprene, a synthetic rubber in quantity production in this country since 1932. Neoprene was not developed as a mere "rubber substitute". It was planned as a new material that the rubber industry could use for those applications where rubber could not be employed because of the severe conditions of service.

Neoprene had its beginnings at a time when the search for synthetic rubber appeared so hopeless that a leading scientist in this field said: "Regarded from the technical standpoint, synthetic rubber is today no longer a practicable proposition". Fortunately, such a pessimistic attitude did not permeate the chemical industry. At the very moment those words were written, chemists of E. I. du Pont de Nemours & Co., Inc. were actively prosecuting a search for a method of making butadiene rubber from acetylene.

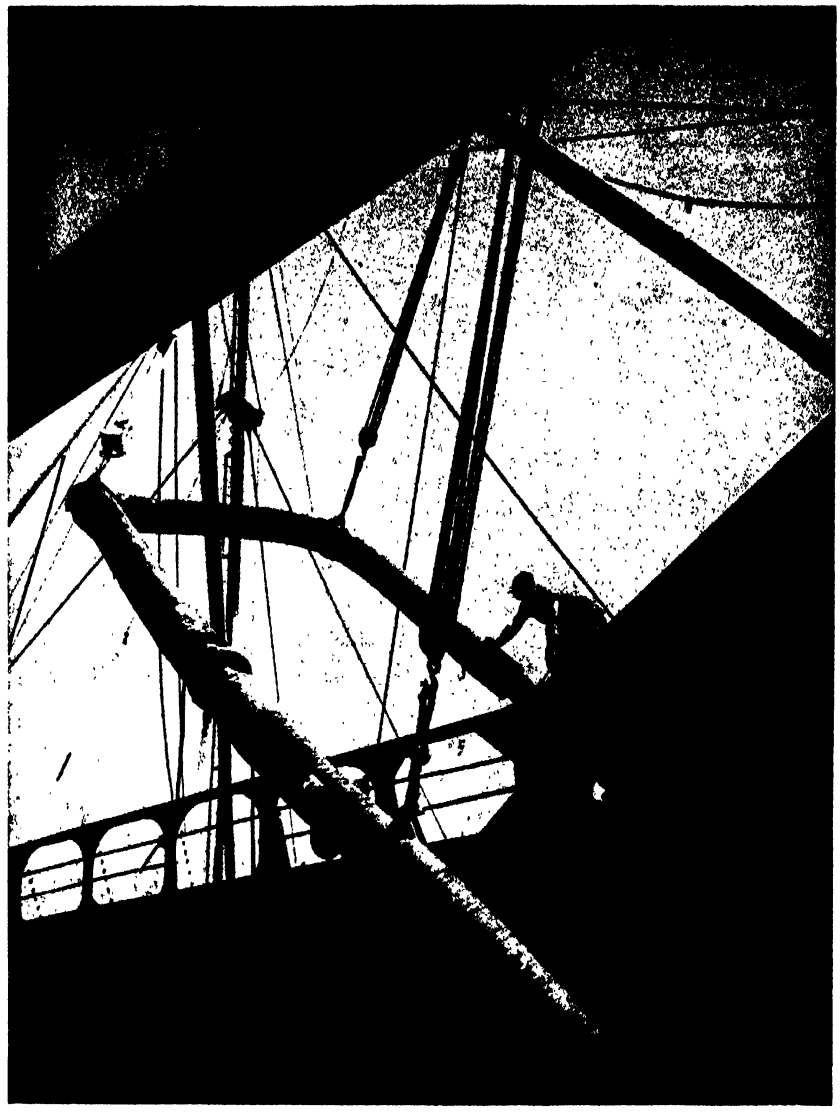
The solution of this problem was vastly accelerated by a chance meeting of a young chemist and a college scientist at a meeting of the AMERICAN CHEMICAL SOCIETY. The scientist was reporting merely on some research on acetylene gas. He told of producing from acetylene a yellow oil called "divinylacetylene" and of a strange odor that had persisted in the reaction, an odor which led him to suspect the presence of monovinylacetylene gas. The young chemist was vitally interested in this latter statement; it was a definite clue to the problem of producing synthetic rubber.

Synthetic rubber never was made from divinylacetylene, although the chemical was found useful in the preparation of a valuable type of corrosion-resistant finish. When finally produced on a pilot-scale basis in a du Pont laboratory in 1929, it was found to contain a contaminant. And, note carefully, that contaminant turned out to be the elusive monovinylacetylene, a colorless liquid with a sweetish odor.

At last the chemists found they could have this material in substantial quantities. Combined with hydrochloric acid and left standing, it turned to a jellylike substance with some of the properties of rubber. This ultimately was developed into the long-sought commercial product.

What the chemists actually had done was not to synthesize rubber but to synthesize a material containing rubber's desirable qualities and, in addition, superior properties of its own. These properties include superior resistance to the effects of oils, chemicals, sunlight, ozone, and oxidation, forces which had previously limited the usability of natural rubber.

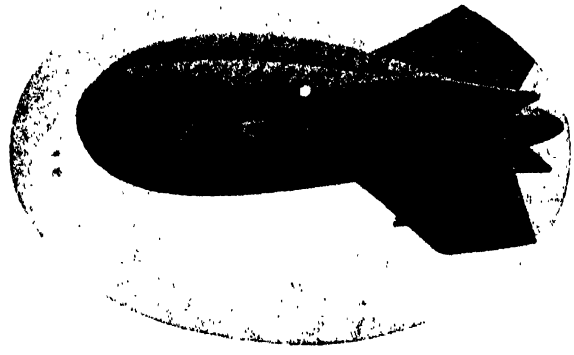
Since this development, over 10 years ago, the synthetic rubber industry has been growing steadily. Without fanfare, this new material found its way into literally thousands of different products where it proved of inestimable value. It was used despite the ready



This belt conveying oil-treated coal has a neoprene cover used because of its abrasion resistance when soaked with oil.

availability of natural rubber and despite a substantial difference in price. It was used because it paid its way in simplified design, in lowered maintenance, in increased production.

Thus engineers and designers knew neoprene. They knew its abilities and its limitations. They had seen and had taken part in the steady improvement in the crude material, in compounding practices, in application methods. They were ready to put the material to work wherever its properties might be required.



For all of these reasons, neoprene, the "noble rubber", developed to meet the need for a new material, was found to be, early in 1941, a material so much in demand that it was necessary to put it under mandatory priority control. Production had essentially doubled in each year since the introduction of the material, but this was not enough. Engineers who had tested neoprene in their own plants and in their products as molded goods, diaphragms, hose, belting, tubing, rollers, gloves, packing, and thousands of other products were calling upon this material to do the same jobs in the vastly expanded production program. And the products which had been proved in automobiles were called upon to do similar jobs in aircraft, in tanks, and in trucks. Today, neoprene production has been tremendously expanded, yet the continued demands for the material still make it necessary to allocate it to the war effort in the order of uses of importance, whether they be an aircraft part, a machine tool packing, a ship's power cable, or a protective coating for a metal tank.

In this way the chemical industry, with particular contributions from the rubber sections, has built up an industry which is of extreme importance to the future of the

ROBERT YARNALL RICHIE PHOTO

Because of the sunlight resistance of neoprene, it is now employed in the construction of barrage balloons.

← The flexibility and abrasion resistance of this neoprene part are used advantageously to seal over the oil-well tubing where oil resistance is a major factor.

Neoprene-faced asbestos gloves combat deteriorating effect of hot metal flux

country. Quietly, and without fanfare, chemists continued to seek a material which was called "impractical". Thinking only of better products for industry, for the professions, and for the home, they achieved their goal and industry put the material to work. Today this material has an even more vital job. And, behind the scenes, removed from the publicity, the chemical industry is striving to improve the materials it already has, is working to increase production, and is seeking every compounding improvement that will ensure the products made from these materials being better than they have ever been, with longer life, and with a greater field of usefulness.

American Process Zinc Oxide

AMERICAN process zinc oxide has been made available by the New Jersey Zinc Co., 160 Front St., New York, N. Y. Although in 1941 both zinc oxide made from metal (French process) and zinc oxide made from ore (American process) were on the list of critical materials, American process zinc oxides are now readily available.

Examination for Water Chemists

THE Board of Civil Service Commissioners of the City of Los Angeles, Calif., is seeking qualified chemists for the Los Angeles Water and Health Departments, at salaries from $150 to $250 per month. Applications must be on file by November 20, 1942.

Nylon

E. K. BOLTON, E. I. du Pont de Nemours & Co., Inc., Wilmington, Del.

IN 1928 a long-range variety of chemical exploration was initiated in the laboratories of the Chemical Department of the du Pont company. This research has had far-reaching implications, both scientific and commercial, since out of it came nylon—source of the first truly synthetic textile fiber—destined to exert a profound influence on international trade.

The immediate objective of this work was to gain a better understanding of the little-known field of polymerization—that is, the union of small molecules to form large molecules such as those found in rubber, resins, and cotton. There was, however, the definite hope that this chemical exploration would lead to the creation of a distinctly new textile fiber.

Early in this work Wallace H. Carothers and his associates undertook to develop a background of scientific work on "linear" polymers—that is, materials whose molecules form long chains, similar to the long-chain molecules of silk. He chose first to study polyesters, the condensation products arising from the reaction between dibasic acids and glycols.

But fibers spun from these polyesters were of theoretical interest only. The melting points were too low for general textile purposes and they were too much weakened by water. Nevertheless, these fibers suggested that some related type of polymer might produce filaments which would possess the characteristics desired for textile purposes.

Further investigation was accordingly undertaken in an effort to create a superpolymer from which strong, elastic, and water-resistant fibers could be drawn or spun, but many difficulties were encountered. Numerous new superpolymers were synthesized, but each was deficient in one or more vital textile properties. At one stage of the work the outlook was so dark that investigations along this line were actually halted for a time.

Fortunately, however, the work was not permanently abandoned and finally a new type of fiber-forming material, known as a polyamide, was prepared. The first polyamide synthesized, although by no means ideal, appeared so promising that extraordinary efforts were made to bring the development to commercial success. Finally, after several more years of painstaking research, Carothers and his staff developed what they called "66" polymer, made by the reaction between hexamethylenediamine and adipic acid, and it is of interest that, although many different types of nylon are possible and many polyamides were synthesized and evaluated in the course of this work, the "66" variety is still the type most widely used for textile purposes.

On October 27, 1938, du Pont announced to the world the development of this family of new synthetic polyamides—christened "nylon"—from which, among other possible applications, could be spun textile fibers surpassing in strength and elasticity any previously known textile fiber, either natural or synthetic. In addition, bristles better than any pig bristles from the Orient could be made from the same nylon used in the manufacture of textile fibers.

But as yet the battle was only well under way. Next came research directed to the development on a laboratory scale of manufacturing processes for the intermediates, the polymer, and nylon yarn, and the development on a semiworks scale of the chemical and engineering data needed for the erection and operation of a large-scale plant. Space does not permit recounting all the difficulties encountered in working out the details of these operations on laboratory and semiworks scale, but the task was enormous.

The development of manufacturing processes for the intermediates, polymer, and yarn represents one of the largest cooperative projects within the experience of the du Pont company. From the time laboratory work was started until designs could be turned over to the construction engineers, some 230 chemists and engineers were at one time or another engaged.

Nylon polymer was an entirely new material with properties different from those of any previous synthetic product, and spinning nylon yarn from the molten polymer was entirely different from the spinning of either acetate or viscose process rayon. No complete picture can here be given of the numerous and peculiar chemical and engineering problems which had to be solved. Many types of spinning-cell melting grids, for example, were designed and tried before a satisfactory type was worked out. Special pumps also had to be designed for the molten polymer—pumps that could be operated at the high temperature of 285° C. with small clearances and no lubrication other than the polymer itself.

Each and every step of the process and the equipment for it, however, were worked out on a semiworks scale with such nicety that except for size the first commercial plant which went into operation early in 1940 was practically a

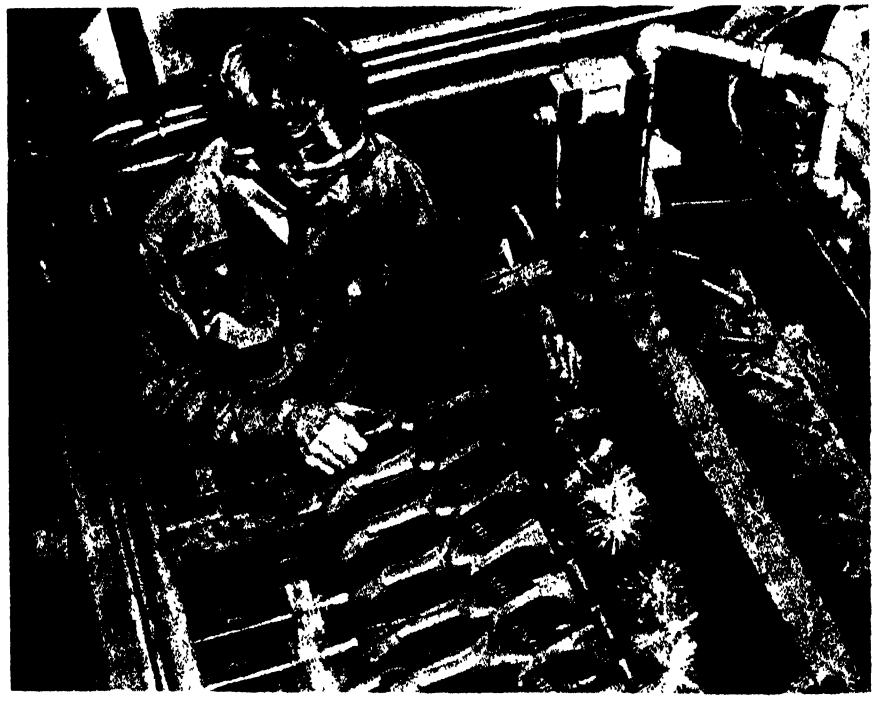
Nylon's first bath. Molten polymer, extruded on a huge casting wheel, at the du Pont nylon plant in Delaware, is quickly sprayed with water, to help solidify it into a strip resembling ivory. Later it is chopped, melted, and extruded again as filaments.

duplicate of the semiworks plant in all details. And the second plant, which went into production late in 1941, was virtually a duplicate of the first—a tribute to the thoroughness with which details of the various operations had been worked out.

With nylon in commercial production it might appear to some that the job was completed. But such was not the case. Before nylon could reach the Nation's counters, many problems associated with the conversion of this yarn into finished fabrics had to be ironed out—problems of which the average chemist has little knowledge.

For example, it was necessary to develop yarns of different diameters and twists for a variety of uses, and the good qualities of this new yarn had to be confirmed by actual wear tests. In 1939 and the early months of 1940 more than 150,000 pairs of nylon stockings in various weights, colors, and constructions were subjected to the most rigorous testing. Sizes for this new type of yarn had to be developed, similar to the sericin which coats and protects the silk fiber during knitting and weaving operations.

Technical service men, versed in every phase of textile technology, had to go into the field and show the mills how to use nylon yarn, particularly the methods employed for "pre-boarding" hosiery—a special process for setting the shape of stockings by means of heat treatment on a form to ensure that hosiery will maintain its original shape.



Later, as the market for nylon yarn began to broaden beyond hosiery, further field work was done in cooperation with textile mills directed to the development of a variety of knitted and woven fabrics designed for every conceivable purpose. Before this work had progressed very far, however, Pearl Harbor was bombed. As a result, commercial developments were largely suspended, and today the entire production facilities of du Pont's two nylon plants are being devoted to the manufacture of products for use in connection with the war effort.

Such, in brief, is the saga of nylon—an all-American development, conceived and brought to fruition during peacetime, but now playing a vital part in winning the war.

1943 Spring Meeting, A. C. S.

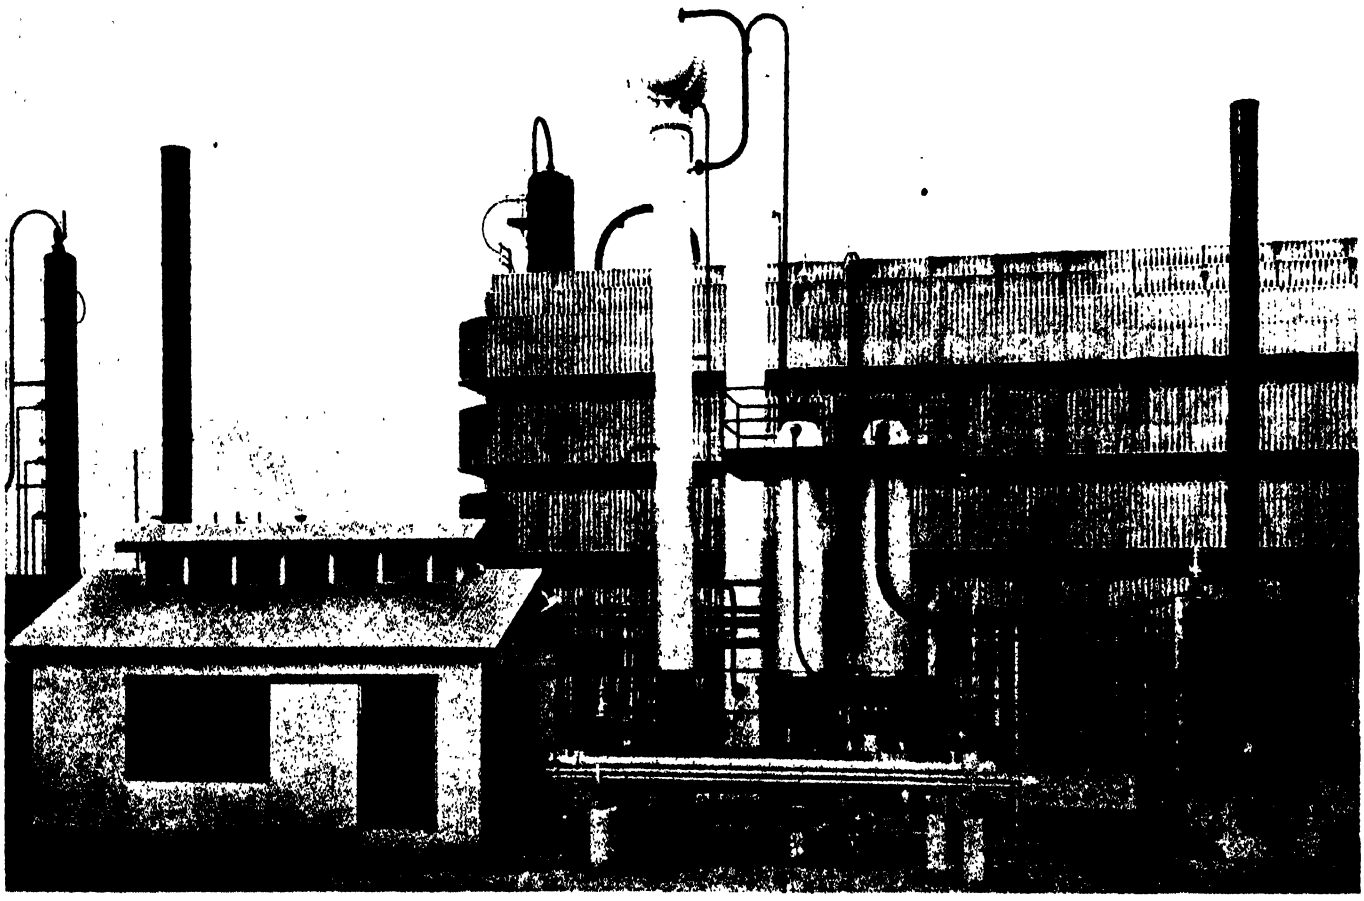
War activities have preempted so much hotel space in Indianapolis that the local committee feels it cannot care adequately for registrants at the 105th national meeting of the American Chemical Society. The Board of Directors, therefore, has voted to postpone the Indianapolis meeting until such time as the committee feels that meeting attendants can be housed.

The Detroit Section, recognizing the emergency that exists, has stepped into the breach and invited the Society to meet with it in April 1943. Hotels are less crowded in Detroit than in most major cities. The Board of Directors has accepted the invitation. The Society is deeply grateful to the Detroit Section for its willingness again to be host so soon after the successful meeting held in that city in September 1940. Further particulars will be published in the near future.

Brushes made of nylon bristles are a great aid in cleansing bottles, a rapidly expanding use for these new brushes. Bristles of nylon, the new material developed in the laboratories of the du Pont company, are exceptionally durable and sanitary.

Aviation Gasoline

By Polymerization and Alkylation of Cracking Gases



V. N. IPATIEFF, Universal Oil Products Co., Chicago, Ill.

No one will dispute that today the potential strength of an army depends basically on two factors: its supply of explosives and its supply of gasoline. The number of tanks, guns, and airplanes which an army could accumulate would have little significance if it did not have enough explosives or gasoline. The offensive ability of an army lacking either would be greatly curtailed. However, it is not alone the quantity of gasoline which is important; the quality of gasoline also plays a very important role. Aviation, the new and most important branch of the army today, requires gasoline of high quality, and to be effective, must have it in great quantities. The higher the quality of the gasoline—i. e., the higher the octane number—the greater will be the speed the airplanes can develop and the greater the air advantage.

Unfortunately, high octane gasoline cannot be obtained directly from either natural crude oil or its thermal cracking, and obtaining it in large quantities was a tremendous problem which faced the chemist a decade ago. It is to the credit of the United States that her chemists solved the problem first, and most brilliantly. And it was done by a magic little thing called a "catalyst".

The problem confronting the chemist a decade ago, when "70" was considered a "high" octane number, was to convert the straight-chain hydrocarbons (which have low octane numbers) found in petroleum to the so-called side-chain hydrocarbons which have much higher octane numbers. Several answers were found almost simultaneously. Gasoline from gases was one and it consisted of polymerizing or combining two or more simple hydrocarbon molecules into a more complicated one. Thus, for example, when two molecules of some unsaturated hydrocarbon—an olefin such as gaseous butylene—combine, they form dibutylene which is still an olefin but now a liquid. A similar process, called "alkylation", refers to the uniting of an olefin and a saturated hydrocarbon—a paraffin—or a cyclic hydrocarbon—a naphthene. What makes these processes so important is that in every case these molecules unite in side-chain arrangements, and the resulting synthetic gasoline has an octane number between 80 and 100 depending on the original hydrocarbons used. Thus in one stroke a high-quality gasoline is developed and a use found for billions of cubic feet of waste gases formed yearly by the cracking process of petroleum.

These new syntheses of hydrocarbons

A catalytic polymerization unit. Some units are being converted to the production of special components for 100-octane aviation gasoline.

became possible through the action of a catalyst—a substance which will greatly accelerate a reaction without itself changing. Although a catalyst can be anything, each reaction can be stimulated only by a specific substance, and most of the time of the chemists who tried to solve the aviation gasoline problem was spent searching for the substances which cause hydrocarbons to condense.

Hundreds of catalysts and their actions on various hydrocarbons were studied in the laboratories, and out of this work came the simultaneous discoveries of polymerization and alkylation. A short time later another important reaction was discovered—isomerization—in which any straight-chain hydrocarbon could be changed into its isomeric form. This has become an extremely important reaction in the production of aviation gasoline.

Each of these reactions uses different catalysts; some reactions can be stimulated by several catalysts. One of the most important of these, that used in polymerization, is the solid phosphoric acid catalyst developed by the Universal Oil Products Co. Its importance can be best judged by the following facts:

In the United States the thermal cracking process produces 300 billion cubic feet of waste gas yearly containing up to 20 per cent unsaturated hydrocarbons which, by the help of catalytic polymerization, can be converted into polymer gasoline of octane number 82. Several scores of petroleum refineries in the United States are producing polymer gasoline in quantities of several million barrels a year from these waste gases. This is not only a tremendous economy over the old practice of burning the gas to get rid of it, but a great step forward in the motor fuel problem. At the present time methods are being developed whereby the gasoline produced by polymerization may be converted into high aviation gasoline of octane numbers over 100.

As mentioned before, aviation gasoline is also obtained by the alkylation of paraffins and olefins in the presence of various catalysts. The discovery of this reaction in the United States had a great scientific as well as practical significance and amazed the entire chemical world. Previously it had always been assumed that paraffins, the most inert of all organic substances, could not react with other hydrocarbons, and it was not until certain catalysts were found that the "impossible" was performed and paraffins were combined with olefins. Now tens of thousands of barrels of gasoline of octane numbers between 90 and 100 are produced daily by this method.

In such a short article the development of catalytic reactions in the petroleum industry cannot be outlined. Those who wish to acquaint themselves with the subject should refer to the article on "The Problem of Rational Utilization of Petroleum and of Petroleum Distillates" (*1*).

The speed with which American industry has been able to take these reactions and almost overnight put them to work on a large scale is indeed amazing. These feats owe as much of their success to America's highly developed engineering technique—the best in the world—as to her creative inventiveness; and in the history of the petroleum industry, America's contribution will stand out as one of the greatest and most important. The fact that we are at war multiplies the value of these processes a hundredfold for it will be on *our* aviation gasoline that the Allies will fight—and win—this war.

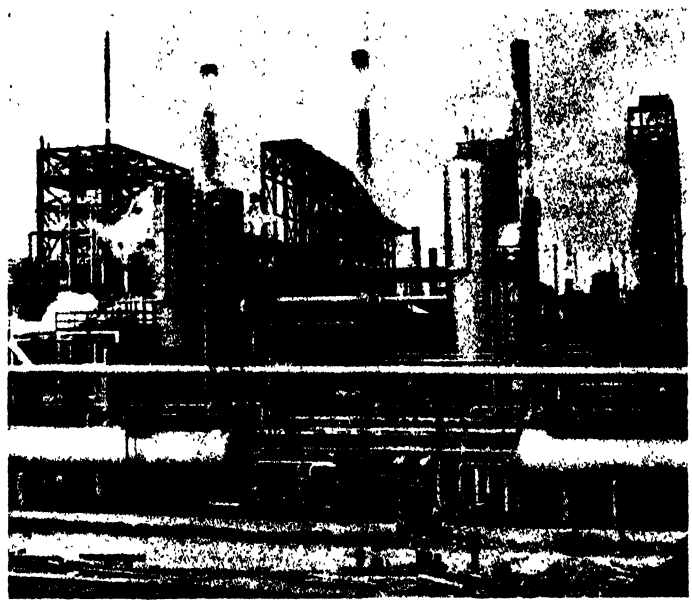
Cracking

J. BENNETT HILL, Sun Oil Co., 1608 Walnut St., Philadelphia, Penna.

CRACKING, in the petroleum industry, may be defined as the breaking down of the hydrocarbon molecules into smaller ones, with attendant polymerization and other side reactions. The science of cracking is distinctly an American development and its commercial application an American achievement.

When cracking by heat was first recognized, its only commercial significance was as a possibility of producing more kerosene from crude oil. Cracking was stimulated by the advent of the automobile and a consequent commercial demand for gasoline, but it was not until World War I that it acquired any considerable commercial importance.



The first commercially successful cracking stills, operated by W. M. Burton at Whiting, Ind., were simply batch stills, throttled so that they could be operated under pressure. Cracking was therefore a thermal reaction taking place in the liquid phase. As petroleum distillation became a continuous instead of a batch process in the early 1920's, cracking followed the same course and cracking stills became a combination of pipe still, pressure reaction chamber, and fractionating tower. The Cross, Dubbs, Holmes-Manley, tube and tank, and other processes developed during this time were all combinations of the same essential elements but differed widely in engineering design. The success of these processes established cracking as a practical and essential procedure for making gasoline and marked the first major period of the development—a period of liquid phase thermal cracking.

During this first period the production of cracked gasoline increased from 1,500,000 barrels during 1914, or 5 per cent of the total gasoline produced, to 122,000,000 barrels in 1928, or 32 per cent of the total gasoline. But it was only during the latter part of this period that it was realized cracked gasoline was something more than an additional quantity of an inferior product, that it had in fact the advantage over straight-run gasoline of what we call today higher "octane number". This realization brought cracked gasoline out of the red-headed stepchild class, washed its face, and sent it to school to learn to be an even better boy. Out of this realization of the possibility of better octane numbers through cracking came the side-by-side development of the high-compression, high-economy automobile engines and the high-octane gasoline to operate them. There was ushered in the second phase of cracking development, a development for quality and not for quantity alone.

Although the first phase of cracking development was largely engineering, the quest for quality in the second phase has been largely a matter of chemical research, followed by engineering. Since research showed that high temperature favored the production of better octane fuels, the first steps were to raise the temperature of the liquid phase processes or to go beyond them and crack at high temperature in the vapor phase as had been done during World War I to produce aromatics. The most important commercial processes resulting from the vapor phase idea are the deFlorez and Gyro processes, the latter being an outgrowth of the earlier Ramage process. While the vapor phase processes produced a higher octane product they also gave a product rich in unsaturated hydrocarbons and suffering thereby in stability.

Most of the development in recent years has been along the line of catalytic cracking. By means of suitable catalysts the desired reactions have been made to progress at lower temperature and the effect of the undesirable high-temperature reactions has been minimized. Using an alumina-silica catalyst made either by activation of a natural clay or synthetically, a cracked product is produced which is low in normal paraffins, high in isoparaffins and aromatics, and low in olefins. Such a product has excellent octane num-

bers. The first such commercial process of catalytic cracking is the Houdry process in which the heavy hydrocarbon vapors are passed through a fixed bed of the catalyst, beds being alternately regenerated by blowing with air. Although Houdry is himself French-born, the process has been developed in this country. It is being used extensively at the present time.

More recently new processes of catalytic cracking have been developed which make the operation entirely continuous. The fluid catalyst process suspends the finely divided solid catalyst in the vapor stream and later separates it, regenerates it, and returns it. The Thermofor catalytic process uses a catalyst bed which moves downward through a tower, the catalyst being continuously removed from the bottom for regeneration. Although no substantial commercial experience on these processes is yet available, extensive commercial installations are being made.

The gasoline from all of the catalytic processes may be retreated with catalyst, resulting in virtual elimination of the olefins and increase in the aromatics.

For many years cracking, by one method or another, has been used on a comparatively small scale to make certain special products other than gasoline, as, for example, ethylene or aromatics. Recently the demand for isobutane, butenes, and butadiene has focused attention on these other materials. The wide cracking knowledge and experience possessed by technical men in this country are making the solution of these problems immeasurably easier.

Nitroparaffins

H. B. HASS, Purdue University, Lafayette, Ind.

THE first nitroparaffin was reported in 1872 by Meyer and Stüber who reacted amyl iodide with silver nitrite. Eight years later Beilstein and Kurbatov treated a heptane fraction with nitric acid in liquid phase and obtained a mixture of isomeric nitroheptanes. In the half century between 1880 and 1930 numerous investigations were carried out in Russia, Germany, and the United States to discover a method of utilizing this reaction for the commercial production of nitroparaffins, but in spite of approximately six thousand literature references on the aliphatic nitro compounds, none had reached commercial production.

In 1930 work was started at Purdue on the assumption that isobutane, the nitration of which had not been reported, might, because of its unique structure—nine relatively unreactive primary hydrogen atoms and one easily substituted tertiary hydrogen—make it possible to obtain better yields of mononitroparaffin than had resulted from the other alkanes. Reaction was slow until the critical temperature of isobutane had been exceeded.

Then it was rapid, and the expected product, tertiary nitrobutane, was obtained in fair yield. Other alkanes, however, reacted similarly under these conditions.

The advantages of the flow method in studying vapor-phase reactions had been apparent for some time in our chlorination researches and this technique was then applied to the nitration. Shorter exposure times and lower pressures in the flow method, as compared with operations in bombs, required higher temperatures for reasonably rapid reaction. Under these conditions an entirely new nitration reaction occurred with a fission of carbon-carbon linkages.

$$RR' + N_2O_4 \longrightarrow RNO_2 + R'NO_2$$

Thus isobutane yields, in addition to the tertiary nitro derivative, 1-nitro-2-methylbutane, 2-nitropropane, and nitromethane.

Soon after preliminary work had indicated the advantages of the new technique in nitrating paraffins, a prominent manufacturer of natural gas gasoline sponsored a fellowship with the Purdue Research Foundation to study the process and the properties and uses of the nitroparaffins. After definitely encouraging laboratory results had been obtained, this company decided not to go into the manufacture of chemicals and discontinued support of the research.

The Commercial Solvents Corp. and one of the important explosive companies thereupon displayed an interest in the nitroparaffins, but after a careful study of nibglycerol trinitrate, $O_2NC(CH_2ONO_2)_3$, and nibglycol dinitrate, $CH_3C(NO_2)(CH_2ONO_2)_2$, they decided not to engage in such manufacture. Commercial Solvents, however, soon erected a pilot plant for the nitration of propane, butane, and isobutane so that quantities of nitroparaffins could be manufactured for research on applications and for market exploration.

The courage and vision displayed by Commercial Solvents Corp. in embarking upon a wholly new technique and in opening up a field of chemistry in which there was no previous record of commercial success can hardly be overestimated. Costly delays were inevitable as problems arose and had to be solved. The pioneering nature of the development was well expressed by the Patent Office which stated, in response to a second patent application from the Purdue Research Foundation, that its original patent (U. S. 1,967,667) "represents the complete state of the art so far as known".

The first pilot plant was destroyed by fire. The second one, however, operated even more successfully than the laboratory experiments had promised. It is still in 24-hour daily operation because the large plant is unable to meet the market demand for nitroparaffins. Commercial operation began in May 1940 after a few birth pangs characteristic of a radically new process.

The only major disappointment of the entire development is the disparity between the size of the present unit and the demand for nitroparaffins and their derivatives. At present the process is operating with propane as the starting material and yields nitromethane, nitroethane, 1-nitropropane, 2-nitropropane, five nitroalcohols and nitroglycols obtained by formaldehyde condensations with these nitroparaffins, the five corresponding reduction products, the aminohydroxy compounds, and salts of hydroxylamine. Potential sales are at least 10 times the present plant capacity.

New and Rare Instruments

THE Committee on Location of New and Rare Instruments has the following offers and requests:

Instruments Offered

Curie electrometer (Paris make)
Loewe-Zeiss liquid interferometer
L. & N. portable potentiometer (No. 7655) with 2 quinhydrone and 1 calomel electrodes
Microammeter, D'Arsonval Type (model S of Sensitive Research Instrument Corp). Rental only
Quartz microscope
Siemens & Halske optical pyrometer
Two-circle reflecting goniometer (several)
Welch d. c. volt-ammeter (0–150 volt, 0–15 ampere)
Westinghouse 4-unit moving coil Type PA oscillograph with three galvanometers
Weston galvanometer (No. 375)
Weston galvanometer (No. 440)
Weston voltmeter (No. 280)

Instruments Needed

Coleman spectrophotometer (10 requests)
Grating spectrograph (9 requests)
Leitz Ultrapak or equivalent
Quartz spectrograph
Zeiss Optimeter
Zeiss-Pulfrich refractometer (8 requests)

If you have rare instruments you would be willing to sell, lend, or lease for essential war research or if you need such instruments, write to D. H. Killeffer, 60 East 42nd St., New York, N. Y., chairman of the committee, who has particulars on the offers and requests mentioned above.

Data Published on Selective Service

BECAUSE of the wide interest in this subject and the need for obtaining trained men for our Production Army, we give below references to information we have published on occupational deferments, including those of men in training, and the need for technically trained persons. Future developments will be brought to the attention of our readers.

WORLD-WIDE CHEMISTRY

The export license requirements for certain synthetic resins have been extended to a wider field. Export licenses are now required for adhesives and cements made wholly or mainly of synthetic resin, and synthetic resin and plastic materials derived from synthetic resins, or from cellulose or casein, in the form of granules, powders, blocks, rods, tubes, sheets, or strip, whether shaped or reinforced with other materials. Export licenses are also required for thermite, diacetin, dichlorodifluoromethane, selenium and its compounds, and triacetin. In order to save lead, the authorities have made suggestions for the substitution of alternative materials for chemical lead. Acid-resisting tiles or concrete can be used in many cases for tanks and containers; where lead is needed, the use of lead alloys is recommended; and the consumption of lead may be reduced also by use of thinner sheets and pipes. Such savings will be made easier if lead with a small addition of tellurium and copper (to give higher fatigue resistance and to increase ductility) is employed. No cereals may be used during the coming season for grain or malt whisky distillation. In the export field the freight registration system has been extended to shipments to West Africa, an important market for certain chemical products; while essential deliveries will not be held up, shipments of less essential materials will be adversely affected.

Pooling of Scientific Research Will Eliminate Waste

Two problems have been prominent in the wartime organization of chemical and other scientific research. One is coordination of research activity with a view to elimination of parallel efforts for the solution of one and the same task; the other is bridging the gap which has been found to exist in many cases between pure science and research and the application of its findings in industry. Both these problems have been brought nearer to a solution by the work of the official research organizations, especially the Department of Scientific and Industrial Research, but it is claimed by the fine chemical group of the Association of Scientific Workers that there is still insufficient pooling of research, development, and production, owing to the number of small production units employed. Among special faults now met in research are unnecessary waste of such items as solvents and failure to examine waste products for possible use and to search for alternative raw materials. A proposal has been made to set up a committee with executive powers for the control of the work of all laboratories and production equipment in general. Such a committee should be drawn from the government, the Association of British Chemical Manufacturers, the Department of Scientific and Industrial Research or another representative research body, and laboratory staffs. "Telescoping" of industry and concentration of production have made considerable progress in Britain, and this proposal aims at the extension of the policy to industrial research.

Coke Proposed for Postwar Fuel

Since the war has brought the importance of fuel problems home to British industry as a whole, much thought has been given to the most suitable arrangements for fuel supplies after the war. The problem is made more difficult, but in a way also eased, by the fact that coal is the only fuel raw material in abundant supply in the British Isles and that all plans must therefore be based on coal or manufactured coal products. It is believed that larger quantities of coke will be needed as producer fuel and for domestic purposes, and it has been proposed that coke may with advantage be treated chemically to make it fit for burning in existing appliances. G. E. Foxwell, discussing the subject in the journal of the National Smoke Abatement Society, states that a great deal of rebuilding will be necessary at the coke ovens after the war. This view is generally shared, and it is also recognized that the carbonizing industries will have to meet largely the demand for smokeless fuels. The coke ovens to be rebuilt after the war could be built on the combination principle and heated by producer gas, says Dr. Foxwell. Clean coal could be produced for coke manufacture and the higher ash intermediate product of the washeries could be carbonized in special ovens to provide coke for the producers. In this way, from 20,000,000 tons of coal, some 1,400 million therms (1 therm = 100,000 B. t. u.; 1 B. t. u. = the amount of heat required to raise the temperature of 1 pound of water from 60° to 61° F.) could be liberated for external use. Allowing 600 million therms for use in steelworks, at least 800 million therms gross providing 400 million therms of useful heat could be obtained annually, to which some 100 million therms in the form of coke could be added from existing or rebuilt coke ovens, making a total of 500 million therms towards an estimated total demand for 1,350 million therms. To take advantage of the coke-oven gas, regional gas grids would have to be built. Additional carbonizing and purification plants will be required in districts remote from the coal fields.

New Emulsifying Agent Recommended for Medicinal and Cosmetical Products

A new emulsifying, suspending, and stabilizing agent, described as a polyose derivative, is offered in the English market. It is soluble in water, is recommended especially for creams of the water-in-oil type, and is said to give a highly viscous solution which sets on standing into thick, stable, colloidal gels free from undissolved, suspended particles and not easily attacked by bacteria. Two varieties are on the market, one yellowish white for emulsions of low oil contents, the other yellower for those of high oil content. The preparation is supplied as a wax or powder, flakes or liquid.

Cellulose Esters Considered Alternatives for Cellulose Acetate

Several esters of cellulose suitable as alternatives to cellulose acetate and

EDITOR'S NOTE. Those interested in further details should address the correspondent whose name and address appear for each country, and enclose sufficient international coupons to prepay the reply. United States stamps should not be sent.

cellulose nitrate (the basic cellulose ester for celluloid) are mentioned by *Chemical Age*. Ethyl cellulose and cellulose acetobutyrate are reported to find favor in the plastics industry.

Bacteriological Peptone and Anesthetic Trichlorethylene Offered in Great Britain

Bacteriological peptone is offered by a British chemical manufacturer to "meet the urgent demand from bacteriologists for a reliable British-made Peptone"; it is free from contaminating organisms, toxic by-products, and fermentable carbohydrate. Trichlorethylene offered in a purified form has recently found increased application as an anesthetic.

Economies Advised In Paint Extenders

British paint manufacturers have from time to time been advised about changes in the supply of important paint materials in order to enable them to change over from one material to another. This system has been working well on the whole and has naturally given a stimulus to the use of such indigenous materials as Cornish china clay and chalk. Recently a British Standard Specification has been issued for distempers, but this is essentially a performance standard, the only stipulation regarding composition being that the distemper must not contain more than 30 per cent of water. For washable oil-free distempers paints based on alkaline silicates or cements sold in dry form are recommended instead of casein. For nonwashable oil-free distempers the compositions are usually based on protein or starch.

Oil Recovered from Waste Rags

Adequate arrangements are in operation for recovering and treating oily rags, cotton waste, and wipers from government factories, services, and railway companies. A considerable number of processing firms are engaged in treating such material from commercial sources, but it is stated that further measures may be necessary to make full use of recoverable oil.

Dehydration Work Progresses

The large-scale process for the dehydration of vegetables developed by the Department of Scientific and Industrial Research at the Low-Temperature Research Station at Cambridge has been tried out in several experimental drying plants in different factories all over the country under the auspices of the Dehydration Branch of the Ministry of Food. Three big plants will be in operation before the end of the year, and one will specialize in the dehydration of potatoes; another will concentrate on soup powders containing dehydrated potatoes, vegetables, and meat. The process is similar to that employed in the semi-industrial plants. The potatoes go to automatic washing machines filled with carborundum rollers, are peeled and trimmed, stored in large wooden vats containing water with a small amount of sulfite, cut by machines into shreds 2.5 by 0.5 inches, freed of some of the starch in the outer layers by means of powerful water sprays, blanched by immersion in boiling liquor or by steam treatment in order to adjust the pH value and to destroy enzymes without softening, and finally dried. The final product contains 5 per cent of moisture and is of uniform color and texture.

G. Abrahamson

150 Halfway St.
Sidcup, Kent, England
October 6, 1942

Continental Europe

Eire

Wartime difficulties in import trade have given a great stimulus to staple industries necessary for the well-being of the country. Two cement factories at Limerick and Drogheda in Eire employ about 700 men. Their output is sufficient to meet the normal demand, although production commenced only a few years ago. Lately, however, difficulties have been experienced in the supply of fuel. A highly volatile coal is required in order to maintain the necessary temperature, and this is normally obtained from Britain. Experiments have been made with peat and Irish coal, but these fuel materials were found to be unsatisfactory. British coal exports to Eire may have to be further reduced owing to the shortage in the British home market.

The production of newsprint is limited to one factory which is also making cardboard and would normally cover about one fifth of the local demand. The shortage of imported newsprint has compelled some weekly papers to use a dark brown paper made from straw. Another straw paper said to be suitable only for a flat printing press is a dull yellow.

Drug Market Shows Slight Improvement

The position in the drug and chemical market has somewhat improved during the past 12 months as a result of adjustments in consumption and increases in production. Calcium carbide, carbon dioxide, formaldehyde, and glue are among chemical products which have been produced for the first time during this war or are produced in increased quantities. The stocks of important drugs are said to be nearly double what they were in the autumn of 1941. Powdered glucose arrived recently from the United States, and supplies of cod liver oil and liquid paraffin were said to be on their way. Certain brands of proprietary products are rapidly disappearing from the market, with a return to doctors' prescriptions and wider use of the British Pharmacopeia.

Reliance Placed on Local Fertilizer Sources

Several unused quarries and mines in Eire have been reopened since the beginning of the war, and it is hoped that some of them may be kept in operation when peace returns. Baryte deposits in county Sligo have been opened, and ochre which is worked in Eire and was sent to England for further treatment is now to be processed on the spot; soon an output of 5 tons of a purified material is expected daily. Great progress has been made in the pyrite mines in the Vale of Avoca, county Wicklow, which have been closed since the 1870's and are to yield 150 tons of ore weekly. Work is also proceeding on the phosphate deposits in county Clare, and both these materials are used to make superphosphates in Eire. The Irish Mineral Development Co. intends to install additional machinery in the pyrite mines in order to make ore with a sulfur content of less than 35 per cent available and to permit use of the copper, lead, iron, and zinc found in the mineral. A manure material which has aroused increased interest in Eire is seaweed. Supplies of copper sulfate are now sufficient to meet the country's needs.

France

France has several important asphalt deposits of which that of Gard is the largest. At present only the northern zone of this deposit is worked, at Saint-Jean-de-Maruéjols, and the entire output is used for road construction purposes. Investigations have now been made with a view to the development of this deposit as a source of liquid hydrocarbons for use as a motor fuel and lubricant. The possibilities of asphalt as a source of motor fuel have been ignored in France because of the ease of importing petroleum in peacetime and of the fact that in wartime there is another indigenous source available in the bituminous shale of Vagnas which contains twice the amount of bitumen. Nevertheless it is believed that the asphalt deposits of Gard could be made available as a source of motor fuel. The composition of the limestone—9.8 per cent bitumen, 81.7 per cent calcium carbonate, 3.8 per cent magnesium carbonate, 1.3 per cent alumina, 2.1 per cent iron oxide, and 1.35

per cent sulfur—is similar to that of Ragusa (Sicily) which is worked under the directions of the Italian Government. It is claimed that the asphalt of Gard could be treated easily by simple distillation at low temperature and that the resulting product would be similar to ordinary crude oil from oil wells. Besides, the region of Gard is known to contain important deposits of lignite which could be used as a fuel.

Propane Gas Results Open Prospect of Postwar Development

The existence of a large oil refining industry enabled France before the war to make more extensive use of petroleum products for other purposes than motor traffic than was the case in other European countries. Now that the French oil refineries either have been closed down or are working at a greatly reduced scale on domestic substitutes, industrial and domestic users of petroleum products have had to revert to other fuel sources. On the other hand, only now have complete results of the experience gained with some oil products been collected. Thus it is stated that use of propane gas as an alternative for coal gas has been very satisfactory. Propane gas can be carried in a liquid form under slight pressures and has been used on a comparatively large scale in rural districts where consumption was not large enough to justify establishment of gasworks. Distribution was in steel tubes of small diameter at 1.5 atmospheres, and the companies engaged in this business have shown favorable financial results although propane gas was sold at prices no higher in terms of calorific value than coal gas in medium-sized towns. This satisfactory result was due in the first place to the higher calorific value of propane gas which reduced the cost of installations for distribution and transport. It is hoped that the use of propane gas for lighting and cooking in rural districts will increase after the war. Some progress with propane gas has also been made in Germany, but the economic conditions there are rather different from those prevailing in France. The German output is obtained from Fischer-Tropsch plants situated in the principal coal-mining regions, so that the propane gas has no transport advantage as compared with coal gas. The financial results seem therefore to have been rather less satisfactory in Germany, the more so as distribution is still being hindered by lack of containers and steel materials.

French Chemists Sent to Germany

Collaboration between the Vichy Government and the German authorities has become more noticeable of late. A list of French chemists available for employment has been collected, and 200 chemists, it is reported, have been ordered to go to Germany. This follows a similar move for workmen employed in French chemical factories. Several thousands of these are to be transferred to Germany in complete groups. It is also reported that arrangements are being made for the bodily transfer of small and medium-sized plants from France to the eastern provinces of Germany.

Denmark

As the oil mills have been cut off from their overseas sources of raw material supplies, Danish manufacturers have experimented with several domestic materials. Oil-yielding plants have been grown by Danish farmers and are expected to contribute to the solution of the problem. Herring oil is said to have been found quite satisfactory as a medium in paint manufacture, but to give good results it must be purified, and the costs are rather higher than in the case of comparable vegetable materials. Oil produced from small herrings is to be used in tanneries. It is planned to process the entire output of herring oil so as to make it suitable for industrial application.

Feeding Stuffs Obtained by New Conservation Methods

The Danish sugar factories have received an order for 10,000 tons of molasses feeding stuffs. The product is a new material which is obtained from the juice of sugar beets and treated with ammonium sulfate, superphosphates, and a yeast material.

Natural Gas Becomes Fuel for Sea-Going Vessels

The supply of fuels has met with considerable difficulties in Denmark, the more so since deliveries of imported coal have been held up by transport conditions and great damage has been done to the peat production by heavy rains. Natural gas has been investigated as a possible source of energy for local cement and brickworks and for cooking and lighting, and now it is reported that a fishing vessel has completed successful trials with natural gas as a motor fuel. It is reported that 20 fishing vessels are to be equipped to use natural gas; a larger number would have been fitted but for a shortage of steel containers.

Peat Coke and Tar Oil Output to Be Increased

The Danish Government will spend 9,000,000 kroner in order to encourage the peat industry, which provides important fuel for gas producer plants. Special attention has been paid to the production of a better-quality fuel which is free of the disadvantages in filtering experienced with earlier peat fuels, and large amounts of peat coke—possibly 10,000 tons per annum—are to be used in this connection. The by-product output of tar and tar oil is also to be used to replace formerly imported oil products, and peat ash, which contains certain quantities of phosphorus, potassium, and lime, has been tried out as a fertilizer. It is a promising material for soils deficient in lime, but its large-scale use is hindered by the great variations in the contents of minerals between peat ash from different sources.

Hungary

Power Station to Operate on Natural Gas

Construction has commenced on an electric power station in Transylvania which will operate on natural gas. The plant is situated at Marosvarhely, and the cost of erection will be 20,000,000 pengö. Natural gas has been proposed as a source of energy for several industrial purposes, and long-distance pipelines are under construction to facilitate its distribution. Meanwhile the production of crude oil continues with the help of German petroleum companies.

Staple Fiber Factory Begins Operations

The Hungarian Viscose Co. which has a capital of 9,000,000 pengö announces that it will begin production of artificial silk and staple fiber in the near future. A Swiss process is employed and the number of workers will be 1,500 when the plant is in full operation. For the time being, however, only one third of this number will be employed as the supply of raw materials is not sufficiently large to permit full use of plant facilities.

German-Hungarian Chemical Cooperation Established

A special chemical commission has been attached to the committee formed by the German Industrial Federation for negotiations with industrial organizations in Hungary, and on the Hungarian side also a special commission to deal with chemical products has been formed. These two chemical commissions have held joint meetings and elected a joint chairman, who is a director of I. G. Farbenindustrie. From the German point of view Hungary is particularly interesting as a supplier of chemical products because the country is situated more favorably in relation to German industrial districts than other satellite states and, furthermore, produces

certain raw materials which are not available within Germany, such as bauxite, natural gas, oilseeds, poppy, and other drugs. German firms have therefore shown particular interest in chemical enterprises in Hungary, and the new move is no doubt calculated to encourage joint industrial undertakings in the chemical field.

Rumania

Oil Prospected in Undeveloped Districts

D. Breda, chief of the Directorate for Mineral Oils, has been entrusted with the drafting of executive orders for the new Petroleum Bill, one of the principal objects of which is the encouragement of oil prospecting in undeveloped regions. Twelve areas have been selected in various parts of the country and offered for exploration and development to private interests. The 12 trial areas are each approximately 75,000 acres in size. The prospecting rights were offered to private firms by public tender, and eight areas were taken up at once, whereas further negotiations were necessary for the remaining four areas. In the eight areas disposed of by tender, investments totaling 200,000,000 lei are to be made.

The 12 oil-prospecting areas are: Balteni-Pojogeni (in the district of Gorj), Roesti-Cermegesti (in the district of Valcea), Bals-Ganeasa (in the district of Romanati), Pitesti-Slativarele (in the districts of Arges and Olt), Topoloveni-Glambocelul (in the districts of Arges, Muscel, and Dambovita), Cislau-Tega (in the districts of Prahova and Buzau), Robesti-Trestia (in the district of Buzau), Barsesti-Campuri (in the district of Putna), Tg. Ocna-Harja (in the district of Bacau), Moinesti-Sambureni (in the district of Bacau), Taslau-Campeni (in the district of Bacau), Seletin-Dichtinet (in the districts of Radanti and Storonijet).

Negotiations Begun for Utilization of Danube Reed Banks

I. G. Farbenindustrie A.-G., the German chemical combine which is known to be interested in the utilization of the reed banks in the Danube delta for the production of cellulose, is understood to be negotiating with two Rumanian companies—Letea and Zarnesti—for the erection of one or more cellulose factories in the country. It is believed that these would meet the entire cellulose requirements of southeastern Europe.

New Mines to Be Developed

Steaua Romana, one of the leading oil companies, intends to undertake the mining of aluminum silicate. S. R. P. has obtained a prospecting license for bismuth, lead, and zinc. Intreprinderile Cero-Chimice-Farmaceutice is interested in asbestos deposits. Breaza-Zlatna is investigating asbestos and kaolin deposits. The mercury factory on which construction work has been under way for some time is to be opened shortly; the output will be 130 pounds from 44 tons of ore.

Chile Plans Increase In Digitalis Production

A species of digitalis (*Digitalis purpurea*), which grows wild in Chile, is believed to compare favorably with that formerly imported from European sources. In fact, its strength has never been less than 10 units per grain, according to the Instituto de Fisiologia, which controls the drug. The uncultivated herb flourishes in the favorable climate of southern Chile.

About a year ago digitalis, among other medicinal herbs and plants, was cultivated experimentally on farms under the supervision of the Caja de Colonización (Agricultural Colonization Bank). There appears, however, to be little need for cultivating the herb, since the wild plant has met all tests satisfactorily and grows in sufficient quantity to meet requirements for an indefinite period.

A drying plant has been installed near Osorno under the supervision of the Instituto de Fisiologia but is now operated by the Instituto Bacteriologico. This center now dries about 10 kg. of leaves a day although not operating on a daily schedule, and could produce as much as 100 kg. per day, provided sufficient stocks were regularly available.

While Chile's consumption of digitalis varies between 200 and 300 kg. per year, it is believed that as much as 3 or 4 metric tons could be produced annually.

Drug Manufacture Increases in Eire

The war has given a new impetus to the manufacture of drugs in Eire, according to a recent report to the government. Formerly just an exporter of native medicinal herbs and plants, Eire now has to shift for herself in the matter of finished drug products. Two firms, one in Kilkenny and the other in Limerick, have been experimenting with distilling and processing plants.

Further encouragement has come from the National Agricultural and Industrial Development Association in Dublin, which has prepared a list of some 200 varieties of medicinal herbs and leaves available in Eire with instructions as to how and when to collect them. Centers are being established for storing herbs before they are processed.

New Source of Perfume Oil Reported

United States buyers of perfume oils will probably welcome the news, currently reported in this country, that Mexico is producing a new kind of oil from *lima chicona*. This experiment may disclose a substitute for now scarce Italian bergamot.

During the latter part of 1941 and the first months of 1942 a lime oil factory in Colima processed about 1,500 pounds of what is known as Mexican bergamot cold pressed oil from *lima chicona*, grown principally in the states of Jalisco and Michoacan. A ton of *lima chicona* yields about 5 pounds of oil. Only small plantings of the tree have been made, however, and no immediate increase is anticipated.

Iodine Substitutes Appear in Germany

With the extreme scarcity of iodine in wartime Germany, numerous substitutes for this antiseptic have appeared on the market, according to an unofficial report to the Government. Some are compounds of bromine, which is plentiful in the Reich, but none contains even small amounts of iodine.

In spite of claims to the contrary, the germicidal value of these substances has not been convincingly shown. Actual tests have proved at least two of the substitutes are greatly inferior to iodine in potency. This was particularly true in the treatment of fungus infections of the skin, which are now greatly on the increase in Germany.

Power Alcohol Made from Cereals

The Argentine Congress is now considering a bill providing for the construction, at an estimated cost of 24,000,000 pesos, of alcohol-distilling plants to make power alcohol from corn, wheat, barley, other cereals, and potatoes.

The banks of the Parana River have been selected as the probable location of the proposed plants, presumably because Santa Fe is the center of the cereal zone. However, in view of recent discoveries and developments in other countries in the production of power alcohol from wood waste, sawdust, and wood pulp refuse, consideration may be given to the establishment of a distilling plant in the vicinity of Argentina's chief saw-milling industry.

Because of the increased demand for hydrochloric and sulfuric acids by textile and other factories in India, the Delhi Cloth and General Mills Company, Ltd., will erect a plant for the manufacture of these acids. The company also plans to produce the necessary raw materials, according to information received by the Commerce Department.

POTOMAC POSTSCRIPTS

WPB Activities

Acetic Anhydride. Because demand for acetic anhydride exceeds current production, it has been placed under a system of allocations, the Director General for Operations has announced. General Preference Order M-243, effective October 30, prohibits delivery or use of the chemical except as directed by WPB. The standard chemical allocations forms, PD-600 and PD-601, will be used by persons seeking authorization to make and accept deliveries.

Arsenic. Control over the use of arsenic (arsenious acid) has been tightened by the War Production Board in a revision of General Preference Order M-152 which prohibits the use of arsenic except as authorized by the Director General for Operations and requires all those holding 650 pounds or more to report their inventories to WPB. The original order made deliveries of arsenic subject to WPB approval but did not control end use. The revised order, in addition to controlling end use on future allocations, will control the use of existing inventories. Deliveries and use of 650 pounds or less in any calendar quarter for the manufacture of medicinal chemicals or preparations, or in research, testing, analytical, or educational laboratories are exempted from the restrictions of the order.

Chemical Cotton Pulp. Military exemption from the restrictions on deliveries of chemical cotton pulp has been eliminated by amendment of Conservation Order M-157. The Army and Navy must now apply for specific authorization to accept deliveries of cotton chemical pulp in order that their requirements will be made known to the administrators of the order. The order also was revised so that application for authorization may be made on Forms PD-600 and PD-601, standard chemical forms now being used. Forms for the December allocation had to be filed on or before November 5. Under the order, issued July 1, 1942, no producer may deliver and no buyer may accept any chemical cotton pulp without specific authorization by the Director General for Operations. The amended order still provides exception on deliveries by a producer of 2,000 pounds or less of chemical cotton pulp in any one month in lots of not more than 500 pounds to any one consumer in any month.

Ethyl Alcohol. Amendment 1 to General Preference Order M-30 states that holders of A-1-j ratings no longer are excepted from the restrictions on the use and delivery of ethyl alcohol. When the order originally was drawn, the A-1-j rating was intended to make delivery possible under exceptional circumstances only, but the change in priority rating levels served to liberalise deliveries beyond the extent contemplated. The provision allowing for delivery of ethyl alcohol on A-1-j ratings has been stricken from the order by the new amendment, issued by the Director General for Operations, since the rating of A-1-j is no longer high enough to obtain substantial deliveries, and this amendment simply brings the order into accord with current practice.

Fats and Oils. Corn oil, cottonseed oil, peanut oil, and sunflower seed oil have been added to the list of fats, oils, and oil-bearing materials which the Commodity Credit Corporation will consider for purchase under provisions of WPB General Imports Order M-63. This announcement, made jointly by the Board of Economic Warfare, the Commodity Credit Corporation, and the War Production Board, supplements the list announced September 18, 1942. The revised list includes babassu oil, babassu kernels, cashew nut shell oil, castor oil, castor seed, coconut oil, copra, corn oil, cottonseed oil, muru muru oil, neat's-foot oil, ouricury oil, oiticica oil, palm kernels, palm kernel oil, palm oil, peanut oil, rapeseed oil, sunflower seed oil, and tucum oil.

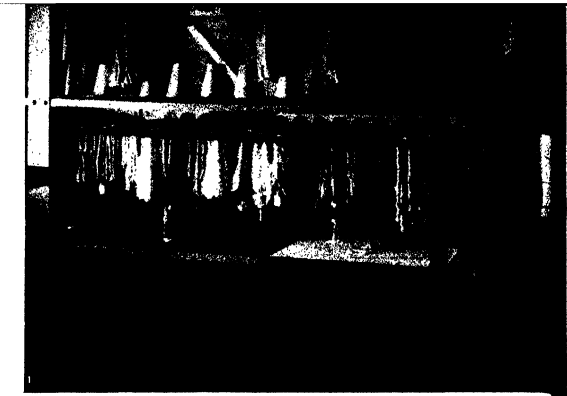
Tinplate. Use of tinplate in packing pyrethrum and rotenone base insecticides is prohibited by Amendment 4 to the Tin Conservation Order M-81. Packers of these products, which are the more expensive type of insecticide, can substitute blackplate or glass for the previously used tinplate containers. A provision for disposition of used cans to detinning plants is deleted from the order to bring it into conformity with M-72-a, which covers disposition of used tin cans.

Toiletries and Cosmetics. Because cosmetic output is controllable through allocation orders covering chemicals used, the Director General for Operations has revoked Order L-171, which set up a percentage production control over toiletries and cosmetics. Since the revocation removes all restriction on the manufacture of cosmetics, the effect will not be felt by the consuming public because limitations on materials entering into cosmetic manufacture will result in approximately the same output as at present. At the same time certain specific difficulties and inequalities will be removed and the industry will have more leeway in the use of available materials. It was emphasised by the Chemicals Branch, however, that fairly rigid restrictions could be expected on cosmetics packaging and luxury toiletries that use critical materials, particularly cosmetics containing alcohol, glycerol, imported oils, waxes, and higher grades of talc.

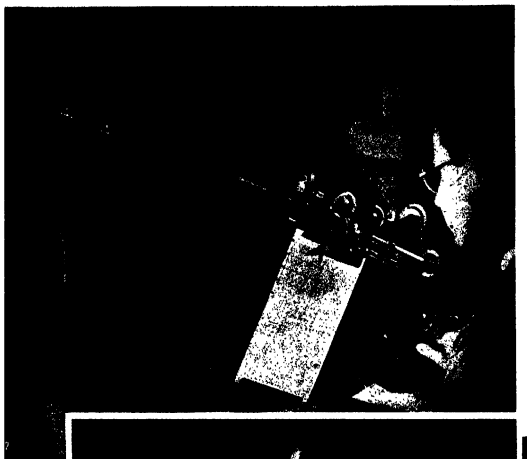
Price Regulations

Containers. In order to encourage the substitution of cheaper containers to replace steel and other critical materials no longer available for packaging numerous chemicals, the Office of Price Administration has informed the chemical industry that upward adjustment of ceiling prices, to permit producers to pass on to purchasers increases in container costs, will not be authorized except in special and unusual cases.

OPA will adjust the maximum prices of individual chemical manufacturers suffering substantial hardship owing to increases in packaging costs if the concern conclusively shows that it is unable to effect economies in container costs by use of cheaper materials. The WPB has prohibited by Limitation Order No. L-197 the use of steel drums in the packaging of approximately 90 important chemicals, but many manufacturers will be able to pack certain of their products in cheaper containers made of fiber or paper, thus reducing their container costs under levels of March 1942, the base pricing period of the General Maximum Price Regulation.



Fertilizers. Elimination of the uneven price structure prevailing for the Florida and Tennessee phosphate rock industry, as well as provision for more adequate production of the higher grades of this important fertilizer material, are provided in Maximum Price Regulation 240, effective October 19, 1942, issued by the Office of Price Administration. The measure, which applies only to phosphate rock produced in Florida and Tennessee establishes specific dollars and cents maximum prices about 20 cents per ton under current levels for the lower grades and at approximately the same level as those now prevailing for the higher grades.



The new measure establishes maximum prices for various grades in a more consistent relationship than was possible under the General Maximum Price Regulation, thus removing the main factor hindering greater output of the higher grades.

Manganese Ores. A maximum price regulation for manganese ores, designed to stabilise the major cost element for manganese alloys, has been announced by OPA in Maximum Price Regulation 248, effective November 9. The new regulation provides maximum prices for all do-

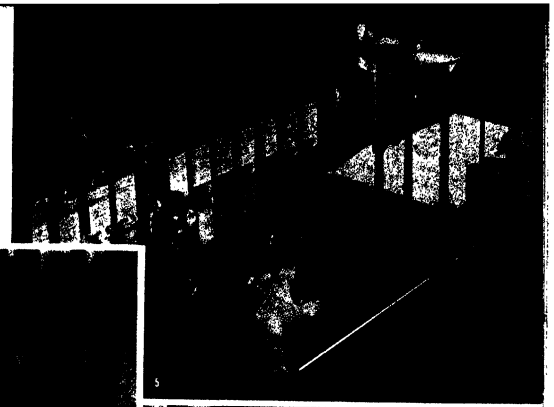
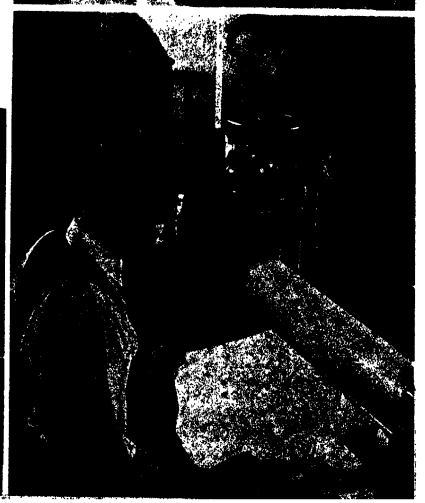
THE CHEMICAL NEWS PARADE



The modern textile laboratory of Röhm & Haas Co., Philadelphia, Penna., has been especially designed to carry on three major activities, namely, research, evaluation of existing products compared to new developments, and sales service. For these purposes specialized equipment designed to make this laboratory unique in its scope has been installed. A specialized piece of apparatus has been set up for testing and checking every plant operation. Machines have been designed for use in the laboratory which duplicate as closely as possible actual textile mill equipment in use. Through a precise control of time, tension, temperature, and drying rate, mill results can be obtained under laboratory conditions. One of the outstanding features of this tri-purpose laboratory is the conditioning room where every fabric or yarn to be tested is first conditioned for at least 24 hours at 70° F. and 65 per cent relative humidity. This measure is of the utmost importance as emphasized and exemplified in the case of tensile strength determinations on certain rayon fabrics, where tensile strength may vary as much as 40 per cent from day to day if such conditioning is not employed. Other pieces of equipment include a Scott tester to determine the efficacy of various textile finishes, a compressometer to measure crush resistance of velvet, and a Brookfield viscometer to test viscosity of textile finish.

(1) Fabrics and yarns to be tested are placed in conditioning room in order to secure necessary uniformity in moisture content to allow for accurate testing comparisons. (2) A Scott tester used to determine efficacy of textile finishes is shown here in action. (3) The stiffness tester is used for testing the stiffness of fabrics after the finishing operation. (4) The latest precision instrument set up by the AATCC to evaluate the hand or drape of fabrics is the drapemeter, outstanding in its simplicity and accuracy. (5) A Stormer viscometer checks on the textile sizings. (6) Since the wash is frequently the test of a good finish, the laboratories are equipped to evaluate finishes from the standpoint of commercial or home laundering. New detergents are evaluated in the Launderometer, right, then used in practical applications in rotary and dasher type washers.



(7) As the conversion of starches with enzymes becomes of increasing importance, the Brabender viscometer is now used to determine with accuracy their enzymatic products, the diastases. This machine, pictured here, automatically determines and records the viscosity of the starch-enzyme mix as it is being subjected to temperature changes. (8) Basic research as it is carried on here is essential in the rapidly changing textile industry. (9) Padding and calendering, shown here, are two of the most difficult plant operations to reproduce in the laboratory. In order to ensure similar results in laboratory tests and plant results special pads and calenders have been developed.

NEUTRAL ALKYL PHOSPHATES

A Group of Organic Phosphorus Compounds That Offer Interesting Possibilities for Further Chemical Research

The organic phosphorus compounds are much less familiar in the industrial field than the inorganic phosphorus compounds. The last few years, however, have witnessed a marked increase in research on the former . . . on the alkyl esters of phosphoric acid in particular. The result has been that many interesting applications have already been suggested. Among them are the following:

Plasticizer in cellulose acetate, in organic acid derivatives of cellulose, and in synthetic resins of the phenol-aldehyde type.

Waterproofing textiles with cellulose acetate.

Accelerators for curing urea-formaldehyde resins.

Polymerizing agents for unsaturated hydrocarbons, drying oils, resins, etc.

Catalysts for the dehydration of glycols and olefinic alcohols to diolefins such as butadiene.

Absorbing fluids in refrigeration systems.

Leveling liquids in printing compositions for vat dyestuffs.

Corrosion inhibitors for gun barrels, bearings of meters and compressors, etc.

Properties of the Neutral Alkyl Phosphates . . . the subject of exhaustive study in the Victor Research Laboratories . . . are summarized in the table below. From the latter it is apparent that a combination of the proper alkyl and phosphate groups will produce compounds which possess, within indicated limits, properties to meet widely varying requirements. Some of these compounds are already in commercial production; others are available only in laboratory quantities. Additional information, as well as samples intended for further research, will gladly be sent upon request.

PROPERTIES OF NEUTRAL ALKYL PHOSPHATES

COMPOUND	Mol. Wt.	Sp. Gr. at x°/4° C.	B.P. °C.	Ref. Index ND	SOLUBILITY

mestic sales of manganese ore of every kind, other than domestic battery or chemical ores, to any private buyer.

WPB Chemicals Branch Announces Allocations

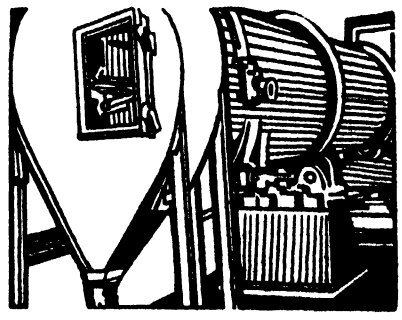
OCTOBER allocations for other than direct military uses have been released by the Chemicals Branch, War Production Board. The Branch explained that allocations are made on the basis of specific end use where possible rather than on priority ratings. Although the program will change from month to month, the pattern will serve as a guide to areas in which chemicals are most likely to be available. The allocation requests in most instances do not indicate actual requirements for a given material, as industry has reduced its requests in fields where a known shortage exists.

The purpose of the release is to provide industry with a pattern for which October requests were granted in full, granted in part, or denied. Copies may be obtained direct from the WPB Office of War Information, Washington, D. C.

WPB Wants Report of Critical Chemicals

ACTING on evidence of slow-downs in the production of urgently needed munitions and other war materials on account of the scarcity of critical chemicals, H. M. Brundage, regional deputy director, WPB, in charge of priorities and materials, has asked all chemical manufacturers, suppliers, and users in the New York–Northern New Jersey area to report their holdings of idle, excess, or frozen stocks of critical chemicals to WPB regional headquarters. Aid will be given to war plants in obtaining the chemicals they need through regional representatives of WPB's Materials Redistribution Branch, and holders of idle, excess, or frozen stocks of critical chemicals will be aided in disposing of such stocks.

Full details are requested as to specifications, quantities, and location of some 150 chemicals listed in Schedule A to Priorities Regulation 13, which authorizes the sale of idle, excess, or frozen stocks to specified purchasers. Copies of Priorities Regulation 13 with the complete list of critical chemicals are obtainable at all WPB offices in this area.



Mr. Brundage explained that although frozen stocks of many materials are moving rapidly into war production under the regulation, the problem in the case of chemicals is complicated, owing to the many specialized uses of chemicals. He pointed out that this program was intended to augment, not supersede, the machinery set up for the sale of frozen stocks under Priorities Regulation 13 and urged holders of frozen chemical stocks to make sales to purchasers specified by the regulation on their own initiative where possible.

No special forms are required and ordinary inventory sheets may be used for making the reports. Details as to the specifications, quantities, and location of the stocks should be forwarded by letter at once to the Materials Redistribution Branch, WPB, 122 East 42nd Street, New York, N. Y.

Food Price Division Set Up by OPA

PRICE Administrator Leon Henderson has announced creation of the Food Price Division in the Office of Price Administration and named as director A. C. Hoffman, who has been price executive of the Food and Food Products Branch now included in the new division. The new division is charged with the formulation, initiation, and administration of food price regulations. Its responsibilities also will include price research and analysis, the conduct of industry relations necessary to the formulation and administration of commodity price regulations assigned to the division, the processing of petitions for amendment, applications for adjustments, and protests, as well as the examination and evaluation of complaints and proposals relative to such food commodities.

The Food Price Division will have six branches: an economic analysis branch, an administrative services branch, and four commodity branches. Each commodity branch, in turn, will be divided into sections under which the various food commodities will be grouped. The four Commodity Branches and the commodities included in each are: Grocery Products Branch, including canned and frozen fruits and vegetables, fresh and dried fruits and vegetables, packaged specialties, imported foods, and beverage products; Meats, Fish, Fats and Oils Branch; Sugar, Tobacco and Dairy Products Branch; and Cereals, Feeds, and Agricultural Chemicals Branch.

Company Reports Simplified by OPA

SIMPLIFICATION in the reporting forms by which 25,000 companies voluntarily file financial reports quarterly with the Office of Price Administration has been announced. An outline of the changes in the program, which provides basic financial data for studies of price control, was presented to the Washington Chapter of the National Association of Cost Accountants by Robert W. King, head of the examination section of OPA's Financial Reporting Branch.

The most important change eliminates the requirement that a company report individual salaries for its officers and for employees receiving $20,000 a year or over. Instead there are substituted simple tabulation of these salaries, showing the range and number of persons in this class but omitting reports on salaries of particular individuals. Another change in the financial report forms, which will take effect on January 1, 1943, will be a provision in the profit and loss schedule for reporting separately charges which are set up to provide wartime reserves. The financial reporting forms give OPA continuing and basic information on price control problems in industries subject to OPA regulation. At present reports are being obtained from virtually all companies with assets of $250,000 or more engaged in manufacturing, mining, construction, and selected companies in wholesale trade and related fields.

Use of Inland Waterways Is Urged by Eastman

JOSEPH B. EASTMAN, Director of the Office of Defense Transportation, has urged shippers and all government agencies to utilize water carriers where possible. Declaring that everything possible must be done to prepare for the increased load which is coming upon the railroads, Mr. Eastman said in a circular to all government agencies that the railroads are carrying a freight traffic load which is running about 30 per cent ahead of 1941 as measured by ton miles. The government looks forward to a continuing increase in rail tonnage through 1943 as a result of the war production program and changes in the character of the movement of traffic.

Emphasising the difficulties of obtaining materials for expansion of railroad facilities to handle the heavier load, Mr. Eastman expressed the opinion that any allocation of material for new freight cars and locomotives will be based on the premise that other available means of transportation will be fully utilized. He said the Nation's inland barge lines and a number of inland water carriers operating along the Atlantic and Gulf intracoastal waterways are not being fully utilized at pres-

ent, and it is therefore necessary to urge not only shippers, but also governmental agencies, to instruct full utilization of water carriers where possible, thereby relieving the railroads and the truck lines of their burden.

New Advisory Committees Set Up by WPB

THREE new advisory committees have been announced by WPB. They are:

FERROMANGANESE INDUSTRY ADVISORY COMMITTEE, Andrew Leith, government presiding officer. J. H. Critchett, Electro Metallurgical Co.; A. M. Harper, Carnegie Illinois Steel Corp.; Charles R. Holton, Bethlehem Steel Co.; Carl McFarlin, Tennessee Products Corp.; Barbour Mitchell, H. J. Lavine & Co.; and Hugh Morrow, Sloss Sheffield Steel & Iron Co.

INEDIBLE ANIMAL FAT PRODUCERS INDUSTRY, E. W. Wilson, government presiding officer. James H. C. Allan, Western California Products Co.; W. C. Butler, Darling & Co.; A. D. Connell, Rath Packing Co.; G. D. Fitch, Wilson & Co.; D. M. Flick, Armour & Co.; A. M. Hayes, The Van Iderstine Co.; Kenneth McKinney, E. Kahn's Co.; Roger E. Morse, Jas. F. Morse & Co.; E. A. Moss, Swift & Co.; Chris Offenhauser, Consolidated Beef Co.; D. M. Pfeiffer, Akron Soap Co.; G. H. Schoen, Schoen Brothers, Inc.; Hugo Slotkin, Hygrade Food Products Corp.; and Rae H. Walters, The Harlan Rendering Co.

LIQUOR CARBON DIOXIDE DISTRIBUTORS ADVISORY COMMITTEE, Donald C. Knapp, government presiding officer. O. A. Brightwell, Jr., Parker-Browne Co.; George O. Cusack, Pure Carbonic, Inc.; Paul Drosto, National Cylinder Gas Co.; John E. Fowler, Fowler Carbonic Co.; Allyn Harris, Cardox Corp.; F. F. Lavedan, The Liquid Carbonic Corp.; R. B. Swope, Southern Oxygen Co., Inc.; J. B. Witt, Witt Ice & Gas Co.; and George W. Dolan, The Mathieson Alkali Works, Inc.

Movies on Fuel Conservation Available

FOUR motion pictures on subjects related to the Government's fuel oil rationing and fuel conservation programs are now available for release to schools, industries, defense organizations, consumer committees, and other groups, the Office of Price Administration has announced. These films, produced under the direction of the Department of the Interior's Bureau of Mines and the U. S. Bituminous Coal Consumers' Counsel for public distribution, include "Heat and Its Control", "The Story of Rock Wool Home Insulation", "The Story of Petroleum", and "Coal for Victory". All are available in 16-millimeter size, free of charge. Applications for the first three should be addressed to the Bureau of Mines Experiment Station, 4800 Forbes Street, Pittsburgh, Penna. Address requests for "Coal for Victory" to The U. S. Bituminous Coal Consumers' Counsel, Box 483, Washington, D. C.

Container Industry Urged to Develop Substitutes

BECAUSE of the increasing scarcity of critical materials for the manufacture of containers, the Containers Branch of the War Production Board has issued an urgent appeal to the industry to concentrate all its research facilities on the development of usable substitutes. Although many substitutes have been developed and are in use, the proportion of containers still made of critical materials is considerably in excess of what it should be in the light of present military demands. It was emphasized that responsibility for developing substitutes rests largely with the individual manufacturers, although the War Production Board is prepared to offer whatever assistance and guidance its facilities permit.

Substitutes should be designed to use a minimum of raw materials, even though the materials required are not at present in the critical category. Manufacturers and packers now using containers made of critical materials are asked not to rely on a continued supply of such containers.

Export of Fats and Oils Restricted by Government

FURTHER limitations on export shipments of certain fats and oils have been established by the Office of Exports, Board of Economic Warfare. General export licenses for a prescribed list of fats to all destinations except Newfoundland have been canceled. The commodities may be exported to Canada and that part of Labrador under Canadian control without regard to export licenses, since, as announced in OWI release 519, October 8, 1942, all license requirements for exports to Canada have been removed. Exporters desiring to ship fats and oils in the commodity group affected by this action to any other foreign destination must apply to the Office of Exports for individual export licenses to cover each proposed shipment.

Wineries May Convert to Alcohol Production

THE Chemicals Branch of the War Production Board is making studies looking toward possible utilization of California wineries for alcohol in the synthetic rubber program, Rubber Director William M. Jeffers has announced. Findings will be reported after distillation engineers have completed their research, and if favorable, it is possible a plant for making butadiene from alcohol will be set up on the Pacific Coast. Conversion of wineries to the production of 190 proof alcohol is described as "do-able but tricky".

Defense Plant Corporation Contracts for New Plants

JESSE JONES, Secretary of Commerce, has announced that the Defense Plant Corp., subsidiary of RFC, has authorized execution of a contract with the Dow Chemical Co., Midland, Mich., for machinery and equipment to be placed in a plant in Michigan. It is estimated that the cost will be in excess of $1,500,000. These facilities will be operated by Dow Chemical Company, and title will be retained by the Defense Plant Corp. Also authorized is the execution of a contract with U. S. Industrial Chemicals, Inc., New York, N. Y., to provide plant facilities in Maryland. It is estimated that this will cost in excess of $1,000,000. U. S. Industrial Chemicals, Inc., will operate these facilities and title will remain in Defense Plant Corp.

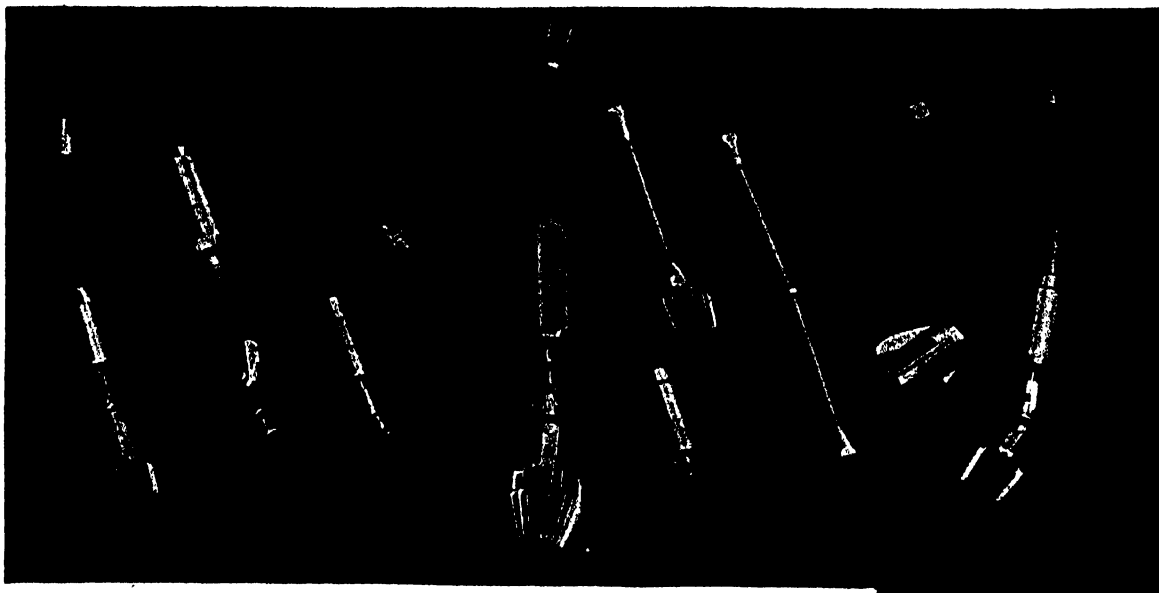
Storage of Coal

TO ASSIST commercial coal users in minimizing storage losses, the Division of Solid Fuels Utilization for War of the Bureau of Mines is organizing a group of experts to advise industries on best methods of stockpiling coal to avoid spontaneous heating and degradation of the stored product. Experts who will assist in this survey include W. D. Langtry, H. C. Carroll, W. W. Anderson, G. E. Keller, and R. W. Langtry, Commercial Testing and Engineering Co., 307 North Michigan Ave., Chicago, Ill.; and Douglas Henderson and C. T. Engvaldsen, Gould, Henderson and Brunhes, 215 Fourth Ave., New York, N. Y.

Persons encountering difficulties in the storage of coal in commercial quantities are asked to inform the Division of Solid Fuels Utilization for War, Bureau of Mines, Washington, D. C., or the nearest of the two consulting firms.

Chemical Manufacturers' Indexes

THE July index of value of chemical manufacturers' inventories was 162.8 compared with 162.7 in June, and 122.1 for July of 1941 taking the average month of 1939 for the index of 100, according to the survey of the Department of Commerce.



July index of value of chemical manufacturers' shipments was 172 compared with 168 for June, and 155 for last July, using the 1939 average month at 100.

Indexes of value of chemical manufacturers' inventories were 163.6 in August, and 163.3 in July, as compared with 125.2 in August 1941, using 1939 average month as 100, according to a report by the Bureau of Foreign and Domestic Commerce.

Chemical producers' shipments indexes were reported at 172 in August, and 169 in

Small tubes to clean?

Cleaners for small tubes, curved or straight. Although small, these cleaners are exceptionally powerful.

Speed the job with

ELLIOTT-LAGONDA EQUIPMENT

Two-speed geared motor, steam or air driven, for cleaning straight tubes in condensers and heat exchange apparatus. One of four types available.

KEEP TUBULAR APPARATUS UP TO HIGHEST EFFICIENCY. Remove deposits or fouling of any kind, in tubes straight or curved, from ½-in. diameter up, with Elliott-Lagonda tube cleaners.

On this page are some of the cleaners, cutters, drills and brushes supplied for small tubes, as in heaters, evaporators, heat exchangers, and other tubular apparatus for processing. Also available, cleaners for boiler tubes, still tubes, pipes up to 20 in.

If you have an out-of-the-ordinary tube cleaning problem, call upon the expert aid of Elliott-Lagonda specialists. For detailed data on equipment, write for Bulletin Y-10.

Various drills, brushes and cutter heads for removing different types of incrustation or fouling in small tubes.

July, as compared with 155 in the previous August, using the same 1939 average month as 100.

Alien Property Custodian Seizes Additional Patents

LEO T. CROWLEY, alien property custodian, has announced the seizure of an additional 2,600 enemy patents, principally German-owned, among them many chemical patents. Including the announced seizures, more than 13,000 enemy-owned patents and patent applications have been taken over by the Office of Alien Property Custodian. Many of these patents already have been licensed to American companies, while research upon the feasibility of devices and processes covered by the patent applications is continuing.

APPOINTMENT of a staff of technical consultants on the Nation's rubber program has been announced by Rubber Director William M. Jeffers. They will serve under Bradley Dewey, deputy director, upon whom Mr. Jeffers has placed responsibility for the technical aspects of the program.

Those named are E. B. Babcock, Firestone Tire and Rubber Co.; L. D. Tompkins, U. S. Rubber Co.; E. R. Gilliland, M. I. T.; W. L. Campbell, Kroger Grocery Co.; Morehead Patterson, American Machine Foundry Co.; and Ray P. Dinsmore, Goodyear Tire & Rubber Co.

Treatment of Coal with Calcium Chloride

AN EXTENSIVE program of research on the treatment of coal with calcium chloride to reduce dust in handling and to avoid difficulty with the freezing of wet coal has been initiated at the Battelle Memorial Institute under the joint sponsorship of the Calcium Chloride Association and Bituminous Coal Research, Inc.

The new program of research will supplement and be correlated with a program that the Calcium Chloride Association has carried on for four years and is continuing at West Virginia University under the direction of W. A. Staab.

FERTILIZERS and chemicals in large quantities are now being sent to Finland by Germany, it is unofficially reported. Wood products comprise the major part of Finland's deliveries to Germany.

Staff Changes at Kansas State College

THE following men have recently left the Chemistry Department, Kansas State College, for other positions:

Capt. H. W. Marlow	Sanitary Corps, War Department
A. L. Olsen	Ordnance Plant, Pryor, Okla.
A. C. Andrews	Ordnance Plant, Pryor, Okla.
Donald Olson	Ordnance Plant, Pryor, Okla.
Erwin Olson	Ordnance Plant, Pryor, Okla.
Carl Latschar	Ordnance Plant, Pryor, Okla.
W. J. Peterson	North Carolina State College, Raleigh, N. C.
B. W. Beadle	American Meat Institute, Chicago, Ill.
A. E. Hostetter	Department of Shop Practice, Kansas State College
D. G. Kundiger	Röhm & Haas, Philadelphia, Penna.
E. P. Meibohm	National Defense Research Committee, Pittsburgh, Penna.
Raymond Olson	Texas Co., New York, N. Y.
Edward Stickley	Washburn Municipal College, Topeka, Kan.
C. R. Friede	E. I. du Pont de Nemours & Co., Inc., Woodbury, N. Y.
Donald Edgar	Hercules Powder Co., Christianburg, Penna.
L. Warren Brandt	Trojan Powder Co., Allentown, Penna.
Ernal P. Galbraith	Remington Arms, Salt Lake City, Utah
James K. Woods	Joseph E. Seagram & Sons, Louisville, Ky.

New additions to the staff include:

F. C. Lanning	University of Minnesota
Marvin Schreiber	University of Kansas
Don McCoy	McPherson College, McPherson, Kans.
Thomas Thomson	Seattle, Wash.
Mina Goehring Hall	University of Iowa
Elizabeth LaRue Conrad	University of Iowa
Charles Wagoner	McPherson College and Kansas State College
Joseph Weybrew	University of Wisconsin
Henry Lau	Kansas State College

Rubber Scrap Collection

THE rubber scrap pile of the Nation is considerably larger than it is generally thought to be if figures compiled by the Standard Oil Co. of Indiana may be taken as an index.

Immediately following the scrap rubber drive Standard announced that 41,798 tons had been collected in the 14 states in which it operates. About the same time an announcement was made from Washington that 454,155 tons had been collected in the country as a whole.

The latest figures available show that Standard and its subsidiaries together collected 61,271 tons of scrap rubber or about 13.5 per cent of the nationwide total as originally reported. The oil industry is shipping scrap rubber to central receiving depots and rubber reclaiming plants at the rate of about 4,000 tons a day.

Training of Chemical Engineering Aides

PRATT INSTITUTE, Brooklyn, N. Y., under the sponsorship of the Engineering, Science, and Management War Training Program, in cooperation with the United States Office of Education, is conducting a tuition-free course for the training of chemical engineering aides.

This course is under the educational charge of Tod G. Dixon, head of the Department of Chemical Engineering, and H. Russell Beatty, institutional representative of the ESMWT. It is planned to meet the needs of the chemical industry for young men and women to take positions as laboratory technicians. It will be a full-time day school course meeting 30 hours a week for 20 weeks beginning November 9.

Who Makes It?

THE following chemicals are wanted by The National Registry of Rare Chemicals, Armour Research Foundation, 35 West 33rd St., Chicago, Ill.:

Phospho-erythronic acid, oxalacetic acid, cuprous benzene sulfonate, glucose-6-phosphoric acid, phosphopyruvic acid, phosphoglyceric acid, dihydroxyacetone phosphate, creatine phosphate, acetoacetic acid, α-ketoglutarate.

AVAILABLE NOW-

in reasonable quantities, those who require an anhydrous alcohol, resin reactant or specialty solvent, would do well to consider and investigate the possibilities offered by

Furfuryl ALCOHOL

Most uses of Furfuryl Alcohol depend on the fact that it will resinify in the presence of dilute mineral acids or acidic salts. This is an advantage in the manufacture of heat setting binders, coating compositions, and molding materials. Our Bulletin 58 describes the application of such a resin to wood and other porous surfaces and a copy will gladly be sent upon request.

Other uses are as a dye solvent, acid resisting cement, and impregnating agent. If you have a problem embodying any of the possibilities of Furfuryl Alcohol, let us know and we shall be glad to supply all available information.

The Chemist vs. the Chemical Engineer

Mr. S. D. Kirkpatrick, Editor,
Chemical and Metallurgical Engineering,
330 West 42nd St.,
New York, N. Y.

Dear Sid:

I HAVE just finished reading James H. McGraw, Jr.'s editorial which appeared in all McGraw-Hill publications [see *Chem. & Met. Eng.*, 49, 75 (1942)] for October. I am troubled, really troubled, and I think the situation is one that can be remedied only by frank appeal to you for your help. I think it is a matter of seriousness, equally to both branches of the chemical profession—Chemistry and Chemical Engineering. As I have said to you before, more or less publicly, you have given more honorary degrees in chemical engineering than have been conferred by all of the Chemical Engineering Departments in our colleges and universities. I believe that the situation is running away from us, both you and me, even if our ideas differ little except for your quite natural desire to aggrandize the term "chemical engineer".

This editorial by Mr. McGraw is well written. It will be read with interest by many. Its basic theme is right, but you know and I know, even if he does not, that it is both the chemist and the chemical engineer who have brought about the wonderful progress in our industries. To claim the development of everything, even to the sulfa drugs, vitamins, etc., etc., by implication or otherwise, as the work of "the chemical engineer" is going to hurt the chemical engineer more than it hurts the chemist. If this editorial is true, the AMERICAN CHEMICAL SOCIETY is made up entirely of chemical engineers. To have all chemical research and development ascribed to the chemical engineer will make it necessary to change the name "Chemical Profession" to "Chemical Engineering Profession", and instead of 21.9 per cent of our members being chemical engineers, 100 per cent become chemical engineers by courtesy. If "chemical engineer" is to become the standard cognomen for "chemist", the Institute of Chemical Engineers, to which both you and I belong and which we honor, will lose the specific place it now occupies. For some time, in order that such accomplishments as Mr. McGraw mentions might be accredited to the chemical profession and justly accredited, I have used the term "chemists *and* chemical engineers" when referring to the profession. I think you will admit that to be a good chemical engineer one must first be a good chemist.

What can we do about it? Are you ready to help in the aggrandizement of the "chemical profession", or do you prefer to continue to claim all the accomplishments of the chemist as the accomplishments only of "the chemical engineer"? I am quite sure you do not claim that a chemical engineer does not belong to the chemical profession.

Mr. McGraw assigns the future of the synthetic rubber industry to "the chemical engineer". Only yesterday I had a request from one of our largest rubber companies for six Ph.D. chemists. Please do not get the idea that I am in any way minimizing the accomplishments of chemical engineers as such. I am not. To me, the chemist and chemical engineer are one breed of cat. One may be a tomcat and the other a tabby, but we will cease to have a high breed of kittens unless they appreciate each other.

I am wondering how others feel about this matter. I am *thinking* of asking Doctor Howe to publish this as an open letter in CHEMICAL AND ENGINEERING NEWS so that I can find out. Have you any objection?

Cordially yours,
CHARLES L. PARSONS, *Secretary*

AMERICAN CHEMICAL SOCIETY
1155 SIXTEENTH ST., N. W.
WASHINGTON, D. C.
October 15, 1942

Dr. Charles L. Parsons, Secretary,
American Chemical Society,
1155—16th St., N.W.,
Washington, D. C.

Dear Charlie:

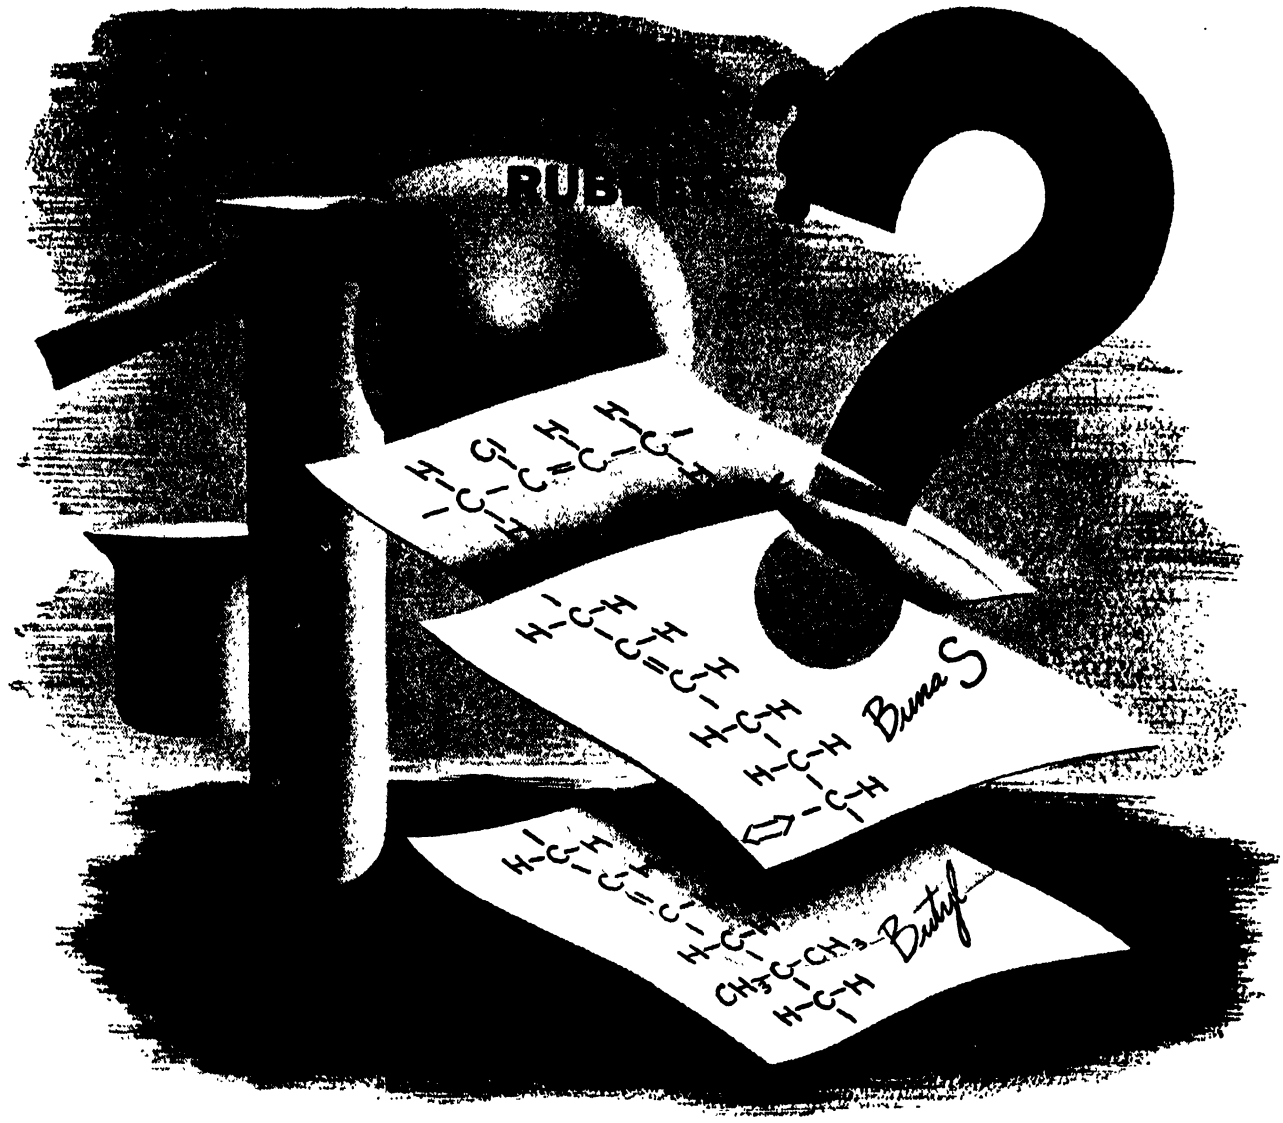
YOUR interesting letter of October 15 gets priority over the pile that is on my desk as a result of about three weeks' absence on work for WPB. Before I had left for Washington, however, I had read Mr. McGraw's statement several times and had seen nothing in it that seemed to me to be at all derogatory to the work of the chemist. Certainly, that was far from Mr. McGraw's purpose in this series of editorial advertisements running through all McGraw-Hill publications and reviewing the contributions to the war effort being made by the industries and professions served by these magazines. That this series should be concerned more with engineers than with chemists, physicists, bacteriologists, and other scientists is only natural because the advertisements parallel the fields of our papers.

A careful rereading of the current statement failed to reveal any claim that the chemical engineer was solely responsible for the war developments and other striking progress made by the chemical industries. That there were important contributions from others goes without saying. Had it been the purpose of the statement to pay tribute to the work of the chemist an even more striking story might have been told of the achievements of the research laboratories and the developments that have resulted from chemical control of practically all manufacturing operations. There is also a story, much less important to be sure, to be told about the contributions of physicists, mechanical, civil, and electrical engineers who have done a lot to advance the chemical process industries.

Frankly, I don't think that either you or I can afford to spend very much time these days arguing over the old chemist *vs.* chemical engineer controversy. That belongs back in the dark ages when *Industrial and Engineering Chemistry* ran the word "Engineering" in very small type and would never have thought of calling its NEWS EDITION "CHEMICAL AND ENGINEERING NEWS". Nor can I see anything very constructive to be gained by my admitting that the chemical profession may include chemical engineers as well as chemists.

Perhaps Mr. McGraw was wrong in assigning the future of the synthetic rubber industry to the chemical engineer. He had fairly good precedent, however, in the technical suggestions from the Baruch report, which in Paragraph 9 of Section 12 reads as follows:

> 9. The committee suggests the institution of a prompt survey to determine the number of *chemical engineers* and other technically trained men who will be required to operate the synthetic rubber plants now under construction: and if this survey indicates a serious shortage of such technical talent, the Manpower Commission be called upon for assistance in devising a policy for meeting this situation.



There is also an earlier reference in Section 6 on "The Synthetic Program", in which the following statement is made:

> It is fortunate that the program for the needed plants is generally in the hands of as competent *engineers* as there are in the country.

I got a great deal of merriment out of your Tom Cat and Tabby reference, and if you will let me publish a slightly less personalized version of your letter, I am sure it would bring forth some very interesting comments from *Chem. & Met.* readers. And, of course, there would be no objection on my part to any publication Doctor Howe wishes to make in CHEMICAL AND ENGINEERING NEWS.

With kindest personal regards,
Sincerely yours,
S. D. KIRKPATRICK, *Editor*

CHEMICAL AND METALLURGICAL ENGINEERING
330 WEST 42ND ST.
NEW YORK, N. Y.
October 20, 1942

MANY people will be surprised to hear that what we call synthetic rubber is not rubber at all but a new group of chemical compounds, basically different from the latex from trees, and similar only in certain properties, such as elasticity.

To the rubber chemist and manufacturer of rubber products, these chemical formulas are new raw materials which must be vulcanized, processed and fabricated into useful forms. But since they are basically different from rubber, processing them into such a complex product as a tire, for example, presents a completely new set of chemical problems. For many of the compounding materials used with latex cannot be used with the synthetics.

Here is a situation that calls for chemical ingenuity of the highest order. Developing the new compounds was only the beginning of the job. Finding the right processing materials to make them effective is as great, if not a greater problem. In this field Wishnick-Tumpeer, Inc. has been particularly successful. Special Witco Carbon Blacks, for instance, are helping to make synthetic tires tougher and more durable. Again, Stearite, a specially developed synthetic stearic acid, has made improvements in compounding possible. And No. 20 Softener, another product of the Witco research laboratory, has helped to solve a specific processing problem. Thus, one by one, difficulties are being solved by energetic, intelligently directed research. This close cooperation with the rubber industry is part of the service Wishnick-Tumpeer gives to the many industries using chemicals, oils, pigments, asphalts and allied products.

Egloff Honored

PRESIDENT GUSTAV EGLOFF of the American Institute of Chemists was characterized by Marston T. Bogert as a man "who makes hay out of the grass that grows under the other fellow's feet" at a dinner given by the institute in his honor at The Chemists' Club, New York, on October 23. Speakers at the dinner in addition to Dr. Egloff were: Robert J. Moore, Bakelite Corp.; George A. Burrell, Atlantic States Gas Co.; Robert E. Wilson, Pan-American Petroleum and Transport Co.; Marston T. Bogert, Columbia University; and H. J. Halley, Universal Oil Products Co. E. H. Northey, of the Calco Chemical Division of American Cyanamid Co. and chairman of the institute's New York Chapter, presided.

Dr. Egloff, director of research of the Universal Oil Products Co., Chicago, looked into the future of petroleum products in an address entitled "Wartime Chemicals from Natural Gas". Synthetic tires having lives equal to that of the vehicle on which they are used, synthetic rubber at a price which will ensure its permanent place in our economy, and many other vital products of natural hydrocarbons were foreseen by Dr. Egloff as probable immediate outcomes of present research and development.

Consulting Chemists and Chemical Engineers Hold Meeting

THE annual meeting of the Association of Consulting Chemists and Chemical Engineers, Inc., was held at The Chemists' Club, New York, N. Y., on October 27, 1942, in the form of a symposium entitled "The Consulting Chemist and Chemical Engineer in War and Peace". Wm. J. Schepp of the Schepp Labs., Inc., East Paterson, N. J., was the speaker of the evening, the title of his address being "The Consultant and Industry or The Practical Catalyst".

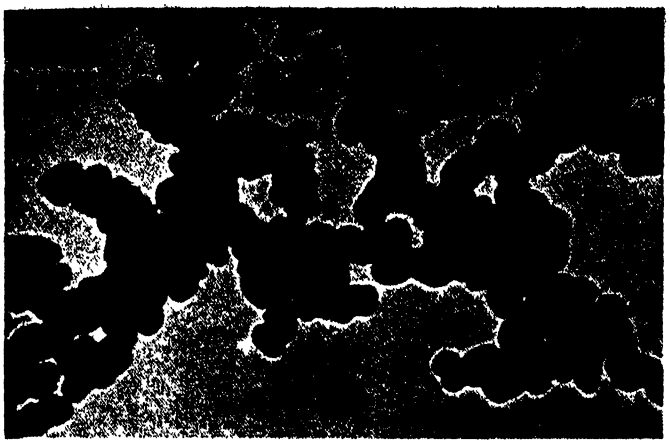
The election of new officers and directors was announced as follows: president, H. P. Trevithick; vice president, Albert Parsons Sachs; secretary, Wm. C. Bowden; treasurer, Henry M. Shields; directors, Philip P. Gray, I. F. Laucks, C. Weaver, Erwin Di Cyan, Prentiss T. Bee, C. A. Crowley, Bernard L. Oser, Henry M. Shuldener, and Arthur W. Thomas.

Gasoline, Past, Present, and Future

THE Seventeenth Edgar Marburg Lecture, given by Graham Edgar before the 45th annual meeting of the American Society for Testing Materials, and entitled "Gasoline, Past, Present, and Future", has been published as a 14-page booklet. It is available at 35 cents a copy from A. S. T. M. Headquarters, 260 South Broad St., Philadelphia, Penna.

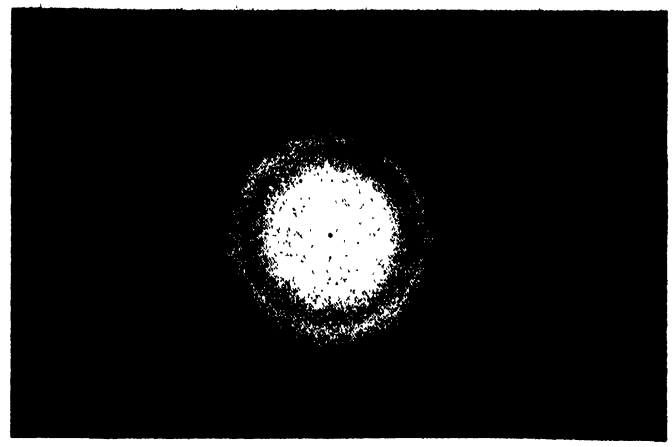
Rust Prevention Committee

AT THE request of the Quartermaster Corps, a technical committee has been appointed to formulate a program and undertake to investigate methods for the control of external corrosion of metal containers, with special reference to electrolytic tinplate. The personnel is as follows: E. J. Cameron, chairman, H. A. Gardner, H. W. Gillett, C. O. Ball, R. H. Lueck, C. E. Maier, G. C. Scott; alternates: Bruce Gonser, W. H. Harrison, Lee Hart, and H. R. Smith.



Training for Safety Auditors

THE third class of safety auditors has begun work in the headquarters of the Safety & Security Branch, Office of the Chief of Ordnance, 333 North Michigan Ave., Chicago, Ill., and includes eight women, the first to take explosives safety training in a class which also includes men. The intensive 6-week course prepares students to become explosives safety auditors in munitions and explosives plants.



Government to Finance Synthetic Scrap

TO AUGMENT inadequate supplies of war-vital steel scrap the government is planning to finance production of synthetic scrap iron by a direct reduction process. At a recent meeting of the Association of Iron and Steel Engineers, E. S. Harman, production manager of the Loftus Engineering Co., said that his company at the request of the War Production Board was preparing preliminary plans to construct the country's first commercial plant to use a process which he developed. This plant, it is estimated, would produce six times as much scrap as the sponge iron produced by other means and would be the only one with commercial possibilities as to capacity.

HOW TO GET TWO SOLUTIONS TO ONE MYSTERY

A case-study of the practical application of the RCA Electron Microscope

The RCA Electron Microscope now offers research experts two different approaches to the mystery of sub-microscopic particles. First, it enables them to study physical appearances at magnifications never before obtainable. Secondly, it enables them to penetrate deeper, to peer into the atomic lattice itself and study the actual composition and structure.

By its inherent high resolving power making possible useful magnifications up to 100,000 diameters, the RCA Electron Microscope reveals details that furnish the scientist with invaluable clues. And by the use of an "adapter", it can quickly be converted into a diffraction camera—yielding the secrets of size, structure, position and relationship of the atoms in the substance...Thus the door is opened to significant new analyses and research about the materials America needs today and will need in the future.

The RCA Electron Microscope is a compact unit, drawing its power from an ordinary 110-volt, 60-cycle, single-phase A.C. outlet. Its operation can be mastered by a competent laboratory technician

Complete data and literature are available on request.

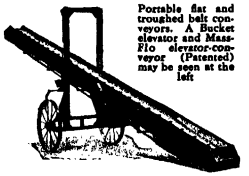
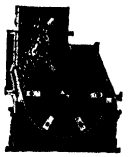
Section of steel apron conveyor



Section of scraper conveyor

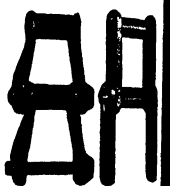
Three-roll belt idler (Patented)



Portable flat and troughed belt conveyors. A Bucket elevator and Mass-Flo elevator-conveyor (Patented) may be seen at the left

Double roll coke sizer (Patented) — a section of spiral flight is shown below

Screenings grinders for chips, sewage and other delibering work



Finished roller chains in single, double or multiple strands—below is the Reliance Drag

Detachable, Hercules, Reliance and Steel Knuckle chains

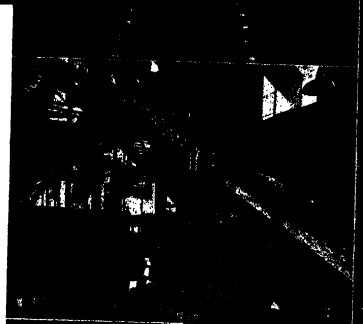
JEFFREY MATERIAL HANDLING AND REDUCTION EQUIPMENT:

BIN VALVES — Bottom and side discharge types

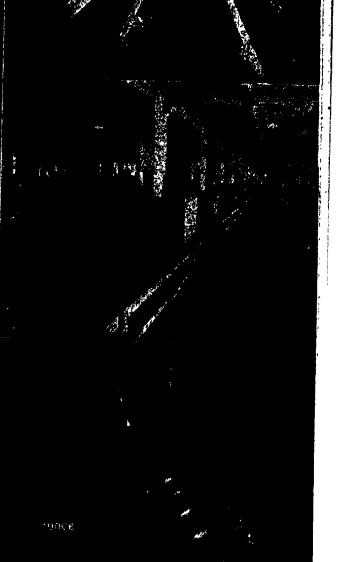
CHAINS and SPROCKETS — A complete line for conveying, elevating and driving service

CONVEYORS — Apron, belt, bucket, portable, scraper, spiral, trolley and V-bucket

CRUSHERS — Pulverizers and Shredders — single roll, double roll, Flextooth, Rotary ring and swing hammer types

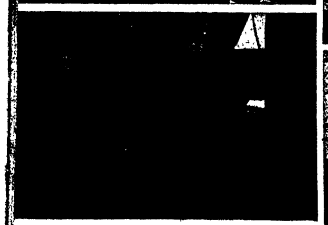


ELEVATORS — bucket and Mass-flo types



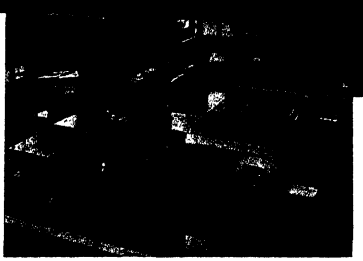
FEEDERS — Apron, belt and grizzly types

POWER TRANSMISSION MACHINERY — gears, pillow blocks, take-ups, couplings, clutches, pulleys and shafting



PORTABLES — Belt, bucket and scraper types for loading and unloading operations — also Stackers for bags, boxes, etc.

CAR PULLERS — Skip Hoists — Weigh Larries — Mono-veyor systems

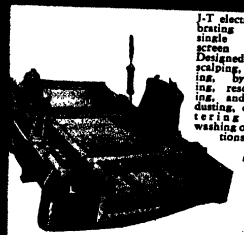


JEFFREY-TRAYLOR ELECTRIC VIBRATING EQUIPMENT (Patented)

COOLERS — Custom built units for processing under closely-controlled conditions

CONVEYORS — for handling hot, gassed materials without dust lost or degradation — tubular or pan types

DRYERS — apply principle of balanced vibration to processing operations — solid or louvered type conveying surface

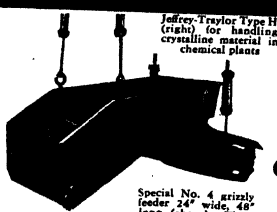


FEEDERS — special sizes and designs of decks to handle all kinds of feeding problems in chemical plants

PACKERS — high frequency vibration applied to packing operations — increases container capacity — decreases packing time

SCREENS — single or double deck sizes ranging from 2 to 40 sq. ft. of screening surface

WAYTROLS — used for continuous feeding where gravimetric accuracy is required. Completely automatic

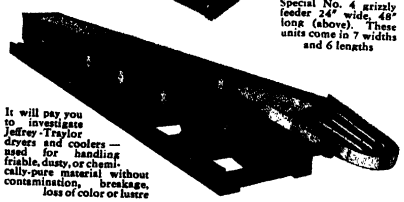


BIN CHECK VALVES — used in connection with vibrating feeders — prevents arching and flooding of finely divided material

J-T electric vibrating FB-2 single deck screen (left). Designed for scalping, sizing, by-passing, rescreening, and dedusting, dewatering and washing operations

J-T 36" x 72" No. 5 heavy duty electric vibrating feeder

Jeffrey-Traylor Type H direct-type Dryer (right) for handling crystalline material in chemical plants



J-B small reagent feeder (right) with vibrating hopper. Special sizes and designs of decks to suit conditions

Waytrol (above) used for batching, porportioning, weighing and feeding.

No. 3 special low head barrel packer (above) — set level with floor for easy handling of barrel or container

It will pay you to investigate Jeffrey-Traylor dryers and coolers — used for handling friable, dusty, or chemically-pure material without contamination, breakage, loss of color or lustre

Special No. 4 grizzly feeder 24" wide, 48" long (above). These units come in 7 widths and 6 lengths

J-T water sprayed cooler (above) for plastics. Has built-in drip pan and equipped with nose screen, for scalping out foreign matter

Rotary bin check valve (above) — prevents flooding and arching of material

THE JEFFREY MANUFACTURING COMPANY

885-99 North Fourth Street, Columbus, Ohio

Sales Offices: Indianapolis, Birmingham, Boston, Chicago, Cleveland, Cincinnati, Detroit, Harlan, Houston, Milwaukee, New York, Philadelphia, Scranton, Salt Lake City, St. Louis

Acid Treatment Shows Increase in Turpentine Yield

For some time the Forest Service of the U. S. Department of Agriculture has been experimenting with acid solutions applied directly to fresh streaks on slash pine trees immediately following chipping. The research work has been carried on at the Olustee Experimental Forest, 13 miles east of Lake City, Fla., where foresters found a 40 per cent solution of sulfuric acid most effective in increasing gum flow yields.

At the beginning of this year's naval stores season, a number of private operators in Florida and Georgia cooperated in tests with the sulfuric acid solution on slash pine. Their records show an average increase of 25 per cent gum flow. These commercial tests, conducted for the purpose of increasing turpentine and rosin yield for war needs, were sponsored by the Forest Service with the cooperation of the Agricultural Adjustment Agency.

Foresters tried out more than 100 possible stimulants but sulfuric acid has given the best results. They are still attempting to improve on the sulfuric acid solution by conducting tests with some 40 substances that might possibly provide greater stimulation.

Experiments also are under way looking to methods that will increase gum yield from longleaf pine as well as slash.

New Patented Rosin Process Available

Clean and brilliant rosin, unusually free from impurities, is possible through a new producing process for which a patent (U. S. Patent 2,295,235) has been issued to Jesse O. Reed, U. S. Department of Agriculture. The patent has been assigned to the Secretary of Agriculture.

An essential part of the process is that the crude oleoresin is made "dry" or water-free by adding turpentine near the end of the normal distillation period so that the whole mass can be readily filtered through media of various types, including paper.

By driving out the water in the rosin, the inventor has found that impurities can be easily filtered out, with the result that the final rosin is clean and brilliant. The turpentine added to the rosin to drive out the water need not be distilled off to produce a solid rosin, but may be retained to form a liquid product that can be handled in the same manner as other sticky materials.

Persons in the naval stores industry who wish to use this new process should apply to the Secretary of Agriculture for a license. Further information may be obtained by writing to the Naval Stores Division of the Bureau of Agricultural Chemistry and Engineering, United States Department of Agriculture, Washington, D. C.

Awards for War Production

The International Nickel Co. plant at Huntington, West Va., has received its third war production award, giving it the right to fly the Army-Navy "E" with two stars.

The Army-Navy Production Award has been presented to the Victory Plastics Co., which makes a scabbard of Tenite, for high achievement in the production of war materials.

On September 25 Rear Admiral E. J. O'Brien, chief of the British Admiralty Technical Mission, paid tribute to the part which employees of The Foxboro Co. are playing in war production.

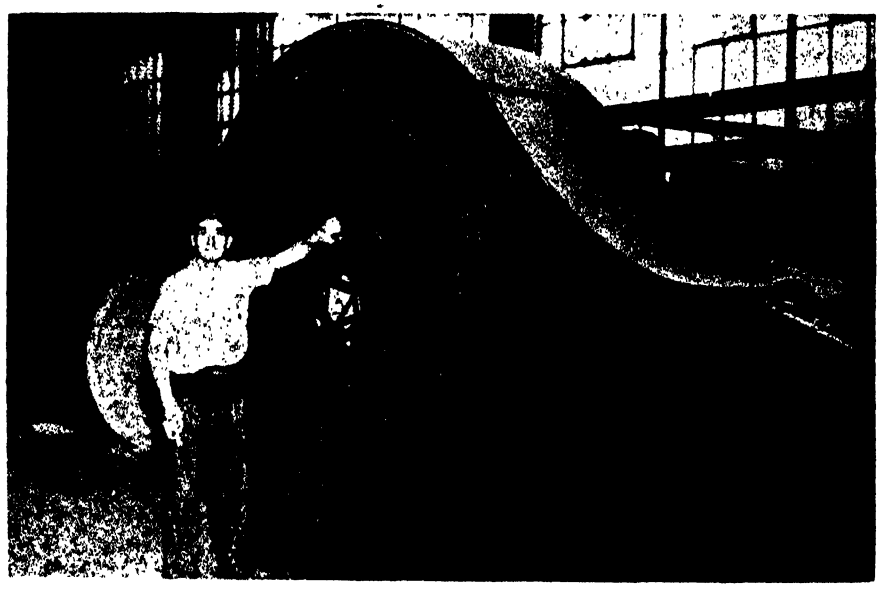
John T. Nevitt, Jr., has received the first-prize war bond in a production-slogan contest for employees of Leeds & Northrup. His slogan was "V Depends on Me".

Tube-Turns, Inc., was the first company in the state of Kentucky to receive the Army-Navy "E", at a ceremony which took place on September 18.

The September issue of *Kodak* is devoted to an account of the presentation of the Army-Navy Production Award to the Eastman Kodak Co.

Receipt of the Army-Navy "E" by the Rustless Iron and Steel Corp. of Baltimore, Md., has focused attention on the company's special process which enables use of submetallurgical grade chromite in the making of stainless steel, resulting in savings of chromium and nickel nearly 50 per cent greater than those obtained with other processes.

Presentation of the Army-Navy "E" flag to the American Machine & Metals, Inc., East Moline, Ill., was made on October 1. The company doubled its original production quota of 20-mm. antiaircraft gun mounts and exceeded quotas on other war items.



The seventh and eighth awards of an Army-Navy "E" to plants owned or operated by the du Pont company for outstanding accomplishment in production of war materials were made jointly on November 6 to the local plants of the Electrochemicals Department and the Chemical Warfare Service.

The Chemist in Three Wars

Otto Eisenschiml, Scientific Oil Compounding Co., Chicago, Ill., has added to his lengthy list of interesting contributions to literature "The Chemist in Three Wars", an historical paper read before the American Institute of Chemists in Chicago on September 18. It tells what chemists did in the Civil War and World War I, and what they are doing to help win the present war.

Deferment

Whenever appeals are filed by mail or Form 42-A is sent to a local board, they should always be sent by registered mail with a return receipt form.

Steel and Wire Reinforce Conveyor Belt

Although apparently no different from any other conveyor belt, this section of a new belt for the Olive Iron Mining Co. in Duluth, Minn., actually represents an epochal advance for belts of this type in that it has a steel-wire carcass instead of the conventional cord or fabric carcasses. It was developed by the Goodyear Tire & Rubber Co. of Akron, Ohio, to speed the flow of iron ore to the nation's war-humming mills, in addition to other tasks where extra-strong belts are required for the war effort.

IMPORTANT CHEMICAL REACTIONS IN WAR-TIME

POLYMERIZATION
ISOMERIZATION
ALKYLATION
HYDROGENATION
HYDROGENATION
DEHYDRATION
DEHYDRATION
NITRATION
DESULPHURIZATION

The manufacture of many synthetic products involves one or more of these reactions—the reactions, the processes and the finished products require chemical compounds. . . . . The production of these chemical compounds for synthetic organic processes has become a special job of the Harshaw Chemical Company. So many of these materials have been standard items in the past, that it is natural to step into the role of supplier to war-time industry. . . . . Whatever your requirements, call on Harshaw—if we do not have the material you want, we may be in a good position to make it for you, or possibly our technical staff can suggest some other material that will do the job as well or better. . . . . A few Harshaw chemicals are listed.

VITAL CHEMICAL MATERIALS

Anhydrous Hydrogen Chloride
Anhydrous Hydrogen Fluoride
Anhydrous Boron Trifluoride
Aluminum Salts
Antimony Salts
Chromium Salts
Cobalt Salts
Copper Salts
Manganese Salts
Nickel Salts
Silver Salts
Tin Salts

Irving M. Abrams has recently transferred from the University of Minnesota to Stanford University, Calif., where he is Bristol-Myers post-doctorate fellow and junior research associate. Dr. Abrams received his Ph.D. degree in physiological chemistry at the University of Minnesota at the close of the summer session.

John H. Adam, who has been associated with the Red Star Chemical Co., Inc., New York, N. Y., for the past year, has been appointed sales manager by the Allied Raw Materials Corp., New York, N. Y.

Captain L. F. Audrieth is on indefinite leave from the University of Illinois, where he is associate professor of chemistry, and has been called to active service in the Technical Group at Picatinny Arsenal as chief of the Research Division. F. T. Wall has succeeded him as editor of the Register of Phi Lambda Upsilon.

E. G. Bailey, vice president of The Babcock & Wilcox Co., New York, was presented with the first Percy Nicholls Award "for notable scientific or industrial achievement in the field of solid fuels" on September 30 at the banquet of the joint Fuels Conference of the Coal Division, American Institute of Mechanical Engineers, and Fuels Division, American Society of Mechanical Engineers.

Herman E. Bakken, who has been assistant director of research for the Aluminum Co. of America, has been made associate director. E. H. Dix. Jr., chief metallurgist, and R. L. Templin, chief engineer of tests, have been made assistant directors.

Elmore J. Baruth, for several years manager of the Depew Container Corp., Depew, N. Y., has resigned to become technical director for the McCreary Tire & Rubber Co., Indiana, Penna.

Benjamin Becker, formerly chemist for the Metal and Thermit Corp., is now staff sergeant technician in the Chemical Warfare Service, Edgewood Arsenal, Md.

Louis H. Brendel, manager of jobber distribution, Manning, Maxwell & Moore, Inc., Bridgeport, Conn., has entered the Navy as a Lieutenant Commander in the Incentive Division.

T. P. Callahan has become affiliated with The Alden Speare's Sons Co., 156 Sixth St., Cambridge, Mass.

James J. Carney is now employed as research chemist for Merck & Co., Inc., at Elkton, Va. He was formerly assistant professor of organic chemistry at the College of St. Thomas, St. Paul, Minn., and was recently granted a Ph.D. degree in organic chemistry by the University of Minnesota.

Ralph H. Carter has resigned his position as microbiologist with Chas. Pfizer & Co., and has accepted a position as research fellow, Department of Bacteriology, Iowa State College, Ames, Iowa.

John T. Clarke has transferred from the Research Laboratories of the Eastman Kodak Co., to the Research and Development Division of the Tennessee Eastman Corp., Kingsport, Tenn. He received the B.S. degree in organic chemistry from Harvard University in 1942.

G. M. Compeau has left the Calco Chemical Division, American Cyanamid Co., and has accepted a position as chemist with the National Oil Products Co., Harrison, N. J.

Walter A. Cook, head of the Chemistry Department, University of Akron, has been called to active duty by the War Department. Captain Cook is stationed at Edgewood Arsenal, Md., and has been assigned to the Chemical Research Division.

Margaret M. Cooper is now on the staff of the Texas State College for Women, Denton, Tex., as assistant professor of chemistry. She spent the preceding academic year in postdoctorate research in textile chemistry at the Pennsylvania State College.

William H. Coppock, since September 1939 assistant professor in the Chemistry Department, Eastern Illinois State Teachers College, is now assistant chief chemist of the Sangamon Ordnance Plant, in Illinois.

D. L. Cramer, who was granted the Ph.D. degree from the Department of Physiological Chemistry at The Ohio State University in August, is now employed as organic research chemist in the Division of Organic Research, Norwich Pharmacal Co., Norwich, N. Y.

William Crocker, managing director of the Boyce Thompson Institute for Plant Research, Yonkers, N. Y., is to spend the winter quarter, January to March 1943, at the University of Washington, Seattle, Wash., as Walker-Ames visiting professor. He will give a series of 10 lectures on "Special Chapters in Plant Physiology", dealing with projects developed at the institute during the past 18 years, and will also give several popular lectures and conduct a seminar in botany.

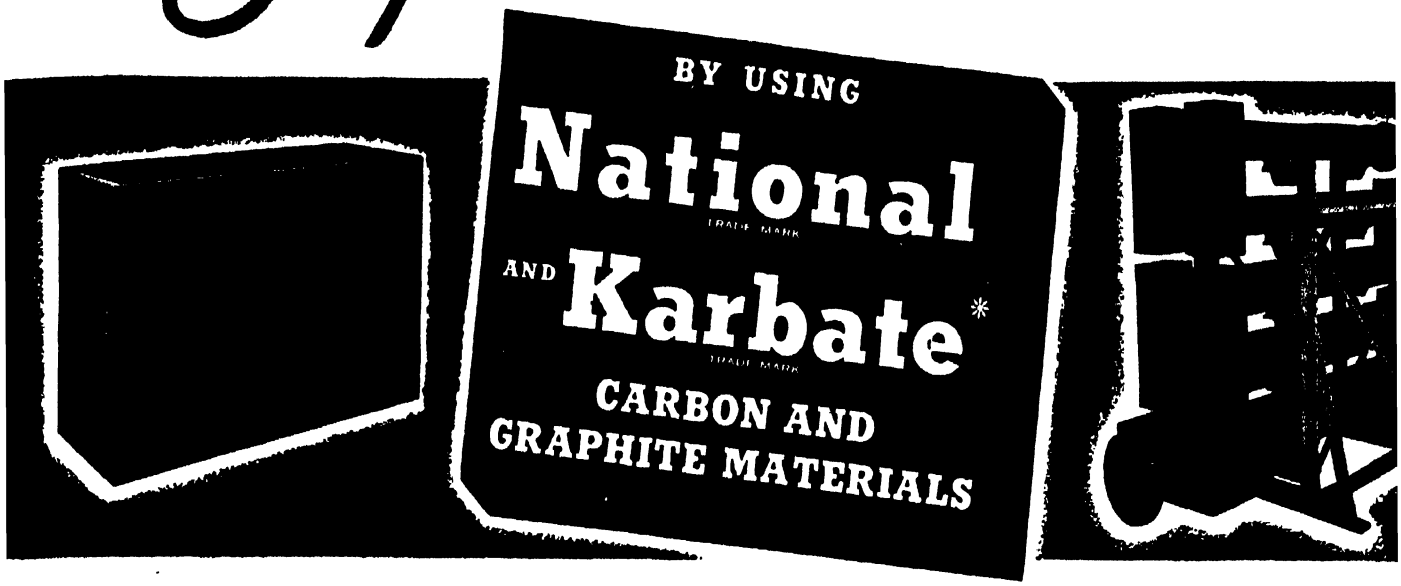
D. S. Davis, assistant professor of chemical engineering at Wayne University, is now research and development mathematician for the Michigan Alkali Co., Wyandotte, Mich. He will continue the college credit and ESMWT courses in nomography and empirical equations offered by Wayne.

Captain Cyrus G. Dunkle, C. W. S., formerly on the faculty of the Department of Technical Instruction, Chemical Warfare School, Edgewood Arsenal, Md., has been assigned as instructor and chemical warfare officer at the Army Administration Officer Candidate School, State College, Miss.

Charles G. Durbin has been transferred from the position of control chemist at the Naugatuck Chemical Division of the U. S. Rubber Co. to become assistant chemical superintendent of the Pennsylvania Ordnance Works, operated by the same concern.

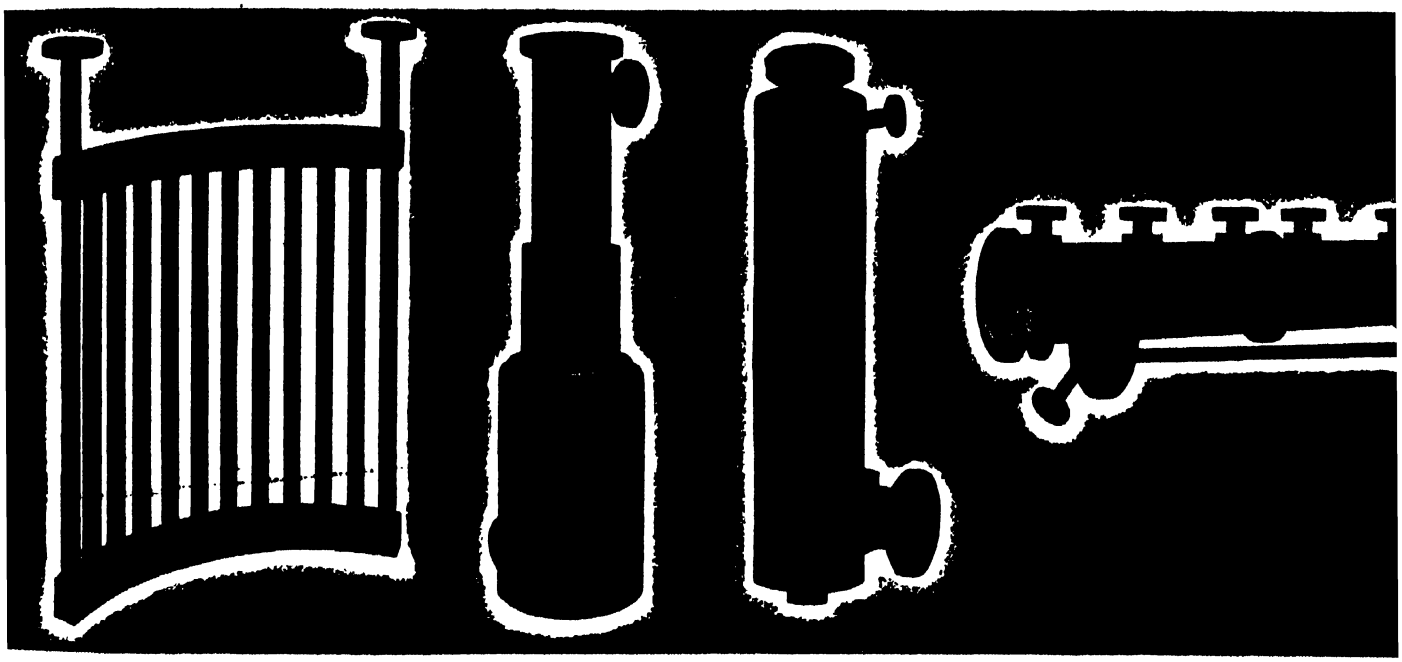
Sidney Eisenberger, since 1930 faculty member of the Department of Chemistry, College of the City of New York, is now vice president of Academy Laboratories, Inc., Woodside, L. I., N. Y., which has recently completed construction of a plant for the manufacture of cocodylic acid and cocodylates, formerly made almost exclusively in France.

R. Maxwell Elliott has been appointed vice president of the Whiting Corp., Harvey, Ill. **D. Polderman, Jr.,** formerly district sales manager of the New York–Philadelphia district, has been made a member of the executive committee.



H. V. Fairbanks has left the University of Louisville, where he was instructor in chemical engineering, to go to the Rose Polytechnic Institute, Terre Haute, Ind., as assistant professor of chemical engineering, in charge of metallography and engineering materials.

G. J. Fink, formerly supervisor of research, Lime Products Section, United States



CONTINUED ON PAGE 1396

IN EQUIPMENT DESIGNED FOR THE PRODUCTION OR USE

Hydrochloric Acid

FOR THE CONSTRUCTION OF PROCESSING UNITS

● Carbon, graphite and "Karbate" materials are used in the construction of equipment for all processes involved in the manufacture or use of hydrochloric acid. This includes absorbing, cooling, rectifying, boiling and condensing units, conveying and circulating systems, vats, tanks and other containers.

These materials are resistant to the action of hydrochloric acid in all phases and concentrations. The excellent heat transfer properties of graphite base materials are of advantage in equipment used for heating, cooling and stripping processes. Good mechanical strength, exceptional resistance to thermal shock, ease of machining, and availability in a wide variety of forms adapt these products to the fabrication of practically any desired type of processing equipment.

EXPERIENCE HAS PROVED THE DURABILITY OF CARBON AND GRAPHITE MATERIALS IN THE PRESENCE OF HYDROCHLORIC ACID AND THE ECONOMY RESULTING FROM THEIR USE

WHATEVER YOUR PROBLEM — *Consider Carbon and Graphite* — WRITE FOR INFORMA

Gypsum Co., Chicago, Ill., has become research associate at the National Bureau of Standards, Washington, D. C. He will supervise cooperative research of the bureau and the National Lime Association on masonry mortars, as well as other research sponsored by the association.

Loren V. Forman

Loren V. Forman has been appointed a research associate at The Institute of Paper Chemistry, Appleton, Wis. He will be instructor in pulp and paper technology and in charge of pulp and paper testing. Since 1940 Dr. Forman has been associated with The Mead Corp., dividing his time between the Chillicothe, Ohio, and the Kingsport, Tenn., mills.

Francis Glick, while completing residence requirements for the Ph.D. in biochemistry at the University of Illinois, is employed as biochemist on an OSRD national defense project at the University of Illinois Medical School, Chicago, Ill.

Henry B. Hardt is now professor of chemistry and head of the department at the Stephen F. Austin State Teachers College, Nacogdoches, Tex., where he has a new and well-equipped science building. For three years Professor Hardt was at Westminster College, Fulton, Mo.

C. Sheldon Hart is now assistant professor in Carleton College, Northfield, Minn., where he is teaching analytical chemistry.

Walter R. Hausch, who received his M.S. degree from the University of Cincinnati in June, is a graduate assistant in the Department of Chemistry, Purdue University, Lafayette, Ind.

Eugene M. Hetzel has been promoted to superintendent of the Carondelet, Mo., plant, succeeding Mr. Wilson.

Eugene M. Hetzel

Florence E. Hooper recently resigned from the faculty of The Stout Institute, Menomonie, Wis., to become assistant professor in chemistry at George Washington University, Washington, D. C.

Captain Wm. S. Hutchinson, Jr., has been relieved from his assignment in the Industrial Service of the Office, Chief, Chemical Warfare Service, and assigned to the 83rd Separate Chemical Battalion, Camp Gordon, Ga., as battalion executive officer. He was formerly with the Mallinckrodt Chemical Works, Laboratory Chemical Sales Department.

Edwin P. Jones has accepted a position as a principal research chemist in the Engineering and Development Section, Eastern Regional Laboratory, Philadelphia, Penna.

Harold M. Kaplan has received the Ph.D. degree from the University of Michigan and has accepted a position on the research staff of the Solvay Process Co., Syracuse, N. Y.

Anson R. Kendall, professor of chemistry at Dakota Wesleyan University since 1936, has been appointed assistant professor of chemistry at the Michigan College of Mining and Technology, Houghton, Mich.

Lynn King, Charles W. Gould, and **Vincent C. Meunier,** formerly of the Columbia Chemical Division, Pittsburgh Plate Glass Co., are now employed at Marco Chemicals, 934 Bethlehem Pike, Philadelphia, Penna., organized by **I. E. Muskat,** formerly research director of Columbia.

Samuel Kohan, formerly control chemist for the Florasynth Laboratories of New York, has been assigned to the Chemical Warfare Service at Fort Story, Va., as assistant to **Lieutenant Harry C. Winter,** chemical officer of the Harbor Defenses of Chesapeake Bay and Fort Story, and formerly research chemist, Biochemical Research Foundation of the Franklin Institute.

A. C. Kracklauer, president, and **W. J. Kracklauer,** sales manager of the Sparkler Filter Manufacturing Co., Mundelein, Ill., have received awards in the $200,000 industrial study on arc welding of the James F. Lincoln Arc Welding Foundation.

Donald Long has been granted a research fellowship in chemistry at the Illinois Institute of Technology, Chicago, Ill., sponsored by the Quaker Chemical Products Corp.

Herbert E. Longenecker has been appointed associate professor of biochemistry and associate director of the Buhl Foundation projects at the University of Pittsburgh, during the absence of **Charles Glen King,** who is on leave to serve as scientific director of the Nutrition Foundation and visiting professor of chemistry at Columbia University.

William G. Luqueer, Raymond J. Carey, Carl Axel Bergman, Roy J. Ziegler, and **George Brownlee, Jr.,** are on leave of absence from the General Dyestuff Corp. for military service.

Charles G. Maier

Charles G. Maier, for nearly 20 years associated with the U. S. Bureau of Mines, has been named to the supervisory staff of the Battelle Memorial Institute, Columbus, Ohio, to direct and correlate an enlarged program of fundamental research.

Dean Edmund A. Schoeld has left Waldorf College, Forest City, Iowa, to take a position with the American Potash Co., Carlsbad, New Mex.

John L. Voth is now working for Basic Magnesium, Inc., Las Vegas, Nev., in the analytical chemistry department. Previously he was employed by the Sierra Magnesite Co.

Prestige

SEE OUR SCALE AND CORROSION CHAMBER OF

HORRORS

IN THE

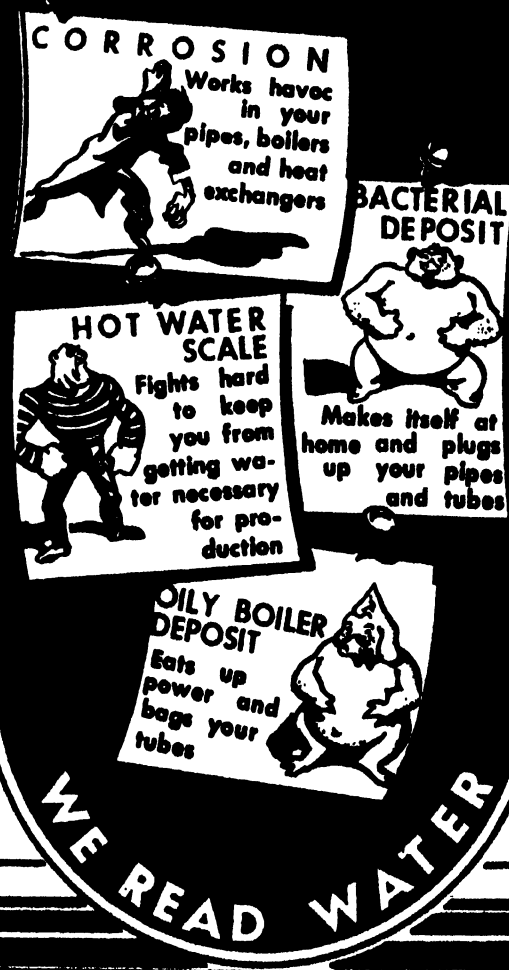
Sherman Hotel

SPACE NO. 50

NOV. 24 TO 29

This company was founded in 1930 on the idea of serving industry.

Our services definitely improve efficiency, increase production, add years to the life of equipment, and actually reduce operating costs.



Our growth is due to the accomplishment of these four services for industrial plants throughout the nation. Today we are serving eleven times the number of plants that we served four years ago. So we must be accomplishing results.

Scale, corrosion and living organisms are destructive forces that sap the efficiency of your factory before you realize it.

We don't claim to know your conditions or your needs. We have to make a survey, fill out forms and take samples for analysis before we can begin to talk factually about your problems and what to do about them. That's one reason we succeed . . . each job is tailored to its individual requirements.

We don't charge for this preliminary survey and analytical work. We can't . . . it's too fundamental to finding out what, if anything, we can do for you. So, we invite you to take advantage of one of our surveys and reports. We will do it personally or by mail depending upon where you are and which you prefer. This is one service we can provide and we are providing to help win the war.

You won't be obligated in any way by asking for our advice, and if we can help you, whether it takes our products or not, we will be happy. Our advisory service is a contribution we are proud to have available for your use right now. Use it freely.

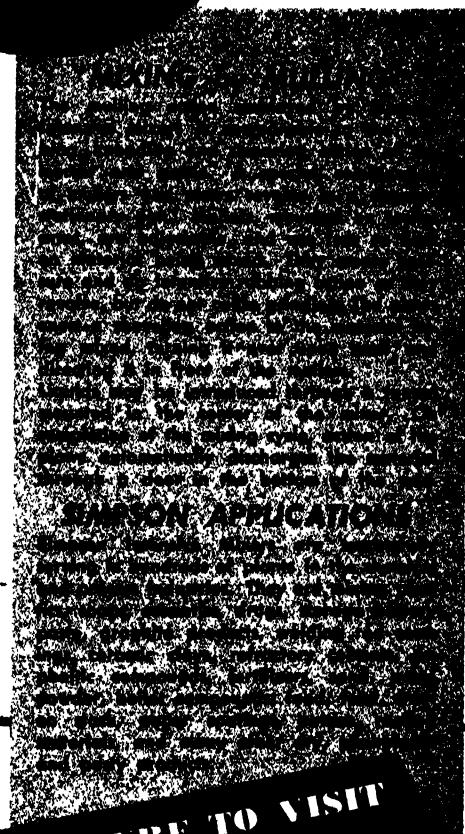
CHEMICAL AND ENGINEERING NEWS



VOLUME 20, NO. 21 • NOVEMBER 10, 1942

SIMPSON *Intensive Mixers*

Mix it... BETTER FASTER *for* LESS!

IN mixing operations on dry, semi-plastic and pasty materials, Simpson Intensive Mixers will provide greater uniformity . . . improve quality . . . reduce mixing time — and all at lower labor, power and maintenance costs. They handle batch capacities from 100 lbs. to 2 tons, with smaller models for laboratory and small production work. They may be equipped for processing materials where heating, cooling, pressure or vacuum is required. Simpson Intensive Mixers will do your mixing better, faster and at lower cost. Write for complete information and literature, or call a National engineer to help solve your mixing problems.

Here is a stainless steel 24" Laboratory model Simpson Mixer equipped for vacuum. Be sure to see it in operation at the show.

BE SURE TO VISIT BOOTH NO. 149 at the CHEMICAL SHOW CHICAGO — NOV. 24 to 29

SIMPSON

National Industrial Chemical Conference

The general subject of applied chemistry and chemical research, with particular emphasis on fields related to the war effort, will be featured in the 1942 Conference. The following program will high-light the discussions of the Conference.

PROGRAM

MEETINGS

WEDNESDAY, NOVEMBER 25 2–4 P.M.

"PLASTICS AND PAPER"

Presiding, NORMAN L. SHEPARD, Chemical Director, American Cyanamid Company, New York

"Raw Material Supplies for Plastics Manufacture"
By ARTHUR E. PETERSEN, Chief of Organic Plastics and Resins Section, Materials Division, Chemical Branch, War Production Board, Washington, D. C.

"Paper and Paper Materials"
By ALLEN ABRAMS, Vice-President in Charge of Research and Development, Marathon Paper Mills Company, Rothschild, Wisconsin.

THURSDAY, NOVEMBER 26 6:30 P.M.

Joint meeting of the National Industrial Chemical Conference and the Chicago Section of the American Chemical Society

Presiding, R. C. NEWTON, Vice-President, Swift & Co., Chicago

"The Electron Microscope in Relation to Chemical Research"
By V. K. Zworykin, Associate Director, Research Laboratories, RCA Manufacturing Company, Camden, New Jersey.

FRIDAY, NOVEMBER 27 2–5 P.M.

"FOOD AND THE RELATION OF FOOD TO THE CHEMISTRY OF PLANTS AND THE SOIL"

Presiding, C. G. KING, Scientific Director, The Nutrition Foundation, Inc., New York

"The Soil and Crop Basis of Better Nutrition"
By L. A. MAYNARD, Director, School of Nutrition and the United States Plant Soil and Nutrition Laboratory, Cornell University, Ithaca, New York.

"Soil Fertility and the Human Species"
By W. A. ALBRECHT, Chairman, Department of Soils, College of Agriculture, Columbia, Missouri.

"Food and Nutrition as Related to War"
By C. G. KING, Scientific Director, The Nutrition Foundation, Inc., New York, New York.

FRIDAY, NOVEMBER 27 8–9:15 P.M.

Presiding, VICTOR CONQUEST, Director of Research, Armour & Company, Chicago

"The Cyclotron and Its Uses in Research"
By P. GERALD KRUGER, Department of Physics, University of Illinois, Urbana, Illinois

SATURDAY, NOVEMBER 28 1:45–5 P.M.

"A SYMPOSIUM ON INDUSTRIAL WAR PROBLEMS"

Presiding, C. S. MINER, Director, Miner Laboratories, Chicago

"Control of War Time Incendiaries"
By WARD V. EVANS, Professor of Chemistry, Northwestern University, Evanston, Illinois.

"Waste Treatment in Industry as Related to War Economy"
By F. W. MOHLMAN, Director of Laboratories, Sanitary District of Chicago, Chicago, Illinois.

"The Salvage and Conservation of Chemicals in Industry"
By S. DONALD PERLMAN, Executive Chemical Director, Industrial Salvage Section, Conservation Division, War Production Board.

INDUSTRIAL MOVIES

A continuous program of industrial movies will be shown during the National Chemical Exposition as an educational feature.

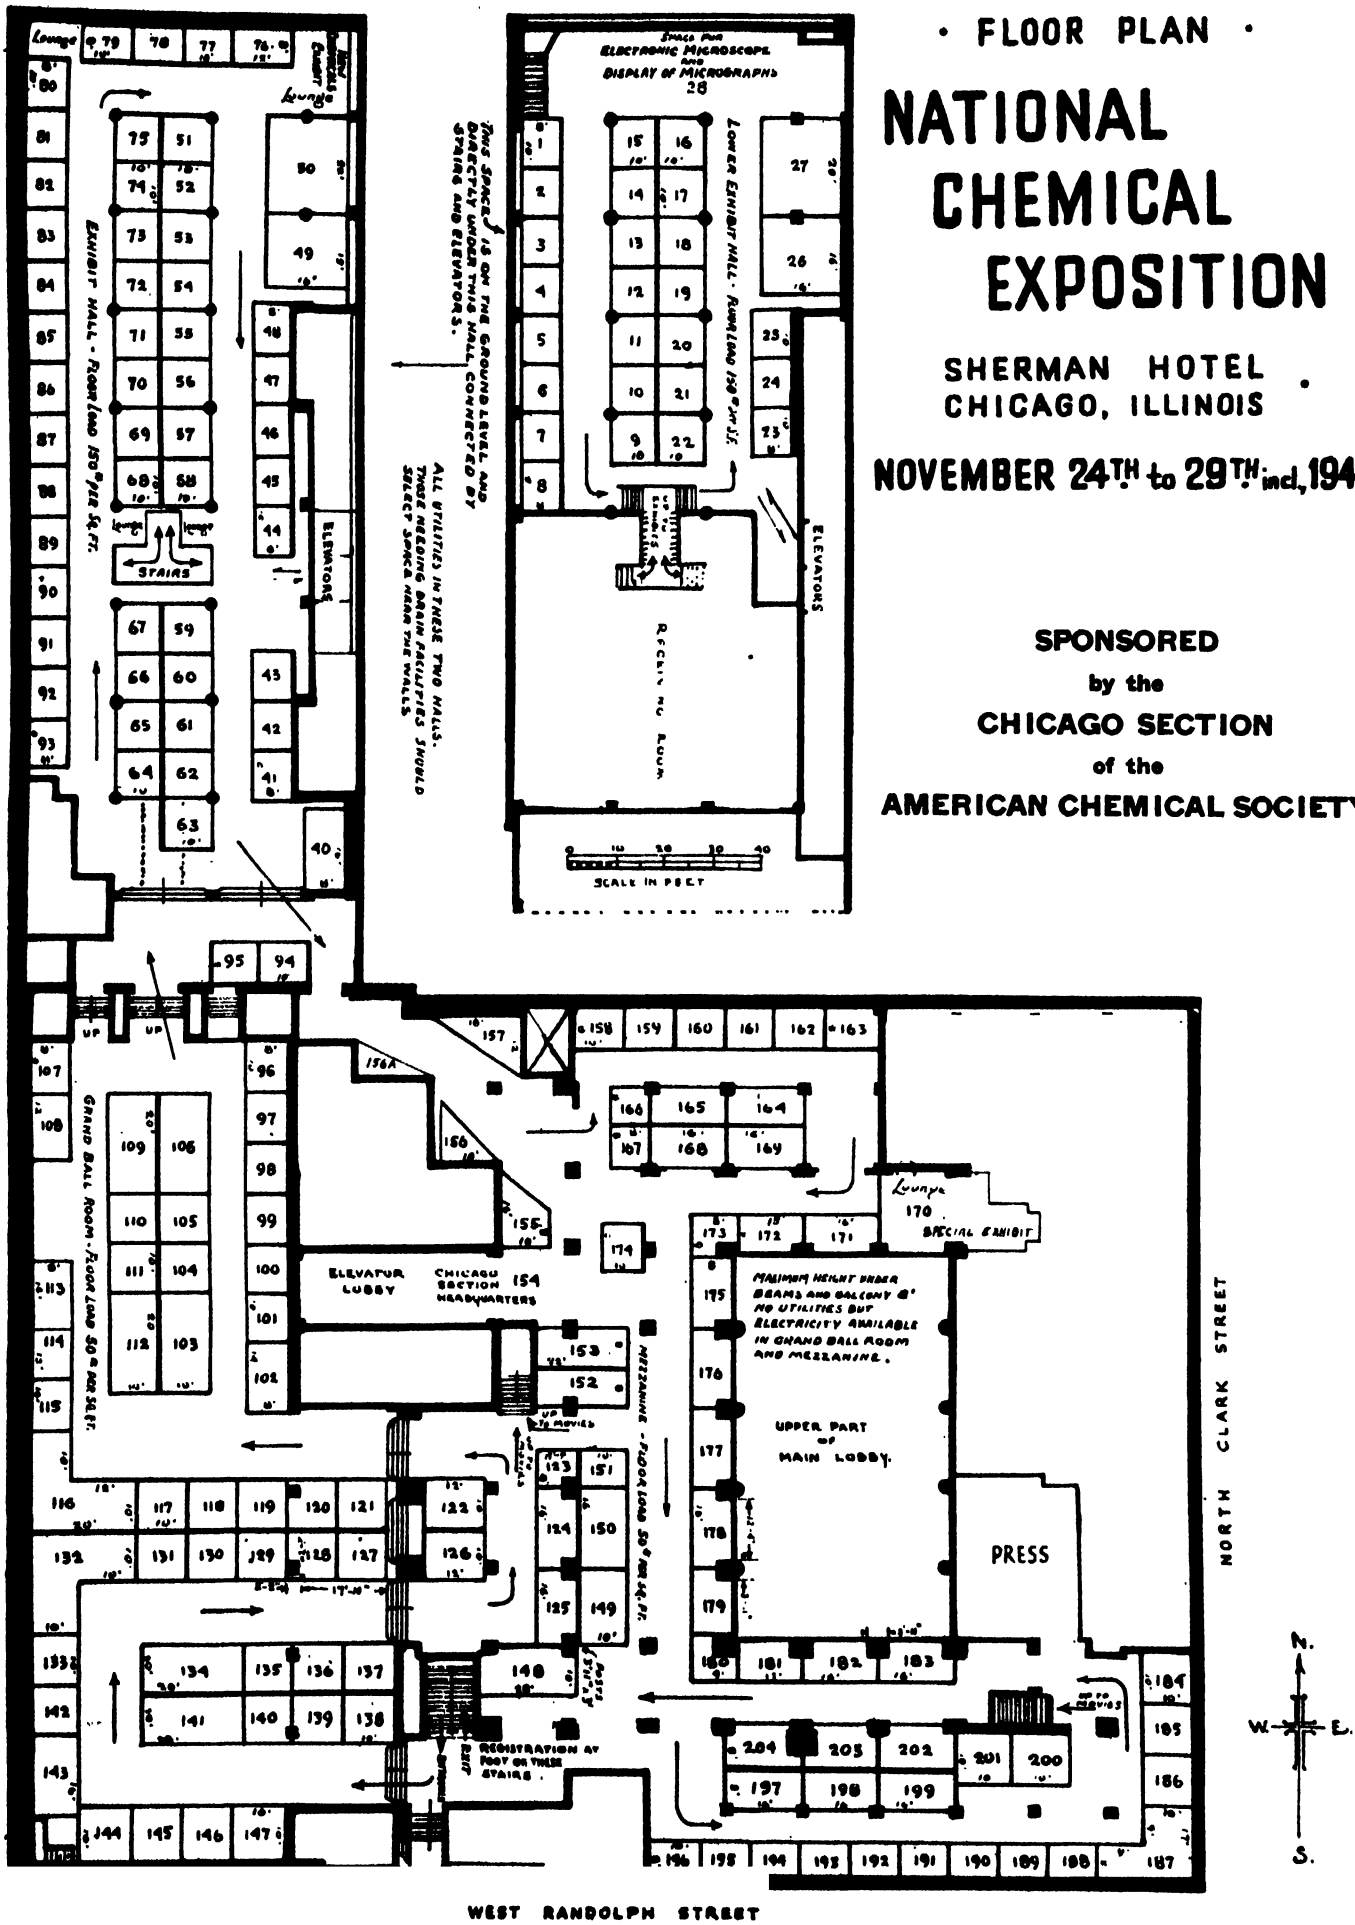
These movies will provide a liberal education in chemical processing. These films show interesting features in the manufacture of plastics, rayon, chemical stoneware, glass, bread, coke, white lead, canned foods, glass insulators, gelatin capsules, steel and aluminum, as well as miscellaneous subjects related to chemistry in the field of photography, natural resources and special plant construction.

SPECIAL EXHIBITS

The War Production Board (W.P.B.) is preparing a special exhibit to demonstrate the reclamation and recovery of solvents, paints, oils of all kinds, toluol and chemical by-products.

Mr. Clayton Grandy, Trade Association Director of the Industrial Salvage Section, Conservation Division, War Production Board, and Mr. S. Donald Perlman, Executive Chemical Director of the same section, are in charge of the preparation of this special exhibit.

The War Production Board is anxious that everyone concerned with industrial production see this special exhibit. More and more attention will have to be paid to salvage and conservation as the war continues. It is not likely to be long before there will be some degree of shortage of almost everything. It is an important subject and this exhibit will give everyone an excellent opportunity to learn the vital facts about it, and in the shortest possible time.



"Successful Alternates and Substitutes" will be the subject of an extensive exhibit now being prepared by Dr. Harrison E. Howe, editor of INDUSTRIAL AND ENGINEERING CHEMISTRY. This exhibit will show the old and the new. Dr. Howe will also have an exhibit showing "The Chemist's Part in Civilian Defense."

The "New Chemicals" exhibit by W. J. Murphy, editor of CHEMICAL INDUSTRIES takes on added significance at this time. Chemists from all over the nation will be carefully examining this display for chemicals to help them solve their emergency war problems.

LIST OF EXHIBITORS NATIONAL CHEMICAL EXPOSITION

The following list of exhibitors with their booth numbers was supplied by the management of the National Chemical Exposition, and is complete as of November 2nd.

	Booth No.
Ainsworth & Sons, Inc., Wm., 2151 Lawrence St., Denver, Colo.	58
Alloy Products Corp., 221 Madison St., Waukesha, Wis.	153
Alox Corporation, Buffalo Ave. & Iroquois St., Niagara Falls, N. Y.	194–195
American Heat Reclaiming Corp. (with F. M. deBeers & Assoc.)	125
American Instrument Co., Silver Spring, Md.	67
American Resinous Chemicals Corp., Peabody, Mass.	113
Ampco Metal, Inc., 1745 S. 38th St., Milwaukee, Wis.	99
Angel & Co., H. Reeve, 7–11 Spruce St., New York, N. Y.	120
Armour & Co., Chemical Division, 1355 W. 31st St., Chicago, Ill.	132
Atlas Powder Co., Wilmington, Delaware	107–108
Atlas Publishing Co., 133 W. 21st St., New York, N. Y.	53
Bareco Oil Co., Box 2009, Tulsa, Okla.	72
Bennett Mfg. Co., 14600 Princeton Avenue, Chicago, Ill.	98
Brabender Corporation, Rochelle Park, N. J.	174
Buffalo Foundry & Machine Co., Buffalo, N. Y.	143
Bump Pump Co., LaCrosse, Wisconsin	101
Campbell Co., The, Hammonton, N. J.	156
Central Scientific Co., 1700 Irving Park Road, Chicago, Ill.	178
Chemical Industries, 522 Fifth Avenue, New York, N. Y.	76–77
Chemical & Metallurgical Engineering, 330 W. 42nd St., New York, N. Y.	141
Chicago Pump Co., 2336 Wolfram St., Chicago, Ill.	110
Commercial Solvents Corp., Terre Haute, Ind.	150–151
Consolidated Products Co., Inc., 15 Park Row, New York.	182
Corn Products Refining Co., 17 Battery Place, New York.	51–52
Corning Glass Works, Corning, N. Y.	169
Croll Reynolds Co. (with F. M. deBeers & Associates)	125
Darco Corporation (with Atlas Powder Co.)	107–108
deBeers & Associates, F. M., 20 N. Wacker Drive, Chicago, Ill.	125
Denver Equipment Co., 1400—17th St., Denver, Colo.	131
Dicalite Co., The, 520 N. Michigan Avenue, Chicago, Ill.	168
Dorr Co., The, 570 Lexington Avenue, New York, N. Y.	89–90
Durametallic Corp., 2104 Factory St., Kalamazoo, Mich.	117–118
Eimer & Amend (with Fisher Scientific Co.)	115–116
Emery Carpenter Container Co., 3620 W. 38th St., Chicago, Ill.	173
Engelhard, Inc., Chas. (with Hanovia Chemical & Mfg. Co.)	59–60–61
Ertel Engineering Corp., 40 W. 48th St., New York, N. Y.	197
Eutectic Welding Alloys, Inc., 40 Worth Street, N. Y. C.	195–196
Fansteel Metallurgical, 2200 Sheridan Road, No. Chicago, Ill.	134
Federal Classifier Systems, 127 N. Dearborn St., Chicago, Ill.	164
Filter Paper Co., 57 E. 24th St., Chicago, Ill.	63
First Machinery Corp., E. 9th St. & East River Dr., New York, N. Y.	188
Fisher Scientific Co., 711–23 Forbes St., Pittsburgh, Pa.	115–116
Fitzpatrick Co., W. J., 111 N. Canal St., Chicago	177
Fletcher Works, Inc. (with F. M. deBeers & Associates)	125
General Ceramics Co., Keasbey, N. J.	80–81
Glycerine Producers Assn., c/o The Miner Laboratories, 9 S. Clinton St., Chicago, Ill.	157
Glyco Products Co., Inc., 230 King St., Brooklyn, N. Y.	62
Goslin-Birmingham Mfg. Co. (with F. M. deBeers & Associates)	125
Graver Tank & Mfg. Co., East Chicago, Ind.	104
Gump Co., B. F., 431–37 S. Clinton St., Chicago, Ill.	87–88
Haering & Co., D. W., 205 W. Wacker Drive, Chicago, Ill.	50
Hamilton Manufacturing Co., Two Rivers, Wisconsin	144–5–6–7
Hammond Drierite Co., W. A., Yellow Springs, Ohio	54
Hanovia Chemical & Mfg. Co., Chestnut St. & N. J. R. R. Avenue, Newark, N. J.	59–60–61
Hardinge Co., York, Pa.	82
Haveg Corp., Newark, Delaware	121
Hercules Powder Co., Wilmington, Delaware	129–130
Honan-Crane Corp., Lebanon, Ind.	181
Huppert Co., K. H., 152 W. Walton Place, Chicago, Ill.	97
Illinois Electric Porcelain Co., Macomb, Ill.	65
Industrial & Engineering Chemistry, 330 W. 42d St., New York, N. Y.	122–126
Industrial Instruments, Inc., 156 Culver Avenue, Jersey City, N. J.	92
Infilco, Inc. (Formerly International Filter Co.), 325 W. 25th Place, Chicago, Ill.	102
Insto-Gas Corp., 1900 E. Jefferson Avenue, Detroit, Mich.	56
Johns-Manville Corp., 22 E. 40th St., New York, N. Y.	83–84
Kewaunee Manufacturing Co., Adrian, Mich.	179–180
Kimble Glass Co., Vineland, N. J.	142
Kold-Hold Manufacturing Co., 424 N. Grand Ave., Lansing, Mich.	73
Koppers Co., Koppers Building, Pittsburgh, Pa.	68–69–70
Leader Iron Works, Inc., 2110 N. Jasper St., Decatur, Ill.	42
Lithgow Corporation, 333 W. 40th Place, Chicago, Ill.	155
Loeb Equipment Supply Co., 910–14 N. Marshfield Avenue, Chicago, Ill.	55
Ludlow-Saylor Wire Co., Newstead Avenue & Wabash R. R., St. Louis, Mo.	85–86
Lukens Steel Co., Coatesville, Pa.	136–7–8–9
Marathon Paper Mills Co., Rothschild, Wisconsin	96
McGraw-Hill Pub. Co., 330 W. 42nd St., New York, N. Y.	141

NATIONAL CHEMICAL EXPOSITION

SHERMAN HOTEL
CHICAGO, ILLINOIS

NOVEMBER 24TH to 29TH incl., 1942

SPONSORED
by the
CHICAGO SECTION
of the
AMERICAN CHEMICAL SOCIETY

A BRIGHT SPOT AT THE SHOW...

BOOTH 153

Where a construction demonstration will highlight the tremendous possibilities for flawless process piping with the new A-P-C Welding Fittings!

When A-P-C Stainless Steel Sanitary Fittings were first announced, it was news — and important news for the dairy, food and allied industries.

Todays *new* A-P-C Fabricated Welding Fittings are equally important to you and your process. A-P-C Welding Fittings are flawlessly formed into two identical halves — then welded together and ground smooth. They are made of stainless steel — sheet or plate — from any analysis.

For further details and a chance to see A-P-C Welding Fittings and the A-P-C Expanding Process — don't fail to come to Booth 153!*

** If you can't come to Chicago — don't miss out entirely — write us. We'll gladly send you the story in print.*

1942 NATIONAL CHEMICAL EXPOSITION NOVEMBER 21-29 1942 SHERMAN HOTEL CHICAGO

ALLOY PRODUCTS CORP.

WAUKESHA, WISCONSIN

Descriptions of Exhibits

The following descriptions of exhibits were supplied to our editors and include all information obtainable up to closing date, November 2.

William Ainsworth & Sons, Inc., 2151 Lawrence St., Denver, Colo. **Booth 58**

Alloy Products Corp., 221 Madison St., Waukesha, Wis. **Booth 153**

Stainless Steel, fabricated type, welding fittings. Carbon Steel, fabricated type, welding fittings. Stainless Steel, fabricated type, sanitary fittings. APC Automatic expanding equipment. These fabricated type welding fittings have both light and heavy walls. No castings whatsoever are used in the fabrication hence blowholes and porous spots are totally eliminated.

Alox Corp., Buffalo Ave. & Iroquois St., Niagara Falls, N. Y. **Booths 194-195**

On display will be a full line of oxygenated hydrocarbons. These products are made from waste petroleum materials by carefully controlled oxidation (the Burwell process) into alcohols, ketones, acids, etc., which may be used as the starting point for esters, metallic soaps, acid halides, organic sulfides, thio ether, etc., for use in the lubrication, medicinal soap, pharmaceutical, and similar industries. Featured will be certain polarized oils.

American Instrument Co., Silver Spring, Md. **Booth 67**

On exhibition will be Constant Temperature Baths in operation, which can be held at temperatures within plus or minus 0.005° C. by means of such auxiliaries as Aminco LoLag immersion heaters, time-tested thermoregulators, etc: Also a new, improved oven, constant in temperature to plus or minus 0.5° C. and with a uniformity throughout the working chamber of plus-minus 0.25° C. In addition will be apparatus for high temperatures and pressures and latest developments in field of catalytic hydrogenation.

American Resinous Chemicals Corp., Peabody, Mass. **Booth 113**

On display will be products manufactured from the new synthetics, Vulprene and Sulprene, derived from non-critical materials. Specimens will include insulated wire, extruded tubing and molded products. Industrial examples typifying the use of resinous emulsions as latex replacements for paper, leather, textile, rubber, and metal industries will also be stressed.

Ampco Metals, Inc., 1745 E. 38th St., Milwaukee, Wis. **Booth 99**

On exhibit will be castings of Ampco metal used in acid and corrosion resistant service such as chains in pickling service, valves, etc. Extruded aluminum bronze heavy wall tubing will also be displayed as well as Ampco-Trode coated aluminum bronze welding rods and samples of welds.

H. Reeve Angel & Co., Inc., 7-11 Spruce St., New York, N. Y. **Booth 120**

On exhibit will be various types of filter papers for industrial and research laboratory use. Especially featured will be the Whatman chemically prepared filter papers and the Reeve Angel American filter papers.

Armour and Co., Chemical Div., 1355 W. 31st St., Chicago, Ill. **Booth 132**

New chemicals and fatty acids applicable and suitable to the war effort and their place in shaping things to come. Included, among others, will be Amines—octadecyl, octadecenyl, octadecadienyl, hexadecyl, tetradecyl, dodecyl, decyl, octyl, di-n-octadecyl, di-n-hexadecyl, di-n-tetradecyl, di-n-dodecyl, etc. Nitriles—octadecane, octadecene, octadecadiene, hexadecane, tetradecane, dodecane, decane, and octane; also 9-27-pentatriacontadien-18-one, 14-heptacosanone, 8-pentadecanone, and others. Fatty acids included will be stearic, oleic, palmitic, myristic, lauric, capric, caprylic, and unsaturated acids of the clupanodonic series. Also, glycerides containing high proportions of conjugated double bonds, cottonseed pitch, and marine pitch.

Atlas Powder Co., Wilmington, Del. **Booths 107-108**

New products and new techniques of use will be shown, important today for war, interesting for tomorrow's new world: Finishes for government specifications; partial fatty acid ester emulsifiers, wetting agents and dispersing agents; hexitols, hexamides and hexitans for synthesis; resin coated fabrics for military use; activated carbons for purification of liquids.

Atlas Publishing Co., 133 W. 21st St., New York, N. Y. **Booth 53**

Publications

Bareco Oil Co., Box 2009, Tulsa, Okla. **Booth 72**

On display will be the complete line of Be Square Special Waxes. These compounds are high melting point, microcrystalline petroleum waxes which, while not new, are finding many new uses in industry due to the lack of waxes ordinarily used. These materials are now being supplied to the armed forces and many war industries.

Bennett Mfg. Co., 14600 Princeton Ave., Chicago, Ill. **Booth 98**

Brabender Corp., Rochelle Park, N. J. **Booth 174**

Three Recording Viscosimeters will be shown: The Plastograph, for heavy, pliable material under controlled temperature conditions; the Viscograph, to record viscosities at increasing temperatures with the temperature increases fully automatic and at a constant rate; the Recording Viscosimeter, an inexpensive but highly versatile recording instrument with different speeds, paddles, and measuring springs. Also there will be shown a Moisture Tester, semi-automatic.

Buffalo Foundry & Machine Co., Buffalo, N. Y. **Booth 143**

Emphasis will be placed on the Research and Testing Plant Facili-

ties of this Company. Because of size limitations and scarcity of materials, photographs and drawings will constitute the main exhibit.

Bump Pump Co., LaCrosse, Wis. **Booth 101**

The Campbell Co., Hammonton, N. J. **Booth 156**

The Caulfield Pipettor permits the pipetting of fluids without the use of the mouth, avoiding accidents and contamination. A rubber bulb equipped with a special valve and very sensitive control permits the ingress of liquid. Measuring off is accurate to less than 1/100 of a c.c.

Central Scientific Co., 1700 Irving Park Rd., Chicago, Ill. **Booth 178**

Featured will be: A Waring Blendor in which metal has been replaced with plastic, providing better insulation and cooling; a Cenco cylindrical oven in which copper and steel have taken the place of aluminum without detriment to the performance or appearance; A Cenco-Cooley "Indexer" Furnace which has a rotating hearth for easy removal of crucibles or dishes; a Buechner Funnel for large volume filtrations; Corning new, low-actinic glassware; Cenco absorption cells made of "Pyrex," with fused windows ground and polished flat to within a few wavelengths.

Chemical Industries, 522 Fifth Ave., New York, N. Y. **Booths 76-77**

A series of New Chemicals for Industries.

Chemical and Metallurgical Engineering, 330 West 42nd St., New York, N. Y. **Booth 141**

Publications.

Chicago Pump Co., 2336 Wolfram St., Chicago, Ill. **Booth 110**

Featured will be a working model of a specialized unit for mixing and agitating. Photographic panels of various types of this equipment and pumps for service in the chemical industries will be displayed.

Commercial Solvents Corp., Terre Haute, Ind. **Booths 150-151**

Featured will be "New Chemicals at Work." The display will consist entirely of items which require one of the nitroparaffins for their manufacture—new types of waterproofing textiles, grinding and polishing assistants, dry cleaning soaps, new types of lacquers and dopes, textile dyes, synthetic rubber products and dozens of other materials. Introduced only a little over two years ago, the Nitroparaffins are already serving practically every type of industry.

Consolidated Products Co., Inc., 15 Park Row, New York, N. Y. **Booth 182**

Corn Products Refining Co., 17 Battery Place, New York, N. Y. **Booths 51-52**

Due to present conditions no products will be on display. However, there will be an exhibit of materials made from these products, and a comfortable place to sit and discuss problems.

Corning Glass Works, Corning, N. Y. **Booth 169**

A complete line of laboratory and industrial glassware, showing how glass conserves vital materials. Featured will be: Nash Centrifugal Pump with "Pyrex" glass parts, in operation (widely used in chemical, food and beverage, paper and pulp, textile and steel industries); "Pyrex" glass piping in a variety of sizes, with fittings; a modified Soxhlet design "Pyrex" extraction apparatus in operation, especially adaptable for extracting large volumes of materials.

F. M. deBeers & Associates, 20 N. Wacker Drive, Chicago, Ill. **Booth 125**

On exhibit will be equipment from Goslin-Birmingham Co., Fletcher Works, Inc., American Heat Reclaiming Corp., and Croll-Reynolds Engineering Co. Featured will be a cut-away model of spiral heat exchanger, a heavy duty centrifugal, a steam jet unit made of Synthane, Flexo disc expansion joints for high temperature and pressure work, and a Conkey dewaterer.

Denver Equipment Co., 1400—17th St., Denver, Colo. **Booth 131**

An interesting display case will be exhibited showing the importance of the flotation process in removing the outer, bitter hulls around a grain of wheat and its importance to the food industry for increasing the vitamin content of bread. Flowsheets of metallurgical plants showing the actual products produced, will also be used.

The Dicalite Co., 520 N. Michigan Ave., Chicago, Ill. **Booth 168**

There will be a complete specimen display of all Dicalite products. In addition, specimens of actual products in which Dicalite is used as an ingredient or which have been clarified with Dicalite Filteraids will be shown. This will demonstrate how Dicalite replaces critical materials in part or whole, or how it extends supplies of these materials.

The Dorr Co., Inc., 570 Lexington Ave., New York, N. Y. **Booths 89-90**

The central theme of this exhibit will be a summary of the work being done by the Dorr Co. in processing of essential metals for the war effort, based on the three basic Dorr operations of agitation, classification and sedimentation. A secondary theme will be the critical materials substitution in Dorr equipment, shown by means of colored working drawings. The Dorr Hydro-Treator, a self-contained water treatment unit, will also be featured.

Durametallic Corp., 2104 Factory St., Kalamazoo, Mich. **Booths 117-118**

DURA SEAL—A Mechanical Seal that rotates with the shaft.

DURA PRESSURE UNIT—for circulating lubricating oil at uniform pressure.

DURAMETALLIC—A flexible twisted metallic packing.

DURA PLASTIC—A plastic semi-metallic packing.

DURA HOOKS—A flexible handled packing puller.

Emery - Carpenter Container Co., 3620 W. 38th St., Chicago, Ill. **Booth 173**

Charles Engelhard, Inc., Newark, N. J. **Booths 59-61**

This exhibit is part of that of Hanovia Chemical & Mfg. Co. Indicating and Recording Pyrometers, Flualyzers and Gasalysers will be featured.

The Problem — —

One of Today's Vital Needs Is to Extend Supplies of Rubber and Latex

One Solution —

Resin and Lacquer Emulsions

—Developed to meet the need for *Substitutes*, *Extenders* and *Modifiers* for LATEX

VULPRENES—Solid Extenders and Substitutes

—for CRUDE, RECLAIMED and SYNTHETIC RUBBER

Resin and Lacquer Emulsions have been finding an ever-widening use in many industries. They have proved invaluable in replacing other materials in adhesives, modifiers, binders and fillers, grease proofing, waterproofing, sizing, impregnating, coating, color dispersions and innumerable other uses.

In the Rubber Industry these emulsions are being used today as *Latex Modifiers* and *Complete Latex Replacements* to extend, thicken, stabilize, increase penetration, improve resistance to acids, oils and solvents; in *Coatings* to produce adherent pigmented or clear coatings on paper, fabric, and rubber and as intermediate coats for lacquer on rubberized cloth; in *Rubberizing* textiles; in *Latex Treated Papers* to increase strength and improve ageing; in *Adhesives*, for paper, for leather to cloth, and cloth to cloth.

These are just a few of the known applications in the rubber field. Undoubtedly in your own plant you will find many uses for these emulsions to improve your products and extend the supply of the vital materials, LATEX, RECLAIMS, and SYNTHETICS.

Our Technical Staff Will Be Glad to Help You Solve Your Problems...

Write Today for Any Additional Information You May Require on our Products...

A few of Our Products of Interest to the Rubber Industry

VULPRENES A series of polymers designed to replace rubber for insulation, coatings, and moldings where the extreme flexibility, tensile strength, and abrasion resistance of rubber are not required. Available in a wide variety of modifications for individual requirements.

ALKYD 18 An alkyd type resin emulsion which is non-yellowing and non-oxidising. Film is water-white and non-tacky. Preferred where slight oxidising action may be considered harmful to rubber. Extender for latex in coating, combining and impregnating processes.

EMULSION 58-8 A series of emulsified elastomers containing up to 65% solids. Recommended for use as full latex replacements in impregnation and combining.

PIGMENT BASES Concentrated aqueous dispersions of pigments in resin bases, available in all shades and viscosities, suitable for spreading, spraying, etc.

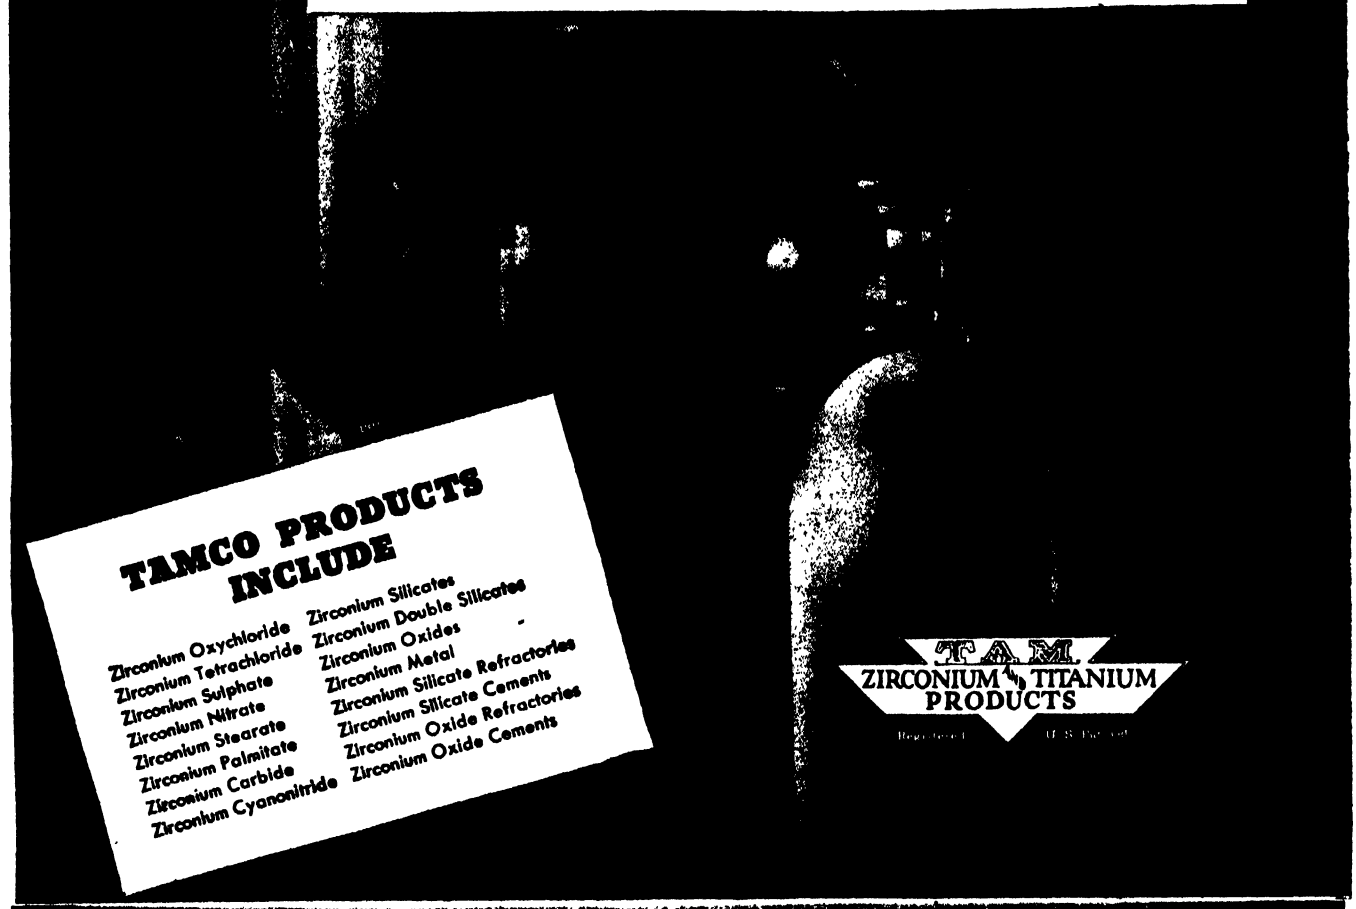
Also Acrylic, Vinyl, Maleic, Phenolic, Hydrocarbon, Ethyl Cellulose, Cellulose Acetate and Nitrate emulsions and solutions for various applications.

AMERICAN RESINOUS CHEMICALS CORPORATION

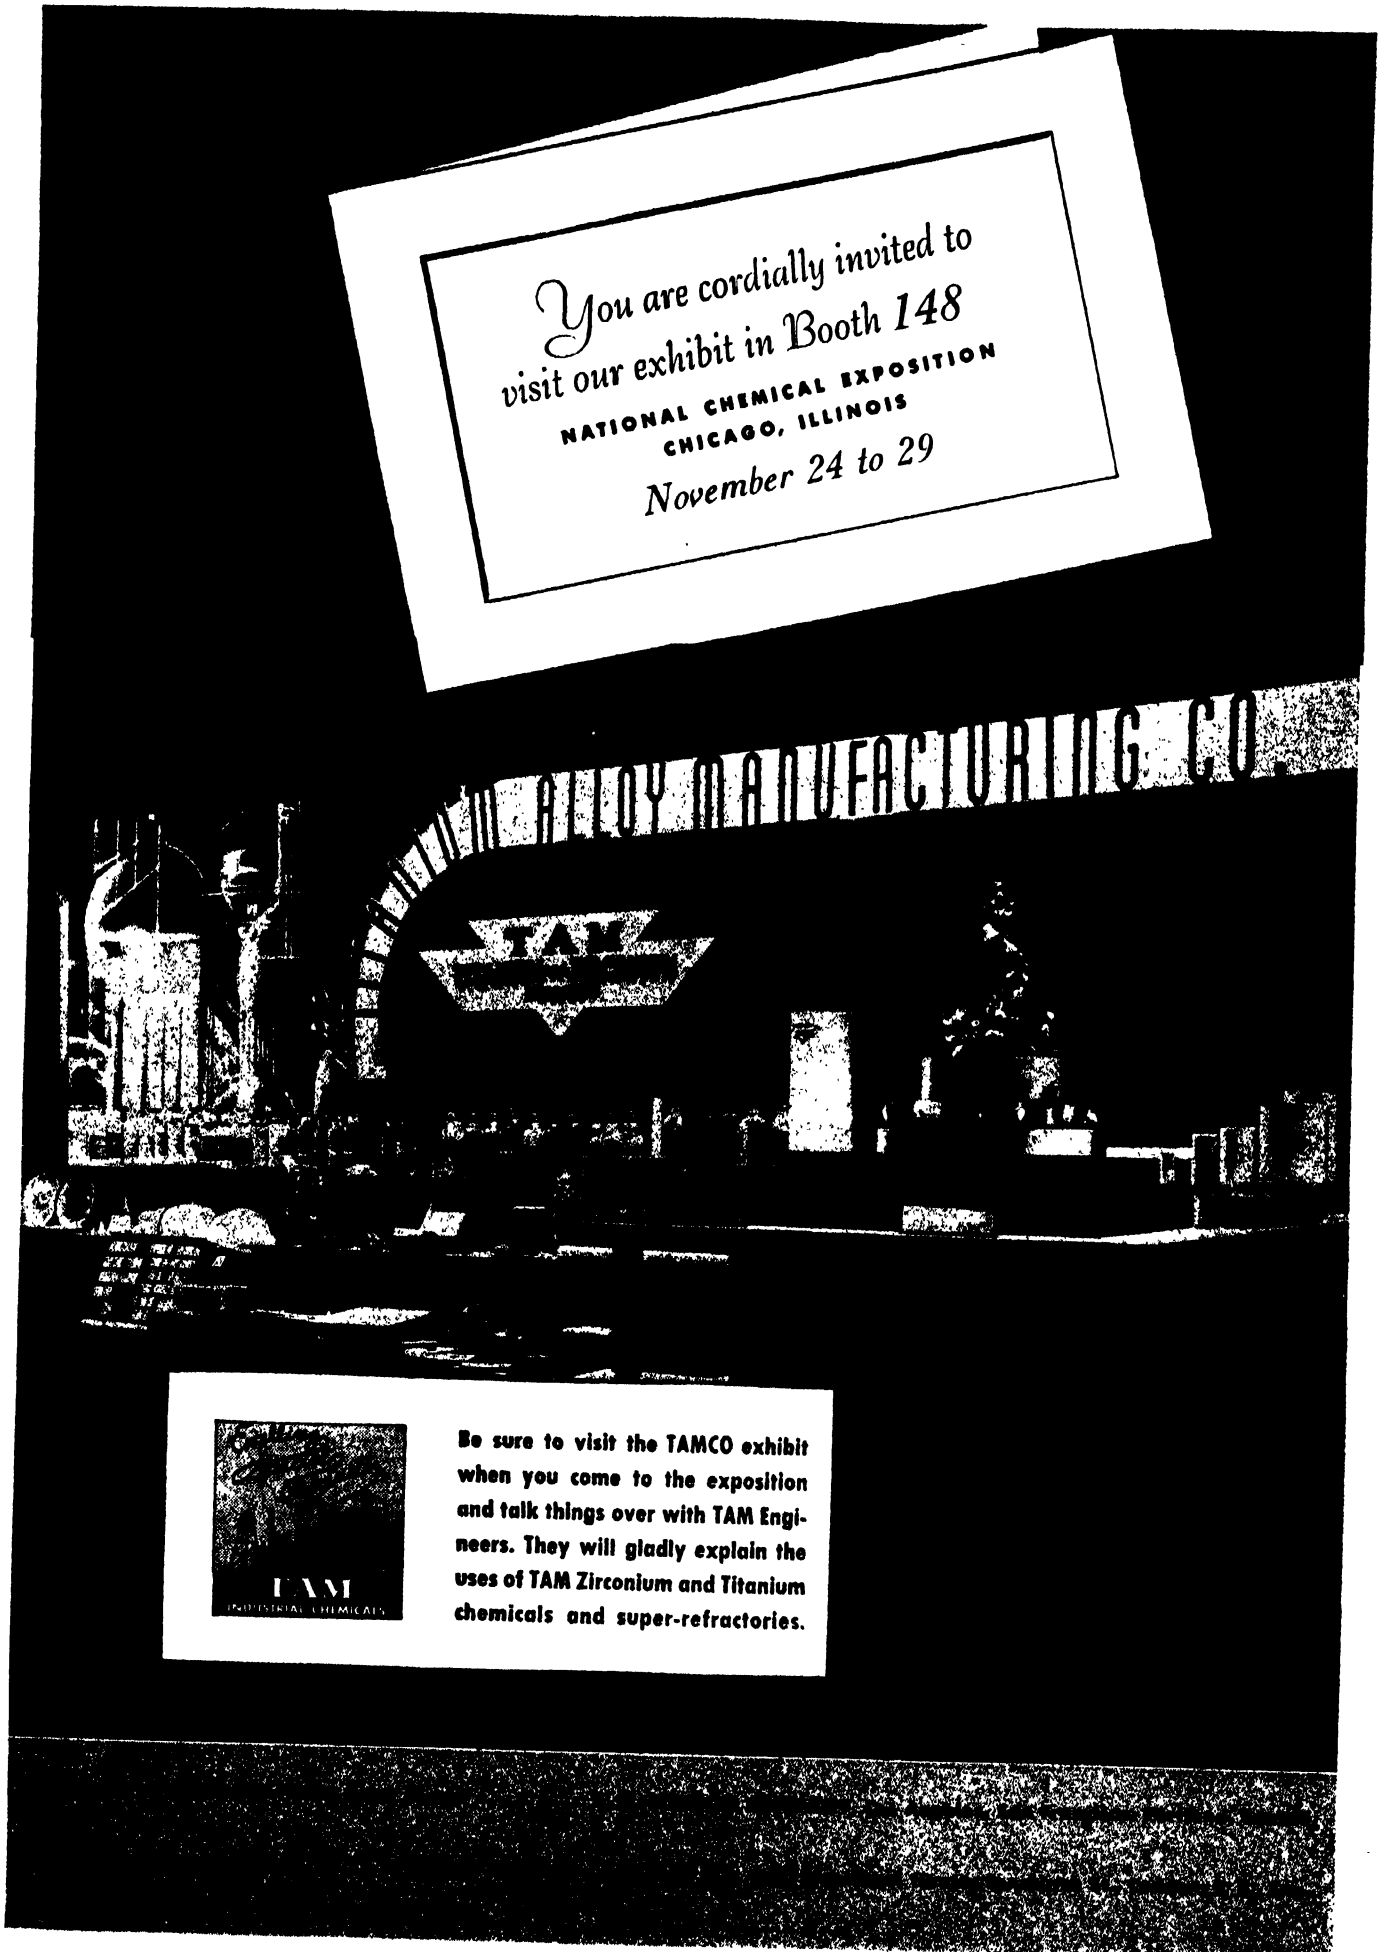
Coatings • Rubber Synthetics • Resin, Wax, Lacquer Emulsions

MAIN OFFICE and LABORATORIES

PEABODY, MASS.



Factory Branches: Newark, N. J., and Chicago, Ill.



ZIRCONIUM
in industry

Today, Defense and non-defense manufacturing has emphasized the ever-increasing uses and possibilities of the element ZIRCONIUM and its compounds in industry. TAMCO Zirconium compounds are being used successfully in the manufacture of Refractories, Electrical Resistors, Resins, Dye Extenders, Water Repellents, Catalysts, Abrasives, and Ceramics.

TAMCO'S development engineers and research laboratories have long been cooperating with the industry. Write today, for a TAM resident field engineer to call at your plant and discuss the potential use of Zirconium Compounds with you.

TITANIUM
ALLOY MANUFACTURING COMPANY

You are cordially invited to
visit our exhibit in Booth 148
NATIONAL CHEMICAL EXPOSITION
CHICAGO, ILLINOIS
November 24 to 29
TAM
Be sure to visit the TAMCO exhibit when you come to the exposition and talk things over with TAM Engineers. They will gladly explain the uses of TAM Zirconium and Titanium chemicals and super-refractories.

Ertel Engineering Corp., 40 W. 48th St., New York, N. Y. Booth 197

In general there will be on display equipment for the process industries. Particularly featured will be the hard rubber filter and acid-resistant pump made by this company, self priming and suitable for liquids up to 200° F.

Eutectic Welding Alloys, Inc., 40 Worth St., New York, N. Y. Booths 195-196

Castolin Eutectic Alloys will be demonstrated, showing their advantages in production welding and the reclamation of equipment. The process used allows low temperatures, combined with high tensile strength and is applicable to steel of all compositions, cast iron, malleable iron and non-ferrous metals. This process is valuable for salvage work and maintenance.

Fansteel Metallurgical Corp., 2200 Sheridan Rd., N. Chicago, Ill. Booth 134

Featured will be a plant for the production of anhydrous hydrogen chloride. Models, charts and photographs will describe HCl absorption systems, anhydrous HCl plants, gas coolers for chlorine, heat exchangers for corrosive equipment and Tantalum parts for chemical plant use.

Federal Classifier Systems, Inc., 127 N. Dearborn St., Chicago, Ill. Booth 164

On display and in action will be laboratory air classifying units that serve to separate finely ground material according to particle size. Also a semi-commercial battery operating under positive pressure and adapted to chemicals, plastics plus various powdered metals of any density.

The Filter Paper Co., 57 E. 24th St., Chicago, Ill. Booth 63

On display will be a complete line of filter papers, asbestos filter pads and fibre, filter aids, cloth and quartz, laboratory filter presses, pumps and motors, stainless steel and glass-lined tanks, Filco easy ride conveyors, and similar material. The strategic position of filter media and equipment will be featured.

First Machinery Corp., East 9th St. & East River Drive, New York, N. Y. Booth 188

A full line of second hand machinery and chemical equipment for the industries will be outlined with posters and literature.

Fisher Scientific Co. & Eimer and Amend, 711-23 Forbes St., Pittsburgh, Pa.; 633 Greenwich St., New York, N. Y. Booths 115-116

Here is a combination exhibit of apparatus and chemicals. The Fisher Scientific Company will show recent developments in instruments and apparatus for laboratory and research work, particularly for the industrial plant. The Eimer and Amend Company will have on display a full line of Tested Purity Reagents.

W. J. Fitzpatrick Co., 111 N. Canal St., Chicago, Ill. Booth 177

Models exhibited will be of completely new design, two of them especially developed for war work. On display will be a Model D Comminuting Machine in three models and a Model A Triturating Machine in a single model.

General Ceramics Co., Keasbey, N. J. Booths 80-81

Featured will be corrosion-proof ceramic equipment for the chemical industries, of standard design, for many purposes outside of the strictly chemical field. Stoneware pumps, valves, piping and containers will constitute most of the exhibit. Also on display will be a new porous diaphragm of ceramic ware for electrochemical operations.

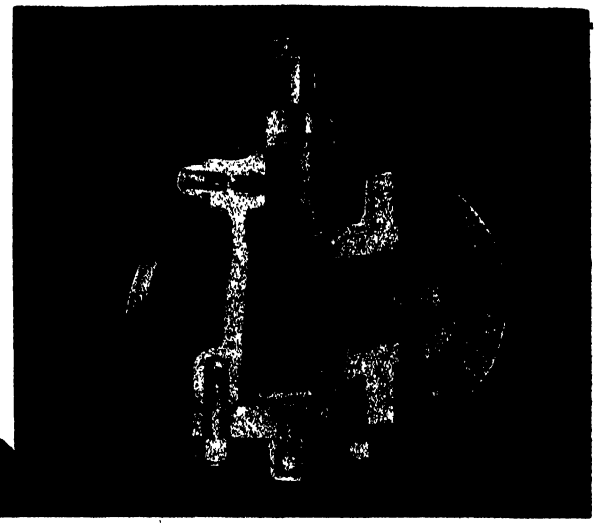
Glycerin Producers Assn., c/o Miner Laboratories, 9 S. Clinton St., Chicago, Ill. Booth 157

With the approval of the government, glycerine will be on display. No active promotion will be attempted due to the restriction on glycerine sales.

Glyco Products Co., Inc., 234 King St., Brooklyn, N. Y. Booth 62

Featured will be a number of esters of various Polyhydric Alco-

Let's talk "Turkey" about NORDSTROM valves



You've probably seen hundreds of Nordstrom Valves in various chemical plants — yet you yourself may never have tried them. We claim without reservation that Nordstrom Valves will cost you less to operate than any other type of valve you have ever used. We claim that they are easiest to operate, most fool-proof in construction, most compact in design. Because they are lubricated with "Sealdport" lubrication they most effectively guard against corrosion, erosion, etc. For such extreme conditions and for high temperatures we recommend our Merchrome Coated valves. Ask for further details.

MERCO NORDSTROM VALVE COMPANY

A Subsidiary of Pittsburgh Equitable Meter Co.

Main Offices: Pittsburgh, Pa. Branches in principal cities.

KEEP UPKEEP DOWN

hols which are suggested as plasticizers, synthetic waxes, emulsifying agents, softeners, etc. Also on display will be new chemicals to meet the requirements and problems of the war industries and products made from available raw materials to be used as substitutes for materials no longer available.

Graver Tank & Mfg. Co., East Chicago, Ind. **Booth 104**

On display will be the Graver Remote Control Chemical Proportioner, with diagrammatic drawings showing the application of this unit to water treating plants. Various installation photographs covering water conditioning equipment will also be displayed. Featured will be a Proportioner which provides accurate feeding of chemicals in proportion to the volume of water being treated.

B. F. Gump Co., 431-437 S. Clinton St., Chicago, Ill. **Booths 87-88**

On exhibit will be full sized models of Bar-Nun rotary sifters, Draver Feeders and continuous mixing systems, Bar-Nun "Auto-Check" net weighers and Vibrox Barrel packers. These units will be ready for operation, to show their uses in grinding, sifting, mixing, weighing and packaging dry, powdered or granular products.

D. W. Haering & Co., 205 W. Wacker Drive, Chicago, Ill. **Booth 50**

A complete exhibit of scale and corrosion specimens will be featured as a "Chamber of Horrors" including many charts and diagrams relating to this control. An operating model cooling system and a model proportioning installation will also be displayed as well as chemical pumps, and water treatment chemicals.

Hamilton Manufacturing Co., Two Rivers, Wis. **Booths 144-147**

On exhibit will be an assembly of various items of furniture for the industrial laboratory such as a fume hood, storage cases, titration tables, work tables and sinks. Also a line of Victory Filing units of wooden construction.

W. A. Hammond Drierite Co., Yellow Springs, Ohio **Booth 54**

This industrial dehydrating agent will be shown in regular, DuCal, Indicating and molded forms. Particular emphasis will be placed on the use of this material in defense and war industries. Also shown will be a Flosdorf-Mudd Cryochem apparatus widely used in the dehydration of serums from the frozen state.

Hanovia Chemical & Mfg. Co., Chestnut St. & N. J. R.R. Ave., Newark, N. J. **Booths 59-61**

A comprehensive display of ultraviolet ray lamps in many sizes and capacities as used in industrial plants. Illustrated will be the ultraviolet water sterilizer apparatus for formation of vitamin D from sterols and equipment for polymerization and halogenation processes, such as the chlorination of synthetic rubber, acrylic acid, acetic acid and mineral wax. Fused quartzware of many shapes will also be featured.

Hardinge Co., York, Pa. **Booth 82**

This exhibit will be based on the major products manufactured, such as cone mills, rod, tube and batch mills, the Hardinge "Feedometer," classifiers, dryers, thickeners, and similar equipment for the process industries.

Republic **HOMOGENEOUS LEAD COATINGS**

are:

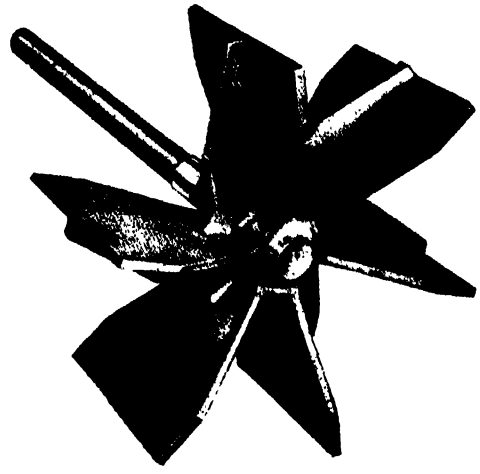
INSEPARABLE FROM THE BASE METAL

•

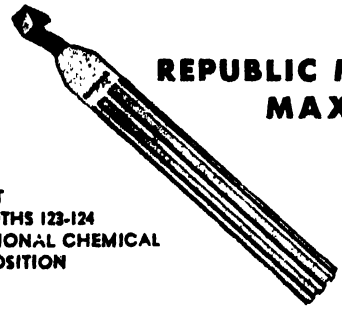
TIN FREE

•

DENSE—NON-POROUS



99.97% PURE



Even the sharp edge of a chisel cannot separate a Republic homogeneous lead coating from its steel base. Republic's exclusive "tin-free", non-metallic flux permits bonding lead to steel with a bond virtually inseparable — comparable to Class 2 A.S.M.E. Welding. Republic homogeneous coatings expand and contract with the base metal — no embrittlement . . . no cracking . . . no buckling.

Republic's exclusive process results in a lead coating of unrivalled purity (99.97% pure) plus a dense, non-porous structure which prevents "pin-hole" rusting through the pores of the lead.

Write for new Bulletin No. 1700, today.

REPUBLIC MULTI-EDGE ANODES PROVIDE MAXIMUM THROWING POWER

The efficiency of a lead anode is in direct proportion to the number of its throwing edges. Republic's 10-cornered lead anode gives maximum throwing power, and hence, greatest plating efficiency. Hooks are made to specification and are burned into the anodes by the exclusive Schlundt process.

VISIT
BOOTHS 123-124
NATIONAL CHEMICAL
EXPOSITION

REPUBLIC LEAD EQUIPMENT CO.

JONES ROAD • CLEVELAND, OHIO

A UNIT OF THE UNITED STATES STONEWARE CO.

Two Ways to Find SUBSTITUTES for *hard-to-get* materials!

A few classifications of Glyco Products and some of the industries that use them:

Products

Polyhydric Alcohol Esters	Special Emulsions
Defoaming Agents	Synthetic Waxes
Deodorizers	Preservatives
Emulsifying Agents	Synthetic Resins
Plasticizers and Flexibilizers	Wetting and Foaming Agents

Industries

Abrasives	Oils
Adhesives	Paper
Cements	Pigments
Ceramics	Polishes
Coatings	Rubber
Leather	Textiles
Lubrication	Soaps and Cleaners

1. If you plan to come to the National Chemical Exposition in Chicago, be sure to visit our booth. Here you will find complete information on replacements available in regular commercial quantities for such products as:

Glycerin	Dibutyl Phthalate
Beeswax	Carnauba Wax
Montan Wax	Aluminum Stearate (Technical)
Japan Wax	Olive Oil (Technical)
Ozokerite	Vegetable Gums (For thickening)

Industrial chemists from our laboratories will be in attendance to discuss your specific problems. Glyco Products have proven themselves a dependable source to scores of manufacturers and chemists who have been looking for substitutes for *hard-to-get* materials. Also on display at the booth will be Glyco's regular products: emulsifying agents, polyhydric alcohol esters, synthetic waxes, etc. . . . they have helped many people — maybe they can help you.

2. If you are unable to attend the show, write today for your free copy of our new catalog. It contains many formulae, new ideas, and complete information on a wide selection of synthetic materials. Our laboratories are always available to people who are looking for replacements of hard-to-get materials or who have specific problems in which Glyco Products may be of service. May we hear from you?

CHEMICALS BY GLYCO

GLYCO PRODUCTS CO., INC.

248 KING STREET BROOKLYN, N. Y.

Haveg Corp., Newark, Del. **Booth 121**

Featured will be typical examples of the wide range of applications which have been developed to substitute Plastics for critical materials of construction. New plastics are available for strong acid and caustic processes. Also featured will be the important, new Haveg-Saran pipe and tubing.

Hercules Powder Co., Wilmington, Del. **Booths 129-130**

A report on the latest news on available chemicals for industry will be given. Major focus will be on war-important uses and the choice of materials to meet them. Several new products, among them Dresinate, Hercules chlorinated paraffin, and hydroabietyl alcohol, will also be presented.

Honan - Crane Co., Lebanon, Ind. **Booth 181**

K. H. Huppert Co., 152-156 W. Walton Place, Chicago, Ill. **Booth 97**

On exhibit will be electric furnaces for production and laboratory use. This display will consist of units covering a multiple range of temperatures and sizes. Included will be automatic and manual temperature control equipment.

Illinois Electric Porcelain Co., Macomb, Ill. **Booth 65**

Featured will be the use of porcelain pipe and fittings to replace strategic materials in process industries today. There will be on display samples of high grade wet porcelain piping, with fittings, flanges, valves, which form a complete, corrosion and resisting unit.

Industrial and Engineering Chemistry, 330 West 42nd St., New York, N. Y. **Booths 122-126**

Publications of the American Chemical Society.

Industrial Instruments, Inc., 156 Culvert Ave., Jersey City, N. J. **Booth 92**

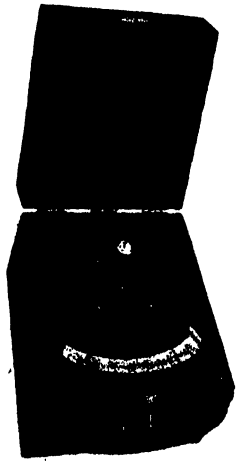
A complete line of conductivity apparatus for laboratory and plant test and control will be exhibited. Also on display will be Limit Bridges, conventional Wheatstone Bridge, Resistance and Capacitance Decade Boxes, Megohm Bridge and Voltage Breakdown Testers—equipment adapted from laboratory technique for use in general industrial practice.

Infilco, Inc., 325 W. 25th Place, Chicago, Ill. **Booth 102**

On exhibit will be the Accelator, Cation and Anion Exchangers, Gel Catalysts, Silica Gels and Zeolites. Featured will be an example of solids precipitation from process industry liquids by the Accelator process; production of "distilled water" without distillation, by the Catanexer and new uses for silica gel and gel catalysts.

Insto - Gas Corp., 1900 E. Jefferson Ave., Detroit, Mich. **Booth 56**

The famous trade character "Gassy Gus" will assist in showing the instant lighting and safety features of Insto-Gas torches and furnaces and their many uses for the chemical factory maintenance. Various types and sizes of torches and metal melting furnaces will be on display, particularly the No. 1-A lead welding torch.



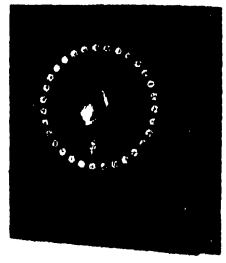
PRECISION
SIMPLICITY
DEPENDABILITY

3 "MUSTS" in your instrumentation purchases for war-time production!

All three are an integral part of your purchase when you buy "Engelhard" Industrial Precision Instruments. For these qualities and many new and special features are "built in" by skilled workmen who have spent their lives on precision instrument work. *Simplicity* has been achieved only through careful and extended tests. *Precision* and *dependability* — under the most severe service conditions — result from the fine tolerances required in Engelhard construction and in close attention to even the most minute details.

Manufacturers of Precision Instruments for Over 40 Years!

Indicating and Recording Pyrometers
Automatic Temperature Control



Industrial, Automotive and Fuel Gas Analyzers

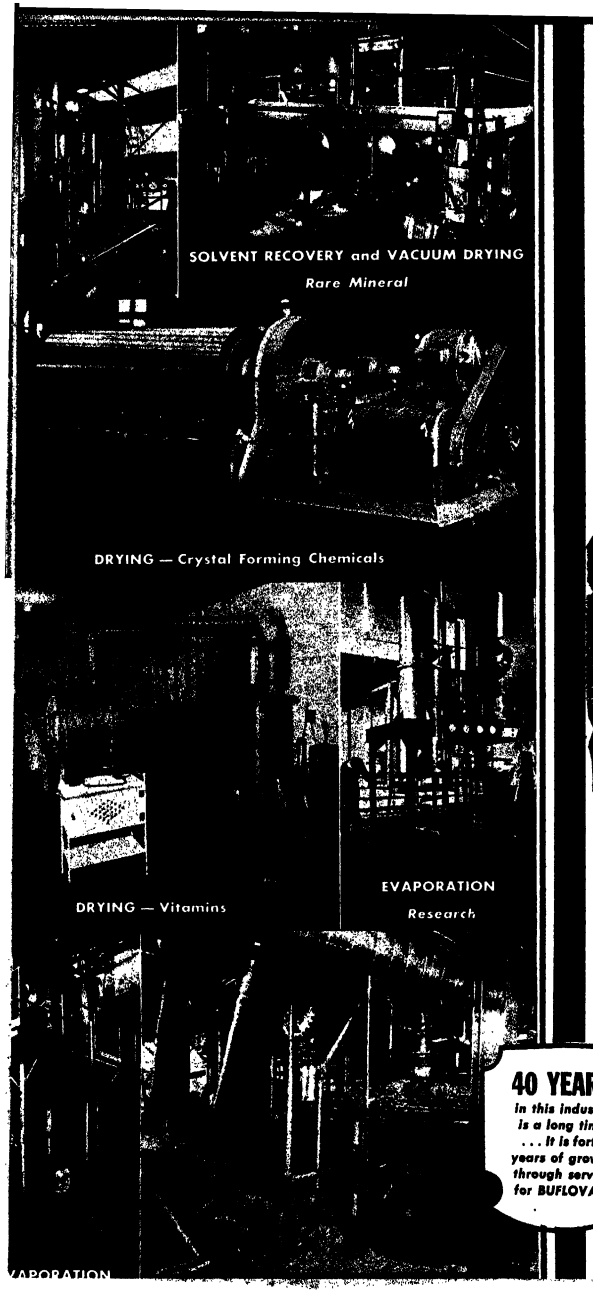
INVITATION

We want to extend a personal invitation to all visitors at the National Chemical Exposition, Sherman Hotel, Chicago, November 24, to visit our home office and plant which is located only a short distance from the convention center.

Our exhibit at the exposition is located at Booths 127 and 128. Technical representatives will be present at all times. Examine our presentation of instruments and apparatus and discuss your problems with our representatives.



E. H. SARGENT & CO.

155-165 East Superior Street ★ Chicago, Illinois

VOLUME 20, NO. 21 • NOVEMBER 10, 1942

To Help You

PLAN TODAY

BOOTH 143
NATIONAL CHEMICAL EXPOSITION
CHICAGO NOV. 24–29

for TOMORROW

IN striving to meet the seemingly impossible production requirements and changed processes imposed by the war, many American manufacturers are keenly aware of the inadequacy of their present equipment. The major problem, in most cases, is one of equipment conversion . . . to meet today's needs with yesterday's equipment, *and still plan for tomorrow.*

To solve such problems successfully often requires more than a conference of plant executives. It's a job for men who have served the whole processing industry; and who are, therefore, abreast; or even ahead of the times in creative design. This is a job requiring combined technical advice with adequate research facilities.

To help you with such problems, we invite you to meet the BUFLOVAK Engineers at the National Chemical Exposition in Chicago, this month . . . Submit your problems to them—they can offer many valuable suggestions right there.

If they haven't the answer, they will get it for you promptly, thru the facilities of the BUFLOVAK Engineering Department, Research and Testing Plants. This is the source from which more than 4000 processing problems involving drying, evaporation, extraction, impregnation, solvent recovery, crystallization, etc., have been successfully handled during the past 30 years.

To those unable to attend the National Chemical Exposition, we extend this offer: Send us your problem in detail and we will submit a complete, unbiased report or suggestion prepared by our Technical Staff.

1270 Sixth Ave.—New York

THE
SPIRAL HEAT EXCHANGER—a tube-less, full counter-flow unit. Hundreds in service—offering the following operating advantages:—

- High heat trans. coefficients.
- Low pressure drop—streamline flow.
- Small floor space—compact.
- All surfaces easily cleaned.
- Minimum radiation losses.
- Reduced scaling due to rapid, centrifugal, turbulent flow.
- Uniform-rapid-temperature change.
- Extra wall thickness can be used for corrosive materials.

See our interesting exhibit.

Chicago, Ill.-Tel. RANdolph 2326

Serving the Middle-West thru representation of well-known, progressive builders of modern Process Machinery and Equipment.

Johns-Manville Corp., 22 E. 40th St., New York, N. Y. Booths 83-84

J-M Celite Filter-Aids and Mineral Fillers feature this exhibit, the keynote being the high-flow rate grades that, in many cases, are making it possible to get greater production from present processing equipment without the sacrifice of clarity or quality, using the filter aids; and the many war uses, including camouflage paints, of the mineral filler.

Kewaunee Manufacturing Co., Adrian, Mich. Booths 179-180

Featured at this exhibit will be a new material "Kemrock" for table tops, sinks, vats, fume hoods, etc., where a high resistance to acids and alkalis is required. Also a new, adjustable stool which is instantaneous in its adjustment, of wood, and with less than five ounces of metal in its construction. A special titration table, with unusual lighting for easy and accurate reading will also be featured.

Kimble Glass Co., Vineland, N. J. Booth 142

A comprehensive display of Kimble Blue Exax and Normax Precision Retested graduated ware and the special Kimble Brand laboratory glassware and apparatus. A new unit is the Brewer culture dish cover—an ingenius but simple device for easy cultivation of anaerobes without expensive equipment. Featured will be bottles and other items for preparation and injection of parenterals, especially blood plasma.

Kold-Hold Manufacturing Co., 424 N. Grand Ave., Lansing, Mich. Booth 73

On exhibit will be a Hi-Low Cabinet, a Hot and Cold Bath unit and a minus 90° F. 5 cubic foot model cabinet, all in actual operation. These machines are for the production calibration and type testing of instruments, temperature processing of sub-assemblies, rapid cooling and heating of metal parts in shrink fits, and for the rapid aging of heat-treated parts. All models come in horizontal types, too.

The Koppers Co., Koppers Bldg., Pittsburgh, Pa. Booths 68-70

No actual products will be exhibited but displayed will be an illuminated background on which

DESPITE tremendous preoccupation with the war effort, we are represented at the National Chemical Show with much of interest and import now and for the future.

Developments have been accelerated by war-imposed scarcities; war conditions are responsible for some highly specialized techniques to meet current demands. The progress report of chemical applications in industry is exceedingly interesting and you may find developments of real significance to your own business. Our technical representatives will be on hand.

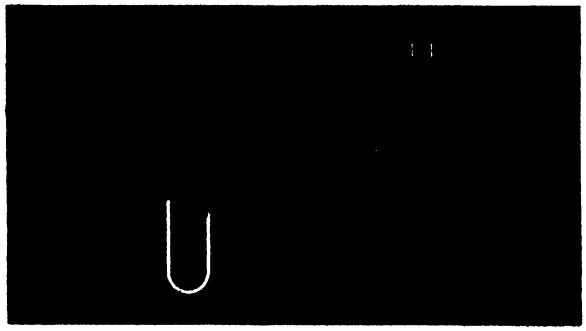
Wheelco UNIVERSAL
Program Controller

THESE *Wheelco*

The Wheelco UNIVERSAL "Electronic Principle" Controller, with Program Control integrally incorporated, provides dependable enforcement of any heating or cooling cycle with completely automatic temperature regulation, plus instantaneous control action and extreme accuracy of temperature measurement. UNIVERSAL Program Controllers are available as Capacitrols, Potentio-trols or Resistance Therm-otrols, and adaptable to all types of processes for measuring, indicating or controlling temperatures from −50 to +3600°F., or equivalent °C.



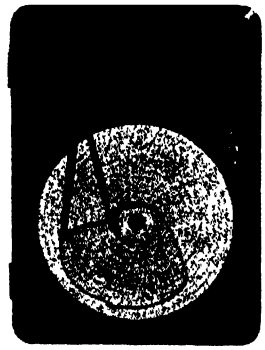
Wheelco REMOTE
CONTROLLER

INTERFACE CONTROL — An Interface Pick-up Unit is placed in the vessel with the tip at the point where the interface is to be maintained. A movement of the interface between the two liquids causes control action.

These Remote Controllers employ the Wheelco "Electronic Principle" Control System and can be utilized for most applications where control is essential. In no case is it necessary to have any contact between the factor being controlled and the actual control apparatus. They operate on a differential of .001 to .125 inch change in liquid level. They may be used with electrolytic liquids as well as dielectric liquids having dielectric constants of as low as 1.8. Wheelco Remote Controllers can be actuated by any means which will affect the capacity or inductance of the Pick-up Unit as is suggested by the diagrams on the left and below. See this Controller in operation, or write for Bulletin Z6000.

FLOW OR DIFFERENTIAL PRESSURE CONTROL — The Pick-up Unit is applied to a differential pressure manometer measuring pressure drop across a flow meter orifice plate. Flow is governed by means of a motorized throttling valve, energized by a Remote Controller.

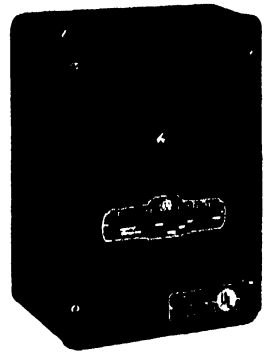
LIQUID LEVEL CONTROL — The Immersion Pick-up is used where gage glasses are not permissible. The Remote Controller will energize the valve motor to open or close the valve, according to the position of the liquid level with respect to the Pick-up Unit.



CONTROLLERS

Save . . .

VITAL WAR PRODUCTION MAN HOURS and MATERIAL



—thru the famous "Electronic Principle" Control System that revolutionized the temperature control field when it was introduced in 1935, and which has since been proved to provide faster, more accurate control than any other type of control. The Proved-in-Service Superiority of the "Electronic Principle" Control has been demonstrated in every application where temperature control is essential. It pays daily dividends in the form of product uniformity, reduced spoilage and increased production by eliminating the faults inherent in other types of controllers.

Wheelco "Electronic Principle" Temperature Controllers may be combined with Flame-otrol (combustion safety control), Proportioning Control, Program Control or Purging Timers. Scale ranges from −50 to +3600°F., or equivalent °C. Request Bulletin No. Z6000.

Wheelco Program Therm-otrol

The Wheelco Program Therm-otrol combines the Proved-in-Service Superiority of the "Electronic Principle" Thermometer Controller with Program Control to provide dependable enforcement of any heating or cooling cycle, with completely automatic temperature regulation. Therm-otrols are available as Indicating or Recording Controllers and may also be combined with Flame-otrol (combustion safety control), Proportioning Control or Purging Timers. Scale ranges from −50 to +1000°F., or equivalent °C. Request Bulletin Z6000.

Wheelco Flame-otrol

The Flame-otrol is a combustion safeguard which assures positive protection against combustion explosion hazards, regardless of fuel burned. The Flame-otrol provides instantaneous shut-off of fuel supply in case of flame failure. It is the only combustion safeguard listed and approved by both Underwriters' Laboratories and the Associated Factory Mutual Laboratories for all types of fuel. Furnished for any complete operation—electric ignition, manual or automatic, time delay for purging or any other sequence desired. Request Bulletin L2.

Wheelco Instruments Co.
851 W. HARRISON STREET CHICAGO, ILL.

or — WRITE FOR DESCRIPTIVE LITERATURE

will be featured Ammonium Thyocyanate. The basic construction features of Koppers Coke Ovens will also be shown.

Leader Iron Works, 2110 N. Jasper St., Decatur, Ill. **Booth 42**

Principally through the media of photographic illustrations, there will be exhibited a wide variety of steel and alloy process equipment including tanks, kettles, heat exchangers, fractionating columns, and special equipment of other types.

Lithgow Corp., 333 W. 40th Place, Chicago, Ill. **Booth 155**

Featured will be the unusual applications and corrosion tests of two special coatings: Lithcote and Cotoid. The former is based on phenolaldehyde resins, the latter on copolymer vinyl resins. Most of the immersion tests to be shown have been in progress for over five years.

Loeb Equipment Supply Co., 910-914 N. Marshfield Ave., Chicago, Ill. **Booth 55**

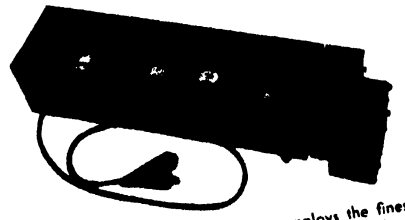
Used equipment for the process industries. Also Alsop electric mixers, glass-lined tanks, filters and like equipment.

The Ludlow-Saylor Wire Co., Newstead Ave. & Wabash R. R., St. Louis, Mo. **Booths 85-86**

Screens and wire cloth will be shown in a variety of square and oblong meshes from coarse screens woven of one-inch rods to gauges having 325 meshes per lineal inch. Included in the exhibit will be samples of stainless steel, Monel metal, nickel, aluminum, tinned steel, galvanized and plain steel, brass, bronze and other commercial metals and alloys.

Lukens Steel Co., Coatesville, Pa. **Booths 136-139**

The preparation and rolling of slabs of Nickel-Clad, Inconel-Clad and Monel-Clad Steels, their subsequent rolling and flanging and the fabrication of various pieces of equipment will be shown in a kodachrome motion picture. Also, in movie form will be shown the casting, in the open hearth of a huge 110,000-lb. ingot and its final form of a 76,000-lb. plate.



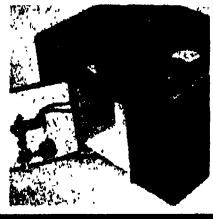
Marathon Paper Mills Co., Rothschild, Wis. **Booth 96**

This exhibit will feature the use of lignin to replace metals and other strategic materials. The paper products shown are designed to replace metal foils, tin plate and similar materials in the food industry. Lignin plastics are for use in place of certain phenolic plastics or metal.

Merck & Co., Inc., Rahway, N. J. **Booths 105-106**

The vital role of nutrition in wartime will be featured. A high light of this will be a striking display of the crystalline structure of individual, pure vitamins. Other sections will show the part played by the sulfonamides and other chemotherapeutic agents in the treatment of war burns and wounds, as well as strategic chemicals essential to the war program.

SAVE TIME with these Beckman Instruments



THE BECKMAN SPECTROPHOTOMETER employs the finest type crystal quartz monochromator covering the full spectral range of interest in spectrophotometry 200 mu in the ultra-violet to 2000 mu in the infra-red. Interchangeable light sources adapt it for all types of spectraphotometric work and direct readings can be made in both % Transmission and Density, simultaneously. Although remarkably versatile and accurate, this instrument is unusually simple to operate. Send for descriptive literature!

Today minutes are priceless. Anything that will speed up industrial processes...anything that will save time in research work ...anything that will help you do your job better, *faster*, is worth investigating thoroughly.

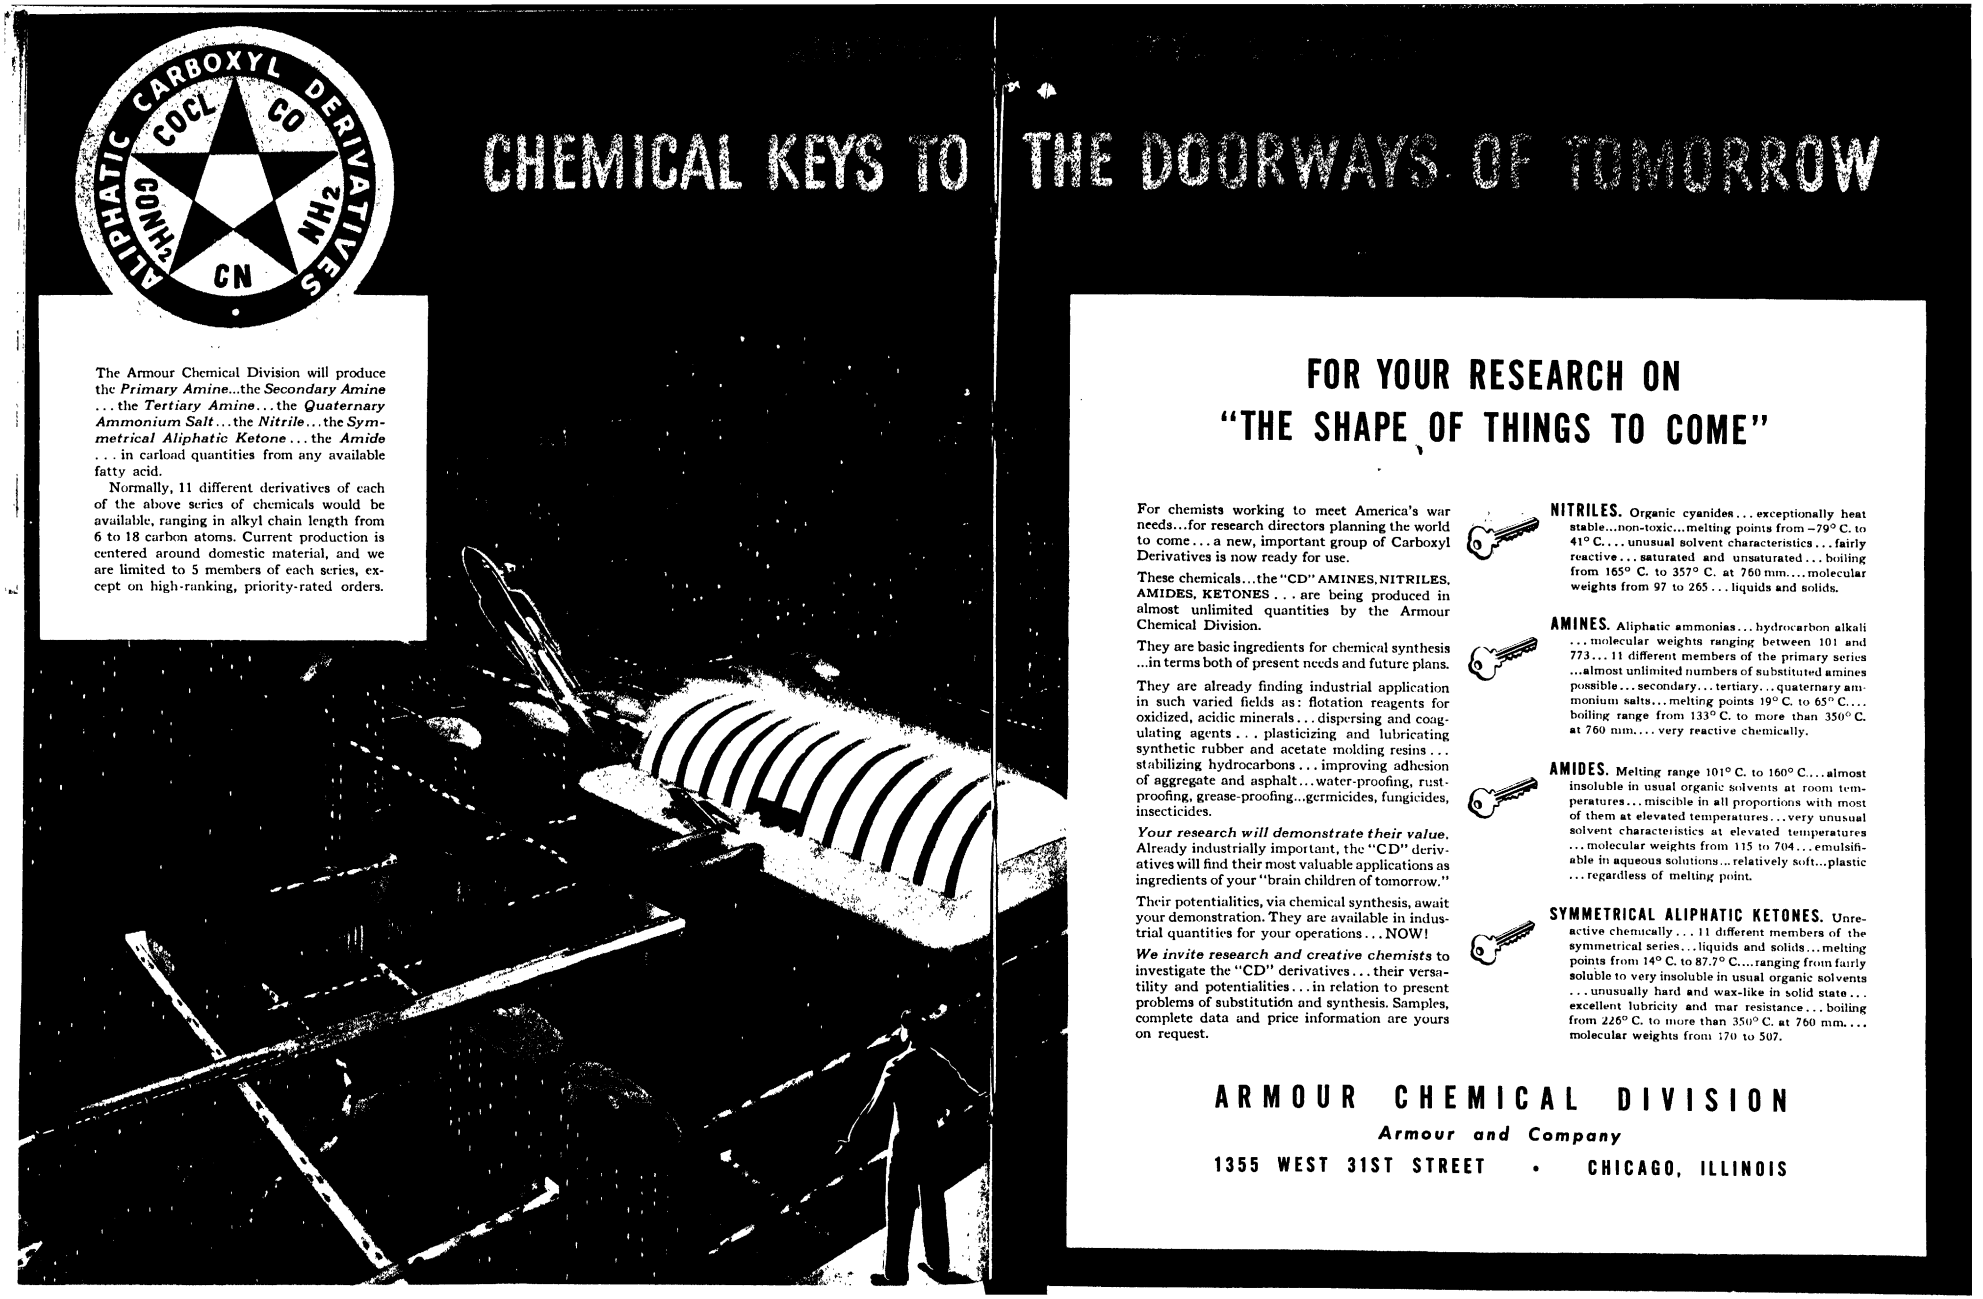
And that's where Beckman equipment fits into the picture. For in thousands of laboratories and industrial plants throughout the nation, Beckman instruments are cutting vital hours from process operations...are speeding up production of essential materials...are reducing waste... are increasing the ease and accuracy of research and control determinations.

Read about these instruments. Note their many outstanding features... *features provided by no other similar equipment on the market today.* Then send for *detailed information* on the instruments you need to speed up YOUR production!

THE BECKMAN LABORATORY pH METER provides highest accuracy and versatility in pH research and control work. Has direct temperature compensation. - 1300 to + 1300 mv scale for oxidation-reduction potentials ..continuous (non-ballistic) indication of circuit unbalance and many other time-saving features A wide variety of special electrodes is available for use with this instrument, adapting it to the many requirements of research work Ask for Bulletin 31!

NATIONAL TECHNICAL LABORATORIES • South Pasadena, Calif.

THE BECKMAN INDUSTRIAL pH METER combines unusual simplicity with the ruggedness necessary for portable plant and field use. Its sealed and shielded glass electrode system can be used anywhere with complete freedom from electrical disturbances. It gives instant pH readings at the touch of a button .. and also provides continuous pH indication over the full range 0 to 14 pH. Ask for Bulletin 21!



THE BECKMAN AUTOMATIC pH METER is the most advanced pH instrument available today. It is used to control —*automatically*—large scale industrial process operations ...operates directly from 115-volt AC current (no batteries) ...and incorporates all the famous Beckman pH developments such as Sealed and Shielded Glass Electrodes...Automatic temperature compensation... use of Beckman High Temperature and High pH Electrodes for difficult conditions...etc. Can be used with *any* standard potentiometric recorder and control equipment. Ask for Bulletin 16!

IMPORTANT! Among the many advancements available in Beckman pH Equipment *exclusively* are *Beckman High Temperature Glass Electrodes*—the *only* glass electrodes that can be used continuously at temperatures to as high as 100°C. (212°F.)...and *Beckman High pH Electrodes*—the *only* glass electrodes that can be used in highly alkaline solutions, *even in the presence of sodium ions.* These important features mean wider adaptability, higher accuracy, greater speed in your pH control operations. *Only Beckman equipment has them!*

Beckman INSTRUMENTS SPEED PRODUCTION ...REDUCE WASTE

CHEMICAL KEYS TO THE DOORWAYS OF TOMORROW

The Armour Chemical Division will produce the *Primary Amine*...the *Secondary Amine* ... the *Tertiary Amine*... the *Quaternary Ammonium Salt*... the *Nitrile*... the *Symmetrical Aliphatic Ketone*... the *Amide* ... in carload quantities from any available fatty acid.

Normally, 11 different derivatives of each of the above series of chemicals would be available, ranging in alkyl chain length from 6 to 18 carbon atoms. Current production is centered around domestic material, and we are limited to 5 members of each series, except on high-ranking, priority-rated orders.

FOR YOUR RESEARCH ON "THE SHAPE OF THINGS TO COME"

For chemists working to meet America's war needs...for research directors planning the world to come... a new, important group of Carboxyl Derivatives is now ready for use.

These chemicals...the "CD" AMINES, NITRILES, AMIDES, KETONES ... are being produced in almost unlimited quantities by the Armour Chemical Division.

They are basic ingredients for chemical synthesis ...in terms both of present needs and future plans.

They are already finding industrial application in such varied fields as: flotation reagents for oxidized, acidic minerals... dispersing and coagulating agents ... plasticizing and lubricating synthetic rubber and acetate molding resins ... stabilizing hydrocarbons ... improving adhesion of aggregate and asphalt... water-proofing, rust-proofing, grease-proofing...germicides, fungicides, insecticides.

Your research will demonstrate their value. Already industrially important, the "CD" derivatives will find their most valuable applications as ingredients of your "brain children of tomorrow."

Their potentialities, via chemical synthesis, await your demonstration. They are available in industrial quantities for your operations... NOW!

We invite research and creative chemists to investigate the "CD" derivatives... their versatility and potentialities... in relation to present problems of substitution and synthesis. Samples, complete data and price information are yours on request.

NITRILES. Organic cyanides... exceptionally heat stable...non-toxic...melting points from −79° C. to 41° C.... unusual solvent characteristics... fairly reactive... saturated and unsaturated... boiling from 165° C. to 357° C. at 760 mm.... molecular weights from 97 to 265... liquids and solids.

AMINES. Aliphatic ammonias... hydrocarbon alkali ... molecular weights ranging between 101 and 773... 11 different members of the primary series ...almost unlimited numbers of substituted amines possible... secondary... tertiary... quaternary ammonium salts... melting points 19° C. to 65° C.... boiling range from 133° C. to more than 350° C. at 760 mm.... very reactive chemically.

AMIDES. Melting range 101° C. to 160° C.... almost insoluble in usual organic solvents at room temperatures... miscible in all proportions with most of them at elevated temperatures... very unusual solvent characteristics at elevated temperatures ... molecular weights from 115 to 704... emulsifiable in aqueous solutions... relatively soft...plastic ... regardless of melting point.

SYMMETRICAL ALIPHATIC KETONES. Unreactive chemically... 11 different members of the symmetrical series... liquids and solids... melting points from 14° C. to 87.7° C.... ranging from fairly soluble to very insoluble in usual organic solvents ... unusually hard and wax-like in solid state... excellent lubricity and mar resistance... boiling from 226° C. to more than 350° C. at 760 mm.... molecular weights from 170 to 507.

ARMOUR CHEMICAL DIVISION

Armour and Company

1355 WEST 31ST STREET • CHICAGO, ILLINOIS

Merco - Nordstrom Valve Co., 400 Lexington Ave., Homewood, Pittsburgh, Pa. Booth 40

An illuminated center unit will illustrate Nordstrom patented "Sealdport" lubrication. Nordstrom valves will be displayed to show ease of operation. In addition will be featured various types of gas meters, gas pressure regulators and Pittsburgh-National liquid meters.

Metal Glass Products Co., Belding, Mich. Booths 166-167

Mojonnier Bros. Co., 4601 W. Ohio St., Chicago, Ill. Booth 78

Featured here will be a set of photomurals showing the Mojonnier Vacuum spray dehydrators for converting products into powder; a new, high-density evaporator; cold wall tanks that are used for storage and cooling; Mojonnier Foamless Fillers especially suited for filling chemical products where care must be taken not to incorporate air.

The Morse Magneto Clock Co., 17 East 42nd St., New York, N. Y. Booth 91

On exhibit will be the Morse Tape Clock, a portable watchman's clock with a tape in place of a dial. Distinctive features of this clock are: a printed record; order of stations visited distinctly shown; a three-day record on one tape; an unlimited number of stations, 900 or more.

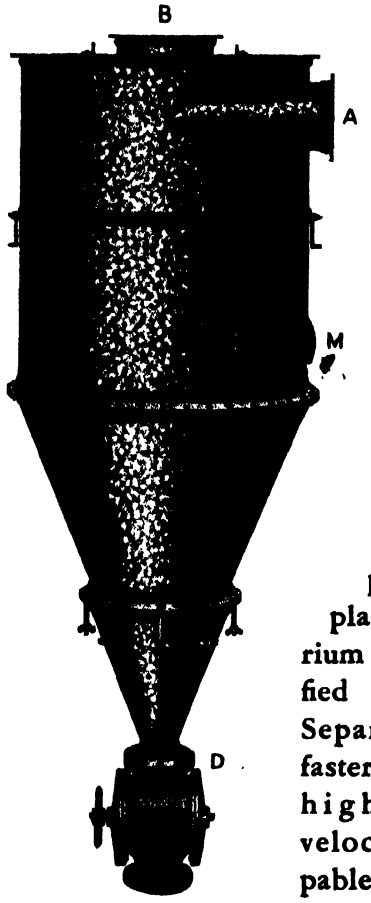
National Engineering Co., 549 W. Washington Blvd., Chicago, Ill. Booth 149

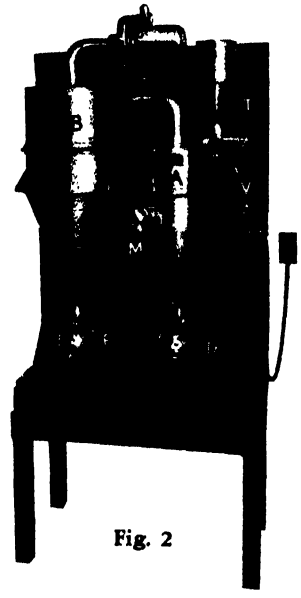
On display will be a 24-inch model stainless steel laboratory-size Simpson Intensive Mixer, equipped for mixing under vacuum. The exhibit will also include examples of a wide variety of products whose ingredients were blended by the mulling action of the Simpson Mixer, showing its adaptability to many chemical industry problems.

National Technical Laboratories, 820 S. Mission St., South Pasadena, Calif. Booths 23-24

On exhibit will be: automatic pH Indicators for the continuous measurement of industrial proc-

IN PEACE AND IN WAR FEDERAL CENTRIFUGAL CLASSIFIERS ARE REQUISITIONED FOR THE JOB THAT IS RATED IMPOSSIBLE





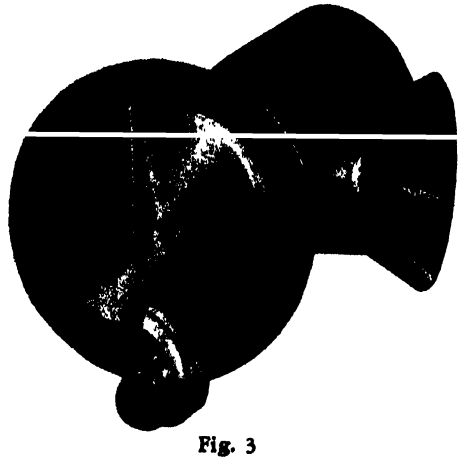


Fig. 1

Years of experimental work made it possible for Federal engineers to design and provide workable systems that refine vast tonnages of bauxite and aluminum oxide for ultimate production of rod, bar and sheet aluminum, also 1.5 micron powder for surfacing metal. Another achievement is amorphous silica for parachute cloth and for finishing transparent plastic sheets required to protect airplane pilots. Barium nitrate, classified with Federal Separators burns faster, resulting in higher muzzle velocity. Impalpable iron oxide serves to polish binocular lenses.

Fig. 2

Fig. 3

With power taken from light socket single Federal Laboratory Unit (Fig. 2) *classifies 3000 lbs. of powdered iron in 24 hours* for the Signal Corps. Valve, shown in (Fig. 3), controls particle size.

See Units Operating at Chemical Show, Chicago, November 24-29 Booth 164.

FEDERAL CLASSIFIER SYSTEMS, INC.
127 North Dearborn St. Chicago, Ill.

esses; a spectrophotometer suitable for measuring in the range of from 220 to 1000 millimicrons; another spectrophotometer for routine measurements in the 2 to 22 micron range; glass electrodes for the pH range of 0 to 14 and temperatures of 0° to 100° C.

Ohio Chemical Mfg. Co., 1177-1199 Marquette St., N. E., Cleveland, Ohio — **Booth 119**

On exhibit will be samples of the rare and common gases which are supplied to research and industrial laboratories.

Olson Filtration Engineers, 4630 W. Flournoy St., Chicago, Ill. — **Booth 94**

Omega Machine Co., 3409 E. 18th St., Kansas City, Mo. — **Booth 140**

Here will be shown a working model of 1/8 scale size, of a Gravimetric Feeder and Slaker actually feeding and slaking quicklime at high temperatures. Also shown are volumetric feeders and variable speed transmissions for feed drives and other light duty applications.

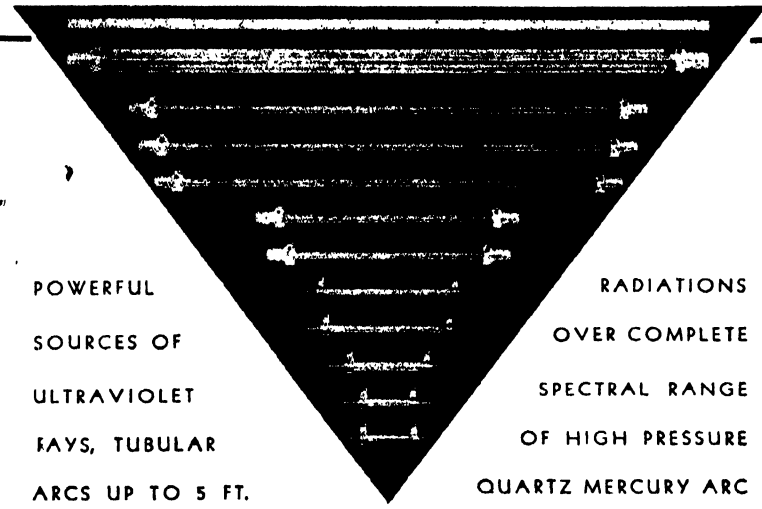
The Permutit Co., 330 W. 42nd St., New York, N. Y. — **Booth 79**

Operating will be equipment showing the use of materials for the removal of cations and anions as applied to water, the refining of solutions, recovery of small concentrations of ions, the separation of ionizable substances from non-ionizable substances—the technique of cation and anion exchange and removal as applied to industry.

Leonard Peterson & Co., Inc., 1222-34 Fullerton Ave., Chicago, Ill. — **Booth 176**

Laboratory furniture, including accessories in connection with it, will be on exhibit, special attention being given to equipment for industrial plants and research laboratories.

The Pfaudler Co., 89 East Ave., Rochester, N. Y. — **Booths 44-45**



On display will be a small, high pressure, and glass-lined reaction kettle; glass-lined pipe, which, when jacketed, is used for heat exchanger. Emphasis will be the increased yield and decreased processing time, through elimination of undesired catalysis, by use of glass-lined equipment, as well as increased yield through high pressures and larger capacities.

Podbielniak Centrifugal Super-Contactor Co., 8312-44 S. Chicago Ave., Chicago, Ill. — **Booth 27**

Exhibit will consist of displays of precise laboratory fractionating apparatus, covering the entire boiling point range of distillable materials; also photographs, charts, etc., on the centrifugal counter-current contacting type of pilot and production scale fractional distillation and liquid-liquid reacting apparatus. A new apparatus, the "Semi-Robot," low-temperature fractionation analysis apparatus, and the "Hyper-Cal" high temperature unit will be shown, as well as the "Hyd-Robot" with new, automatic controls.

Proctor & Schwartz, Inc., 7th St. & Tabor Road, Philadelphia, Pa. — **Booth 112**

Due to present conditions, no

American Industry finds ULTRAVIOLET RAYS point the way to speed and efficiency

In many vital processes. New theatres of operation for using ultraviolet rays are continually being tested and developed. Consider whether any of the following applications could apply to your process:

ULTRAVIOLET RADIATIONS

For accelerating chemical reactions.
(Photo-, rather than Thermo-activated)
As a polymerizing catalyst in the production of certain types of synthetic rubber, resinous compounds and chlorinated hydrocarbons.

●

For activating sterols to form Vitamin D.
For accelerated bleaching, fading and aging tests on such products as paint and pigment, rubber, dyes, textiles, paper.

●

For the sterilization of water and air.
For the examination of metal surfaces prior to plating.
For qualitative determinations by fluorescence.

●

Write for information, outlining your objective.

HANOVIA CHEMICAL AND MANUFACTURING CO.
NEWARK, NEW JERSEY DEPT. 351-E

SEE OUR EXHIBIT AT THE CHEMICAL SHOW—BOOTHS 59-61

actual units of drying and dehydrating machinery will be displayed. Photographs and diagrams will show the most advanced developments in industrial drying machinery. Samples of dehydrated foods from the new Food Dehydrator will also be shown.

Pulverizing Machinery Co., Chatham Rd., Summit, N. J. **Booth 135**

Exhibited will be several units appropriate for laboratory, pilot plant, or small industrial use. The MIKRO-PULVERIZER for demonstrating the usefulness for greater production, power savings, and fewer man hours of labor. The Bantam MIKRO-PULVERIZER for jobs too small for the bigger units. A stainless steel unit especially adapted for use on such products as pharmaceuticals, where absolute purity is necessary.

Raymond Pulverizer Div., Combustion Engineering Co., Inc., 1315 N. Branch St., Chicago, Ill. **Booth 111**

Small model unit of various separators and pulverizers will be on display. Features will be model units of air separators (mechanical air classifiers) for laboratory and commercial use; mechanical air separators; a laboratory mill for soft and medium hard materials, with feeder, screen mill, etc.

Reinhold Publishing Corp., 330 West 42nd St., New York, N. Y. **Booths 122-126**

Books for the chemical profession and the process industries, including the American Chemical Society Monographs.

Ross & Rowe, Inc., 75 Varick St., New York, N. Y. **Booth 43**

A complete line of various grades of Lecithin will be on exhibit. Also there will be shown the advancements made during the past year, in the quality and standardization of lecithin and the application of the correct grade of lecithin both as a surface tension modifier and antioxidant agent. The use of this material in camouflage paint will be demonstrated, as well as its use as a shortening extender in baked goods.

Sarco Co., Inc., 475 Fifth Ave., New York, N. Y. **Booth 175**

Steam Traps of four types; thermostatic, high pressure, for individual trapping of process equipment and related supply lines; low pressure for steam heating systems; float-thermostatic for hot water generators, heat exchangers and process equipment requiring accurate temperature control; inverted bucket type for general industrial use.

Temperature Regulators, self-operating and electric, for hot water heaters, fuel oil heaters and all types of process work in chemical industries.

Pipe Line Strainers, for water, steam, compressed air, gas, etc.

E. H. Sargent & Co., 155-165 E. Superior St., Chicago, Ill. **Booths 127-128**

Emphasis will be placed principally on instruments for metallurgical analysis, such as modern high speed electrolytic analyzers and the Heyrovsky polarograph. Also on exhibition will be a wide variety of instruments and apparatus essential to the general industrial, testing, control, analytical and research laboratories.

Cenco's 6

Booth 178

OUTSTANDING VACUUM PUMPS

★ **Pressovac**—The latest addition to the Cenco line of pumps—Best for educational purposes, chemical laboratory filtrations, distillations, etc. Vacuum, 0.1 mm—air pressure, 8 lbs. $47.50

★ **Hyvac** $75.00

★ **Supervac** 95.00

★ **Megavac** 155.00

★ **Hypervac 20** 300.00

★ **Hypervac 100** 900.00

Priced for operation on 115 volts AC, excepting Hypervac 100 which is for 230 or 460 volts AC.

Sperry Engineers

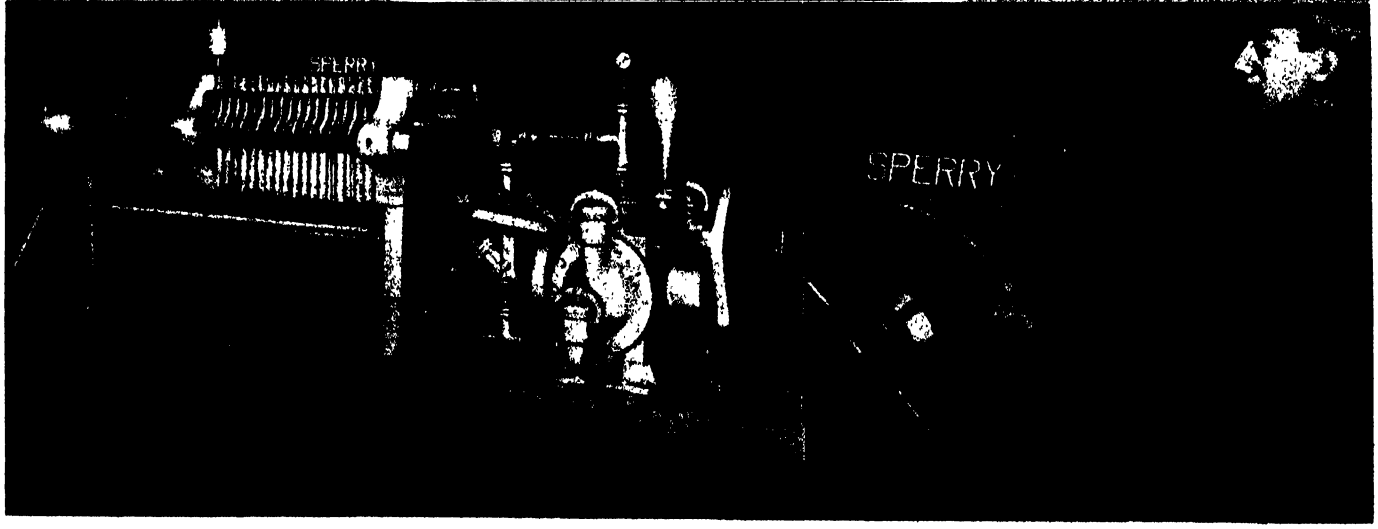
CAN SOLVE YOUR FILTRATION PROBLEMS

THE FIRST Sperry Filter Press was built more than 45 years ago. The years since then have been years of advancement—years of experimenting and research—of meeting new and complex filtration problems—and solving them.

Today, Sperry Filter Presses are used in hundreds of the foremost manufacturing plants of the country embracing practically every known type of industrial filtration.

In the War industries Sperry's contribution to increased speed and efficiency has been outstanding, and hundreds of items vital to Victory are dependent upon the experience which has been built into this equipment.

Whatever your industrial filtration problem may be, you'll find it to your advantage to consult Sperry. Send us a sample of your material. We'll gladly make an analysis and submit unbiased recommendations without obligation.



NOTE: We have on hand for immediate delivery, two new 26″ Sperry Filter Presses, recessed, washing type, 39 plates, center feed, gear closure. Also 32″ presses. Phone, wire, or write for details and prices.

See our exhibit at the National Chemical Exposition, Booth 25, Hotel Sherman, Chicago, Illinois, November 24th to 29th.

Solving
WATER CONDITIONING PROBLEMS
Successfully!

That's been our job
for over 30 years

We've learned a lot about the peculiarities of water and the requirements of hundreds of different processes in which it is used. We've tackled the difficult problems along with the easy ones. And we've solved them — all — successfully.

Today, in hundreds of diversified industries throughout the country you'll find Graver Water Conditioning Equipment meeting the most rigid requirements with record-breaking efficiency and economy.

Graver service is complete, including analysis, design, engineering, and manufacture of the equipment to meet your individual needs.

Graver engineers are at your service and will be glad to consult with you on any specific water conditioning problem without obligation.

Be sure to see our exhibit at the National Chemical Exposition, Booth No. 104

TORCHES and FURNACES on Display at BOOTH No. 56

CHEMICAL EXPOSITION

See the New Insto-gas No. 1-A Lead-Welding Torch

Welding lead pipe is now the alternate for wiping solder. Here is a torch that's easy to handle and ALWAYS produces the non-oxidizing flame necessary for lead-welding. **See it at the Show!**

5 SIZES OF TORCHES

There are five sizes of Insto-Gas torches ranging from the small pencil flame of the No. 1 to a 24 inch flame of the No. 5 Super Torch. The No. 5 will deliver 200,000 B.T.U. per hour with maximum temperature of 2700°F. Insto-gas torches are ideal for sweating all sizes of copper pipe fittings.

MELTING FURNACE

The Insto-Gas metal melting furnace melts 40 pounds of lead in less than six minutes. There is no waiting for hot metal, for Insto-Gas lights instantly; no pumping or priming. Insto-Gas can be used safely in enclosures. For Safety use Insto-Gas torches and melting furnaces — *listed by both Underwriters and Factory Mutuals Laboratories.*

Write today or new folder on lead welding and complete information on all torches and furnaces.

Insto-Gas Corporation

1900 E. Jefferson Ave., Detroit, Michigan

Schaar Co., 754 W. Lexington St., Chicago, Ill. **Booth 109**

Here will be featured complete equipment for today's laboratories, with particular emphasis on new pieces of apparatus which will make the work of the chemist and the technician easier, faster and more accurate. Murgatroyd and Ermintrude will be present to assist, and make you feel at home.

Claude P. Schneible Co., 3951 W. Lawrence, Chicago, Ill. **Booth 199**

On display will be a Multi-Wash Collector equipment unit for the removal of dust, fumes or odors from exhaust air, to ventilate plant operations, remove nuisance or recover valuable products. An operating unit, with glass shell to demonstrate features and principles, will be in operation. Photomurals of installations will be exhibited also.

Schnell Publishing Co., Inc., 59 John St., New York, N. Y. **Booth 171**

Publications

The Selas Co., Erie Ave. & D St., Philadelphia, Pa. **Booth 93**

Micro-Porous porcelain filter crucibles—an outstanding example of substitution for chemical analytical filtrations. Other types of these filters eliminate the use of centrifuges and other separatory devices. Industrial grades of microporous ceramic media to replace corrosion resistant wire screen will also be featured.

The Sharples Corp., 23rd & Westmoreland Sts., Philadelphia, Pa. **Booth 114**

Due to present conditions, this exhibit will be limited to large size photographs illustrating the operation of the latest types of Sharples centrifuges. A laboratory model Super-Centrifuge will be on display to give a three-dimensional illustration of the principles covered in the photographs and cross sectional views.

E. H. Sheldon & Co., Muskegon, Mich. **Booth 103**

On display will be laboratory furniture and shop benches, fume hoods, wall tables, acid resistant table top material and similar equipment.

Sivyer Steel Casting Co., 1675 S. 43rd St., Milwaukee, Wis. **Booths 74-75**

A complete display will feature stainless steel castings, heat resistant steel castings, and similar units, both in the rough and machined stages. These include valves, fittings, filter press plates, and other important pieces of chemical industry equipment.

Sparkler Manufacturing Co., Mundelein, Ill. **Booth 71**

On display will be a laboratory filter with glass sides, in operation to show the building up of a filter cake on a horizontal plane. There will also be two new laboratory filters, one with an electrically heated jacket, the other with a steam heated jacket. There will also be a production size model in stainless steel, with a capacity of 600 gallons per hour.

D. R. Sperry & Co., Batavia, Ill. **Booth 25**

This exhibit will display many different types of industrial filter press plates as well as samples of various kinds of filter cloth. A small press will also be shown, complete, together with photographs and diagrams which explain the operation of the Electric Hydraulic Closing Device.

Titanium Alloy Mfg. Co., Niagara Falls, N. Y. **Booth 148**

Samples of their products will be on exhibit. These materials, such as zirconium, are taking the place of strategic materials in various industries. Zirconium oxide is for the ceramic industry, to replace tin oxide and antimony oxide. Zirconium and titanium products are being used also in the electrical field to replace mica and steatite.

Union Bag & Paper Co., Woolworth Bldg., New York, N. Y. **Booth 172**

Triangle Package Machinery Co., 906 N. Spaulding Ave., Chicago, Ill. **Booth 204**

On exhibit will be an eight section, volumetric filler of new design,

air operated for high speed and the accurate measuring and filling of powders and free flowing materials. Also on display will be reversible, rotating agitators which come to rest between discharges—a new unit in filling equipment.

Featured will be large multiwall paper bags now being used for types of shipping containers no longer available. Also a miscellaneous collection of special bags for automotive parts, tools, insecticides and many other uses and materials.

United States Stoneware Co., 60 East 42nd St., New York, N. Y. — **Booths 123-124**

Featured will be: "Tygon" synthetic rubber-like tank linings, tubing, gasket material, corrosion resistant paint; "Resilon" (depolymerized colloidal resin) tank linings for the replacement of rubber. Also on display will be a line of Chemical Stoneware and Ceramic equipment, including stoneware lined centrifugal acid pumps, chemical stoneware piping, valves, etc.

Walker - Wallace, Inc., 14 W. Utica St., Buffalo, N. Y. — **Booth 64**

Exhibited will be the APV Plate Heat Exchangers. These units come in either the H.E.R. or the "Paraflow" type, depending on the size and rate of flow needed. These units are available in five models of frames and ten types of plates, serving every purpose.

Wallace & Tiernan Co., Inc., Newark, N. J. — **Booth 133**

On display will be chlorine control apparatus, chemical feed control, water treatment equipment and reagent solution pumps. Featured will be experience and case histories showing the importance of chlorination and proper water treatment in eliminating production waste, as related to process and cooling waters.

Waukesha Foundry Co., Waukesha, Wis. — **Booth 46**

On exhibit will be examples of rough, polished and machined castings of corrosion resistant "Waukesha Metal," Monel, Nickel, Everdur, Brass, Bronze and Aluminum. Also on display are Waukesha pumps, ball bearing, rotary seal medols of positive displacement, slow speed type. One model will be in operation to illustrate adaptability for pumping operations in synthetic rubber and other chemical processing plants.

Wheelco Instruments Co., Harrison & Peoria Sts., Chicago, Ill. — **Booth 41**

On display will be the Universal Model Temperature Controller, Remote Controllers with gage glass, Immersion and Interface Pickups, Recording Thermometer Controller and the Flame-otrol, a combustion safety controller. In operation will be the Remote Controller and the Flame-otrol. Featured will be the interchangeable elements of the Universal Controller and the many applications of the Remote Controllers.

Wilkens - Anderson Co., 111 N. Canal St., Chicago, Ill. — **Booth 57**

New laboratory instruments will be displayed, among which the following will be especially featured: the Bendix Electro Deplater for tin plating; the Coleman Electronic Photofluorometer and Spectrophotometer; the WACO Electrolytic Apparatus for metal deposition. Also, of special interest, will be the Semi-Micro apparatus, which stretches the college chemical inventory 10 to 15 times.

Wilson Chemical Feeders, Inc., Buffalo, N. Y. — **Booth 152**

The Wilson "Pulsafeeder" a chemical feeder designed to feed practically any chemical in solution form will be shown in operation, with cut-away parts to show the construction. The important detail about this unit is the fact that the solution being pumped, whether it be sulfuric acid, a slurry, or other chemical solution, does not come in contact with any working part of the feeder.

York Ice Machinery Corp., York, Pa. — **Booths 47-48**

Through graphic presentation, the importance of air conditioning and refrigeration equipment to the total war effort will be given, particularly on applications in industrial chemistry. Featured will be manufacturing facilities or processes which have originated from or have been stimulated by the war-time requirements.

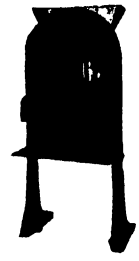
Equipment For
• SIFTING
• PACKING
• FEEDING
• WEIGHING

INVESTIGATE Gump Equipment for more efficient, economical processing of dry, powdered or granular materials. Recommendations on equipment to meet your requirements will be offered without obligation.

• BAR-NUN ROTARY SIFTERS

Modern, big capacity, rotary motion sifters with mechanical bearings throughout. Assure complete, thorough separations and uniformity of product. One to four separations . . . for sifting, scalping or grading.

• VIBROX PACKERS



Efficient, smooth-running, vibrating packers that usually pay their own cost through reduction of labor, handling and container costs. Made in five sizes to pack containers from 5 to 750 lbs.

• DRAVER FEEDERS

For accurately feeding, by volume, a pre-determined amount of material. Capacities easily and accurately controlled by single adjustment and set lock. Used in continuous mixing systems or for regulating capacity flow to production machines.

• BAR-NUN WEIGHERS

Speedy, extremely accurate automatic weighers that weigh and check-weigh a variety of materials into all types of containers. Two sizes—1/4 ounce to 8 ounces, and 2 ounces to 2 pounds. Accuracy 1/64th ounce, plus or minus, to 8 ounces; 1/32nd ounce, plus or minus, to two pounds. Power feed models only.

See this Gump Equipment and get complete information at our exhibit during the National Chemical Exposition, Hotel Sherman, Chicago. Or, write us today.

IMPOSSIBLE filtering jobs made POSSIBLE

SPARKLER HORIZONTAL PLATE FILTERS

See them operate at the Chemical Show Booth 71

It's amazing how perfectly Sparkler Filters purify, clarify and restore liquids to their original usable condition. Every day these filters are performing wonders in successfully completing filter jobs heretofore thought impossible.

Capacities: 1 pint to 10,000 G.P.H.

NO LIMIT ON FILTER AIDS

Sparkler's use every filter medium to advantage—papers, carbons, diatomaceous earths, or any kind of chemical treatment—economically and efficiently. A size and type for every filtering operation.

Write for free demonstration right in your laboratory — no obligation.

SPARKLER FILTERS
WITH THE HORIZONTAL PLATE

LABORATORY CHEMICALS

MERCK

INDUSTRIAL CHEMICALS

In the laboratories of every branch of industry, there is a constant need for laboratory chemicals which conform to rigid standards of quality and dependability.

For more than three generations, the name MERCK has been identified with fine chemicals. Merck & Co., Inc. pioneered in the establishment of definite standards for Reagent and C. P. grades of chemicals. During succeeding years, Merck has kept pace with the advance of science by supplying the chemicals essential to new discoveries, and their industrial development and application.

The unvarying quality and dependability of Merck Laboratory Chemicals are the result of a traditional insistence on the highest standards for the production of all products bearing the Merck label. Raw materials are obtained from the best-known sources of supply. Progressive research and control chemists are constantly engaged in the important work of improving the manufacturing processes to satisfy the high Merck standards and the exacting demands of modern industry. The tireless search for new and better products also is reflected in the development of containers which keep step with the most advanced trends and requirements.

It often surprises our friends to learn that the Merck Industrial Chemical Line includes more than six hundred different products. Because of the variety of forms and grades which we offer, there is practically no requirement for quality or price which we cannot meet satisfactorily.

Notwithstanding our foresight and best judgment since the outbreak of World War II, supplies of a number of Merck products are diminishing, and others are completely exhausted. This condition is readily understandable when consideration is given to the fact that great quantities of raw materials ordinarily used for peacetime products are being diverted to munitions, armament, and other essential requirements. In addition, the Government is buying finished chemicals for war needs, in quantities for which production did not exist in peacetimes.

Our plants are working at full capacity day and night, coincident with the supply of raw materials, to meet the demands of the War Program, as well as the increasing requirements of our customers whom it is our desire to serve to the limit of our ability and our resources.

In these trying times, we trust that we may have the benefit of your cooperation and good will in order that we may be of every possible service during the National Emergency.

*We invite you to visit our Exhibit (Booths 105-106) at the National Chemical Exposition

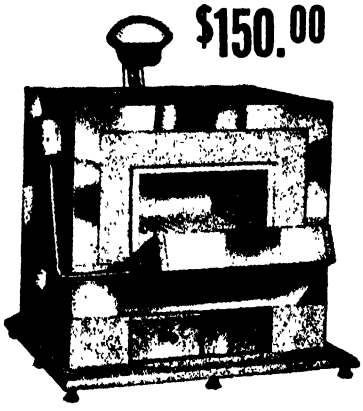
HUPPERT HEAT TREATING and LABORATORY FURNACES

•

"... built for lifetime service!"

•



$117.50

Three heat ranges. High, 1400° F. to 2000° F. Medium, 800° F. to 1400° F. Low, 0 to 800° F. Seven point adjustment in each range permits maintaining the exact temperature desired. Large, accurate Pyrometer.

Extra large interior dimensions: 4½" wide, 3¾" high, 9" deep. Overall dimensions, 15" wide, 19" high, 25" deep. 110 or 220 volts, A.C. or D.C. Wattage load from 400, minimum, to 1700, maximum.

$150.00

Designed for heat treating various metals, laboratory samples and test work. Has three heat ranges: 0–800° F., 800°–1200° F. and 1200°–2000° F.

Furnished with removable porcelain tray, may be had with or without pyrometer, has counter weighted door, fully enclosed contacts, and Transite Base.

Operates on 110 v. A.C. or D.C.; min. load 800 w., max. load 1750 w. Special voltages also available at additional cost. Inside dimensions: 8" wide, 4" high, 6" deep (2" throat)

Huppert Furnaces are ruggedly built for heavy duty service, with no exposed contacts. Prices range from $24.75 up with standard heat ranges up to 2500° F. (Special voltages, dimensions and temperature ranges to order.)

(*Continued on page 1440*)

Acid-proof masonry can be ready for use within 24 to 36 hours after the last brick is laid, with U.S. Stoneware's "Vitric-10" —the remarkable quick-setting, chemical-hardening cement.

"Vitric-10" is resistant to all mineral acids, salts, solvents and hydrocarbons (hot or cold), with the one exception of hydrofluoric acid. "Vitric-10" possesses strong bonding and adhesive properties; is highly resistant to abrasion; is unaffected by abrupt temperature changes; and is simple to handle.

Acid-proof masonry is built entirely from non-critical materials. In addition to its instant availability, acid-proof masonry offers other very definite advantages for chemical plant construction: (1) Its initial cost is low; (2) properly installed, the maintenance cost is practically nil; (3) solution contamination is non-existent; (4) acid-proof masonry operates perfectly at high temperatures or under abrupt temperature changes.

OTHER U. S. STONEWARE CEMENTS

In addition to "Vitric-10", U.S. Stoneware manufactures other highly specialized cements, including:

"Pre-Mixt"— requires only the addition of water.

"Portite"— sulphur base heat-and-pour type cement.

"Vitric" Fire-proof cement — for acid conditions continuously above 500 degrees F.

"Duralon"—a new synthetic resin cement, completely non-porous with high compressive and tensile strength.

With U.S. Stoneware's "USSCO" acid-brick and U.S. Stoneware's wide range of acid-proof cements, suitable combinations can be found to work satisfactorily under the most severe operating conditions.

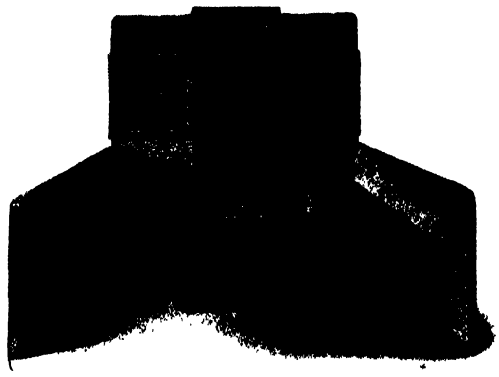
754 WEST LEXINGTON STREET CHICAGO, ILLINOIS

Ammonium thiocyanate finds a variety of uses in industry . . . for the production of resinous condensation products, insecticides, metal plating baths, textile finishing agents, pickling compositions, photographic chemicals, lubricants and adhesives.

Ammonium thiocyanate has a behavior similar to other ammonium salts, but it also provides the variations of the thiocyanate group which is very stable and, in many reactions, resembles the halogens.



If you are now using any ammonium salts in your processes, such as chloride, acetate, oxalate, carbonate or nitrate, you may find you can use ammonium thiocyanate to advantage.

Samples and quotations on request.

KOPPERS COMPANY

Tar and Chemical Division

PITTSBURGH, PA.

THOUGH the AINSWORTH plant and personnel are busy today in producing balances and precision instruments for the War effort, some of us will be in Chicago in Booth 58, at the National Chemical Exposition, Nov. 24th to 29th.

A sincere invitation to come in and relax with us is extended. Your needs are changing and we want to know now how we may better serve you when the war is won! Research and development go on in spite of today's emphasis on production!

AND to those of you, with priority over our production, who perhaps are using an Ainsworth balance for the first time, we extend a special welcome . . . that you may become better acquainted with the other models in the Ainsworth line!

AINSWORTH
DENVER, COLORADO

STABILITY is built into every Ainsworth balance . . . through precision workmanship and a sure knowledge of construction and design.

BOOTH 57 COME into our booth at the National Chemical Exposition and operate those newer laboratory instruments . . . our Modern Tools for the Chemist.

THE college chemistry instructor knows WACO for its close cooperation with authorities in Chemistry . . . particularly the Semi-Micro technic for Qualitative and for Elementary Organic classes. Semi-Micro fits perfectly into the 3-year college course and the present need for saving Victory materials!

INDUSTRIAL chemists, too, will find much in the way of time-saving pieces . . . among these the Bendix Electro De-Plater, Coleman Spectrophotometer and Photofluorometer, pH Meters, WACO Electrolytic Deposition Apparatus, WACO Electronic Relay . . . all ready for a trial run!

★ IF you are unable to visit our Booth at the National Chemical Exposition in Chicago, Nov. 24th to 29th, write for WACO Catalyst, Vol. 6-IE . . . it shows a complete listing of all the WACO exhibit apparatus.

CONSTANT TEMPERATURE EQUIPMENT

BOOTH 67

★ **BATHS** . . . General or special purpose for water or oil. Adjustable to temperatures from −30 to 200° C. Constant to as close as ±0.005° C. With or without built-in refrigeration.

★ **CABINETS** . . . For drying, incubation, etc., with very close temperature control. Humidity control to suit requirements.

★ **THERMOREGULATORS** . . . Sensitive, reliable and adjustable bi-metal and mercury types for holding the temperature of air or liquid baths to precise limits.

★ **SUPERSENSITIVE RELAYS** A complete line of reliable types for controlling heater loads.

★ **LoLAG IMMERSION HEATERS** . . . Flexible and pipe-fitting (bayonet) immersion heaters featured by the well-known Aminco LoLag construction and flexibility of application. Copper, steel or monel metal sheaths. Ideal for constant temperature work. Improved open-coil heaters for lasting service in electrically heated ovens, etc.

★ **MOTOR-DRIVEN STIRRERS** Inexpensive, powerful, quiet and long-lived types for every stirring need.

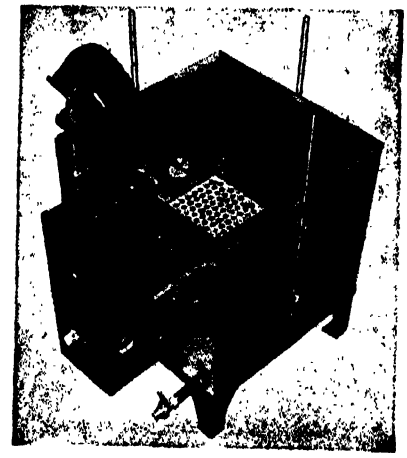

Illustration shows one type of Aminco constant temperature water or oil bath, with or without built-in refrigeration and with or without shaking mechanism for a wide range of operating temperatures, with temperatures constant to as close as ±0.005°C.

★ **MOTOR-DRIVEN PUMPS** . . . for heads up to 6 ft . . . husky, dependable, long-lived centrifugal type for continuous operation . . . ideal for circulating liquids in or through constant temperature and other apparatus . . . various types of mountings to suit conditions.

★ *Fully described in Catalog NP-41*

★ **OVENS** . . . new improved forced-draft type . . . guaranteed for 5 years . . . unusually close temperature control (±0.5° C.) . . . high degree of temperature uniformity through the working chamber (±0.25° C.) . . . range, room to 260° C.

Described fully in Bulletin NP2102.

Incubators, Fermentometers for Vitamin Assay and Control, and Manometric Apparatus for Micro Respiration Studies.

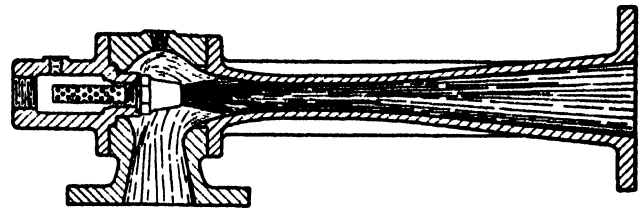
"TIMESAVERS" in WARTIME PRODUCTION

FILCO FILTER PAPER

We are proud of the honor and distinction of having Filco Filter Paper and other Filco Filtering Equipment hard at work answering the filtering needs in so many wartime production schedules.



Our Engineers are constantly at work in our laboratories solving countless industrial problems and fitting filtering media to the many new uses created in recent months.

We can be of service to you, too! Write us regarding your filtering needs, so that together we may point for new records of production . . . new achievements . . . until final Victory is ours!

Visit our Booth No. 63
National Chemical Exposition

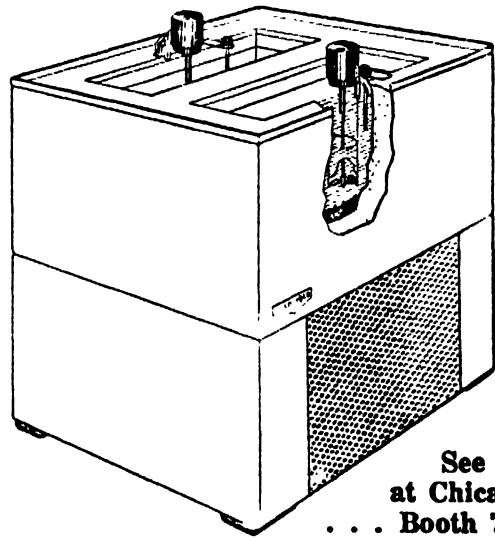
KEEP 'EM FLOWING!



We refer to the vapors being removed from thousands of Condensers and Processing Vessels by Croll-Reynolds Steam Jet Evactors. Production Equipment for this apparatus is being pushed to keep up with what seems to be an ever-increasing demand. Now, even more than ever, we are eager to help the operators of the many thousands of Croll-Reynolds Evactors get the maximum performance from existing equipment.

In some cases vacuum can be increased by merely changing the nozzles. Capacity can often be increased by changing the nozzles and throats or by re-machining them. It is our policy to keep in stock rough castings for throats and suitable materials for nozzles which can be promptly machined for individual conditions on prevailing priorities. Complete new Evactors for vacuum to a small fraction of 1 mm. are still being made subject to crowded conditions on ordnance equipment.

ORGANIC CHEMISTRY

Organic Derivatives of Antimony — by Walter G. Christiansen. $ 3.50
Glycerol and the Glycols — by James W. Lawrie. 7.25
Nucleic Acids — by P. A. Levene and Lawrence W. Bass. 4.50
The Catalytic Oxidation of Organic Compounds in the Vapor Phase—by L. F. Marek and Dorothy A. Hahn. 9.00
Carotinoids and Related Pigments: The Chromolipoids — by Leroy S. Palmer. 4.50
The Ring Index — by Austin M. Patterson and Leonard T. Capell. 8.00
Organic Arsenical Compounds — by George W. Raiziss and Joseph L. Gavron. 6.75
The Mechanism of Homogeneous Organic Reactions from the Physical Chemical Standpoint — by Francis Owen Rice. 3.75
Anhydrous Aluminum Chloride in Organic Chemistry — by Charles A. Thomas. 15.00
The Reactions of Pure Hydrocarbons — by Gustav Egloff. 16.75
Physical Constants of Hydrocarbons — by Gustav Egloff.
Volume I, Paraffins, Olefins, Acetylenes, and Other Aliphatic Hydrocarbons. 9.00
Volume II, Cyclanes, Cyclenes, Cyclynes, and Other Alicyclic Hydrocarbons. 12.00
Pyrolysis of Carbon Compounds — by Charles Dewitt Hurd. 9.50
Chemical Refining of Petroleum, 2nd Ed. — by Vladimir A. Kalichevsky and Bert Allen Stagner. 7.50
Modern Methods of Refining Lubricating Oils — by Vladimir A. Kalichevsky. 6.00
Isomerization of Pure Hydrocarbons — by Gustav Egloff, V. Komarewsky and George Hulla. 9.00

INORGANIC CHEMISTRY

Diatomaceous Earth — by Robert Calvert. $ 4.00
Fixed Nitrogen — Edited by Harry A. Curtis. 12.00
Equilibria in Saturated Salt Solutions — by W. C. Blasdale. 3.50
Sulfuric Acid Manufacture — by Andrew M. Fairlie. 9.75
Nitrogen System of Compounds — by Edward Curtis Franklin. 7.50
Manufacture of Soda, 2nd Ed. — by Te-Pang Hou. 9.50
Solubility of Non-Electrolytes, 2nd Ed. — by Joel H. Hildebrand. 4.50
Hydrochloric Acid and Sodium Sulfate — by N. A. Laury. 3.00
The Properties of Glass — by George W. Morey. 12.50
The Properties of Silica — by Robert B. Sosman. 9.50
The Industrial Development of Searles Lake Brines, with Equilibrium Data—by John E. Teeple. 2.25
Soluble Silicates in Industry — by James G. Vail. 7.25

BIOLOGY AND MEDICINE

Electron Microscope — by Burton and Kohl. $3.85
Electrophoresis of Proteins — by H. A. Abramson, L. S. Moyer and M. H. Gorin. 6.00
Electrokinetic Phenomena and Their Application to Biology and Medicine — by Harold A. Abramson. 7.50
The Animal as a Converter of Matter and Energy — by Henry P. Armsby and C. Robert Moulton. 3.50
Photodynamic Action and Diseases Caused by Light — by Harold Francis Blum. 6.00
The Development of Physiological Chemistry in the United States — by Russell H. Chittenden. 4.50
Surface Equilibria of Biological and Organic Colloids — by P. Lecomte Du Nouy. 3.50
The Chemistry of Enzyme Actions, 2nd Ed. — by K. George Falk. 3.75
The Chemistry of Natural Products Related to Phenanthrene, 2nd Ed. — by L. F. Fieser. 7.00
Thyroxine — by Edward C. Kendall. 4.25
The Physiological Effects of Radiant Energy — by Henry Laurens. 6.00
Therapeutic Agents of the Quinoline Group — by W. F. Von Oettingen. 6.00
The Vitamins, 2nd Ed. — by H. C. Sherman and S. L. Smith. 6.00
Mineral Metabolism — by A. T. Shohl. 5.00
Colloid Chemistry — by Thé Svedberg. 4.25
The Chemical Aspects of Immunity, 2nd Ed. — by H. Gideon Wells. 4.50

PHYSICS

Phenomena at the Temperature of Liquid Helium — by E. F. Burton, H. Grayson Smith and J. O. Wilhelm. $ 6.00
Properties of Ordinary Water-Substance — compiled by N. Ernest Dorsey, Physicist. 15.00
The Raman Effect and Its Chemical Applications — by James H. Hibben. 11.00
The Kinetics of Homogeneous Gas Reactions — by Louis S. Kassel. 6.50
Photochemical Processes — by George B. Kistiakowsky. 4.25
The Chemical Effects of Alpha Particles and Electrons, 2nd Ed. — by Samuel C. Lind. 3.75
The Photochemistry of Gases — by William Albert Noyes, Jr. and Philip Albert Leighton. 10.00
Molecular Rearrangements — by C. W. Porter. 3.00
The Modern Calorimeter — by Walter P. White. 3.00
The Structure of Crystals, 2nd Ed. — by Ralph W. G. Wyckoff. 7.50
The Structure of Crystals, Supplement Volume II — by Ralph W. G. Wyckoff. 6.00

(See these books at Booth 122, Chicago Show.)

Reinhold Publishing Corporation

FOR THE DURATION

Monographs and other Reinhold Books

RUBBER, PLASTICS AND RESINS

Chemistry and Technology of Rubber — by Carroll C. Davis and John T. Blake. $15.00

Science of Rubber — Edited by Prof. Dipl.-Ing K. Memmler — Translated by R. F. Dunbrook & V. N. Morris. 15.00

Latex, Its Occurrence, Collection, Properties and Technical Applications — by Ernst A. Hauser. 4.00

Polymerization and Its Applications in the Fields of Rubber, Synthetic Resins, and Petroleum — by Robert E. Burk, Howard E. Thompson, Archie J. Weith and Ira Williams. 7.50

Chemistry of Synthetic Resins — 2 parts bound in one Volume — by Carleton Ellis. 20.00

Chemistry of Synthetic Surface Coatings — by William Krumbhaar. 4.00

Plastics and Molded Electrical Insulation — by Emile Hemming. 6.00

Casein and Its Industrial Applications — by Edwin Sutermeister and Frederick L. Browne. 6.50

Systematic Survey of Rubber Chemistry — by Clayton W. Bedford and Herbert A. Winkelmann. 8.00

PETROLEUM, FUELS AND LUBRICANTS

Chemistry of Petroleum Derivatives — by Carleton Ellis.
Volume I $18.00
Volume II 20.00

Lubricating Greases: Their Manufacture and Use — by E. N. Klemgard. 15.00

Conversion of Petroleum, Production of Motor Fuels — Thermal & Catalytic Processes — by A. N. Sachanen. 6.00

Motor Fuels: Their Production and Technology — by Eugene H. Leslie. 6.00

Shale Oil — by Ralph H. McKee. 4.50

Catalysis — Inorganic and Organic — by Sophia Berkman, Jacque C. Morrell and Gustav Egloff. 18.00

Emulsions and Foams — by Sophia Berkman and Gustav Egloff. 8.50

METALLURGY

Protective Coatings for Metals — by R. M. Burns and A. E. Schuh. $ 6.50

Silver in Industry — Edited by Lawrence Addicks. Sponsored by the Silver Producers' Research Project with the active cooperation of the National Bureau of Standards and many universities and scientific organizations. 10.00

Corrosion Resistance of Metals and Alloys — by Robert J. McKay and Robert Worthington. 7.00

Tin — Its Mining, Production, Technology and Applications — by C. L. Mantell. 5.25

Beryllium: Its Production and Application — Translated by R. Rimbach and A. J. Michel. 10.00

Bearing Metals and Bearings — by W. M. Corse. 5.25

Sampling and Analysis of Carbon and Alloy Steels. Prepared by The Chemists' Committee of the Subsidiary Companies of the U. S. Steel Corp. 4.50

Sheet Steel & Tin Plate — by R. W. Shannon. 5.00

Textbook of Metallography, Chemistry and Physics of the Metals and Their Alloys — by G. Tammann. 7.00

Titanium, With Special Reference to the Analysis of Titaniferous Substances — by William M. Thornton, Jr. 3.75

Zirconium and Its Compounds — by Francis P. Venable. 3.00

Arsenical and Argentiferous Copper — by J. L. Gregg. 4.00

Molybdenum, Cerium and Related Alloy Steels — by H. W. Gillett and E. L. Mack. 4.25

FOOD AND NUTRITION

We Need Vitamins — by Walter H. Eddy and G. G. Hawley. $ 1.50

What Are the Vitamins — by Walter H. Eddy. 2.50

Minerals in Nutrition — by Z. T. Wirtschafter. 1.75

Outlines of Food Technology — by H. W. von Loesecke. 7.00

Mineral Metabolism — by A. T. Shohl. 5.00

Animal as a Converter of Matter and Energy — by Henry P. Armsby and C. Robert Moulton. 3.50

Marine Products of Commerce, Their Acquisition, Handling, Biological Aspects and the Science and Technology of Their Preparation and Preservation — by Donald K. Tressler. 12.00

Comprehensive Survey of Starch Chemistry — by Robert P. Walton. 10.00

MISCELLANEOUS

Chemical Action of Ultraviolet Rays — by Carleton Ellis and Alfred A. Wells. 2nd Ed. by Francis F. Heyroth. $12.00

Uses and Applications of Chemicals and Related Materials — by Thomas C. Gregory. 10.00

Condensed Chemical Dictionary — 3rd Ed. Edited by Thomas C. Gregory. 12.00

Industrial Solvents — by Ibert Mellan. 11.00

Industrial Chemistry, an Elementary Treatise for the Student and General Reader. 4th Ed. — by Emil Raymond Riegel. 5.50

Modern Practice in Leather Manufacture — by John A. Wilson. 9.50

Soilless Growth of Plants — by Carleton Ellis and Miller W. Swaney. 2.75

Temperature — Its Measurement and Control in Science and Industry — Sponsored by the American Institute of Physics. 11.00

Principles of Patent Law for the Chemical and Metallurgical Industries — by Anthony W. Deller. 6.00

Modern Pulp and Paper Making — by G. S. Witham, Sr. Second Edition. 6.75

330 West 42 Street, New York, N. Y.

FIFTY YEARS OF **QUALITY** IN MODERN **LABORATORY FURNITURE**

INDUSTRIAL LABORATORY TABLE 6610

DESIGNED AND BUILT WITH AN UNDERSTANDING OF YOUR PROBLEMS

Today's conditions demand utmost efficiency from every piece of equipment in your laboratory . . . and that's where PETERSON LABORATORY FURNITURE rises and shines . . . designed by men who are cognizant of the very latest requirements and built by men to whom the tradition of fifty years of quality is a creed! Our staff of experts will, at your request, assist in the planning of more efficient laboratory layout . . . without charge or obligation.

Write for PETERSON'S Furniture Catalog Gratis of course.

LEONARD PETERSON & CO., Inc.

1222-34 FULLERTON AVE. CHICAGO, U. S. A.

Specify EIMER AND AMEND TESTED PURITY REAGENTS

Electrometric Titrations Employed

E & A Tested Purity Reagents are prepared and analyzed by the latest approved methods. They comply with the A. C. S. Specifications for purity, and the exact analysis of each lot is stated on the label.

The reliability provided by E & A Tested Purity Reagents has caused them to be adopted for analytical work in many leading laboratories.

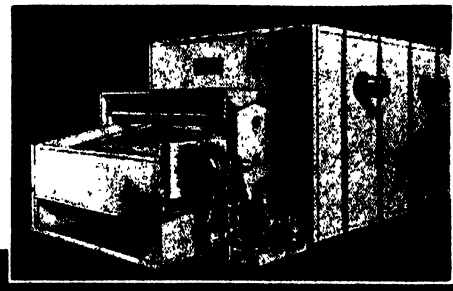
PROCTOR DRYING MACHINES

FOR THE PROCESS INDUSTRIES . . . . . .

For speedily, uniformly drying wet-solid materials having characteristics permitting the holding of a definite shape after extrusion, there is the Proctor Aero-Form Drying System with Rolling Extruder Feed shown above.



For materials that are in an extremely moist state after filtering, settling, etc., there is the Proctor Aero-Form Dryer with Fin Drum Feed which slightly pre-dries the material before it goes through the actual drying cycle.

Proctor & Schwartz engineers have solved drying problems, both simple and complex, for most of the outstanding firms in the process industries. The installation of Proctor Dryers, engineered to fit each particular need have assured drying processes of the highest efficiency.

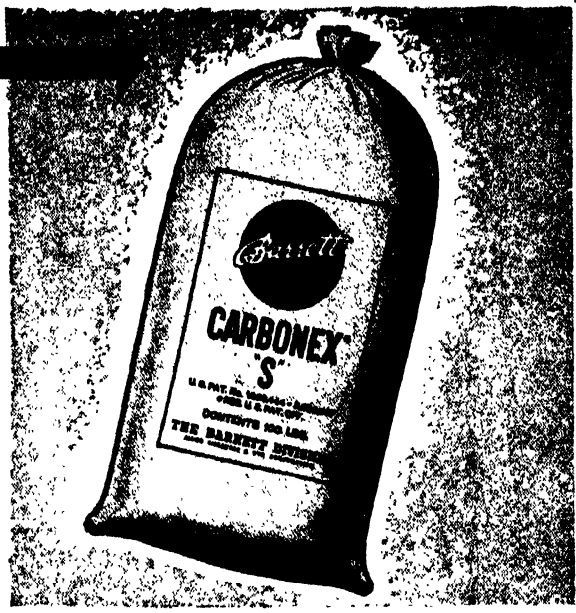
Illustrated here and briefly described in the captions are some of the satisfactory means evolved by Proctor engineering for satisfactorily drying wet-solid and plastic materials *automatically and continuously* instead of by the slow, and far less efficient batch method.

Among the great number of chemicals dried successfully on Proctor Machines are compounds of aluminum, barium, calcium, copper, lead, iron, magnesium, manganese, nickel, zinc, etc.... colors and dyestuffs...crystalline materials...cellulose and protein plastic bases, cellulose acetate, etc.

Proctor's over half a century of broad experience in designing and building drying equipment for almost every industry, from food to veneer, has earned this company widespread recognition as the leader in its field.

PROCTOR & SCHWARTZ • INC.

PHILADELPHIA



The Proctor Aero-Form Drying System with Granulator Feed, shown at left, is for the uniform, speedy drying of lumpy or granular materials and for particularly hard framed press cake.

MIX

WITH

FOR

In the cause of victory few things are more vital than conservation of the nation's dwindling rubber supplies. But fortunately there are hundreds of thousands of tons of scrap rubber available. Fortunately, too, there is no shortage of Barrett Carbonex* S.

When used in reclaim rubber stocks this improved coal-tar compounding material displays a number of significant properties.

Extender—up to 15% of the rubber hydrocarbon.

Reinforcing Softener—A highly practical control of toughness.

Rapid Extrusion—Minimizes swelling, sagging and flattening.

Improved Tear Resistance—An important factor to increase wear.

Promotes Better Processing—Calendering and extruding properties greatly improved.

Excellent Aging Qualities—A final great help in conservation.

The staff of the Barrett Research Laboratories will be glad to cooperate with you in using Carbonex S and other Barrett rubber compounding materials to meet your requirements. Wire or write today for full information.

Experiments Made in Eucalyptus Oil Production

THE largest eucalyptus tree plantations in Brazil are found in the State of São Paulo, according to a recent survey, and this state is also the principal center of eucalyptus oil production. Started in 1937, the industry has not gone beyond the experimental stage. Of the 100,000,000 eucalpytus trees in São Paulo, only 1,000,000 are of a type suitable for distillation of the oil.

Several Brazilian companies have produced oil experimentally but the results have not come up to the standard of oils imported from Australia. Unfortunately for the essential oil industry, the tall eucalyptus tree is valued chiefly in Brazil for its use as a fuel and in construction. Usually leaves from felled trees are removed for distillation with little regard for the age of the tree, selection and maturity of the leaves, time of year, and weather conditions. The resultant oils, therefore, lack uniformity.

Potash Produced from Alunite Deposits

THE Commonwealth Supply and Development Minister recently announced that the government of Western Australia will produce potash from the alunite deposits in Lake Campion, according to a report received by the Department of Commerce. It is expected that Australia will eventually supply its total requirements from this source; production will begin with 5,000 tons a year.

Sales of Industrial Chemicals Decrease

WHOLESALERS' sales of industrial chemicals of 20 establishments decreased 10 per cent this August, as compared with August a year ago, according to a report of the Bureau of Census. Sales decreased 7 per cent over those made in July; total August sales were $1,477,000.

Sales of chemicals for the first eight months of this year were reported at $16,216,000. Inventories at the end of August, as reported by 15 establishments, were valued at $916,000, 35 per cent more than those of the previous August. Stock sales ratio for August was 76; for July, 72; for August, 1941, 49.

Sweden Reveals Insecticide Shortage

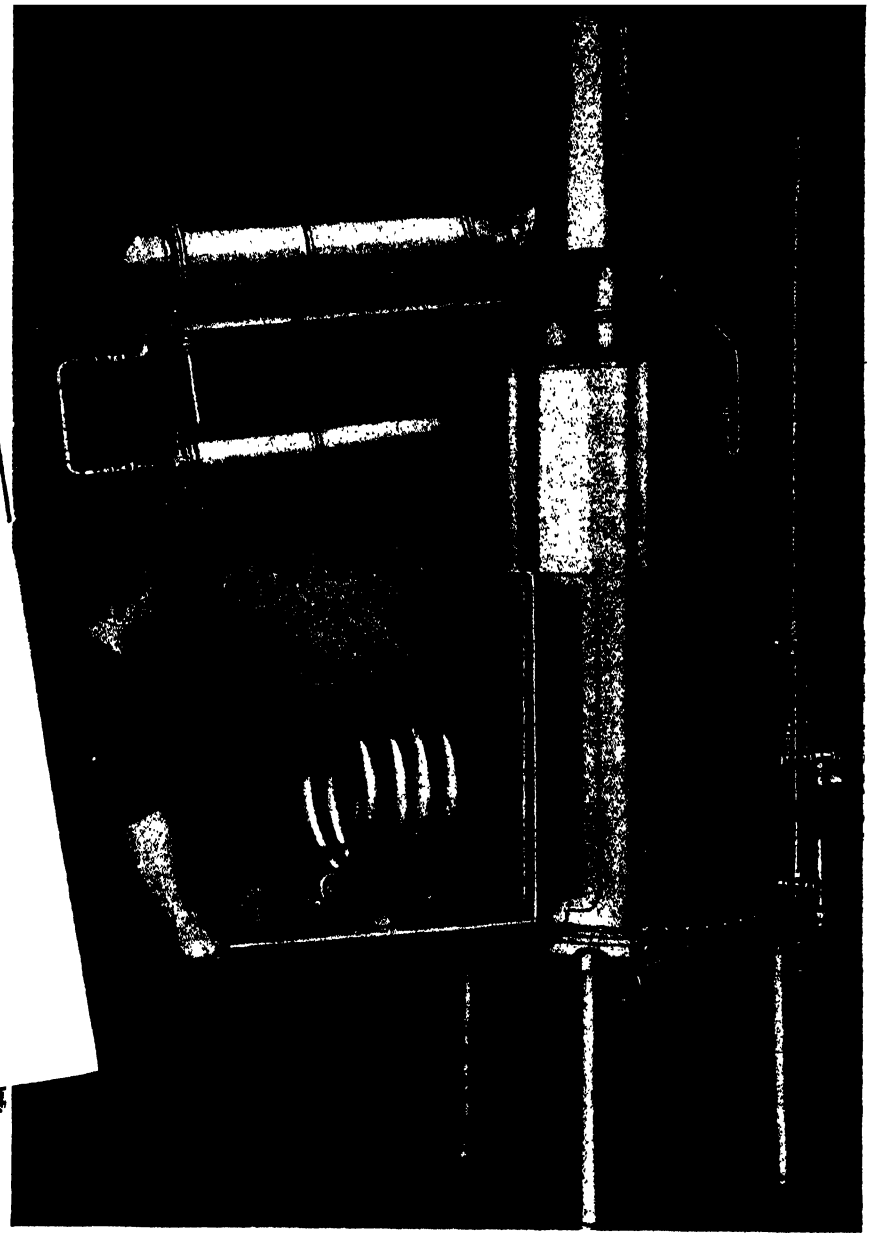
RECENT reports from Sweden to our Government indicate an increasing shortage of insecticides. There are still substantial stocks of arsenic powder, but nicotine preparations cover only two thirds of the requirements. Supplies of copper sulfate for the treatment of potatoes against plant mold are sufficient for only 10 per cent of the potato acreage.

THE annual consumption of phenol in Mexico amounts to approximately 10,000 kg., it is stated in an industrial report to the Department of Commerce. The United States, and formerly Germany and the Netherlands, have been the chief suppliers.

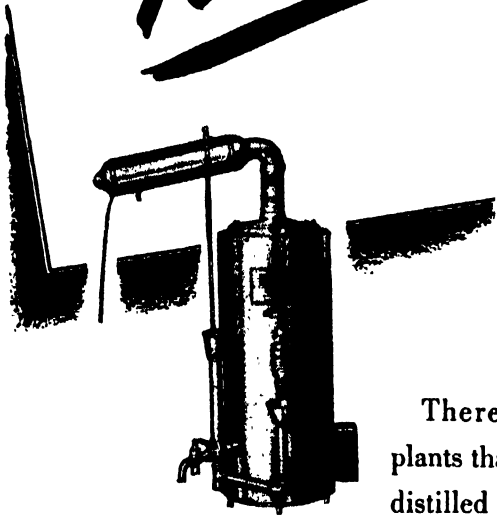
Venezuela Develops New Asbestos Deposit

A PROMISING asbestos deposit has been found near Tinaquillo in the State of Cojedes, Venezuela, and is being developed by Cia. Anon Minas de Amianto de Tinaquillo of Caracas, Venezuela. Most of the asbestos is in irregular cross-fiber veins similar to those in Quebec, Canada.

A mill capable of handling 6,000 tons of asbestos fiber a year is now under construction and is scheduled to be put into operation by the end of 1942.



Germany Studies Magnesite Industry



GERMAN controlling interests are studying methods of bolstering Austria's magnesite industry, according to a report to the Department of Commerce. Within the past year a research group has been looking into the production and treatment of magnesium metal, and a company has been organized to investigate the use of magnesite refractories.

FIVE known deposits of alunite in Australia have been reported by investigators appointed by the South Australian Chemical Institute to study the state's alunite possibilities, says an unofficial report to the government. One of the deposits merits particular attention because of its location close to Port Pirie, where adequate shipping and transport facilities are available.

They Put Plants and Labs *On Even Terms*

There are many plants that need pure distilled water for actual product productions as well as for experimental laboratory work. And to be on the safe side—to insure production quality on a par with laboratory work—these plants use Barnstead Water Stills on both the production line and laboratory bench.

Barnstead large industrial type stills produce distilled water that is just as pure in quality as the distillate of the small Barnstead laboratory type stills. Moreover, they produce this pure distilled water at a very low cost. They are operated economically by steam and they have easy-cleaning facilities and special features for preventing scale formations within the still.

There is a Barnstead Water Still for every requirement. Sizes range from ½ to 500 gallons per hour. Operation of laboratory type stills is by gas, steam, or electricity.

New Chemical Method of De-salting Water

Replaces

DISTILLED WATER

at a fraction of the cost in

PROCESS INDUSTRIES
AIRCRAFT PLANTS
DISTILLERIES
PHARMACEUTICAL HOUSES
SYNTHETIC RUBBER PLANTS
CERAMIC INDUSTRY

The ILLCO-WAY method of purifying water is one of ion exchange, using Amberlite synthetic resins to produce a final effluent which compares very favorably with single-distilled water. The water is not evaporated, so no heat is used in the process which is daily meeting the exacting standards of industrial and technical concerns requiring purified water.

1,000 gallons for less than a dollar!

LOW COST — The cost of the treated water is amazingly low — *less than a dollar per thousand gallons*, on the average water supply, including depreciation and maintenance. And when the supply is low in dissolved solids, the cost may be considerably less.

No Heat Used— No Fuel Required!

Operation is completely automatic (between periodic regenerations). Pipes will not lime up. Maintenance costs are reduced to a minimum. A unit delivering 300 gallons an hour occupies a space about 4 x 10 feet. Made of finest materials to protect the purity of water. Available in units producing from 100 to 50,000 gallons an hour.

Tungsten Production in Americas Increased

CHIEF producers of tungsten are Bolivia and Argentina, both of which have signed agreements for sale of their exportable tungsten to the United States. Argentina is expected to increase her tungsten production to about 3,000 tons a year, according to a release from the Office of the Coordinator of Inter-American Affairs. Some tungsten is produced in Peru, Mexico, Brazil, and Chile.

Algin Used in Waterproofing Agents

THE Industrial Research Council in Eire has been experimenting with the utilization of algin in making waterproofing agents and plastic materials. A product was prepared which proved upon testing to be a satisfactory substitute for sago flour in the sizing of twine. The possibilities of this material as a substitute for starch are also being investigated.

Syrian Alcohol Production Decreases

ALCOHOL was formerly manufactured in Syria from molasses imported from Czecho-Slovakia, and the cutting off of imports from that country obliged manufacturers to use seeds and grains obtainable locally. The higher cost of these materials resulted in a considerable increase in the price of alcohol, which rose to about $2.75 per gallon at the end of last year. This caused a decreased demand, and the output for 1941 dropped to 130 tons, about 50 per cent of the normal annual production.

New Franco-German Dyestuffs Company Created

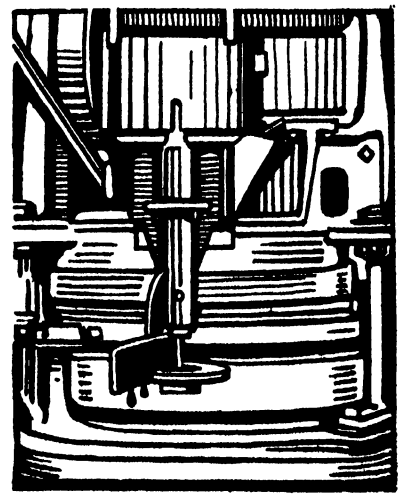
CREATION of a new Franco-German dyestuffs company has been approved by the Vichy government, according to an unofficial report. The company will be known as Société Anonyme de Matières Colorantes and Produits Chimiques Francolor, and capital has been fixed at 800,000,000 francs. It is stipulated that at least half the directors shall be French and that the president of the company must always be a Frenchman. German capital, however, holds a controlling interest in the stock.

BRAZIL'S principal chemical imports in 1940–1941 were as follows: mineral salts, caustic soda, and other inorganic chemicals, 93,933 tons in 1940 and 85,306 in 1941; pharmaceutical and other synthetic organic chemicals, 45,627 tons in 1940 and 42,420 in 1941; aniline dyes, essences, etc., 4,778 tons in 1940 and 6,682 in 1941.

Corn Fungus Used For Medicinal Purposes

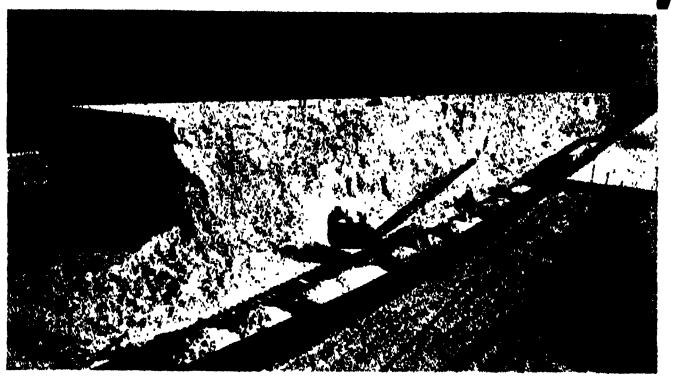
IN MEXICO the prosaic corn plant, products of which range from Bourbon whisky to paper, harbors a fungus which may become an important substitute for ergot, if unofficial reports from that country prove to be correct. Experiments are being conducted with a view to determining the efficacy of this parasite.

Rubber and Cinchona Development in South America



THE United Fruit Co. may establish plantations to cultivate rubber and cinchona in several South American countries, including Colombia.

ALTHOUGH the extension of the war and the shortage of tonnage destroyed many former markets, unofficial reports received from Chile by the Department of Commerce indicate the nitrate industry maintained a high level of activity during the past year. For the first time since 1933 stocks on hand were low enough to require extra production to build them up as a reserve against possible heavy sales.



HAITIAN trade statistics, obtained through a Department of Commerce report, show 18,673 kg. of chemical and pharmaceutical products imported during May, valued at $6,489. For the 8 months October 1941 to May 1942, imports were 471,758 kg., with a value of $133,074.

A PROJECT to increase the production of power alcohol in India has been approved by the War Resources Committee, states an unofficial British report to the government. Twelve plants have been ordered from the United States.

THE Chile nitrate plant "Rica Aventura", which had been closed for 12 years, is again in operation and production has begun. it is stated in an unofficial report from Britain.

makes possible

EXACT VOLUME CONTROL

in Pumping Chemicals

With a Milton Roy Step-Valve Pump you can handle chemicals in precise quantities, from full pump capacity *down to one pint or less per hour.*

You can pump acid sludge, slurries, liquid latex, asphalt, fibrous materials in suspension, etc. . . . as well as acids, alkalis, oils and treating chemicals.

You have a wide choice of materials of construction . . . any metal which can be cast or forged and machined . . . or machined from the solid, metal or transparent plastics.

Milton Roy Pumps are simple, with few moving parts. Step-Valves, with double-ball checks, are non-clogging and self-cleaning, eliminate air-binding entirely, minimize wire-drawing.

Other features include adjustable plunger stroke, while operating if desired; integral-gear motors; compact design; heavy construction.

Capacities: Simplex Pumps, 1300 g.p.h.; Duplex Pumps, 2600 g.p.h. Special pumps to order. Write for catalog.

We are still making prompt deliveries of most standard pumps. If we can help in your war effort 'phone or wire.

Roy PUMPS

Foundation Appointments

THE appointments to fellowships under the sixth annual series of fellowship awards of the Lalor Foundation, which covers the academic year 1942–43, are:

A. Calvin Bratton from the University of Texas to work with E. K. Marshall at Johns Hopkins University Medical School.

Edward H. Frieden from the University of California to work with Roger J. Williams at the University of Texas.

Francis J. Reithel from the University of Oregon to work with Edward A. Doisy at St. Louis University School of Medicine.

James R. Weisiger from Johns Hopkins University to work with A. Baird Hastings at Harvard University Medical School.

The work of these men is in fields closely associated with problems related to the war.

Owing to war conditions, appointments to the five remaining fellowships originally scheduled for the 1942–43 series have been postponed.

The present plan of the foundation is to discontinue its regular program of fellowship awards until the demobilization of scientific personnel at the end of the war. Thus the usual fellowship awards will go into a reserve to form an accumulation for post-war assignment. To date 15 such awards are scheduled to be made available at that time for post-doctorate research in chemistry. The standard annual stipend of a Lalor Foundation award is $2,000.

Annual Tables of Physical Constants

THE Annual Tables of Physical Constants and Numerical Data are being delivered in installments of 32 pages, and the first installment of the issue for 1942 has just been sent out. It includes fundamental constants, structure in liquids, transference numbers of electrolytes, and heat and entropy of fusion. Headquarters are at the Frick Chemical Laboratory, Princeton, N. J.

URUGUAY has taken steps to conserve its supplies of medicinal chemicals, according to an unofficial report to the Government. Stocks must be declared and a committee of doctors and pharmacists has been appointed to control their allocation.

THE manufacture of vanillin from sulfite lye will be attempted for the first time in Germany by Ligrowa, G. m. b. H., according to unofficial sources. This company was recently established at Mannheim, with a capital of 1,200,000 marks.

RESERVE stocks of phosphate are being built up in the Netherlands West Indies, shipments for the June quarter being less than in the previous quarter. The Newport phosphate mine has continued to operate with about 300 men employed.

P. Duff & Sons Establishes Industrial Fellowship

P DUFF & SONS, INC., Pittsburgh, Penna., has founded in Mellon Institute an industrial fellowship that will be concerned with the scientific investigation of the production, improvement, properties, and uses of cane molasses; the development of better and new cake mixes; and the evolution of other ready-to-use mixes for baking purposes, embracing composition, preparation, packaging, and storage.

Arthur J. Nolte, a food specialist, assumed the incumbency of this fellowship on October 22. Since 1935 he has been with the U. S. Bureau of Agricultural Chemistry and Engineering at Winter Haven, Fla., as chemist.

Montana Awards in Chemistry

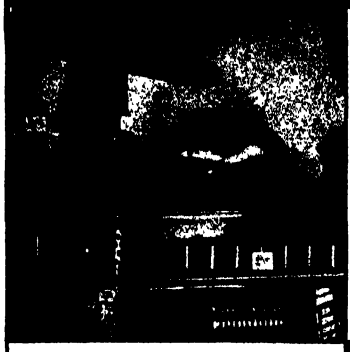
IN THE item regarding awards in chemistry at Montana State College [CHEM. ENG. NEWS, 20, 1238 (1942)] the name of Sam Eagle, who received the award in 1931, was omitted. Mr. Eagle is now with the Standard Oil Co., Richmond, Calif.

Institute of Gas Technology

NEW appointments to the research staff of the Institute of Gas Technology, Chicago, Ill., are Paul E. Peters, formerly of the North Shore Chemical Industries, E. P. Walter, recently of Stepan Chemical Co., and Paul W. Garbo, recently with the Barrett Division.

Isopropyl Ether Explosion

IT IS well known that isopropyl ether forms peroxides very readily, and that these peroxides may cause an explosion if the ether is distilled or an ether extract is taken to dryness on a hot plate. It seems less well known that an old sample of isopropyl ether may detonate if jarred.



A 5-gallon can, about one quarter full of isopropyl ether, was placed on the floor under a shelf in the stockroom several years ago and apparently forgotten. One morning a janitor decided to move it when he swept. As soon as he lifted the can, it exploded. The detonation occurred in the liquid phase, not in the vapor. The upper part of the can was uninjured. The tin in contact with the liquid showed no evidence of great force outward, but the metal was stretched severely. The tin was pulled thin, and many small tears appeared, a few millimeters in length. The two largest tears were 4 and 14 cm. long.

Fortunately, the ether did not catch fire, and the janitor was uninjured.

Second Annual Science Talent Search

TWENTY-FIVE thousand high school principals and teachers have been invited to take part in a nation-wide search among the country's 1,650,000 high school seniors for the 40 most talented young scientists of that age in America.

The 40 are to be singled out for special honors and opportunities including attendance at a five-day Science Talent Institute at Washington next February, and up to $14,000 in scholarships.

The invitation was sent by Science Clubs of America, an organization fostered by Science Service. The Science Talent Search, second to be held, is made financially possible by the Westinghouse Electric & Manufacturing Co., which will award Westinghouse Science Scholarships to at least 10, and possibly 40, of the young scientists of the future.

During the institute the contestants will compete in final examinations for the scholarships, which will result in the awarding of eight four-year Westinghouse Science Scholarships of $400 each and two four-year Westinghouse Science Grand Scholarships of $2,400 each, worth $600 per year. One boy and one girl will be selected as winners of the Grand Scholarships. Alternates will be named. Additional $100 scholarships will be awarded at the discretion of the judges.

The Science Talent Search is administered by a committee of four: Harlow Shapley, director, Harvard Observatory, and chairman of Science Service's executive committee; Watson Davis, director, Science Service; G. Edward Pendray, assistant to president, Westinghouse Electric & Manufacturing Co.; and E. B. Roberts, assistant to vice president of Westinghouse.

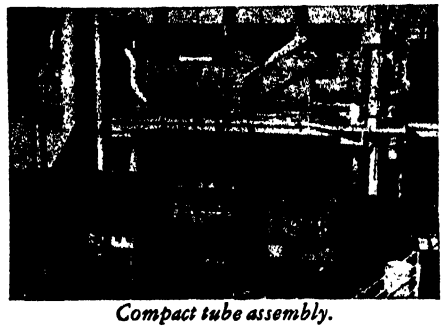
Corrosion Division of Electrochemical Society Formed

ON OCTOBER 9 at the fall convention in Detroit, the Corrosion Division of The Electrochemical Society was organized. At this meeting bylaws were adopted and the following officers elected: chairman, L. G. Vande Bogart, Research and Development Laboratories, Crane Co., Chicago, Ill.; vice chairman, H. H. Uhlig, General Electric Co., Research Laboratory, Schenectady, N. Y.; secretary-treasurer, R. H. Brown, Metallurgical Division Aluminum Research Laboratories, Aluminum Co. of America, New Kensington, Penna.

The Corrosion Division was organized because of the interest displayed by a large number of the members of The Electrochemical Society in this phase of the work. Its object is to coordinate the interests of the society relating to corrosion with individuals and organizations which are particularly interested and active in this field, to solicit papers, and plan symposia.

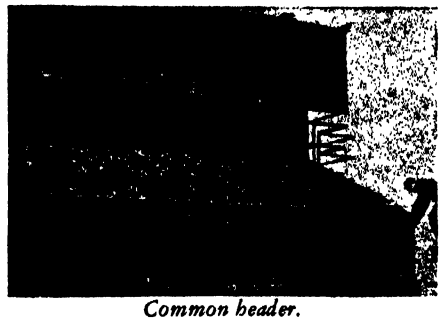
Conservation of Critical Materials

APPLICATION to the war production effort of all the skill and management "know how" acquired by General Motors through many years of manufacturing experience is resulting in the conservation of thousands of tons of critical materials, in important savings in man hours (thus releasing men and machines for further vital work), in sharply reduced costs, in the organization of new methods in maintenance and service, and in substantial contributions to an advancing military technology, Alfred P. Sloan, Jr., chairman of the corporation, states.



Mr. Sloan says that production rates have been accelerated, engines have been increased in horsepower, guns have been simplified and given longer life, and improvements have been made in tank construction, in airplane propeller design, and in the manufacture of shells. New devices have been developed, new characteristics built into old devices. Meanwhile, a sound basis has been established for continued advance in war production techniques.

Henry Sonneborn, III, resigned his position as assistant technical director of L. Sonneborn Sons, Inc., to accept an ensign's commission in the U. S. Naval Reserve, and is attached to the Naval Ammunition Depot, Portsmouth, Va.



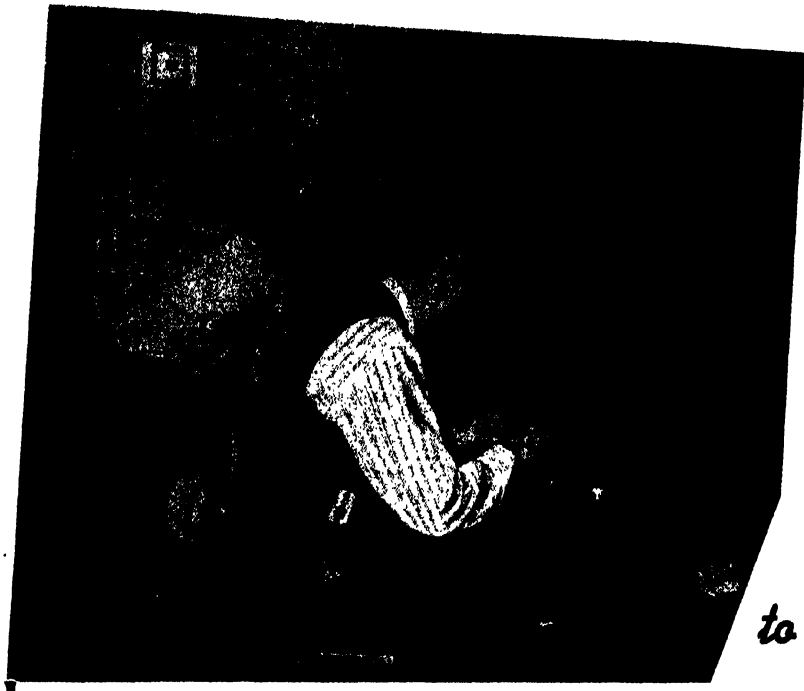
MULTICLONES

Eliminate MANIFOLDING

Multiclone's exclusive vane design permits any number of tubes to be installed with one inlet header and one outlet header simplifying construction and eliminating the complications of manifolding. Less material is needed. Less floor area and less headroom are required. Because the gas travels over a smaller surface there is less surface subject to wear and because of the vane type of construction, should wear occur, it can affect only parts that are easily and readily replaceable without dismantling the entire unit. In the Multiclone, the simplified header construction together with the enclosure of the tubes by the hopper greatly reduces heat radiation. This facilitates temperature control and where condensation might occur reduces insulation requirements to a minimum. The Multiclone design makes possible its installation in existing structures in what would otherwise be waste space and in places where manifolding would be impossible. The single manhole through which all tubes can be reached simplifies inspection. Thus the elimination of manifolding simplifies installation, saves space, decreases wearing surface, reduces heat radiation and gives better temperature control.

Compact tube assembly.

Common header.



No manifolding. Multiclone discharges directly into flue.

WESTERN Precipitation CORPORATION

DOMINION SQUARE BUILDING, MONTREAL

With this Instrument H-B INSTRUMENT CO. determines temperatures to within .001 degree!

Here's How It Works For You!

The overnight importance of high-flying aircraft in our War effort resulted in demands by the petroleum industry for a Thermometer accurate in the temperature range from minus 42°F to minus 28°F for the determination of viscosity in lubricating and other special oils.

Mercury, freezing at minus 38°F., could not be used. Liquid-in-glass Thermometers gave widely varying results because of residue clinging to capillary walls upon rapid cooling to such temperatures.

Now—Accuracy to Minus 42°F.

To solve this problem, the industry turned to the extra facilities and experience of H-B INSTRUMENT COMPANY. Collaborating with the petroleum refining laboratory of The Pennsylvania State College, H-B INSTRUMENT COMPANY brought out a mercury-alloy filled thermometer reading to minus 42°F. Further research has now made possible a thermometer reading safely to minus 50°F.

DOUBLE H DIAMOND B

TRADE-MARK REG. U. S. PAT. OFF.

CONTINUOUS LEADERSHIP IN THE MANUFACTURE OF MERCURY-IN-GLASS THERMOMETERS

Portraying the extra contribution that H-B INSTRUMENT COMPANY makes in the temperature field is the fact that its Certified Standard Thermometers are constantly checked and rechecked against the International Temperatures Scale with a Platinum Resistance Thermometer. This insures a continuing guarantee of accuracy for critical H-B thermometers and thermostats.

The use of the Platinum Resistance Thermometer and Mueller Bridge Circuit, through application of the Callendar Formula, makes possible the manufacturing of thermometers in a new temperature range. In this way, a new mercury or mercury-alloy thermometer is developed. It is then checked against the Platinum Resistance Thermometer to determine the accuracy of this first instrument and thus construct a dependable standard for the new line. With this instrument reading temperatures to .001° H-B INSTRUMENT COMPANY can make standards enabling them to guarantee new or special thermometers accurate to .01°.

This is why today's vital Ordinance plants turn first to H-B INSTRUMENT COMPANY for special temperature instruments for TNT, Toluene, and other explosives and for radio transmission thermometers and thermostats.

Let H-B Instruments solve your unusual Thermometer problems.

Our complete catalog, "Blue Book Part V for Science and Industry", is available upon request. Write for your copy today.

Great Jumping JEEPS!

MEET THE ARMY'S MECHANICAL MULE . . .

The Jeep—our Army's mechanical mule, has achieved a reputation of out-climbing, out-pulling and out-maneuvering anything of its weight ever put on four wheels. On every war front in the world, the Jeep is now the pride and joy of Brass Hats and Buck Privates alike.

But remember the men who build the Jeeps—those who train to operate and follow them—and the millions of others who are engaged in our war effort. For all, there had to be an abundance of water. It was the Layne Organization, who in the majority of cases, drilled the wells and built the systems that provide water by the millions of gallons. To a well water system, the name Layne is as famed as is the name Jeep to a four wheel vehicle.

Layne's reputation like that of the Jeep has been won on the field of action. Throughout the entire Nation, Layne wells and pumps are doing a magnificent job—providing water for ordnance plants, munition factories, training camps, air fields, ship yards and all kinds of war material producers. For late bulletins, address,

Lead Substituted for Critical Materials

EVER since the Bureau of Industrial Conservation of the War Production Board several months ago placed lead in the group of materials available in sufficient quantity to be used as a substitute for more critical materials, the WPB, Army and Navy officials, as well as industry, have been searching diligently for uses of lead that would relieve more critical materials. Lead is the only common metal classified in the least critical group. Already considerable progress has been made.

The use of lead to save critical materials falls naturally into two categories. First, there are many purposes for which lead is normally used to a greater or lesser extent in competition with other materials now critical, for example, in plumbing and for sheet metal work on buildings. Lead-base bearing alloys are rapidly supplanting tin-base alloys in ship construction, Diesel engines, and many other places. Lead-base die-casting alloys are supplanting zinc-base alloys for many purposes when high strength is not important but where good casting qualities are. The lead-base alloys, in addition, are generally superior for corrosion resistance.

Lead pipe and tank linings are taking the place of rubber in many industrial operations. Lead gaskets are, in many instances, proving superior to rubber gaskets used for a multitude of purposes. Lead collapsible tubes have largely displaced those made of tin and aluminum, and lead foil laminated wrappings are finding wide use. Lead coatings are saving much zinc, tin, cadmium, and nickel, formerly used to protect iron and steel products.

In the paint field, considerable savings of critical materials are also possible through wider use of lead pigments.

Lead alloy name plates, hard lead drum trap covers and rings, and water closet floor flanges take the place of brass. Lead alloy couplings are being employed in place of copper and bronze on certain types of cement-asbestos pipe.

Schenley Research Institute

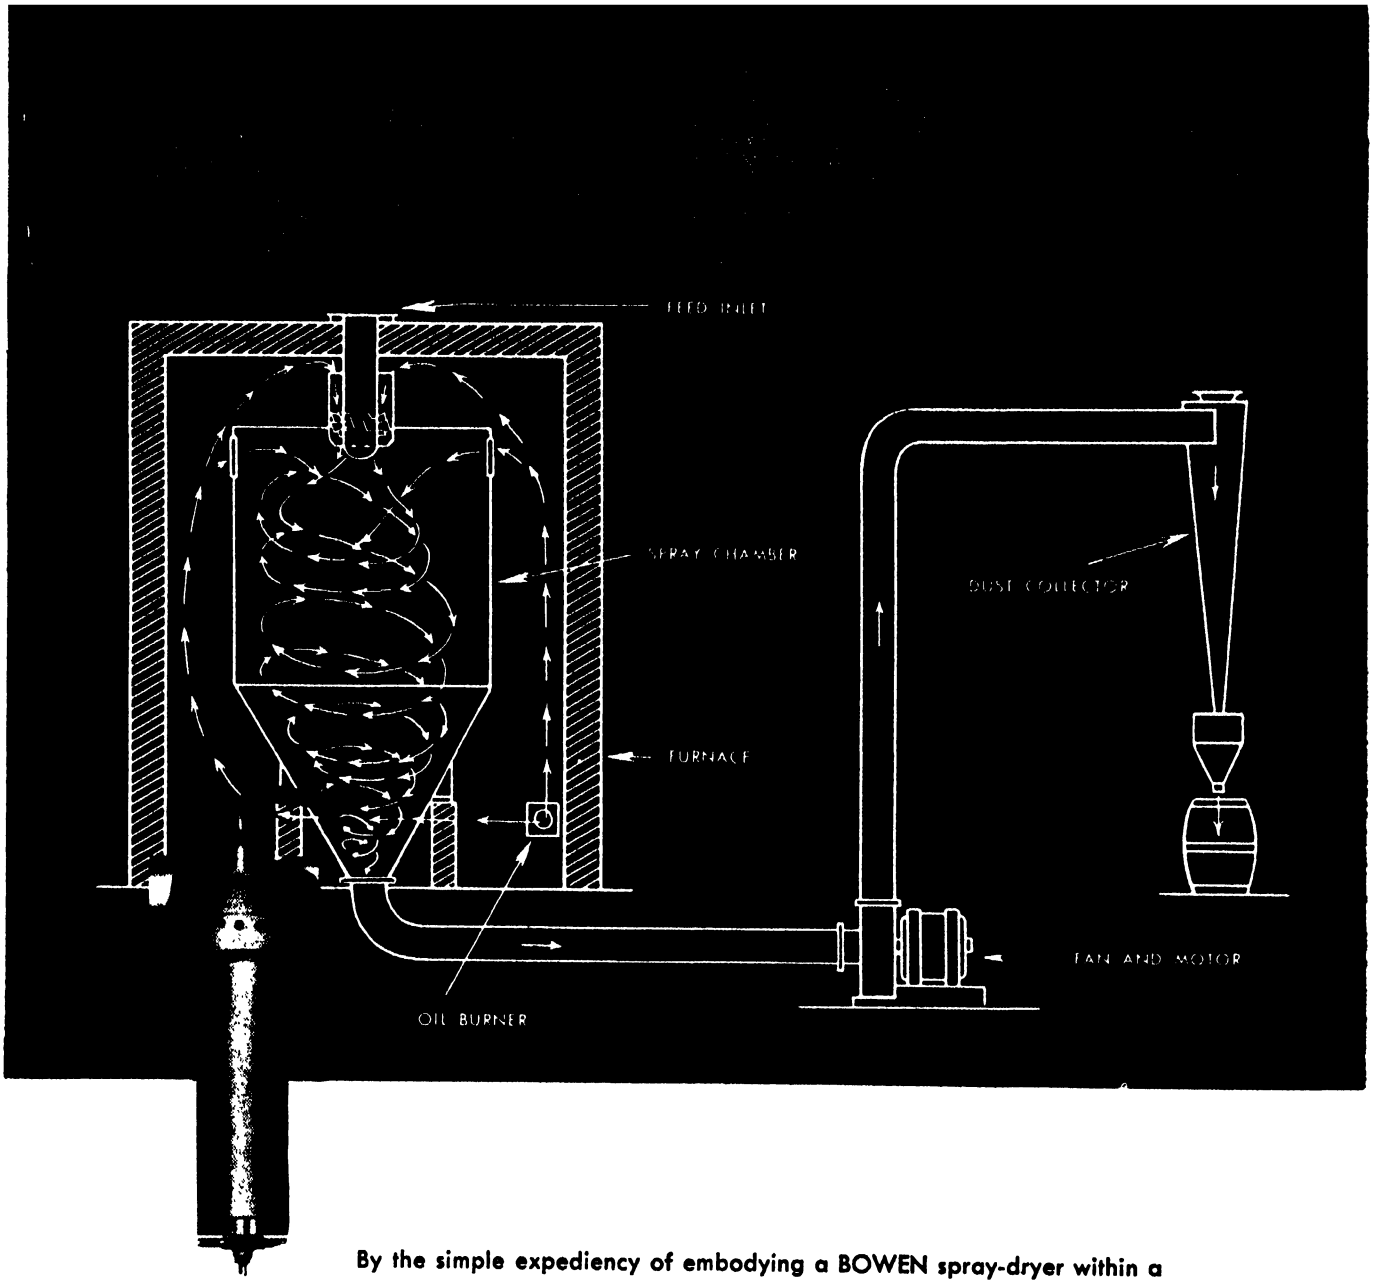
THE Schenley Research Institute, Inc., formerly in the Empire State Building, New York, N. Y., has recently been moved to Lawrenceburg, Ind., where it previously has maintained divisional laboratories. The present laboratories are located in much larger quarters and will combine current research activities.

The laboratory is under the direction of A. J. Liebmann, president, assisted by six divisional heads: G. de Becze, W. Nelson, F. Pellett, M. Rosenblatt, E. Stevens, and T. Wiehe, Jr.

Soap Dispersions Speed Production

OF DEFINITE importance in large-scale industrial and war work is a revolutionary type of paint recently developed. It consists essentially of a suspension of synthetic resins and pigment in soapy water. This paint is nonflammable, quick drying, and eliminates noxious vapors. Resin emulsion paints are being used to camouflage gun emplacements, munitions depots, and large war plants. The dull finish for many Army vehicles is supplied by emulsion paints.

Soap is applied to other war problems in a modern method for the preparation of building blocks from clayey soil and a bitumen emulsion (U. S. Patent 2,275,087). Large numbers of field structures must be put up quickly in modern warfare, and any method which eases the strain on transportation facilities is of obvious value. In this new process only a portable mixer-extruder and a small amount of soap bitumen emulsion need be transported. The main component of the blocks can usually be obtained from the ground around the building area. Another advantage is that the blocks dry within 24 hours, so that fast construction with little storage space is possible.



Asphaltic emulsions will also help alleviate the rubber tire shortage when the new "wrap-around" substitutes are ready for sale. These consist essentially of a heavy ruglike cloth coated with an asphalt emulsion, which can literally be wrapped around the worn-out tires. While the mileage obtainable from these coatings is not great in comparison with rubber treads it is reported that their use is justified by their low cost.

Soap as a Road Builder

THE value of soap as a road-building material was tested recently in experiments made by the Michigan State Highway Department. Soap was mixed with fine sand and used in an effort to resist surface scaling resulting from the use of calcium chloride and sodium chloride spread to remove ice in winter.

Soap a Black-Out Aid

IN BRITAIN where enemy bombers can be guided to their objectives by light-colored roads visible from the air, bituminous emulsions made with soap are being considered to black-out these conspicuous surfaces. By painting a dilute bitumen emulsion on the roadway and dusting with pulverized coal, a cheap and durable blackening effect is obtained (British Patent 534,889).

By the simple expediency of embodying a BOWEN spray-dryer within a furnace, so that the walls of the chamber are radiant, the rate of evaporation is speeded tremendously. A drop of water under such conditions becomes similar to a "Black Body" because the radiant heat is all absorbed, and none is given out. The products of combustion enter the drying chamber in the usual manner and perform their drying operation by conduction and convection, but in addition, the radiant walls of the drying chamber adds heat to the particle of water with the speed of light. This heat penetrates to the center of every particle, vastly increasing its enternal energy and rate of evaporation. Inquiries are invited.

BOWEN

NIACET PRODUCTS

VINYL ACETATE

For the preparation of poly vinyl acetate, alcohol, and acetal resins and emulsions; rubber substitutes; synthesis of sulfathiazol and vitamin B_1.

ACETONITRILE

For the preparation of acetamidine, vitamin B_1, and other synthetic organic chemicals. A solvent for practically all non-paraffine compounds.

MANGANESE ACETATE

For the manufacture of paint and varnish driers; for mordants in textile and leather dyeing; and as a catalyst in various organic syntheses.

COPPER ACETATE

(free flowing, non dusting)

For the manufacture of paint, varnish and lacquer pigments; linoleum and oil cloth; inks; insecticides and fungicides; wallpaper; and as a mordant in the dyeing of furs and textiles.

Live and Learn

After thirty-odd years of experience in the chemistry and technology of foods I recently have had two experiences which suggest that a specialist may be surrounded by everyday facts connected with his speciality but concerning which he is utterly ignorant.

1. I have long deemed it expedient to order poached eggs at restaurants of questionable standing in view of the fact that only a first-class egg will poach successfully. A short time ago at a restaurant of reasonably high grade I was served a "sour" poached egg and on complaining was informed that they always put vinegar in the water in which eggs were to be poached and that an apology (and another egg) were due me because this time the chef had overdone the acidification. I wonder whether this custom is due to an accidental discovery or to expert professional advice.

2. On the diner recently I was served ice cream, the taste of which brought me up standing almost literally. There was an acrid pungency to it utterly foreign to my experience with this favorite delicacy. Instantly I was flooded with thoughts of toxic bacterial activity. I called the steward and reported, expecting him to register at least mild excitement. Not at all. He explained quite casually that the strange taste was that of the dry-ice in which the ice cream had been packed and that my experience was a common one. I tasted again gingerly and was convinced it was the flavor of the useful, necessary carbon dioxide and none other, obviously highly soluble in ice cream mix at freezing temperatures.

McGill University Course on Elastomers

The Department of Chemistry, McGill University, Montreal, Canada, is offering for the fifth consecutive year an extension course on the chemistry and technology of resins and elastomers. The instructor is R. V. V. Nicholls, assistant professor of chemistry and secretary of the Rubber and Plastics Division, Society of Chemical Industry. The course is planned especially for industrial chemists, fabricators, and sales promotion men.

Sulfur Production Continues Upward

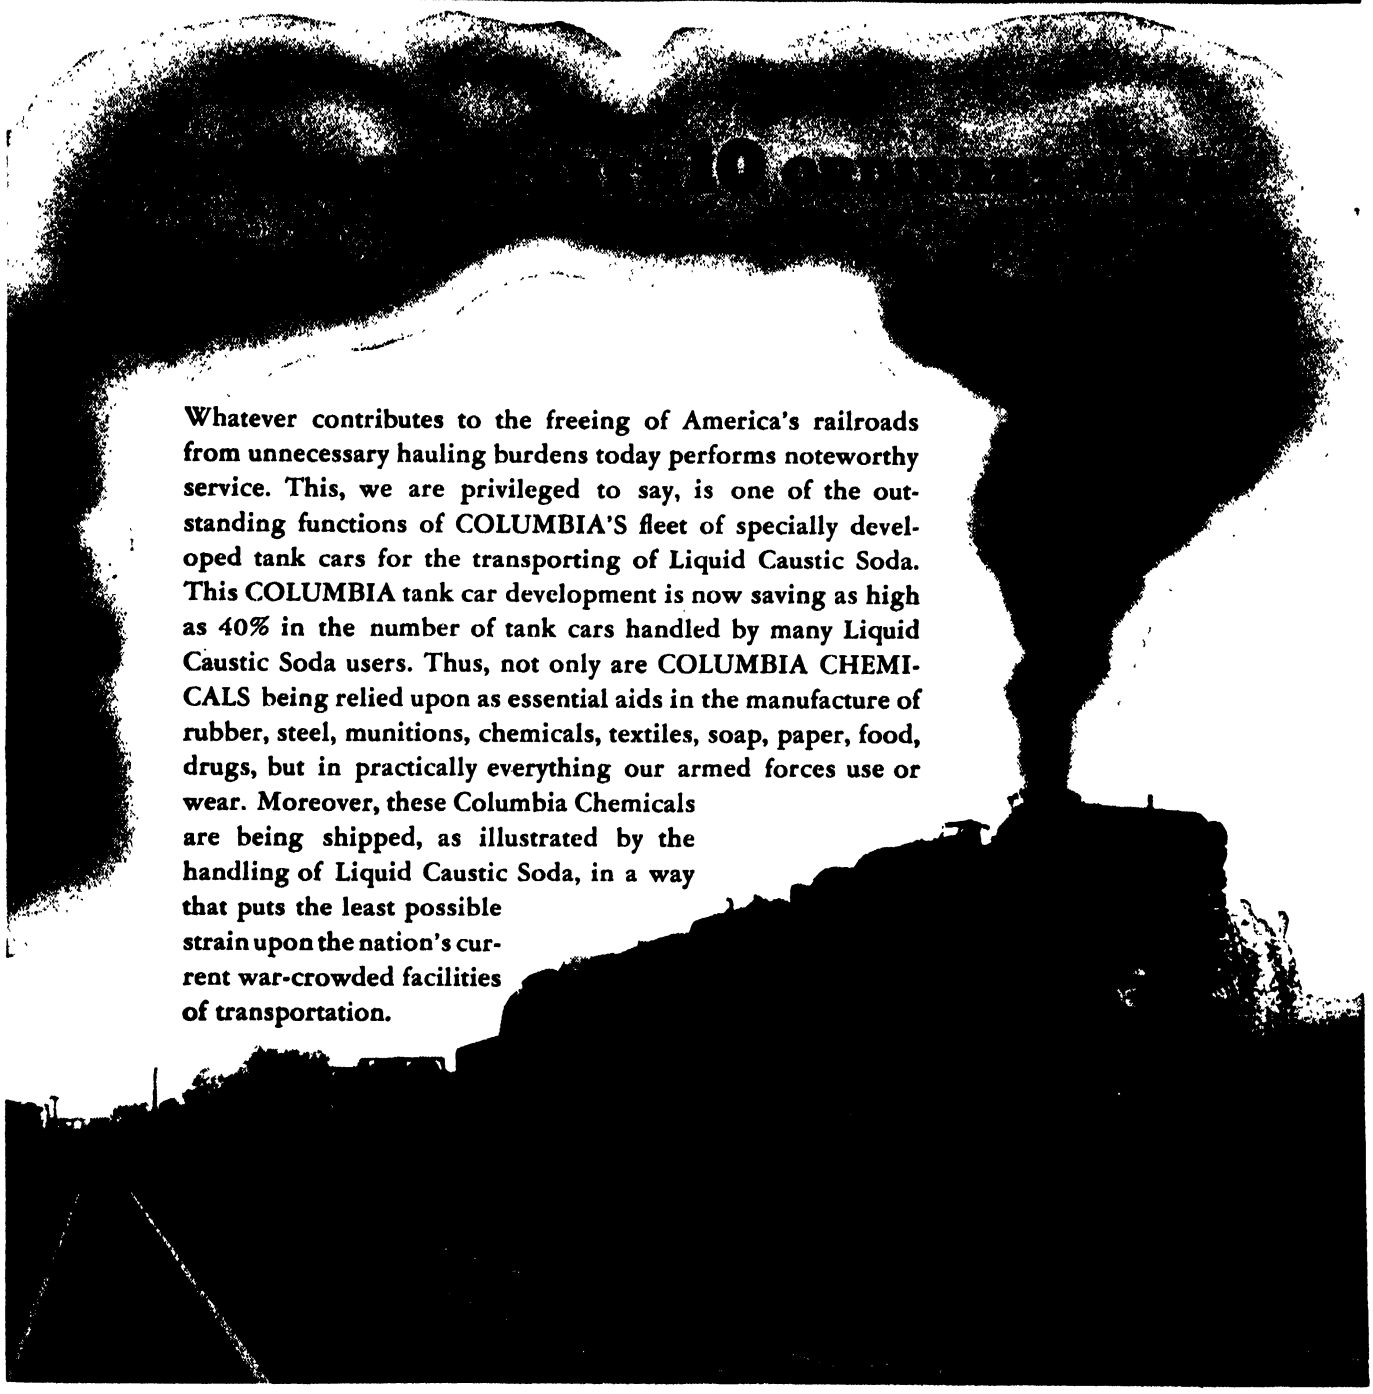
Production of sulfur in the United States increased 25 per cent in the first 8 months of 1942 compared with the same period of 1941, according to a statement released by the Bureau of Mines, Department of the Interior. Mine shipments increased 9 per cent. Producers' stocks of sulfur at mines, in transit, and in warehouses were built up from 4,685,843 long tons on January 1 to 4,927,673 tons on August 31, 1942, a gain of 5 per cent.

Decontamination Squad

The laboratory of the American Cyanamid Corp., Stamford, Conn., has organized, trained, and equipped what is believed to be the first decontamination squad in the State of Connecticut, and is now training a city squad in the same work. T. F. Bradley, a research group leader at the laboratory, is leader of the squad there and is instructor of the city squad, as well as gas identification expert for the Auxiliary Police.

The laboratory squad numbers ten, all trained in how to combat the effects of gas, and equipped with masks and gasproof clothing.

Cellophane Protecting Army Rations



Cellophane is among the materials tested and approved by the U. S. Army Quartermaster Corps for the protection of emergency rations, and tons of cellophane have gone into this use. The packaging must keep foods satisfactorily for a year, protecting them from snow and subzero temperature as well as the sun, heat, and high atmospheric humidity of the tropics. The K ration, formerly called "parachute ration", is now intended for general use in training maneuvers and in many fighting areas. It consists of three meals, weighing slightly more than 2 pounds and providing more than 3,700 calories of energy.

Nutritional Charts for Medical Specialists

Nutritional Charts prepared expressly for medical, dental, and dietetic specialists by the staff of the Research Department, H. J. Heinz Co., Pittsburgh, Penna., has recently been issued in its 11th edition. This is a 44-page compilation that brings up to date information on biotin and other newer members of the vitamin family, and includes a table on clinical criteria of early deficiency disease symptoms in human beings, enzyme-vitamin relationships, and summarized information on the conservation of the nutritive value of foods.

After preliminary experiments conducted by Industrial Gases, Ltd., and the Electricity Supply Board, a plant has been completed in Dublin for the manufacture of zinc oxide. Production, according to unofficial reports, is now progressing at the rate of 10 cwt. weekly.

COLUMBIA CHEMICALS

Whatever contributes to the freeing of America's railroads from unnecessary hauling burdens today performs noteworthy service. This, we are privileged to say, is one of the outstanding functions of COLUMBIA'S fleet of specially developed tank cars for the transporting of Liquid Caustic Soda. This COLUMBIA tank car development is now saving as high as 40% in the number of tank cars handled by many Liquid Caustic Soda users. Thus, not only are COLUMBIA CHEMICALS being relied upon as essential aids in the manufacture of rubber, steel, munitions, chemicals, textiles, soap, paper, food, drugs, but in practically everything our armed forces use or wear. Moreover, these Columbia Chemicals are being shipped, as illustrated by the handling of Liquid Caustic Soda, in a way that puts the least possible strain upon the nation's current war-crowded facilities of transportation.

The Stone That Burns. *Williams Haynes.* 345 pages. D. Van Nostrand Co., Inc., 250 Fourth Ave., New York, N. Y., 1942. Price, $3.75.

AT LAST the tale of the long struggle to make the United States independent in production of sulfur has been written. Williams Haynes' finest and most readable book to date is the result of combining careful research among original sources with fine writing and structure. For years it has been recognized that the story of the development of the Frasch process constituted one of the truly romantic episodes in the pioneering of the American industrial scene. It is indeed fortunate that this story has been told by someone able to appreciate its significance before all of the living participants in the early heroic days have gone.

With the theory and practice of Frasch process mining so well worked out today, as exemplified by four separate companies at five mining locations, it is hard to realize what an adventure the early days of the industry were. This story of MEN and trouble, with the final victory in nearly every chapter won by perseverance, determination, and engineering skill, is not only fascinating reading in itself, but has all the value of history—and this, too, in a field which seldom receives the kind of attention ordinarily reserved for efforts in the fields of war and statecraft.

The first page fittingly sets the stage for the story by dramatizing the moment when sulfur was first pumped out of the ground as a liquid. The first chapter recounts the long and dangerous attempts to mine the salt dome deposits by conventional methods. From this point on the story is told chronologically. Of particular interest to the chemist and engineer is the exposition of economic and financial, political and human complications, which all too often are lost sight of by technical and scientific minds. It is obvious that Herman Frasch could never have succeeded had he not possessed sound business judgment and ability, as well as extraordinary capacity as an engineer and boundless determination and faith.

Chapters IV and V provide a history of competitive difficulties in world markets and production from the earliest beginning of the chemical industry, and outline under what troubled world market conditions Herman Frasch projected his development. Subsequent chapters describe the organization of companies and mining which have stemmed from the original operations at Sulphur, La., while the final chapters of the book discuss the present and future of the sulfur economy.

The book is profusely illustrated with fine pictures, foreign and domestic, old and new. Sketches showing the structure of salt dome formation and well equipment give a very clear exposition of the mechanics of sulfur mining by the Frasch process. An appendix contains the salient statistics of the industry in well arranged form. The author has wisely decided to include only a page giving the chief properties of sulfur, leaving to Mellor the detailed discussion of the more remarkable and controversial data on the more obscure properties. The statistics on production and consumption include much information, such as tables of soil sulfur balance, sulfur content of foods, analysis of pyrites from different sources, etc., which are frequently useful but of heretofore limited accessibility.

The book is not only to be recommended to the scientific and technical personnel of the nation and to the general public for its general reader interest, but also to students of chemistry and engineering. These students will find it excellent collateral reading, as it gives a side of the industrial picture which usually can be seen only after formal education has been completed and the school of hard knocks has taken over one's education.

RESEARCH

EVEN Pollyanna might have difficulty in finding a ray of sunshine in the situation in which many manufacturers have been placed because of present shortages of many materials. Nevertheless the resulting frenzied search for substitutes has often uncovered a hitherto overlooked product which has proven satisfactory or even superior to that formerly used.

Unfortunately, however, it has quite often been found that a new discovery is available in only limited amounts since the producer had not previously received sufficient encouragement to warrant installation of the equipment necessary for large-scale production. Even in such cases the research has not been in vain since with the return of normal conditions the producer will be able to supply the product in adequate amounts, the value of it having been established, and the user will have been awakened to the necessity of investigating all materials which he might use.

There is often a temptation to consider a particular product of manufacture as being entirely satisfactory as regards both quality and cost and to curtail research involving it. Because of present shortages of raw materials and equipment there is also a temptation to curtail research involving new products or new uses for present products.

Chas. Pfizer & Co., Inc. does not subscribe to such views. We believe that when the job now in hand is successfully completed our nation will find itself with a productive capacity greatly in excess of any that it has previously enjoyed and that now is the time to prepare to utilize this. We are increasing our research program, primarily of course in order to help do our share toward finishing this present job as quickly as possible, but also secondarily that new products and new uses for old products may be available for any surplus productive capacity to come.

CONTINUED FROM PAGE 1466

three contributors other than members of the board have submitted 34 syntheses in widely diversified fields. The usual form is followed, presenting first the reaction in detail followed by the procedure. As in previous volumes numerous notes are included, and these add materially to the value of the preparations. The listing of other methods of preparation is continued as a separate heading under each preparation. It is believed that still another heading might advantageously be added. Presumably each contribution is submitted by its author because it is of value in some particular field or is a unique reaction. A heading similar to the three now employed, but indicating the field in which the reaction is of interest, is suggested. A brief statement that the compound is of utility as an intermediate in the synthesis of certain vitamins, dye sensitizers for photographic films, or that the reaction is a unique method of introducing a radical would tend to make the preparations of greater interest to chemists not directly involved in that specific field.

The present volume contains four preparations of sugar derivatives, four of amino acids, and four of organic iodine compounds. The isolation of pure linoleic and linolenic acid from natural oils is described. The unusual reaction of *m*-dinitrobenzene with methanolic potassium cyanide to yield 2-nitro-6-methoxy benzonitrile is employed to give an intermediate for the preparation of 2,6-dimethoxybenzonitrile.

But few errors appear and these are inconsequential. It is questionable whether *d,l*-phenylglycine is a proper synonym for *d,l*-alpha-amino phenyl acetic acid (page 23) and whether 2,3-dimethyl anthraquinone should be referred to as "the yellow quinone" (page 38).

The volume is printed in the usual clear type on good paper and the binding is consistent with previous volumes. The index covers the compounds of this volume as well as those of Volumes 20 and 21. The book should be welcomed as an added tool in the hands of all organic chemists.

A. L. Fox

Proceedings of the Chemical Engineering Division, Society for the Promotion of Engineering Education.

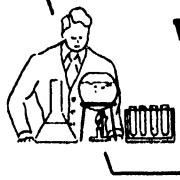
The mimeographed Proceedings of the Chemical Engineering Division of the Society for the Promotion of Engineering Education is a compilation of all the papers presented at the 48th meeting at the University of California, as well as information on past and present officers, constitution, and committees of the Chemical Engineering Division of the society.

This is the first time that a complete report of the Proceedings has been issued since the inception of the Chemical Engineering Division in 1934. The Proceedings should be of interest to teachers in the field of chemical engineering to acquaint them with many of the personnel constituting the division and also to give such men an idea of the type of papers presented by the members at the annual meetings of the division.

In the Proceedings four papers are given on the "Training of Chemical Engineers for Industry", four papers on "Laboratory Course Instruction in Chemical Engineering", four papers on "Lecture Recitation Courses in Chemical Engineering", and six papers on "General Methods of Teaching Chemical Engineering".

Papers presented by such a large group of men naturally are written in many styles and treated in quite a varied fashion. Two of the papers included are in offset printing. The mimeographed papers vary considerably in make-up—some of them double spaced, others single spaced, some with elite and some with pica type. There is a tendency to crowd too much on the pages, showing bad margining and detracting from the appearance of the book. It has a rather light cover, is stapled, and requires some care in handling to prevent disintegration.

The book is intended primarily as a report to the members of the Chemical Engineering Division and is of considerable value to those members who could not make the long trip across country. These men are provided with a full report of the 48th Annual Meeting of the Division.



Frank C. Vilbrandt

Modern Electroplating. 399 pages. The Electrochemical Society, Inc., 3000 Broadway, New York, N. Y., 1942. Price, $5.50.

This book is the outgrowth of a symposium on electroplating held by the Electrochemical Society in October 1941. The volume contains nineteen papers solicited and edited by the Electrodeposition Division of the Society, with a record of the discussion of these papers and with approximately 800 references to the literature. The 26 authors selected to contribute to this symposium are closely connected with the electroplating industry and have turned out papers that are exceedingly practical and yet thoroughly scientific. As a result this book offers the most up-to-date and comprehensive account of electroplating available.

SALVAGE

— — — A BIG WORD IN THE CHEMICAL PROCESS INDUSTRY

WITH the word "salvage" uppermost in the minds of all of us on the home front, let's make sure that the Chemical Process Industry is doing its share in "salvaging" and conserving war-essential chemicals. Many companies are saving untold gallons and pounds of chemicals by the recovery or reclamation of acid, alkali, dye, and other liquors by treatment with NUCHAR Active Carbon.

Check through the following list of chemical products being either recovered or reclaimed by simple low-cost treatment with NUCHAR Active Carbon . . . your plant might be wasting one of these right now, or they might give you an idea on the use of Nuchar for a similar product which you are now discarding after a single use: Recovery of Iodine, Tungsten, Phenol, Glycerin, and Sodium Glutamate; Reclamation of Electroplating Solutions, Drycleaning Solvents, Acetic Acid, Formic Acid, Muriatic Acid, Cellulose Acetate, Nitrate, Scrap Paraffin, and Sulphuric Acid.

CONTINUED FROM PAGE 1468

The first paper presents an excellent discussion of general principles and methods of electroplating. This is followed by papers dealing specifically with the following metals: brass, cadmium, chromium, cobalt, copper, gold, iron, lead, nickel, silver, tin, zinc, and metals of the platinum group. Another paper deals with alloy plating. Accordingly, the book covers practically all metals whose plating is important.

Recent developments in plating thick silver deposits for bearings and in the use of indium bearings are barely mentioned. Another topic which has not been adequately treated is bright copper, for which at least three types of solution, besides the one considered, have attained commercial significance. Finally, there is hardly any reference to the rapidly increasing importance of electroplating in the steel mill, as exemplified particularly in electrogalvanizing and electrolytic tinning.

This book is directed primarily to chemists and chemical engineers in the plating industry, but will also be of value to plating plant operators. Those interested in fundamental research and in the development of new and improved methods for electroplating will find here many suggestions for unsolved problems.

LOUIS WEISBERG

Technique of Plywood. *Charles B. Norris.* 249 pages. I. F. Laucks, Inc., 911 Western Ave., Seattle, Wash. Price, $2.50.

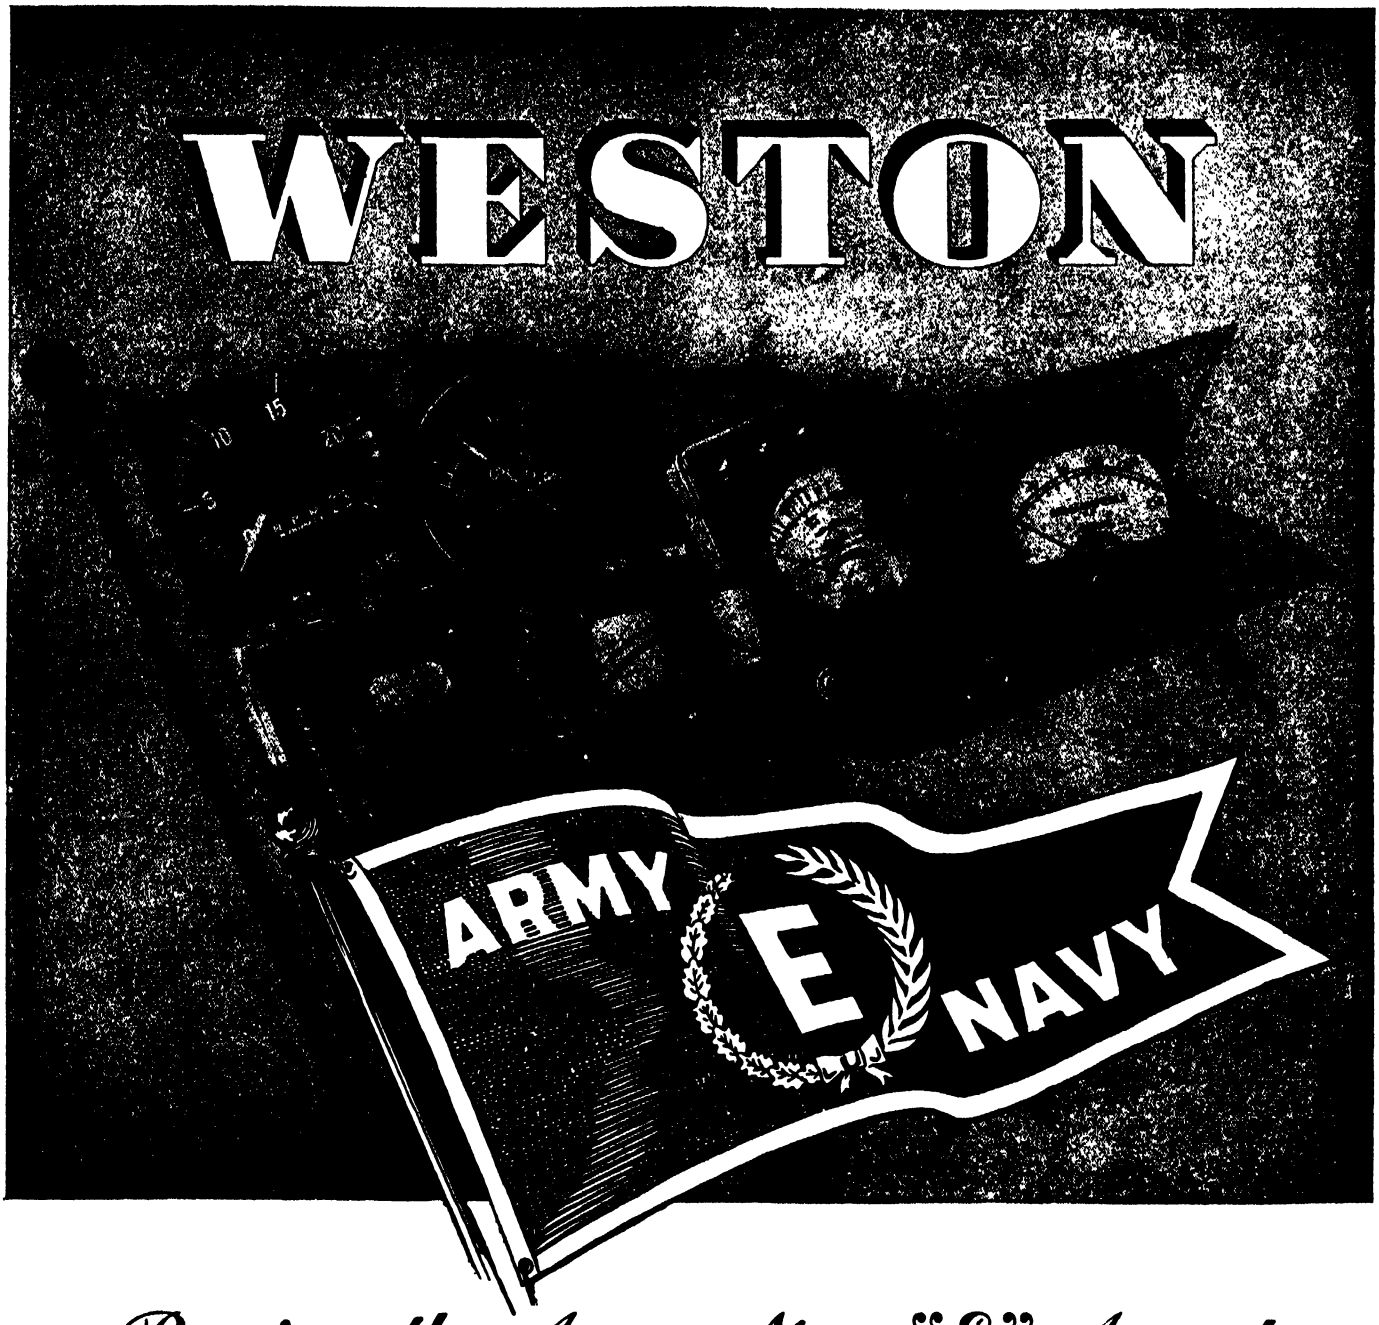
THIS book is a consolidation of a series of articles that have appeared in various trade magazines during the past few years, to which is added a section on "Scientific Principles of Gluing" by I. F. Laucks. The early chapters of the book discuss the problems of balanced construction in plywood and the deflection and strength of horizontal plywood loading. Following is a description of the loading of plywood walls, outlining the problems of elastic stability both in compression and shear. Some seven subsequent chapters are devoted to the elastic theory of wood and plywood. The author's analyses of the various problems are reduced to mathematical formulae, of which 72 are given. This gives an excellent foundation on which engineers can determine proper and suitable strength evaluations and probable design behavior.

A third section of the book treats rather briefly the manufacture of plywood, stressing the hot pressing methods with resin adhesives. The warpage of plywood is given careful analysis in the fourth section, and methods are indicated to keep this at a minimum. The final section on "Scientific Principles of Gluing" is an excellent summary of the fundamentals that a user ought to know about the application of glue to wood.

Norris has spent his adult life in the plywood and adhesives industry, first at the Forest Products Laboratory at Madison, then at the Haskelite Manufacturing Co., Grand Rapids, and I. F. Laucks, Inc., of Lockport. He has recently been called back to the Forest Products Laboratory at Madison to assist in the emergency war program there. No one is better qualified to write such a book, and the job has been well done. It will be a useful volume in the working library of any engineer.

THOMAS D. PERRY

Mercerising. *J. T. Marsh.* 458 pages. D. Van Nostrand Co., Inc., 250 Fourth Ave., New York, N. Y., 1942. Price, $9.00.



TO MOST textile chemists the term mercerization immediately brings to mind one of the romances of science and industry. It began in 1844 when John Mercer, an English calico printer, while attempting to filter a solution of caustic soda through a piece of cotton cloth noticed that although the solution passed through rapidly at first, it always went through slower and slower and finally almost entirely stopped. This observation led to the patenting in 1851 of a process of treating cotton yarn and cloth with caustic soda solution to improve them, particularly as to increase strength, durability, and capacity for absorbing dyes. The process soon became known as mercerization.

It was not until 1899, however, that the most valuable application of mercerization was discovered. At that time Horace Lowe and other experimenters found that if yarn and cloth were mercerized under tension, a high luster was obtained. Adaptation of this treatment led to modern mercerization, which for many years has been one of the most important processes of cotton finishing.

Probably no process in textile finishing has engaged the attention of so many textile chemists as the study of the phenomena of mercerization, its causes, methods of control, and improvement. The author of this book has brought together in one volume the important knowledge available in regard to all phases of this subject, not only chemical and physical, but also the mechanical application of the finishing industry. While other chemicals, such as zinc chloride and sulfuric acid, have been patented and used to

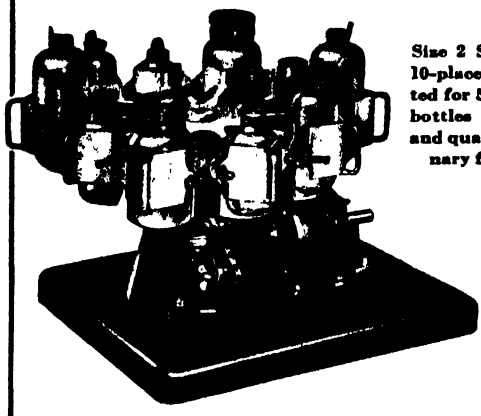
Receives the Army-Navy "E" Award

"On LEADERSHIP rests the responsibility for getting things done."

Only short months ago, the instrument goal in this mechanized war seemed unattainable. In almost unbelievable quantities instruments were needed for our huge plane program—for a two-ocean navy—for tanks, guns and walkie-talkies — for our arsenals and factories — and for countless new devices of war.

To approach this goal meant far more at WESTON than the mere addition of factory and laboratory equipment, and the usual worker-training program. It meant imparting to untrained hands the skill and instrument sense which ordinarily takes years to acquire. For it's this rare instrument sense, backing up sound engineering, which has been responsible for WESTON's continued leadership.

This "E" award to the workers at WESTON—the first to any group in this specialized field—means recognition of their efforts in striving to attain the goal in numbers, while never relinquishing the WESTON quality ideal.



And to our courageous fighting men everywhere, it conveys the assurance that they can depend on the men and women at WESTON to continue furnishing the essential instruments in ever increasing quantities . . . *until victory is won.*

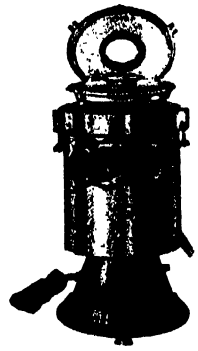
WESTON ELECTRICAL INSTRUMENT CORPORATION, NEWARK, N. J.

INTERNATIONAL

Bottle Shaking Machines

Constructed for large capacities ● Adaptable to containers of various sizes and shapes ● Variable speed from 100 to 600 R.P.M. ● Effective dual motion ● Large motor with friction drive ● Massive base for greater stability.

Size 2 Shaker with 10-place head adapted for 500-1000 ml. bottles and pint and quart size ordinary fruit jars.



A motion is produced similar to shaking by hand, but much more rapid and effective. It is not only reciprocating up and down, but also elliptical and produces within the container a circulation as well as concussion of the fluid. More compact construction is obtained by employing a satisfactory friction drive in place of the conventional belt drive.

International Bottle Shaking Machines can also be furnished with an explosion proof motor for hazardous locations or when volatile materials are being used.

The Size 2 Shaker can be furnished with a variety of heads.

Send for Bulletin S for complete description.

INTERNATIONAL
LABORATORY CHEMICAL CENTRIFUGE

For purely scientific or preliminary to large scale commercial operations this centrifuge is found useful in the separation or dehydration of crystals, pulps or other materials. It can be operated continuously and has adjustable speeds up to 4000 r.p.m. with one size of head, 5" dia. x 2½" deep, furnished in manganese bronze, stainless steel, Monel metal, rubber covered—also Coors porcelain (Cat. No. 436) as illustrated.

Send for Bulletin CH for complete description.

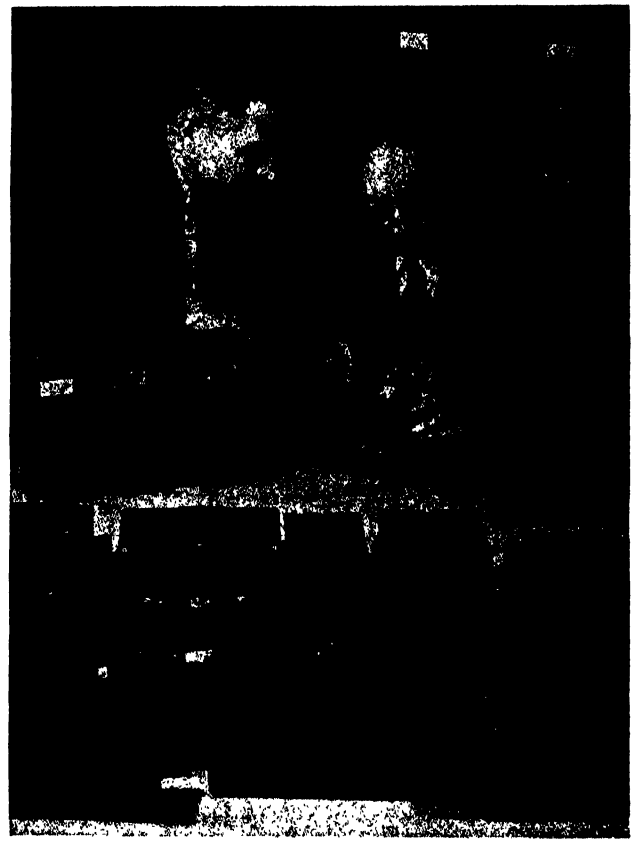
some extent, the author has confined his attention to the treatment of cotton with caustic soda, with minor mention made of its action on linen and rayon.



The text is well arranged, thoroughly illustrated and systematically divided into subsections as follows: Historical Introduction, Cotton, The Mercerising Process, Native Cellulose and Hydrate Cellulose, Theoretical Aspect of the Action of Alkali Absorptive Capacity, and The Efficiency of the Process.

This book is undoubtedly the most complete work that has ever been published regarding mercerization and is highly recommended to everyone who may be interested in the subject.

L. A. OLNEY

J. W. Richardson left his position of assistant supervisor of chemistry for ESMDT at The Pennsylvania State College, which he held from September 1941 to July 1942, to take a position with the Röhm & Haas Co., Plastics Division, Bristol, Penna. He is on leave of absence from his former position of assistant professor of chemistry at the San Jose State College, San Jose, Calif.

K. R. Van Tassel has been appointed manager of sales of the newly formed Integral-Horsepower Motor Section, Motor Division, General Electric Co., Schenectady, N. Y.

Design Simplification Saves Steel

Seen in the foreground are 14 old types of circuit breakers which will be replaced by four new units, developed by the Westinghouse Electric and Manufacturing Co. H. D. Dorfman, Westinghouse engineer, points out the new space-saving contact to J. A. Butts, manager Westinghouse small breaker division. The new line saves 38 per cent steel and 18 per cent copper, reducing weight.

WORTHINGTON PUMP AND MACHINERY CORPORATION • HARRISON, NEW JERSEY

Waste Nylon

THE Nylon Division of E. I. du Pont de Nemours & Co., Inc., has developed a method of converting nylon yarn waste back to some of the complex chemicals from which the fibers were made originally.

After Pearl Harbor, style stepped aside for strategy and nylon production was converted to the manufacture of yarn for vital military uses. The urgency of these military requirements, as well as the shortage of chemicals needed as raw materials in the production of nylon, are the reasons for its waste-reclaiming move. The company is evaluating all-nylon and part-nylon stockings in its experimental recovery project. Some of the nylon waste, that which is undyed and unmixed with other materials, is converted to nylon "flake", a white, crystalline substance looking like soap chips, which is the raw material actually used in spinning nylon yarn. In the case of dyed waste, more complicated treatments must be given. The du Pont Nylon Division is not seeking types of waste that can be used to produce "spun nylon yarn" for direct military purposes.

Ultraviolet Unit

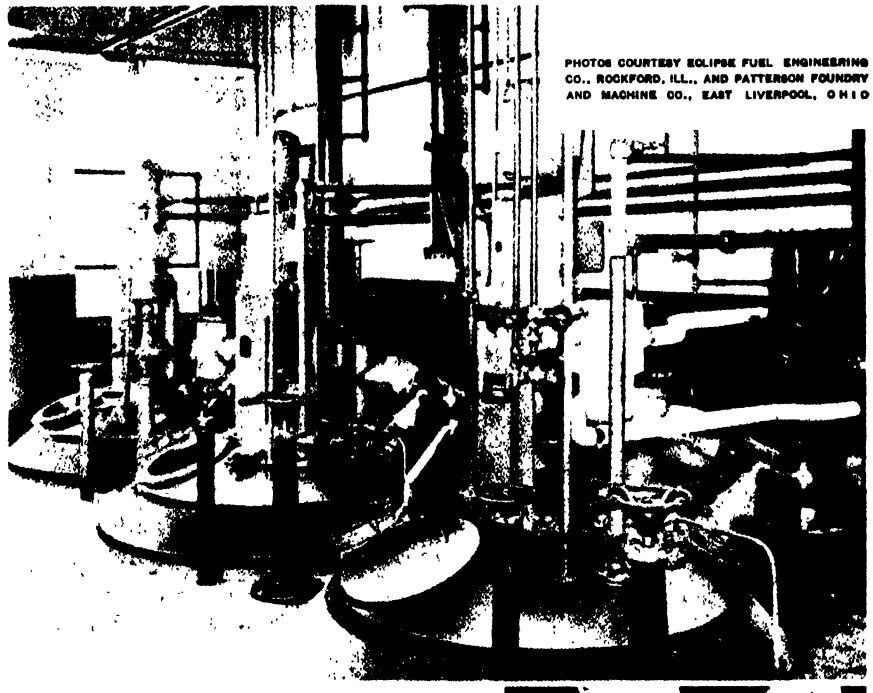
PFALTZ & BAUER, INC., Empire State Bldg., New York, N. Y., are offering a new pure fused quartz ultraviolet generator. This unit is particularly valuable to the chemist for the classification of solid inorganic substances by the characteristic color of their fluorescence. It may also be used for the detection of impurities.

Plastic Patterns

A PLASTIC which for years has given strength and resiliency to box toes of shoes now speeds military production in foundries by affording quick, easy, economical repairs and alterations for patterns of metal castings.

A colloid-treated fabric trade-marked "Celastic", this plastic is double-napped cotton flannel, similar to a cotton blanket, impregnated with cellulose nitrate and a fire retardant making it slow-burning. Wet down with a solvent, it may be formed into any shape, and will retain that shape on drying. It has good adhesive properties, and will stick to wood, metal, and other materials.

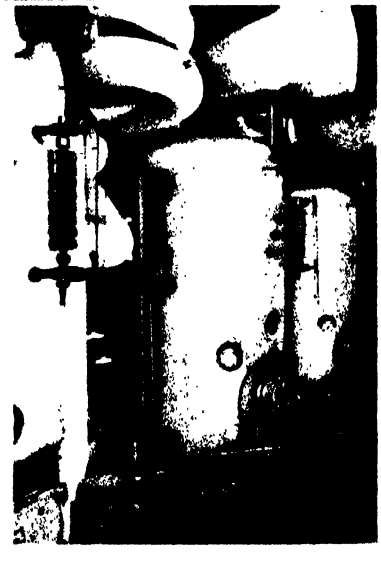
Celastic is made by The Celastic Corp., Arlington, N. J., which is owned jointly by the United Shoe Machinery Co. and E. I. du Pont de Nemours & Co., Inc.



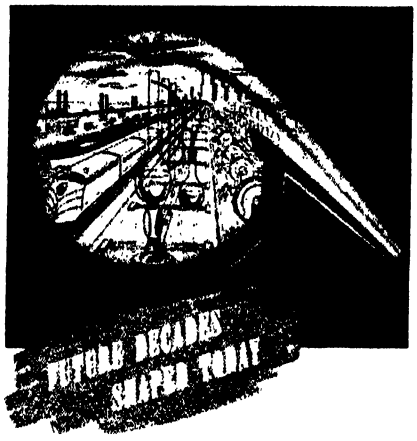
Three-Way Butterfly Valve

QUICK action is provided in a three-way valve of the butterfly type, designed for mixing and interchange service and adapted to fully automatic control by means of an air diaphragm motor or hydraulic cylinder.

The valve is constructed of cast steel or cast iron for pressures up to 600 p. s. i.



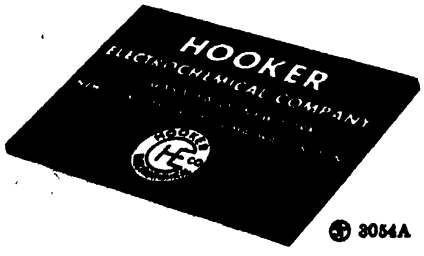
A special feature is the self-cleaning, double-beveled, streamlined vane, which seats wedge-tight against the body of the valve, producing a tight shut-off as well as positive control of volume and pressure. The valve is made by the R-S Products Corp., Wayne Junction, Philadelphia, Penna

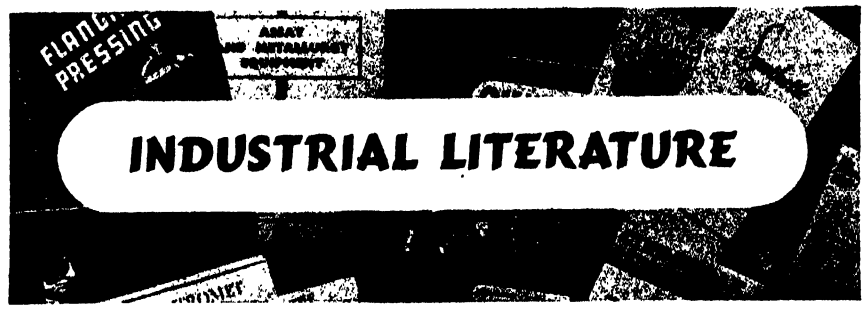


PHOTOS COURTESY ECLIPSE FUEL ENGINEERING CO., ROCKFORD, ILL., AND PATTERSON FOUNDRY AND MACHINE CO., EAST LIVERPOOL, OHIO

Varnish Processing

Top. Years ago varnish was heated in heavy, flat-bottom, copper kettles on wheels over gas, oil, or coke fires. Without automatic temperature control, local overheating and discoloration of the varnish were both inevitable, as was the danger of boiling over and resultant fire. Uniform cooling was impossible, and only relatively small batches could be cooked at one time. Consequently, fuel and labor costs were exceedingly high. *Center and Right.* The three 1,000 gallon, jacketed kettles shown above are heated by the three 1,000,000 B. t. u. McKee Dowtherm Vaporizers at right. Heating or cooling is accomplished instantly by flicking a switch, or it can be done automatically. A better colored varnish results, and each kettleful is the same as the ones which preceded it. The smoky oil fumes and fire hazard of the old process are gone. 700 or 800 gallon batches can be cooked at one time, thereby lowering fuel and labor costs. Three new type kettles make more varnish than 18 of the old kettles.





In the many chemical laboratories where modern marvels are being wrought, future decades are taking shape under our very eyes. Yesterday's achievements have become antiquities, and its farthest horizons are already at our backs.

In this far-reaching progress, HOOKER laboratories are shouldering their full share of responsibility. Never before have the chemists of this country had a greater profusion of chemicals, more uniformly controlled quality, more fully known properties or a greater fund of technical assistance.

HOOKER is glad indeed to be so fortunate in its ability simultaneously to serve chemists, chemistry and our Country.

3054A

Listed publications should be requested directly from the company concerned. Use business stationery, mention bulletin numbers, and refer to this journal. Publications will be sent free unless otherwise noted.

Barrel Pump. A new bulletin, complete with engineering sectional views, describes an electric-hydraulic barrel pump for pumping oil, light, medium, or heavy greases directly from the original container. The pump operates from any electric outlet and discharges constant volume regardless of pressure head. Six capacity and pressure combinations are available to meet all service requirements. *Engineering Bulletin 425 CEN.* TRABON ENGINEERING CORP., Cleveland, Ohio.

Brushes. This bulletin contains information on Staplbond Tampico brushes and steel wire brushes which embody a newly developed type of construction. Other brushes described are circular brass and steel-wire scratch brushes, brushes for glue and sawdust, cotton potash brushes, lacquer, circular cotton wick, spiral wire ring brushes, and many others. *Bulletin Br-103 CEN.* HANSON-VAN WINKLE-MUNNING CO., Matawan, N. J.

Chemicals. A 36-page catalog of chemicals, including sodium sulfite and hyposulfite, phosphoric acid, sodium phosphates, and photographic chemicals. *Catalog CEN.* A. R. MAAS CHEMICAL CO., 4570 Ardine St., South Gate, Calif.

Colloidal Graphite. This is a 4-page informative bulletin on the use of "dag" colloidal graphite as a lubricant for running-in internal combustion engines, compressors, and other mechanical equipment. *Bulletin 421-BB CEN.* ACHESON COLLOIDS CORP., Port Huron, Mich.

Conservation of Copper. This bulletin describes five ways of saving copper in plant electric systems. Diagrammatic layouts cover all five points and the story of copper saved in each case amounts to tons. *Bulletin GED-1011 CEN.* THE GENERAL ELECTRIC CO., Schenectady, N. Y.

Constant Temperature Oven. This leaflet describes a constant temperature oven in the moderate-price field. Illustrations show the oven and its construction which features double-walled door and cabinet, glass-wool insulation, hazard-safe elements, ventilation control, automatic heat control sensitive to plus-minus 0.5° C., from room temperature to 150° C. Thirteen other types of ovens are also illustrated and briefly described. *Leaflet CEN.* PRECISION SCIENTIFIC CO., 1730-54 N. Springfield Ave., Chicago, Ill.

Dehydrator. An illustrated, descriptive pamphlet on dehydrators for eggs, milk, fruit sauces, and other liquid or semi-liquid products. A diagrammatic drawing shows the whole operation; specifications and capacities of various models are given and a low-cost plan of building and equipment set-up is included. Units for filling either glass or tin containers are also shown. *Bulletin 115 CEN.* MOJONNIER BROS. CO., 4601 W. Ohio Street, Chicago, Ill.

Electric Motor Care. This is a series of seven bulletins on the installation, care, and adjustment of electric motors. They have been prepared in an effort to help the user of motors get the longest possible service. A system of suggested checks is offered for locating trouble when the motor or generator fails to operate. *Manuals 21-27 CEN.* CENTURY ELECTRIC CO., St. Louis, Mo.

Electronic Tubes. A quick-selection and comprehensive chart of electronic tubes for industry. Technical data on applications and tubes in tabular form makes it easy to select a tube to fit a particular problem. Bulletin numbers are listed for each tube described for aid in installation and operation. *Chart 168-1-8850 CEN.* GENERAL ELECTRIC RADIO, TELEVISION AND ELECTRONICS DEPT., Schenectady, N. Y.

Fluorescent Lamp Ballast. The new Acme F 100-25, four-lamp fluorescent ballast, is described in detail in this bulletin along with other sizes of ballasts. The manufacturer claims that this unit is designed to provide equalized and balanced secondary voltage to each lamp and that all four lamps will light at the same time, with no drag, delay, or flashing. Core and coil elements are said to be impregnated and compounded to minimize normal resonant vibration. *Bulletin 157 CEN.* ACME ELECTRIC & MFG. CO., Cuba, N. Y.

High-Frequency Heating. High-frequency electrostatic heating is discussed in a 22-page illustrated booklet, which discusses several applications of Thermex equipment and outlines the process. *Booklet CEN.* THE GIRDLER CORP., THERMEX DIVISION, Louisville, Ky.

Hot Water Unit Heaters. This is a standard code for testing hot water unit heaters, and is published to assure the public of uniform practices of tests in industry. Definitions and ratings of heaters, outlines of tests, equipment for testing, test procedure, and computation of results are some of the items covered. *Bulletin AIA 30-d-11 CEN.* INDUSTRIAL UNIT HEATER ASSOCIATION, 5-208 General Motors Bldg., Detroit, Mich.

Lift-Truck. This complete manual tells what a lift-truck is and what performance can be expected of it. It is divided into

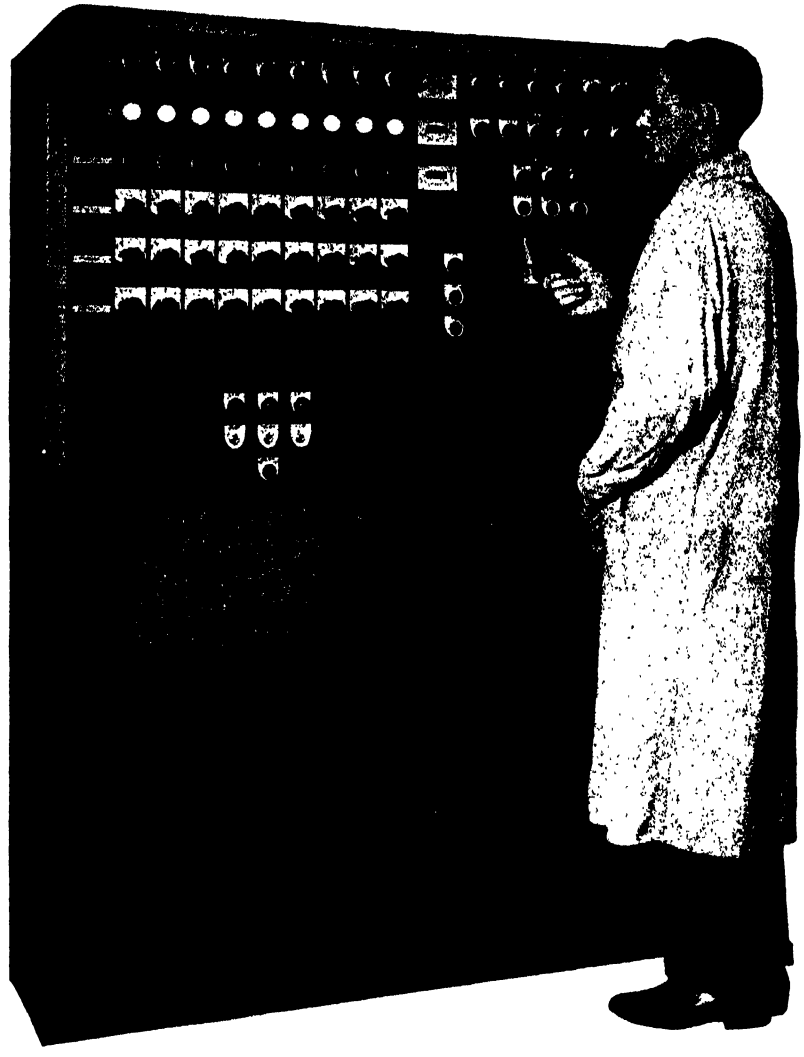
six chapters devoted to design, construction, power plant, operating and control, etc., and contains illustrations and diagrams. *Manual 37 CEN.* TOWMOTOR Co., E. 152nd St., Cleveland, Ohio.

Lockers. A leaflet describes the new line of Victory lockers for shop, factory, and all industrial uses. Made of wood, and containing no critical materials, these lockers are light, durable, and strong. Construction details and sizes are given. *Pamphlet CEN.* CURTIS COMPANIES, INC., Clinton, Iowa.

Micro Program Switch. This leaflet describes a new switch for use in controlling the operation of compressor motors, pumps, solenoid valves or motor-operated valves, pasteurizers or industrial process work. The unit is a series of snap-acting cam-operated switches with a Microtrol driving unit. Adjustable cams may be rotated to change the operation of the switches and the timing of the Microtrol driving unit is also adjustable. It is available with single-pole, single-throw, or single-pole, double-throw switches. *Bulletin F-1420-3 CEN.* BARBER-COLEMAN Co., Rockford, Ill.

Operation Time Recorders. A new bulletin describes both mechanical and electrically operated types of recorder and explains their application to the processes of various industries. Their importance in test engineering, production control, etc., is discussed and diagrams show typical installations for different kinds of work. Complete specifications are included for the single and multi-pen instruments. *Bulletin A-321 CEN.* THE FOXBORO Co., Foxboro, Mass.

Ovens and Dryers. This bulletin gives a description of various types of ovens and dryers for industrial use. Many photographs show installations on all types of plants. Oven construction and method of heating are described in full. Such units as core ovens, heat-treating ovens, web dryers, floor conveyor ovens, drum dryers, overhead trolley and batch type ovens, as well as air heaters are included. Space is devoted to the source of heat and to the various means of handling materials as they pass through the several types of dryers and ovens. *Bulletin 130 CEN.* J. O. ROSS ENGINEERING CORP., 350 Madison Ave., New York, N. Y.



Process Equipment. This 8-page bulletin describes in full a complete line of special and standard equipment for the process industries. Fabrication methods and facilities are discussed along with illustrated descriptions of such units as thermocoil equipment, roasters, reducers, nitrators, vacuum stills, retorts, kettles, etc. Sizes and dimensions on most of the units are also added, as well as plant layouts of equipment for several industries. *Bulletin CEN.* BETHLEHEM FOUNDRY & MACHINE Co., Bethlehem, Penna.

Safety Siphon. A 4-page leaflet gives rules for the operation of a safety siphon for handling acids and other corrosive materials. *Leaflet CEN.* THE ALDEN SPEARE'S SONS Co., 156 Sixth St., Cambridge, Mass.

Speedways Conveyors. This circular describes a line of lightweight conveyors for the process industries. There are many illustrations showing these units in

Weighing

THE WAY TOLEDO DOES IT!

● This man is weighing 9 different ingredients that go into 3 furnaces of an alloy steel plant. He could just as well be controlling the batching operation of a glass plant... a chemical plant... or any other type of plant where batches are proportioned by weight.

The operation is made simple, fast, accurate and completely automatic by Toledo Scale control. Toledo Hopper Scales are set to pre-determined amounts for each ingredient. From there on Toledo automatic controls take over. Scales are electrically interlocked with one another and with related equipment. Accurately weighed batches may be carried away on conveyor belt. Rapid accurate operations with no chance for human error.

Toledo has solved countless problems in weighing, balancing, force-measuring and counting. Look to Toledo for the answer to *your* weighing problems. Write for complete information. Sales and Service in 181 cities in U.S. and Canada.
Toledo Scale Company, Toledo, Ohio.

IN WAR—AS IN PEACE
INDUSTRY LOOKS TO TOLEDO
FOR ALL TYPES OF SCALES

required by many companies to meet Federal Specifications on vital war work. So we will not be able to exhibit at the Chemical Show November 23.

A personal invitation is extended to all visitors at the Show to call at our factory, 361 West Superior Street, Chicago, and see the largest Ometer plant in the world. See Ometers in the process of manufacture and in operation. Just five minutes in a taxi from the Sherman Hotel. We'll be looking for you.

ATLAS ELECTRIC DEVICES CO.

FADE-OMETER

LAUNDER-OMETER

WEATHER-OMETER

actual use and a list of a number of companies using this equipment is included. *Circular CEN.* CHARLES S. JACOBOWITZ CORP., 1432 Niagara St., Buffalo, N. Y.

Stoker Coal Crushers. An 8-page bulletin describing a practical 2-stage coal crushing circuit. Line drawings and photographs amplify the description. Crushing recommendations, capacities, dimension tables, test results on different coals and construction features complete the bulletin. *Bulletin 442 CEN.* McNALLY PITTSBURGH MFG. CORP., 307 N. Michigan Ave., Chicago, Ill.

Super Refractories. A bulletin on these refractories for the process industries. The various types of the Frax line are described and physical characteristics, thermal conductivity and thermal expansion tables are given. Settings for boilers, gas generators, muriactic acid furnaces, still settings, retorts, and similar processes are described, with accompanying line drawings. Filter and diffuser media, catalyst carriers and laboratory ware are also mentioned. *Pamphlet CEN.* THE CARBORUNDUM CO., Refractory Division, Perth Amboy, N. J.

"Tygon" Synthetic. This bulletin brings complete technical and engineering data on "Tygon" synthetic, a rubberlike material useful in the industrial field. A general description of the "Tygons", their characteristics, their chemical resistance to strong and weak acids and alkalis, and organic solvents are presented. Highly illustrated, general and specific applications of these materials as linings for tanks, molded parts, transparent sheets, protective coatings, valve diaphragms, coated pipe and fittings, lined fans and ventilating equipment, insulation, tubing, etc. The impregnation of fabric and future possibilities are also taken up, as well as shatter-resistant glass coatings. *Bulletin 1620 CEN.* THE UNITED STATES STONEWARE CO., Akron, Ohio.

Valves and Fittings. A 4-page pamphlet covering a large assortment of valves and fittings. These include oval, square, and round flanged valves with their accompanying fittings, check valves, elbows, unions, tees, etc. Tables accompanying each type give the pipe sizes and working pressures of each unit. Working temperatures are from minus 70° F. to 300° F. Special alloys and packing can be supplied if the case warrants it. *Pamphlet 192-A CEN.* FRICK CO., Waynesboro, Penna.

Water Analyses. A 20-page booklet "Apparatus and Chemicals for Water Analyses", well illustrated, presenting the various apparatus and chemicals which are used for industrial water analyses for plant control. The book features the test sets required for such determinations as hardness, alkalinity, phosphate, sulfate, dissolved oxygen, pH value, silica, etc. In addition, numerous comparators, photometers, turbidimeters, and similar equipment are displayed. *Booklet CEN.* W. H. AND L. D. BETZ, Frankford, Philadelphia, Penna.

Welding at Low Temperature. This bulletin gives comprehensive data on Castolin Eutectic low temperature welding for repairs and salvage of existing equipment. Comparisons are made, throughout a typical welding case, with bronze welding. The advantages of this method of

welding are aptly set forth, stressing the fact that no copper is needed, and a much lower temperature is required. Such welds need but a temperature of 950° to 1400° F. and the finished joints can be galvanized or porcelainized. *Bulletin 165 CEN.* Eutectic Welding Alloys Co., 40 Worth St., New York, N. Y.

Strategic Materials and National Strength. *Harry N. Holmes.* 106 pages. The MacMillan Co., 60 Fifth Ave., New York, N. Y., 1942. Price, $1.75.

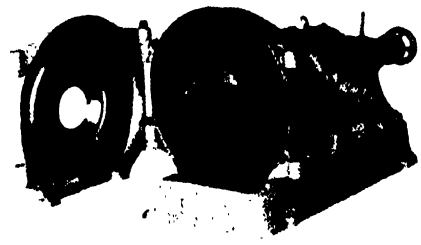
Obviously Professor Holmes, as indicated in his preface, pointed this book for lay consumption and it will contain little that is new to the well informed member of the chemical profession.

It is briefly written, subjects are treated lightly, the analysis of each penetrating no deeper than the outer layer of skin.

Professor Holmes touches on most of the shortages and technical developments of the current war and winds up with a chapter about the future.

It will serve all those who want a quick picture of current shortages and the reasons behind them.

Refractories. *F. H. Norton.* 2nd ed. XIV + 798 pages. McGraw-Hill Book Co., Inc., 330 West 42nd St., New York, N. Y., 1942. Price, $7.50.



This second edition of "Refractories" reflects the progress in both scientific knowledge and technical art made during the past ten years. The 24 chapters are classified in four sections. The first of these is introductory and deals with the history and economics of the refractories industry, the literature on refractories, and an especially meritorious chapter on "Some Fundamental Concepts of Matter in the Solid State". The second section deals with the various raw materials and the methods of their preparation and manufacture; and in this section, the chapter on "The Firing of Clay and Other Refractory Materials" is especially well done.

The section on properties includes eight chapters, the first of which deals with phase equilibrium diagrams. The reviewer naturally has a special interest in this section which may affect his judgment, but considering the importance of these diagrams, it seems that the treatment is inadequate. One not conversant with the subject will get little help in either their interpretation or application; and more references to the original literature would help the critical reader to make for himself the lacking appraisal of the dependence to be placed in the various diagrams of widely differing reliability. The contrast between the definitive information furnished by the phase equilibrium diagrams and the empirical information afforded by the "fusion points" is not brought out; nor is there a discussion of the lack of correlation between the softening point test for refractory materials and any definable physical property or characteristic. The discussion of spalling is good, but that of the reaction between refractories and slags leaves an unsatisfied feeling which is not entirely due to the unfortunate paucity of information on this highly important subject. The discussion of heat transmission is as adequate as can be compressed into the small space allowed it, but the reviewer would have preferred to have had it elaborated, even at the cost of omission of technological data obtainable from the catalogs of manufacturers. The five chapters on the use of refractories give a brief survey of the field.

These are minor differences of opinion as to the distribution of emphasis, which do not affect the reviewer's opinion that this is a thoroughly satisfactory treatment of the subject of refractories, unusually well written and comprehensive in scope, and he unhesitatingly recommends it to all interested in the subject.

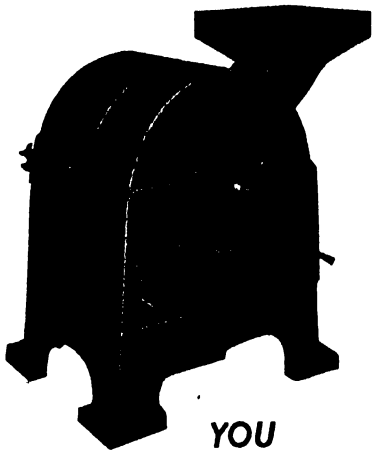
George W. Morey

The
DISC MILL

. . . As "APPLICATION DESIGNED" by Sprout, Waldron will:

DEFIBERIZE — Producing fibers from a wide variety of materials such as Sheet Pulp, Rags, Cotton, Wood, Leather, etc., etc.

GRANULATE — Producing granules of uniform size from materials such as Plastics, Grains, Copra, Malted Milk, Kelp, Raisins, Figs, Meat Scraps, Caustic Soda, Rochelle Salts, Cork, Nutmeg, Mace, Soya Beans, etc., etc.



PULVERIZE — Producing finely ground powders from a wide range of friable materials including Citric Acid, Resins, Dried Molasses, Dried Distillers Grains, Caustic Soda, Charcoal, Clays, Stearic Acid, Grains, etc., etc.

BLEND — Taking two or more mixed powdered materials and blending them into a finished product in which the identity of every ingredient is completely lost.

The Disc Mill is manufactured in sizes ranging from discs of 12 to 36 inches with horsepowers ranging from three to 300. Its versatility in applications comes through changes in plate designs, speeds, inlet and discharge provisions.

SPROUT, WALDRON & CO.
(Incorporated in 1895)
Engineers, Designers, Manufacturers — Since 1866

AS MECHANICS GET SCARCER

YOU NEED BETTER MECHANICS IN YOUR MILL . . .

Skilled men are growing scarce—mechanized war demands specialists in every line in the field and in direct armament production.

You need modern equipment that will perform unfailingly—take up the slack and increase production, even with a less skilled working force.

In the newer plants of the process industries, you will find a surprising number of Prater Installations. They are there because they were sold on a guaranteed basis of capacity per horsepower and control of quality. May we do the same for you.

Pliofilm in Military Equipment

FAMILIAR in peacetime as wrapping for fruit and other perishables, thin sheets of glossy, waterproof film are now speeding the flow of airplanes and other military equipment to the U. S. Army and Navy. Chemists of the Goodyear Tire & Rubber Co. in cooperation with engineers of the Peerless Photo Products Co., Shoreham, L. I., N. Y., have developed an emulsified Pliofilm which has the property of maintaining its exact size under all conditions of wetting and handling. This new product, known as Transphoto film, is being used throughout the airplane and similar industries to hurry the fabrication of templates for war-expanding factories everywhere in the United States, and is saving thousands of precious man-hours previously needed to make the templates. It is said to be highly superior in accuracy to any process used before.

The Transphoto template process can be adapted also to producing similar layouts on masonite, plywood, and similar nonmetallic surfaces if the material is coated first with a special zinc base paint. In one instance of the use of the Pliofilm process, a total of 108 shop templates were reproduced from 18 master layouts in approximately 300 hours, representing a saving of 1,100 man-hours over the time which would have been required by previous methods.

Plastic Replacement for Rubber

TELESCOPING a decade of normal research and development to nine months, the plastic interlayer for automobile safety glass has been converted into a versatile replacement for rubber in numerous military applications, the Plastics Department of E. I. du Pont de Nemours & Co. announced.

Raincoats, bags for transporting drinking water to soldiers, hospital sheeting, life rafts and belts, food bags, water-proof and oil-resistant suits for sailors, and surgical plaster will be made from a fabric coated with "Butacite" polyvinyl acetal resin, instead of rubber.

New Plant of Farrel-Birmingham Co.

COMPLETED and in partial production five months after site excavation was started, the new plant of the Farrel-Birmingham Co., Buffalo, N. Y., records another triumph of cooperation between industry, governmental agencies, and the building contractor in the interests of speeding the war effort.

Virtually a duplicate of the original building of the company and now operating in conjunction with it, the new structure is a modern plant containing 150,000 square feet.

Direct Current Motor-Operated Valves

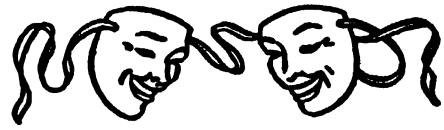
THE direct current motor-operated valves of the Barber-Coleman Co., Rockford, Ill., have been designed for two-position (on off) control of steam, water, or gas. The majority of types available may be used for oil or brine. The valves are suitable for use on heating and cooling coils, bottle washers, plating tanks, humidifiers, hot water storage tanks, boiler feed water control, etc.

Filter Paper

ANOTHER new grade has been added to the line of Hank brand filter papers, produced by Henry E. Jacoby, 205 East 42nd St., New York, N. Y., and will be designated as No. 850. It was developed primarily for filtering intravenous and subcutaneous injectables.

Suggestions Save Time and Materials

EIGHT thousand man-hours and more than 125,000 pounds of scarce steel will be saved because of the ingenuity shown recently by four war workers at the General Electric Co.'s plant at Schenectady, N. Y. The four men headed a group of 60 employees of this plant which received awards totaling $1,575 in one week recently for suggestions which speed war production. Approximately $100,000 has been paid out by General Electric this year for 11,000 suggestions adopted.



Cutting Oils

DEVELOPMENT of a new line of cutting oils which will help speed the American battle of production by increasing machine productivity in war industries is announced by the Standard Oil Co. of Indiana, Chicago, Ill.

The new cutting oils permit faster speeds and new methods of tooling, closer tolerances in sizes and finishes, and increased use of alloy steels which have lower machinability ratings than the metals commonly encountered.

Productioneers

THE name "productioneers" for soldiers in overalls has been coined by the Link-Belt Co., Chicago, Ill., which issues a house organ known as the *Link-Belt Productioneer*.

EMANATIONS

Curing the DTs, or Hair of the Dog That Bit You

THE gloom that heavy water brings
Will quickly vanish, like smoke rings,
If ethyl firewater flows
In due dilution, 'neath your nose.
With Tritium, the plot now thickens,
We've complications, like the dickens:
H_2O, D_2O, T_2O,
HDO, HTO, DTO.
But alcoholic vapors here
Once more relieve a prospect drear.
Tritium has a predilection
For alcohol, as per this diction:
$C_2H_5OH + DTO = C_2H_5OT + HDO$
Thus alcohol the DT cures—
No inebriety endures.

JEROME ALEXANDER

NEW YORK, N. Y.

Fuel Conservation

THE Office of Price Administration, Washington, D. C., in an effort to stimulate discussion on fuel conservation and thereby save valuable fuels that might otherwise be wasted, has sent to selected organizations a letter requesting cooperation. A leaflet on "How to Heat Your Home with Less Fuel This Winter" has also been issued, together with information on the fuel prospect, by states, heating plant efficiency, and conversion.

The chemist is in a particularly favorable position to be of service in this work, by familiarizing himself with the actual conditions and acting as a source of reliable information. He can thus help people to reach a proper decision as to their procedure under the circumstances and to appreciate the seriousness of the situation.

Coffee Bags Made from Colombian Fibers

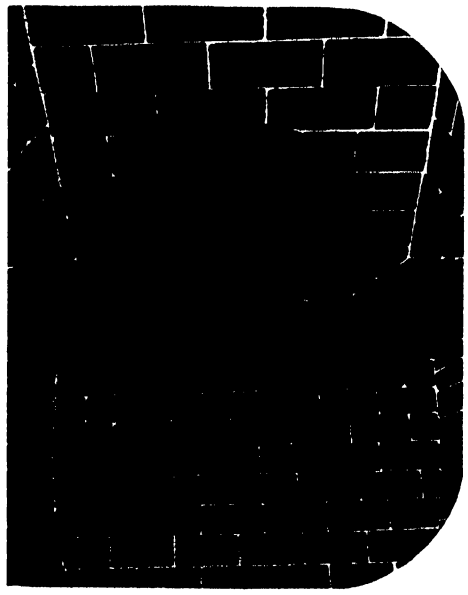
THE American republics are experimenting with native fibers for the manufacture of bagging to be used for coffee, sugar, grain, and other agricultural commodities in place of Indian jute. An important result of this research has been the development of fique fiber in Colombia, where the 1941 output totaled about 38,500,000 pounds, compared with about 23,000,000 in 1940. Some 4,000,000 bags of coffee are now reported going into export in Colombian-made sacks.

Short Course in Coal Utilization

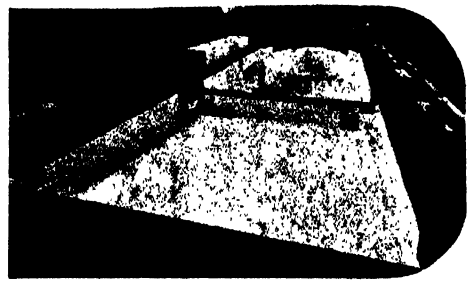
THE papers presented at the sixth short course in coal utilization, held at the University of Illinois from May 21 to 23, 1941, have been collected into a 112-page booklet, Circular 43, which is available at fifty cents a copy from the University of Illinois, Urbana, Ill. It includes 14 papers that present technical and practical information pertaining to coal and its efficient utilization.

Chemists in Civilian Defense

AN ARTICLE on "War Gases, the Chemist's Part in Civilian Defense", illustrated with molecular models of mustard gas, adamsite, phosgene, chloropicrin, and lewisite, is the lead-off in the latest issue of *The Laboratory*, published by the Fisher Scientific Co., Pittsburgh, Penna. The war gases are briefly described, with directions for first aid treatment and decontamination.



MELLON INSTITUTE, Pittsburgh, Penna., is distributing gratis to all interested specialists who request them copies of a publication entitled "Structure and Antipneumococcic Activity in the Cinchona Series".



STEBBINS

Properly Engineered & Installed

LININGS

FOR a long time to come processing apparatus must operate efficiently at peak capacity. To do so, the equipment must incorporate materials, engineering skill and workmanship of the highest order.

Chemical engineers have recognized these essential characteristics in Stebbins Linings for successfully handling acid, alkali and corrosive liquids, gases and vapors in a wide range of equipment.

By employing Stebbins Service, plant owners are assured of a design according to latest engineering practice, materials specifically adapted to operating conditions and superior construction. Under a lump sum contract, Stebbins Service provides all materials and labor with an unqualified guarantee of complete satisfaction.

[a] Source of statistics in first six items: Federal Reserve Board.
[b] Preliminary figures.
[c] U. S. Department of Labor.

As evidence of a growing interest in quinine production in India, the Bengal Provincial Government's budget provides Rs. 1,250,000 for new cinchona plantations, according to unofficial reports to our Government.

South Africa is now producing lactic acid and sulfonated oils in addition to chrome salts and sodium sulfide. Other new products are aluminum sulfate, casein glues, ethyl chloride, and nitrocellulose finishes.

The value of chemicals and allied products manufactured in Canada in 1941 is unofficially reported to the Department of Commerce as $268,500,000. Output in 1940 was valued at $193,900,000.

Package Sizes Revised by Bureau of Standards

Substitution of fiber containers to conserve steel is included in Simplified Practice Recommendation R41-42 issued by the National Bureau of Standards. Covering package sizes for agricultural insecticides and fungicides, this revision of simplified Practice Recommendation R41-40 has been approved by a large majority of the manufacturers, as well as by a representative group of distributors and users of agricultural insecticides and fungicides. Effective November 1, it eliminates several types of packages and also gives a simplified schedule of recommended standard packages for dry lime sulfur. Until printed copies are available, mimeographed copies may be obtained without charge from the Division of Simplified Practice, National Bureau of Standards, Washington, D. C.

Bureau of Standards Issues Paint Specifications

New specifications for road-marking paints have been issued by the National Bureau of Standards following the recent amendment to WPB Order M-56 which permitted the use of certain natural resins in such paint.

Known as "Emergency Alternate Specifications for Paint: Traffic, Exterior, White and Yellow, E-TT-P-115", these specifications are for the purpose of standardizing a satisfactory quality of paints from the natural resins recently made available for this purpose. Until the amendment to M-56, restrictions on both natural and synthetic resins had reduced the properties of the paints to the point where undue waste of pigments was being encountered.

Copies of the new specifications may be obtained from the National Bureau of Standards, Washington, D. C., or from the Protective Coatings and Materials Section, Chemicals Branch, War Production Board, Railroad Retirement Bldg., Washington, D. C.

4/5ths of the Y.M.S. MINESWEEPERS DEPEND ON Westco PUMPS
for BOTH fresh and salt water supply

...and they are equally efficient in YOUR plant!

When fighting ships put to sea, they can't take chances with equipment breakdowns. Particularly in smaller vessels where repair facilities are limited and there's no room for standby equipment, absolute dependability is VITAL!

That's why it is *doubly* significant that in *four out of every five* YMS Minesweepers, Westco Pumps have been given the job of handling BOTH fresh and saltwater supplies. In addition, Westcos are going into Troop Ships, Sub-Chasers, Tankers, Coast Guard Cutters, and other naval vessels.

What better testimony is there to the amazing stamina, high efficiency, and rugged dependability built into Westco Pumps?

TAKE A TIP FROM THE NAVY. When you buy pumps for YOUR plant, remember—*you can't beat Westco performance!*

Rayon Rope In Hydraulic Machines

FUNCTIONING as mechanical packing material to seal against the entrance or escape of water, brine, oil, and other fluids, ropes of rayon are performing many vital war tasks. In numerous instances they are serving as well or better than the packing they have replaced, according to advices reaching the du Pont company's Rayon Department, which developed the special form of rayon used in this application.

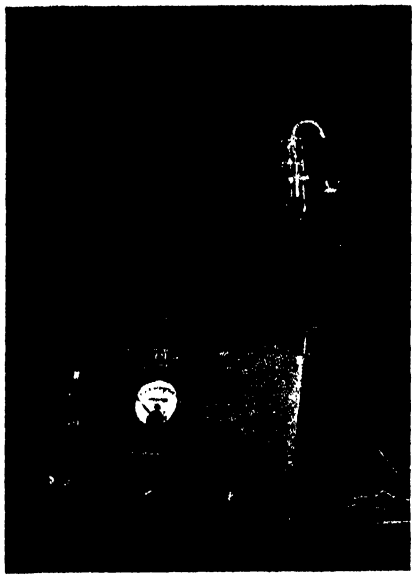
The rayon packing helps retain the high operating pressures of hydraulic shears, punches, and presses as they stamp out airplane parts and other military equipment. Collars of the rayon material fit snugly around shafts of accumulators which build up the tremendous hydraulic power. This type of equipment is used extensively in the war effort where high pressures are needed to stamp out metal parts. Rayon packing properly made up is suitable for hydraulic elevators, for the big pumps at the "water works", and for thousands of other pumps, great and small, throughout industry.

Reducing Spectacle Breakage

THE Temp-R-Lens Corp., Michigan City, Ind., has developed a new method for treating spectacles to increase resistance to breakage. It is particularly important in its application to rimless glasses, where lens breakage is high.

Heat Circulator

THE new Reco heat circulator is said to keep rooms comfortably warm with less fuel. The Reco forces the hot air at the ceiling down, making the air a uniform temperature at the ceiling, at the floor and throughout the room. It is manufactured by the Reynolds Electric Co., 2650 West Congress St., Chicago, Ill.



THE LeVal Filter Co. is moving its plant and office to a new location at 925 Wrightwood Ave., Chicago, Ill.

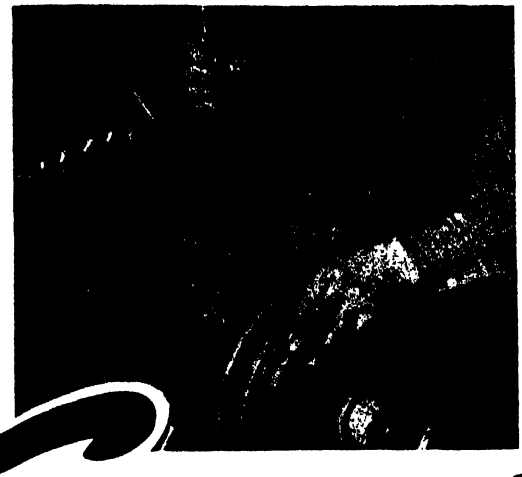
Distillation Products Ionization Gage Meter

A LIMITED number of portable ionization gage meters, Type HG-200, may soon be available from Distillation Products, Inc., Rochester, N. Y. This meter, which is designed to operate in conjunction with the ionization gage, Type VG-1, provides a method of measuring pressures from 10^{-3} to 10^{-9} mm. of mercury.

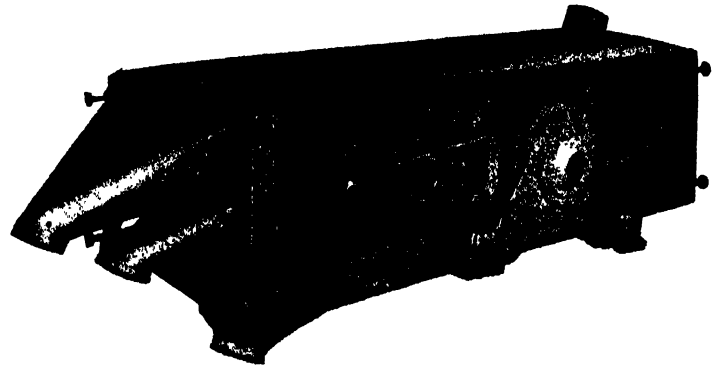


The ionization gage meter circuit features a stabilized amplifier in a balanced vacuum tube of voltmeter design with negative feedback, and an integral amplifier recalibration for elimination of amplifier variation. Other variations in performance are prevented by gas tube voltage regulation and automatic grid current control.

New Type of Conveyor Belt

ALREADY speeding the flow of iron ore to the Nation's blast furnaces, a new type of conveyor belt which uses steel cables in place of the customary cords or fabric has been announced by the Goodyear Tire & Rubber Co., Akron, Ohio.

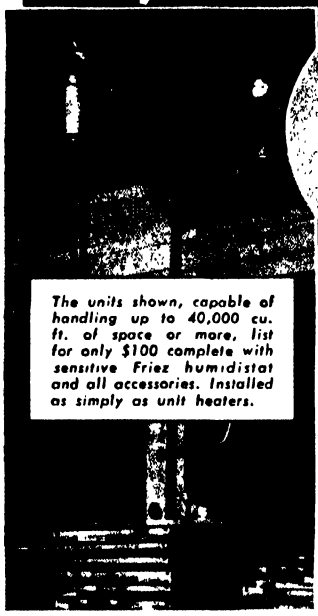
One of the steel-carcass conveyor belts is already in use at the Oliver Iron Mining Co., Duluth, Minn., one of the Nation's principal suppliers of iron ore for guns, armor plate, and other military equipment. This belt is being used at the mine to lift ore 240 feet in a 1,100-foot conveyor. By means of the newly developed carcass of steel cables, the belt completes the lifting task in one continuous operation. It obviates the one, two, or three transfers from individual belts which would have been necessary with the old type of conventional cotton fabric or cotton cord construction.



FOR the fifth successive year, the Board of Judges of the Direct Mail Advertising Association has selected Merck & Co., Inc., Rahway, N. J., as one of the Fifty Direct Mail Leaders of the United States and Canada. This year, the company also won the typography plaque awarded by the American Type Founders Corp. for "The Best Example of Modern Typography in a Direct Mail Campaign".

Selectro

CONTROLLED VIBRATION SCREENING IN THE CHEMICAL INDUSTRY



LEADERS of the nation's chemical industry have overwhelmingly endorsed SELECTRO by their repeat orders. On a basis of product output, operating cost and maintenance, SELECTRO has proven itself the best screen buy.

Of particular importance to chemical screening are the SELECTIVE THROW and ADJUSTABLE TILT features of the SELECTRO. Practically all plant men have observed that the same material under slightly varying moisture, temperature or other conditions, gives an entirely different product. Too fine a stroke may not open the mass sufficiently to permit satisfactory removal of fines. Too heavy a stroke may cause degradation, resulting in excessive fines. SELECTRO is the only screen that you can adjust quickly to meet these conditions as they arise.

Dry Air Robs Output

ARMSTRONG Steam-Type HUMIDIFIERS

They give results that end your dry air problems permanently.

The units shown, capable of handling up to 40,000 cu. ft. of space or more, list for only $100 complete with sensitive Friez humidistat and all accessories. Installed as simply as unit heaters.

DRY air causes fiber breakage in textile mills, warping and checking of wood, shrinkage of paper, excessive static electricity, spoilage of certain foods, cracking of leather, loss of weight, excessive dust and many other evils that cut deep into wartime output.

Hundreds of leading plants in all types of industries are using Armstrong Humidifiers to stymie the dry air nuisance. Ask for literature on this practical method of humidification today.

WRITE TODAY
for your copy of Armstrong's new bulletin, "Armstrong Humidifiers for Industry". It shows how plants in virtually every industry have solved their dry air problems.

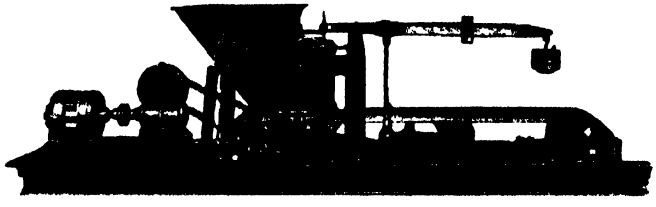
A New LOW PRICED PHOTOELECTRIC COLORIMETER

PORTABLE Lumetron MODEL 400

Accurate and dependable for routine colorimetric and turbidimetric analysis.



An ideal instrument for clinical and metallurgical work and for industrial and educational laboratories.

- Simple to operate
- Portable, Compact, Rugged
- Always Ready For Readings
- Plugs into Any 105 to 130 Volt A.C. or D.C. Light Circuit.

LUMETRON MODEL 400
Complete with 6 color filters and 12 matched test tubes . . . $105

SCHAFFER POIDOMETER

For Speed and Accuracy In Proportioning Materials

The pressure of wartime production places special importance on speed and accuracy. In the proportioning of materials the Schaffer Poidometer guards these factors with unvarying exactness. With its use no proportioning errors can creep in to upset the uniformity or cause variation of the mix.

Schaffer Poidometers are sturdily built to take the punishment of sustained high speed.

If you have a proportioning problem — raw or finished materials — write for Catalog No. 3.

SCHAFFER POIDOMETER CO.
2828 Smallman St. Pittsburgh, Pa.

Processes involving use of sprays must be given the benefit of the right nozzle. You can't get the results you expect by using any handy nozzle. It takes a nozzle built to do the work.

Spraying Systems Co. products and engineers do just one job—provide the right nozzle for any spraying operation. It makes no difference what you want a spray to do, our complete line includes the right nozzle. Our nozzles do better jobs for you and do them faster. And you get still more for your money when you let our engineers submit their solutions to your spraying problems.

Now is the time to get the information you need. Write today.

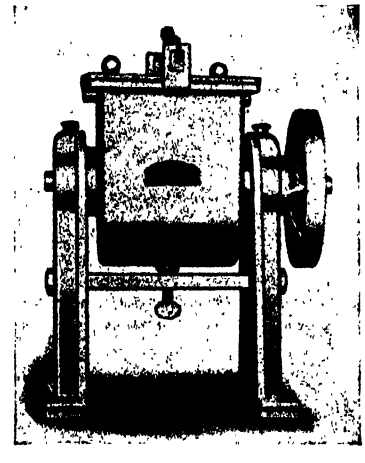
Water Testing Equipment

A new series of water test sets is announced by W. H. and L. D. Betz, Gillingham and Worth Streets, Frankford, Philadelphia, Penna. These A series test sets include the necessary chemicals and apparatus for determining hardness, alkalinities, chlorides, phosphates, and sulfites in water, when any two, three, or four of these tests are required. A special cabinet designed for use on table or wall is provided.



Time Delay Relays

Nearly all types of time delays are now made by Durakool, Inc., 1010 North Main St., Elkhart, Ind. The new BFV type is illustrated in the accompanying cross section. This particular type delays its action upon closing the control circuit and, after such delay, closes the main line circuit, and upon opening of the control circuit the main line follows instantly to an open position. Innumerable types of delays can be readily built up on the foundation of the BFV. The B model, illustrated, has a maximum of 30 amperes. These relays cool, quench, and preserve their contacts as they operate.

IS GRINDING OR MIXING CAPACITY YOUR PRODUCTION BOTTLENECK?

If so you will find a modern Paul O. Abbé grinder or mixer among the highly efficient types we manufacture exactly suited to the requirements of your production.

Carboy Truck

THE Ipco carboy truck, designed to handle carboys with ease and safety, has been developed by the Industrial Products Co., 2820 North Fourth St., Philadelphia, Penna.

Shafts are adjustable for any size carboy and the 24-inch diameter wheels are sufficiently large to carry the load over rough floors.

Textile Finishing Agent

THE development of a new product known as Avitone A textile finishing agent, that releases material now needed for military purposes, has been announced by E. I. du Pont de Nemours & Co., Inc. The new finish is derived from petroleum.

For textile purposes, 100 pounds of Avitone A will replace about 140 pounds of sulfonated tallow, from which some 10 pounds of glycerol may be recovered.

Plastic-Housed Electric Water Light

ADDED protection for crews of coast guard and merchant marine vessels involved in submarine attacks is afforded by a new plastic-housed electric water light attached to life preservers and life rafts, E. I. du Pont de Nemours & Co., Inc., reports.

Upon hitting the water, a weighted base turns the light upright, automatically illuminating it. Use of Lucite methyl methacrylate plastic has reduced the weight to one fifth that of the usual water light.

Magnetic Log Washer

AN IMPROVED type of magnetic log washer for treating fine abrasive and similar materials in the wet state, has been designed by the Stearns Magnetic Mfg. Co., Milwaukee, Wis.

This magnetic log washer consists of a single ribbon type screw conveyor operating at 30 to 32 r. p. m. on a slope with adjustable frame supports over the magnetic field and driven by a gear reduction motor through well guarded variable pitch V belts and sheave.

Transparent Tenite Pipe

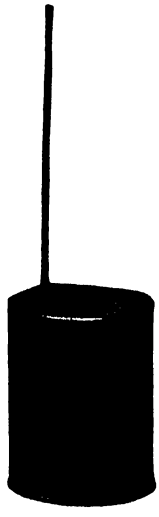
TRANSPARENT Tenite pipe is available in the standard sizes used in beverage dispensing industries. According to the distributor, it has been accepted by leading breweries to replace block-tin pipe in the brewing industry and in dispensing draft beer. The Tenite pipe is used to carry the beer from the kegs, through the cooling system, to the taps in the bar dispenser. It can be readily formed into spiral and flat coils for the commercially used ice-cooling systems and also may be used on the direct draw systems with automatic refrigeration.

This new plastic pipe possesses many advantages not found in other type piping. Its transparency allows the beer to be observed throughout its flow from barrel to faucet. The pipe is kept clean and sanitary by the customary cleaning devices in use, and it can be employed in conjunction with all present standard beer connections and fittings. The inside surface is perfectly smooth and is said to be more uniform than any other beer pipe used heretofore or now on the market. According to the distributor, the beer is conducted through this pipe without losing any of its color, flavor, or head.

Tenite pipe is manufactured, from a cellulose acetate butyrate formula produced by Tennessee Eastman Corp., Kingsport, Tenn. It is extruded in continuous seamless lengths by Extruded Plastics, Inc., Norwalk, Conn., and distributed by North Penn Co., 72 Fifth Ave., New York, N. Y., under the name of "Pennco". The pipe is stocked in both long-length coils and 12-foot straight lengths. The diameters range from $^{3}/_{16}$ inch to $1^{1}/_{2}$ inches outside diameter.

RUBBER and synthetic rubber products can be rendered surface-tack free by means of Hevealac, a liquid coating product produced by the Glyco Products Co., Inc., 230 King St., Brooklyn, N. Y.

Goodyear War Tires



PASSENGER car tire building rooms of The Goodyear Tire & Rubber Co., Akron, Ohio, are beginning to take on their prewar appearance of activity as the company makes ready to go into quantity production of its new war tire.

The new tire, which will give 10,000 miles if driven at speeds of 35 miles per hour and less, contains only four ounces of crude rubber, used in cementing the plies; the balance is reclaim.

The company has completed plans for quantity production. Tire building machines, molds, and ample supplies of reclaim are on hand. It is expected that quantity deliveries to tire dealers can be made by the time the Government's tire-gas rationing plan is placed in effect.

Burrell High Temp. Furnaces help

BURRELL *High Temp.* FURNACES—War specifications have demonstrated the value of higher temperatures in fast "clean" determinations of carbon and sulfur in iron and steel analyses. Accelerators are not required.

MULTIPLE TUBE FURNACES—The 2-tube "most popular" model doubles capacity, measures 14"x17"x22" long, has a 9" heating chamber, and consumes 1.5 kw at 2500°F. Top temperatures of 2650°F. are easily maintained.

MODERN ACCESSORIES—Tap transformers modernize and simplify heat control. Pyrometers with rare metal thermocouples continuously indicate operating temperatures.

QUICK ELEMENT CHANGE—The non-metallic heating elements (no nickel or chromium) are silicon carbide rods which can be changed conveniently without dismantling the furnace.

CATALOG F-241—See the new box, muffle, tube, and pit type furnaces which provide convenient working chambers for a wide variety of heating operations in laboratories and pilot plants. Special high temperature furnaces are built to order.

Subnitrate, powd., barrels	lb.	1.20
Blanc fixe, dry, bags, c/l.	ton	60.00
Bleaching powder, drums, wks.	100 lbs.	2.25
Bone black, 4, bbls., c/l., frt. allowed E.	lb.	.11
Borax, tech., gran., bulk, c/l., frt. allowed	ton	41.50
Bordeaux mixture, drums	lb.	.11
Bromine, cases	lb.	.25
Bromoform, cbys.	lb.	1.42
Butyl acetate, drums, c/l., frt. allowed	lb.	.14½
Aldehyde, drums, l. c. l.	lb.	.16½
Lactate, drums	lb.	.26½
Stearate, drums	lb.	.31
Cadmium, metal, ingots, cases	lb.	.90
Bromide, 25-lb. jars	lb.	1.65
Sulfide, boxes	lb.	1.10*
Caffeine, 100-lb. drums, 10,000 lbs. or more	lb.	2.60
Calcium acetate, bags	100 lbs.	3.00
Arsenate, bgs., c/l.	lb.	.07
Carbonate, precip., bags, 50 lbs., c/l., wks.	lb.	.02½
Chloride, bags, flake, c/l., dlvd.	ton	18.50
Gluconate, U. S. P., bbls., 150 lbs.	lb.	.52
Phosphate, dibasic, 38–40% P_2O_5, bags, Atlan. pts.	unit-ton	No prices
Tribas, bbls.	lb.	.0635
Calomel, bbls., kegs, 50 lbs. or more	lb.	2.95
Camphor, synthetic, dom., tech., gran., drums, ton lots	lb.	.42
Carbazole, 95%, drums, ton lots, wks.	lb.	.70
Carbon bisulfide, drums, c/l.	lb.	.05
Black, reg., uncomp., bgs., c/l., works	lb.	.03625
Dioxide, liq., cyl.	lb.	.06
Tetrachloride, drums, c/l., frt. allowed	gal.	.73
Casein, dom., 20–30 mesh, bags, c/l.	lb.	.19
Cerium oxalate, bbls., wks.	lb.	.35
Charcoal, willow, powd., bbls.	lb.	.06
China clay, bulk, c/l., wks.	ton	7.60
Chloral hydrate, drums	lb.	.90
Chlorine, liq., c/l., cyl., dlvd.	lb.	.05¼
Tanks, wks., frt. equal	100 lbs.	1.75
Chlorobenzene, mono-, drums	lb.	.07
Chloroform, tech., drums	lb.	.20
Chromium acetate, 24%, powd., bbls.	lb.	.22
Coal tar, crude, bbls., c/l., wks.	bbl.	8.25
Cobalt oxide, black, kegs	lb.	1.84
Copper carbonate, 52–54%, bbls.	lb.	.18
Chloride, bbls.	lb.	.23¼
Cyanide tech., bbls.	lb.	.34
Metal, elec.	lb.	.12
Oxide, black, bbls., tons, wks.	lb.	.19½
Sulfate, bbls., c/l., wks.	100 lbs.	5.15
Copperas, cryst., bulk, c/l., wks.	ton	14.00
Cream of tartar, bbls.	lb.	.57½
Cresol, U. S. P., drums, c/l., wks.	lb.	.10¼
Crotonaldehyde, 97%, c/l., wks.	lb.	.15
Cyanamide, 21% N, pulvd., works, contracts	unit-ton	1.52½*
Diamylamine, drums, c/l., wks.	lb.	.61
Diamylene, tanks, wks.	lb.	.09½
Diamyl phthalate, tanks	lb.	.21
Diatomaceous earth, dom., bags, c/l., Pacific Cst.	ton	22.00

Dibutylamine, drums, l. c. l., wks.	lb.	.64
Dibutylphthalate, drums, c/l., dlvd.	lb.	.21
Tartrate, drums	lb.	.92
Dichlorethyl ether, drums, c/l., wks.	lb.	.15
Diethanolamine, drums, c/l., wks.	lb.	.28½
Diethylaniline, drums	lb.	.40
Diethyleneglycol, drums, c/l., wks.	lb.	.14
Monobutyl ether, drums, wks.	lb.	.22½
Monoethyl ether, drums, c/l., wks.	lb.	.14½
Diethyl phthalate, drums, c/l.	lb.	.22
Sulfate, tech., drums, wks.	lb.	.15
Diglycol oleate, light, bbls.	lb.	.17
Dimethylaniline, drums	lb.	.23
Dimethyl phthalate, drums, c/l., dlvd.	lb.	.20
Dinitrobenzene, tech., drums	lb.	.18
Dinitrochlorobenzene, bbls.	lb.	.14
Dinitronaphthalene, bbls.	lb.	.35
Dinitrophenol, bbls.	lb.	.22
Diphenyl, bbls., c/l., wks.	lb.	.15
Diphenylamine, bbls.	lb.	.25
Diphenylguanidine, bbls.	lb.	.35
Epsom salt, tech., bags	100 lbs.	1.80
Ether, concn., drums	lb.	.11
Nitrous, bots., 100 lbs.	lb.	.93
Ethyl acetate, 85–90%, tanks, frt. allowed	lb.	.11
Acetoacetate, drums, c/l., wks.	lb.	.37½
Bromide, drums	lb.	.50
Chloride, drums	lb.	.18
Formate, drums	lb.	.27¾
Methyl ketone, drums	lb.	.09
Ethylene dichloride, drums, c/l., wks., frt. allowed	lb.	.0742
Glycol, drums, c/l.	lb.	.14½
Monobutyl ether, drums, wks.	lb.	.16½
Monoethyl ether, drums, wks.	lb.	.14½
Monoethyl ether acetate, drums, wks.	lb.	.11½
Monomethyl ether, drums, wks.	lb.	.15½
Feldspar, 20 mesh, bulk, wks.	ton	9.75
Film scrap colors, dk., cs., 1000 lbs., E. wks.	lb.	.13½
Fluorspar, 95%, bags, f. o. b. mines	ton	36.20
Formaldehyde, bbls., c/l.	lb.	.05½
Fuller's earth, bags, c/l., mines	ton	8.50
Furfural, tech., drums, contract, works	lb.	.10
Glauber's salt, bbls., c/l.	100 lbs.	1.05
Glycol phthalate, drums	lb.	.38
Stearate, drums	lb.	.26
Hexamethylenetetramine tech., drums	lb.	.32
Hydrogen peroxide, 100 vol., cbys., c/l.	lb.	.16
Hydroquinone, kegs	lb.	.90
Indigo, synth., liq., bbls.	lb.	.16½
Iodine, resubl., jars	lb.	2.00
Iodoform, drums, 100 lbs.	lb.	3.95
Iron acetate, N. F. IV, cbys.	lb.	.17
Iron chloride, tech., cryst., bbls., wks., frt. allowed	lb.	.05
Isopropyl acetate, tanks, frt. allowed	lb.	.10
Lead acetate, white, broken	lb.	.12½
Arsenate, bbls.	lb.	.11
Metal, N. Y.	1 lb.	.0650
Oxide, litharge, bbls., 20-ton lots	lb.	.0800
Peroxide, powd., tech.	lb.	.23
Red, bbls., 20-ton lots	lb.	.09
Sulfate, bbls.	lb.	.0725
White, basic carb., bbls.	lb.	.0825
Lecithin, edible, drums, c/l.	lb.	.28½
Tech., dms., c./l.	lb.	.26
Lime, live, chemical, bulk, wks.	ton	7.00
Lime-sulfur, dry, bags, c/l.	lb.	No prices
Lithopone, ordinary, bbls.	lb.	.04½
Magnesite, calcined, dom., bags	ton	84.00
Magnesium carbonate, tech., bags, c/l.	lb.	.06¼
Chloride, drums	ton	32.00
Fluosilicate, cryst., bbls.	lb.	.18
Oxide, light, bbls.	lb.	.26
Manganese chloride, bbls.	lb.	.14*
Dioxide, 85–90%, bbls., c/l., wks.	ton	74.00
Sulfate, anhyd., bbls., wks.	lb.	.11¼
Mannitol, commercial, bbls., wks.	lb.	.35
Menthol, nat., cans	lb.	13.00
Mercury bichloride, cryst., drums, 50 lbs. or more	lb.	2.39
Mercury, flasks, 76 lbs., mines	flask	191.00
Meta-phenylenediamine, kegs	lb.	.65
Meta-toluylenediamine, kegs	lb.	.70
Methanol, synthetic, drums, frt. allowed, c/l.	gal.	.34½
Tanks, frt. allowed	gal.	.28
Methyl acetate, 97–99%, tanks	gal.	.09½
Chloride, cylinders	lb.	.32
Formate, l. c. l., drums	lb.	.89
Hexylketone, drums, tech., wks.	lb.	.60
Salicylate, drums	lb.	.35
Monoamylamine, drums, c/l., wks.	lb.	.61
Monobutylamine, drums, l. c. l., wks.	lb.	.51
Monoethanolamine, drums, wks.	lb.	.24
Naphthalene, crude, dom., 74 deg., bags, c/l., wks.	100 lbs.	2.75
Nickel salt, single, bbls.	lb.	.13
Niter cake, bulk	ton	16.00
Nitrobenzene, drums	lb.	.08
Nitrocellulose, ester-sol., 30-35, ¼, ½ sec., bbls., wks.	lb.	.26
Nitromethane, drums, l. c. l., wks.	lb.	.25
Octanol, normal, drums	lb.	.85
Oil, castor, No. 3, tanks	lb.	.12¾
China wood, dms.	lb.	.39
Coconut, crude, tanks	lb.	.0835
Cod, Newf., bbls.	gal.	.90
Corn, crude, tanks, mills	lb.	.12¾
Cottonseed, cooking, bbls.	lb.	.16¾
Linseed, raw, tanks	lb.	.1240
Menhaden, crude, tanks, f. o. b. Baltimore	gal.	.0880
Neat's-foot, pure, bbls.	lb.	.19¼
Oiticica, bbls.	lb.	.25
Oleo, No. 1, bbls.	lb.	.13¼
Olive oil, denat., bbls.	gal.	3.50
Edible, Calif., drums	gal.	4.00
Palm, Niger, bbls.	lb.	.0825
Peanut, crude, tanks	lb.	.13
Perilla, drums	lb.	.2450
Rapeseed, denatured, c. i. f.	gal.	.1150
Red, bbls.	lb.	.11¾
Soy bean, crude, tanks	lb.	.12¼*
Sperm, 38°, bbls.	lb.	.1301
Whale, bbls., natural, refined	lb.	.1070*
Ortho-dichlorobenzene, drums	lb.	.06
Ortho-nitrochlorobenzene, kegs	lb.	.15
Ortho-nitrotoluene, drums	lb.	.09
Ortho-toluidine, bbls.	lb.	.19
Para dichlorobenzene, drums, c/l.	lb.	.11
Para-formaldehyde, drums	lb.	.23
Paraldehyde, tech., drums	lb.	.12
Para-nitraniline, drums	lb.	.45
Para-nitrochlorobenzene, drums	lb.	.15
Para-nitrotoluene, bbls.	lb.	.30
Para-phenylenediamine, bbls.	lb.	1.25
Para-toluidine, bbls.	lb.	.48
Paris Green, 250-lb. kegs	lb.	.24
Perchlorethylene, drums, c/l., wks.	lb.	.09
Phenol, drums, c/l., wks.	lb.	.12½
Phenolphthalein, yellow, drums, ton lots	lb.	.80
Phenylethyl alcohol, bottles	lb.	2.10
Phloroglucinol, tech., tins, wks.	lb.	15.00
C. P., tins, wks.	lb.	20.00
Phosphorus, red, cases	lb.	.40
Oxychloride, 175-lb. cylinders	lb.	.15
Trichloride, cyl.	lb.	.15
Phthalic anhydride, bbls., c/l.	lb.	.14½
Platinum, metal, solid	oz.	36.00
Potash, caustic, solid, drums	lb.	.06¼
Potassium acetate, tech., bbls.	lb.	.28
Bicarbonate, gran., bbls.	lb.	.19
Bichromate, casks, c/l., wks.	lb.	.09½
Bromide, U. S. P., gran., bbls.	lb.	.27
Carbonate, 80–85%, calc., casks.	lb.	.06½
Chlorate, cryst., kegs	lb.	.11*
Chloride, tech., cryst., bgs.	lb.	.08*
Cyanide, drums	lb.	.55
Meta-bisulfite, bbls.	lb.	.18
Muriate, fert., bulk	K_2O unit	.53½
Permanganate, tech., drums	lb.	.19¾
Prussiate, red, bbls.	lb.	.70
Yellow, casks	lb.	.17
Pyridine, denat., drums	gal.	1.71
Pyrocatechin, C. P., drums	lb.	2.15
Quinine, 100-oz. cans	oz.	.97½
Resorcinol, tech., kegs	lb.	.68
Rochelle salt, powd., bbls.	lb.	.43½
Saccharin, drums	lb.	1.45
Salt cake, bulk, wks.	ton	15.00
Saltpeter, gran., bbls.	100 lbs.	6.20
Silica, amorph., 96%, 325 mesh, bags, c/l., wks.	ton	17.00
Silver nitrate, vials	oz.	.32½
Soda, ash, 58%, light, paper bags, contract, wks.	100 lbs.	1.05
Caustic, 76%, solid, drums, contract, wks.	100 lbs.	2.30
Sodium acetate, flake, 60%, bbls.	lb.	.05
Alginate, drums	lb.	.79
Antimoniate, bbls.	lb.	.15
Benzoate, U. S. P., bbls.	lb.	.46
Bicarbonate, U. S. P., powd., bbls., c/l., wks.	100 lbs.	1.85
Bichromate, c/l., wks.	lb.	.07¾
Bisulfite, bbls.	100 lbs.	3.00
Bromide, U. S. P., bbls.	lb.	.27
Chlorate, cryst., bags	lb.	.06¼
Chloride, bags	ton	15.70
Cyanide, 96–98%, dom., drums	lb.	.14
Fluoride, white, 90%, bbls., c/l., frt. alld.	lb.	.08
Metallic, untrimmed bricks, drums, f. o. b. Niagara Falls	lb.	.15½
Metasilicate, gran., bbls.	100 lbs.	2.50
Naphthionate, bbls.	lb.	.50
Nitrate, crude, bulk, works	ton	27.00
Nitrite, bbls.	lb.	.06¾
Perborate, bbls.	lb.	.14¾
Phosphate, disodium, cryst., bags, c/l., wks.	100 lbs.	2.55
Phosphate, trisodium, bags, c/l., wks.	100 lbs.	2.70
Picramate, kegs	lb.	.65
Prussiate, yellow, bbls.	lb.	.11
Silicate, drums, c/l., 40°	100 lbs.	.80
Silicofluoride, dom., bbls.	lb.	.09
Stannate, drums	lb.	.33½
Sulfate, anhyd., bags	100 lbs.	1.70
Sulfide, cryst., bbls.	100 lbs.	2.40
Solid, 60%	100 lbs.	3.15
Sulfocyanide, C. P., bbls.	lb.	.55
Thiosulfate, reg., cryst., bgs.	100 lbs.	2.25
Tungstate, tech., kegs	lb.	No prices
Strontium carbonate, tech., bbls.	lb.	.25*
Nitrate, bbls.	lb.	.07¾
Sulfur, bulk, mines	ton	16.00
Chloride, drums	lb.	.03
